Dako'ta (from 'D. Indians'), a territory in the United States, constituted in 1861, bounded E. by Minnesota and Iowa, S. by Nebraska, W. by Wyoming and Montana, and N. by the Dominion of Canada. D. is now divided into N. and S. Dakota: N. D. area, 70,195 sq. miles, and pop. 182,719; S. D. area 76,850 sq. miles, and pop. 328,308. Of these inhabitants 223 are Chinese, and 976 are civilised Indians. The Missouri flows through D. from N.W. to S.E., and N. Red River flows along its E. frontier into Manitoba. The largest sheet of water is the Mini Wakan, or Devil's Lake. The land is most prairie, and in the S. is very fertile, yielding rich crops of wheat, oats, and maize, besides sugar-cane and tobacco. The winters are intensely cold, but the climate is very healthy. The buffalo and deer abound, and the fur trade is valuable. The N. Pacific Railroad intersects D. from E. to W. The solitudes of the Black Hills have, since 1876, become the busy scene of gold-mining, and coal, iron, and copper are also found. The total debt, less sinking fund, of N. D. is over $3,000,000, while that of S. D. is close on $6,000,000. The value of the annual mineral production is, of N. D. over $61,000, of S. D. nearly $4,000,000. Yankton, in S. D., lies in the S.E., on the Missouri, and has a pop. of 3670.

Dalamow, Dalmow, or **Dalmau,** a town in the Rai Bareli district of Oude, on the Ganges, 68 miles above Allahabad. Founded as long ago as 1500 years, it was possessed by the Bhars, who long maintained a gallant resistance to the advance of the Mohammedans. In A.D. 1400, however, they were almost destroyed. There is a splendid Hindu temple of Mahadeo and many mosques. Over 60,000 persons are said to attend the large annual fair here; during the time it lasts, the locality profits much by the trade which goes on between the visitors and the natives. Pop. 5367.

Dalaradia, properly **Dalaraidhe,** a tribe of Picts or *Cruithne* (q.v.), who occupied the southern half of the county of Antrim and the greater part of the county of Down. According to the annals of Tighernach, the founder of the race was Fiacha Araidhe, who lived about the middle of the 3rd c. The annals of Ulster distinguish between the Irish and Scottish Picts, calling the former Cruithnii, and the latter Picti or Pictores.

Dalberg, or **Dalburg,** the name of an old German family raised to the rank of barons of the empire in the 17th c.—**Karl Theodor Anton Maria, Baron von D.,** born at Hernsheim, 8th February, 1744, was educated at Göttingen and Heidelberg, and studied canon law at Worms. He became chamberlain of that city (an office hereditary in the family from the 11th c.) and Governor of Erfurt. D. died at Regensburg, of which place he was archbishop, 10th February, 1817. His reputation stood high as a political ruler, student of science, and patron of letters. He was the author of several scientific works.—**Wolfgang Heribert, Baron von D.** (born 1749, died 1806), brother of the preceding, was the friend to whom Schiller addressed his *Briefe*.

Dalber'gia, a large genus of Leguminous plants, consisting of forest trees and climbing shrubs, natives of the tropics of the Eastern hemisphere. *D. Sisso* of Bengal and the provinces as far N. as the Punjab yields a fine compact timber called *Sissu* or *Sissum*, which, on account of its durability, is employed as sleepers on the Indian lines of railway, in the construction of gun-carriages, for the crooked 'knees' of ships, and for all purposes connected with house-building. *D. sissoides* yields the timber called blackwood and rosewood in Madras, where it is employed in making gun-carriages. *D. nigra* of Brazil supplies much of the 'rosewood' sent to Europe from that country. *D. latifolia*, also called blackwood and E. India rosewood, is the *Sal* (q.v.) of Bengal. *D. monetaria* of Surinam yields a resin not unlike Dragon's Blood (q.v.).

Dalecar'lia, or **Dalar'ne** ('the land of dales or valleys'), an ancient province of Sweden, now included in the län or prefecture of Kopparberg, of which Falun is the capital. The country is poor and hilly. The name is still dear to the inhabitants from the effective assistance given by the Dalecarlians to Gustavus Vasa in freeing Sweden from the Danish yoke in 1521.

Dalgar'no, George, was born at Aberdeen about 1626. He was educated in Marischal College, and afterwards at Oxford, where he taught a grammar-school until his death, 28th August, 1687. D. invented the finger alphabet for the deaf and dumb, treating of the subject in *Didascalocophus, or the Deaf and Dumb Man's Tutor* (Oxford 1680). He also wrote a treatise on a universal language. His writings show great learning, prevision, and originality.

Dalhou'sie, Fox Maule Ramsay, Earl of, was born at Brechin Castle, 22nd April, 1801. He entered the 79th Highlanders in 1819, and, after serving in Canada under his uncle, the Earl of Dalhousie, retired as captain in 1831. In 1835 he entered Parliament for Perthshire as a Whig, and sat for this county for two years, and subsequently for the Elgin Burghs (1830-41) and for the city of Perth (1841-52). In 1852 D., hitherto known as Fox Maule, on the death of his father, became Baron Panmure, and filled in succession the offices of Under-Secretary for the Home Department, Vice-President of the Board of Trade, President of the Board of Control, and Secretary at War (1855-58). His conduct in the latter post, during the war with Russia, excited a good deal of criticism. D. retired from political life in 1858, when Lord Palmerston resigned. In 1860, on the death of his cousin, the Marquess of D., he succeeded to the title of Earl, and the following year assumed the additional name of Ramsay. D., who had married, in 1831, the Honourable Montagu Abercromby, eldest daughter of the second Baron A. (died 1853), died 6th July, 1874, without issue, and was succeeded by his cousin, George Ramsay, 12th Earl of D., born 26th April, 1806; died 1880. Outside of politics, D. will be chiefly remembered for his devotion to the Free Church of Scotland, his last public act being to second, in 1874, the nomination of Dr. Rainy to the Principalship of the Edinburgh New College.

Dalhousie, Marquess of, James Andrew Broun-Ramsay, one of the most energetic Indian administrators that Great Britain has produced, was the third son of the ninth Earl of D., and was born at Dalhousie Castle, 22nd April, 1812. Educated at Harrow and Christ Church, Oxford, D., in 1832, by the death of his only surviving brother, succeeded to the honorary title of Lord Ramsay, and as such contested, although in vain, in 1835 the representation of Edinburgh in the Conservative interest. In 1837 he entered Parliament for Haddingtonshire; but his father, who had been Governor of Canada, dying the following year, he became a member of the House of Peers. In 1843 he showed his vigorous administrative powers and his industry as Vice-President of the Board of Trade under Sir Robert Peel, and still more so two years later as chief of the same department in the time of the railway mania. In 1847 he succeeded Lord Hardinge as Governor-General of India, and arrived at Calcutta 12th January, 1848. At once D. threw himself heart and soul into the work of improving the internal administration and developing the resources of India. He established roads, lines of railway, telegraphs, and irrigation works on a vast scale; reformed and cheapened the postal service; improved the system of education, and placed the various sects in the country on a more rational footing towards each other. Above all, he extended the Indian empire of Britain, conquering Pegu and the Punjab, and annexing several great dominions, the chief of which was Oude. Whether the policy of the 'great annexer' was always wise has been seriously doubted, and many believed that the Indian mutiny during the rule of his successor was to be traced to this policy, which has been described by a French critic as *brusques et precipitées.* But it was heartily approved of by the English nation. In 1849 he was made a Marquess, and obtained the thanks of both Houses of Parliament and of the East India Company, and in 1852 he was appointed Constable of the Castle of Dover and Warden of the Cinque Ports. His health, however, gave way before he left Calcutta in 1856, and after a long and painful illness, he died at Dalhousie Castle, 19th December, 1860. D. married in 1836 the eldest daughter of the Marquess of Tweeddale. She died in 1853, leaving no male issue, and the title of marquess became extinct, the earldom reverting to D.'s cousin, Baron Panmure. See *History of the Marquess of D.'s Administration of British India* (Lond. 1863-64).

Dal′ias, a town in the province of Almeria, Spain, 18 miles W.S.W. of Almeria, in the neighbourhood of mines of lead and antimony. Agriculture, mining, and fishing are the other industries. The principal buildings were destroyed by an earthquake in 1804. There are favourite mineral baths on the seaside near the town. Pop. 6254.

Dal′keith (Gael. *dal,* 'a field,' and *caeth,* 'narrowness,' 'narrow field;' or from *cath,* 'battle,' 'field of battle'), an ancient market-town and burgh of barony, 6 miles S.E. of Edinburgh, between the N. and S. Esks, consisting principally of one long street. The fine old Gothic parish church dates from the 16th c. There are several handsome churches belonging to different denominations, and an Episcopal chapel built by the Duke of Buccleuch within the grounds of D. Palace. The palace was erected about 1700, on the site of a very old castle, once termed the Lion's Den, from the haughty Earl of Morton having resided in it. The estate of D. was purchased from Morton by Buccleuch in 1642. One of the largest grain-markets in Scotland is held at D. The town has manufactures of woollens and brushes, besides tanneries and iron-foundries, and there are valuable coal-mines in the neighbourhood. Pop. of entire town, 7035. See Scott's *Provincial Antiquities.*

Dall′as, George Mifflin, an American diplomatist, was born at Philadelphia, 10th July, 1792. After a brilliant career at Princeton College, he spent a short time in a subordinate diplomatic post at St. Petersburg, and then settled down to the practice of law in his native city, where he filled several important offices, including that of district-attorney of Philadelphia. In 1837 he was appointed United States minister at St. Petersburg, but was recalled in two years. From 1844 to 1849 he held the office of Vice-President of the United States. In 1856 he became minister at the British court, and was entrusted with the settlement of the Central American question. In this capacity he gained the respect of all with whom he came in contact, was an especial favourite with Lord Palmerston, and diligently studied the political institutions of England. D. was succeeded in 1861 at the court of St. James by C. F. Adams. He died 31st December, 1864.

Dalles′ (Fr. *dalle,* 'a flagstone'), the name given by the French *voyageurs* to the rapids on the Columbia or Oregon river, forming, along with the cascades, magnificent scenery, but formidable obstructions to navigation. In the D., lofty walls of basaltic rock rise from either side, leaving a narrow passage, at one point only 58 yards in width, through which the angry waters rush with fearful rapidity.

Dalma′tia, the most southerly crown-land of Austria, lies along the N.E. coast of the Adriatic, and is hemmed in on the land side by Croatia, Bosnia, and Herzegovina. Area, 4940 sq. miles; pop. 527,426, of whom nine-tenths are Slavs (Morlaks of Servian descent), 46,000 Italians (mostly in the towns), and some 360 Jews. It consists of a strip of land 260 miles long, and having an extreme breadth of 60 miles. The coast, abounding in magnificent natural harbours, is surrounded by a fringe of islands, most numerous in the N. and largest in the S., of which the principal are Brazza (q.v.), Lissa (anc. *Issa*), Lesina *(Pharos)*, and Curzola *(Black Korkyra)*. D. is divided into twelve districts—Benkovatz, Cattaro, Curzola, Imoski, Knin, Lesina, Macarsca, Ragusa, Sebenico, Sign, Spalatro, and Zara. The mainland, nestling between the Dinaric Alps (q.v.) and the sea, is watered by few rivers, the largest being the Cettina, Kerka, Termanja, and Narenta. Its surface is in great part swampy, while one-ninth of it is covered with forest; only 22 per cent. is cultivated, yielding chiefly maize and barley. There is also an extensive cultivation of the vine and olive, and among the fruits are the fig, almond, and hill-cherry. Along the coast is found the richest algæ vegetation in all Europe. The climate of D. is hot but healthy, unless in the swampy regions, where fever prevails during certain seasons. The mean temperature is 62·5° Fahr., while its range is from 19° to 95°. D. has valuable coast-fisheries of anchovy, mackerel, and tunny. With fine pastures, it is celebrated for its sheep-farming. Most of the land is under pasture and wood, and agriculture is in a very backward state, sufficient grain not being produced for the wants of the country. D. produces large quantities of Maraschino, and other kinds of dessert wines. In various parts of the mainland and archipelago, asphalt is found, and there are iron and coal mines. Zara is the capital, and the other great trading places are Spalatro, Cattaro, and Ragusa. D. sends nine deputies to the Reichstag, and has a Diet of its own, consisting of forty-three members. The Roman Catholic Church has an archbishop at Zara, and in D. the number of its adherents amounts to about two-thirds of the inhabitants, while the members of the Greek Church are under one-seventh. The Slavs speak the dialect of Herzegovina. As a race, the Dalmatians are intelligent and handsome; the untutored Morlak is bold, independent, and cunning. D. is first known as a 'ledge of Hellenic land,' protected by its hills from the native barbarians of Illyricum. It was conquered by Augustus, B.C. 23, becoming the S. part of the province of Illyricum. In 489 it was captured by the Goths, and in turn by the Slavs (620). Towards the end of the 9th c. the coast-land fell into the hands of the Croatian princes, one of whom, Cascimir Peter, took the title of King of D. (1052). On the extinction of this dynasty (1100), King Ladislaus of Hungary seized part of the territory, while the other portion placed itself under the protection of Venice. By the peace of Passarovitz, 1718, Venice ceded a small piece of D. to Turkey, and by the peace of Campo-Formio, 1796, Venetian D. was transferred to Austria. In 1805 Napoleon annexed part of D. to the kingdom of Italy, and in 1805, having also captured Hungarian D., he united the parts, thus forming the province of Illyria. It again became Austrian in 1814, and was made a crown-land in 1816. See the works of Peter (1857) and Noë (1870).

Dalmat'ic (Lat. *tunica Dalmatica*, from Dalmatia), the characteristic dress of deacons in the early Christian Church, is a tunic extending to the knees, with long wide sleeves open at the sides, and ornamented with two purple stripes, the *angusti clavi* of the Roman dress. The simpler and older form was the *colobium* (Gr. *kolobos*, 'short'), which had only very short sleeves. When the other clergy began to wear the Chasuble (q.v.) the D. was conceded to the deacons, as more elaborate than the colobium, because they had nothing over it, although it was reserved for those at Rome till about the 10th c., when it became generally the proper dress for deacons. See Walcott's *Sacred Archæology* and Marriott's *Vestiarium Christianum.*

Dalri'ada. In the 3rd c. Cairbre Ruighfhadu—*i.e.*, 'Cairbre of the long arm,'—a prince of Munster, removed to Ulster, where his posterity attained considerable power. Bede calls him Reuda, other historians Riada. In 506 a band of his descendants, numbering 150, and led by Loarn, Angus, and Fergus, three sons of Erc, crossed to the opposite coast of Argyllshire, and took possession of Cantire and Knapdale, founding the very small 'kingdom of D.' In course of time they conquered the whole mainland of the county as far as Drumalban or the modern Tyndrum. The northern Picts or Caledonians maintained an almost constant warfare with them, and in the 8th c. appear to have utterly defeated them (having burned their capital, Dun-Add, near Loch Crinan, to the ground). Their history from the following century is involved in great obscurity, but at the close of that period, their leader, Kenneth MacAlpine, appears as king alike of D. and of the northern Pictland. It is believed that he acquired the new territory by inheritance through his mother. He proved to be a man of great ability, subdued both the Strathclyde Britons and the southern Picts, thus reducing Albainn (as it was then called and is still known to all Gaelic speakers) under one sceptre, and eventually imposing on it the name of Scotia or Scotland.

Dalry' (Gael. 'king's field,' or 'level field'), the name of several places in Scotland, of which the most important are—1. A town of Ayrshire, on the right bank of the Garnock, 19 miles S.W. of Glasgow. It owes its prosperity to the development of its extensive coal, lime, and iron fields. There are numerous blast-furnaces in the neighbourhood. There is also a large woollen-mill, giving employment to numerous hands. Pop. Dalry proper, 3686; Blair Works, 667; and Old Carsehead, 219. 2. A village in Kirkcudbrightshire, Scotland, on the river Ken, 15 miles N.N.W. of Castle-Douglas. Pop. 560, as against 603 in 1881.

Dalrym'ple, an ancient Scottish house, which takes its name from the estate of D. in Ayrshire, which it held in the 14th c. The family came into notice in the 15th c. for adherence to Lollardism, and **John D. of Stair** was among the first Scottish gentlemen who embraced the Reformation doctrines. His son, **James D. of Stair,** was a firm supporter of the Scottish Reformation of 1560.—**James D., Viscount Stair,** grandson of the last, was born at Drummurchie, Ayrshire, May, 1619. He studied at Glasgow University, became captain in the army raised to vindicate the Covenant (q.v.), and in 1641 was made Professor of Logic in Glasgow, an office which he resigned before his call to the bar in 1648. A Presbyterian and a Royalist, he was in 1649 appointed Secretary to the Commission sent to Holland by the Scottish Parliament to invite Charles II. to accept the crown, a mission in which D. showed considerable tact. In 1657 he was made a judge under the Cromwellian rule, an office in which he was confirmed at the Restoration, and which he offered to resign in 1663 rather than sign the Declaration Oath. In 1664 he was made a baronet, in 1671 Lord President of the Court of Session, and during the next ten years occupied himself in composing *Institutions of the Law of Scotland.* In 1681 he procured the insertion in the Test Act of a clause which rendered the Act contradictory and invalid. The persecution to which he was thenceforth subjected forced him in 1682 to withdraw to Leyden, where he occupied himself mainly with philosophy until 1688, when he sailed for England with William of Orange. He was reappointed President of the Court of Session, was raised to the peerage, and was the King's chief adviser in Scottish affairs. He died at Edinburgh, 23rd November, 1695. He was a man of great sagacity and learning, of sincere but unimpassioned patriotism, of amiable but almost phlegmatic temperament. His chief works are his *Institutions of the Law of Scotland* (1681), on which his reputation mainly rests, and his *Physiologia Nova Experimentalis* (Leyd. 1686), in which he sought to overthrow the Copernican theory.—**John D., First Earl of Stair,** eldest son of the above, was born in Wigtownshire in 1648. He became an advocate, and defended Argyll in his trial for treason. In 1686 he was made Lord Advocate, in 1688 Lord Justice Clerk, and in 1691 Secretary of State. His memory is stained by his complicity in the Massacre of Glencoe (q.v.). He became Viscount Stair in 1695, was made Earl of Stair in 1703, was largely occupied in preparing the way for the Act of Union, and died 8th January, 1707.—**John D., Second Earl of Stair,** son of the first Earl, was born at Edinburgh, 20th July, 1673. Having accidentally shot his elder brother, he was educated away from home. He studied at the Universities of Leyden and Edinburgh, fought as a volunteer under the Earl of Angus in 1692, was aide-de-camp to Marlborough during the campaign of 1702, in 1706 became commander of the Cameronian Regiment and the Scots Greys, and distinguished himself at Oudenard, Malplaquet, and Ramilies. He became Earl of Stair in 1707, and in 1718 went as British ambassador to Paris, where he skilfully counteracted Jacobite intrigues, but whence he was recalled in 1720, owing to his quarrel with Law, the Minister of Finance. He lived in retirement at Newliston near Edinburgh until 1742, when he was made commander of the British troops in Flanders, and was present at the battle of Dettingen (1743). He died at Edinburgh, 9th May, 1747. He was an able diplomatist and soldier. St. Simon characterised him as 'extravagant, ardent, and ambitious.' See Graham's *Annals of Viscount and First and Second Earls of Stair* (Edinb. 1875). The present Earl of Stair (10th Earl) sits as Baron Oxenford in the House of Lords. He was born in 1819, and succeeded to the title in 1864. He sat in the House of Commons as member for Wigtownshire, from 1841 to 1856. He is a Knight of the Thistle.

Dalrymple, Sir David, a famous Scottish judge and author, the son of Sir James D. of Hailes, and great-grandson of the first Lord Stair, was born at Edinburgh, 28th October, 1726. He was educated at Eton, and at the Universities of Edinburgh and Utrecht; was called to the bar in 1748, and won considerable reputation as a pleader; in 1766 was made a judge of the Court of Session, with the title of Lord Hailes; and in 1776 was nominated one of the Lords of Justiciary, which office he held till his death, 29th November, 1792. D. was a man of admirable character and varied acquirements. Amid his judicial labours he was a voluminous author of works displaying at once profound learning and the graces of an Attic style. Among his works are *A Discourse on the Gowrie Conspiracy* (1757); *Memorials and Letters Relating to the History of Britain in the Reign of James I. of England* (1762); *Memorials and Letters relating to the History of Britain in the Reign of Charles I.* (1766); *Annals of Scotland, from the Accession of Malcolm III., Surnamed Canmore, to the Accession of Robert I.* (1776); *Annals of Scotland from the Accession of Robert I., Surnamed the Bruce, to the Accession of the House of Stuart* (1779). He also edited various early Scottish poems, &c.—**Alexander D.,** a Scottish geographer, brother of the preceding, was born at New Hailes, near Edinburgh, 24th July,

1737. He was educated at Haddington, and in 1752 was sent to Madras as a writer in the service of the East India Company. The study of documents on the commerce of the Eastern Archipelago prompted him to resign his post and sail for these islands, with the view of creating a lucrative traffic. At Sulu, he made a favourable commercial treaty with the Sultan, but his projects were ruined by the outbreak of smallpox among the natives. He revisited England in 1765 to ventilate his mercantile scheme, which the Government would not embrace; went back to Madras as a member of council in 1775, returned to England in 1777, was appointed hydrographer to the East India Company in 1779, and died at Marylebone, 9th June, 1808. He wrote a large number of geographical treatises, political pamphlets, &c.

Dal'ton, a town in Furness, Lancashire, 16 miles W.N.W. of Lancaster, connected with both the Lancashire and Cumberland railway systems, and not far from the magnificent ruins of Furness Abbey. There are iron-foundries in the vicinity, and a considerable trade is carried on in the malting of grain. Romney, the painter, was a native of D. Pop. civ. par. 13,300.

Dalton, John, was born at Eaglesfield, in Cumberland, 5th September, 1766. In 1781 he removed to Kendal, where he became an usher in his cousin's school, and began a series of meteorological records which he continued with the greatest regularity to the day before his death. In 1793 he obtained the chair of Mathematics and Natural Philosophy in the New College, Manchester, became a member of the Literary and Philosophical Society in that city, and shortly afterwards contributed his first paper on some *Extraordinary Facts Relating to the Vision of Colours*. It was suggested by his inability to distinguish certain colours—a peculiarity which is known as *Daltonism* (q.v.), and which seems to have been due to the yellowish tinge of the refractive matter of his eye. In the *Manchester Transactions* for 1802 several other papers appear by him, bearing upon meteorological subjects, upon evaporation, and upon the relations subsisting between the pressure, volume, and temperature of permanent gases. From these is deduced D.'s law that the pressure of a gas at constant volume is proportional to the temperature, which, together with other important principles there laid down, has greatly aided the experimental determination of the specific gravity of gases. Many other valuable contributions to science are to be found in the *Philosophical Transactions*, in Thomson's *Annals of Philosophy*, and in Nicholson's *Philosophical Journal*. In 1793 appeared his *Meteorological Essays* (2nd ed. 1834). In 1803 D. began the working out of his atomic theory, an outline of which was given in the third chapter of the first volume of his *New System of Chemical Philosophy* (1808), while a further development and application appeared in the second volume of the same work, two years later. In 1817 he became President of the Manchester Literary and Philosophical Society, and in 1821 was elected a Fellow of the Royal Society, from which he received a gold medal in 1826 for his scientific discoveries. In 1827 the third volume of the *New System of Chemical Philosophy* was published, the most important part of which is the appendix, in which he treats, with his characteristic sagacity, of various thermal properties of gases. At the second meeting of the British Association at Oxford in 1832, the University conferred upon D. the degree of D.C.L., and at the Edinburgh meeting in 1834 he was made LL.D. In 1833 D. received from Government a pension of £150, which in 1836 was increased to £300. D. died at Manchester, 27th July, 1844. The present development of the atomic theory, with which D.'s name must ever be associated, is given under the article ATOMIC THEORY. D.'s merits as a chemist were as fully appreciated on the Continent as in his native country. He was a foreign Fellow of the Institute of France, a member of the Academy of Sciences of Berlin and Munich, and of the Natural History Society of Moscow.

Dal'tonism. Certain individuals are more or less deficient in the power of discriminating colours. This is D., from the name of the distinguished chemist who was himself the subject of it. It is sometimes termed colour-blindness. The most common form of D. is an inability to distinguish red from green—thus ripe cherries can be distinguished from the leaves of the tree only by their form. In other cases blue and green are confounded. In most cases, the colour-blindness is for the red rays. Frequently low tones of colour give rise to the same sensation as certain mixtures of black and white—producing grey. D., in all probability, depends on some peculiarity of the structure of the retina. It is well known that the periphery of the retina shows defective perception of the different colours—red appearing grey; green, blue; green, yellow, &c.; and it would appear that D. is 'only an extension of the want of perceptivity, normal in the periphery of the retina.'

Dalziel', Thomas, of Binns, W. Lothian, a Scottish general, born about 1599. He took the royal side in the civil war, and held the town of Carrickfergus for the King; was a major-general at Worcester, where he was captured, but escaping from prison, he entered the service of the Czar of Muscovy, and distinguished himself in the wars against the Turks and Tartars. In 1665 he returned to Scotland, and was appointed commander-in-chief of the forces there. On the 28th November, 1666, he suppressed a rising of the Covenanters at Pentland, with more humanity than might have been expected from a man of his ferocity of temper, intensified by Russian service and a fanatical loyalty to his King. After the execution of Charles I. he never shaved his beard, which grew down to his middle, and this, coupled with his antique dress, never failed to gather round him a crowd of boys when he appeared in London. D. died in 1685.

Dam'ages, in law, is the pecuniary recompense due to one person who has sustained loss or injury through the fault of another. Every illegal, unwarrantable, or malicious act, whether fraudulent or not, by which another is injured in his worldly interest, in his person, or feelings, founds a civil claim for D. against the person who has caused the loss or injury. D. for breach of contract are only due when it is impossible to enforce specific performance, and even when a specific penalty is annexed to failure, so long as performance is possible, the debtor in this obligation is not entitled to pay the penalty, and so get quit of the obligation. Where a particular subject has been lost, destroyed, or injured, without criminality on the part of the person culpable, the person sustaining the loss is only entitled to D. according to the real value of the loss, not according to the sentimental value which he may attach to the subject. But if the culpable person has criminally caused the injury, the sufferer, in estimating D., is entitled to have weight given not only to the value of the subject sentimentally, but to possible consequences. A master is civilly liable for the negligence of his servants or others employed by him. Formerly, in England, no action for D. was maintainable against a person who by wrongful act or negligence caused the death of another, though the offender was liable if the sufferer was only hurt, but this defect of law has been remedied by Lord Campbell's Act, which provides that any one who has wrongfully or neglectfully caused the death of another shall be liable in D., even though the circumstances of the act make it felony. The action is only competent to the wife, husband, parent or child of the person killed. The amount of the damages to be paid to the successful plaintiff is fixed by the jury, or, when there is no jury, by the judge.

Dam'aging Manufactures, Machinery, or **Mines.** Statute 24 and 25 Vict. c. 97, enacts the penalty of penal servitude (of 3 years—life) or of imprisonment for any term not exceeding two years, with or without hard labour, and with or without solitary confinement, and, if a male under 16 years of age, with or without whipping, for these offences.

Daman', a seaport and settlement of Guzerat, India, at the mouth of a river of the same name. Ships in the harbour are safe from the S.W. monsoon, and outside the bar there is good anchorage. Endemic fevers prevail, caused by the brackishness of the water. D. belongs to the Portuguese. The settlement of D. includes the pargana of Nagar Havili, and the pop. of the combined district is 49,084, of whom 1615 are Christians and 28,006 are Hindus. The area of the district is 82 sq. miles. The principal crops are rice, wheat, maize, and tobacco. Opium is no longer allowed to be transported, and the weaving and dyeing trade having declined, the town of D. is by no means so flourishing as it was before the British conquered Scinde. Mats and baskets are largely made here, and deep-sea fishing is remunerative to the inhabitants.

Daman, or sometimes **Hyrax,** an anomalous genus of mammalia, a distinct order, *Hyracoidea*, and sometimes regarded as included, from certain resemblances in the teeth, in the family *Rhinocerotidæ*, or that of the Rhinoceroses. Even in the character of its placenta (which is zonary and deciduate) it differs from the *Rodentia*, with which order it has also been supposed to possess structural relations. Hence the genus D. stands as the type of a somewhat aberrant group of mammals, intermediate between the *Ungulata* or hoofed mammals on the one hand, and the Rodents and *Insectivora* on the other hand.

The genus D. is represented by several species, of which the *H. Syriacus* of Syria (supposed to be the 'cony' of Scripture), and the *H. Capensis*, 'Klip Das,' or 'Cape Badger,' of S. Africa, are the best known. The H. of Syria is a small rabbit-like animal, the front feet having four, and the hind feet three toes. The nails are flat. The body is covered with fur, and the snout is divided as in Rodentia. There are four teats in the groin and two in the axillæ. From twenty-nine to thirty-one dorso-lumbar vertebræ exist, a number rarely exceeded in mammals. The adult has eight incisors, no canine teeth, sixteen premolars, and twelve molars. The outer upper incisors are small, but the inner large and curved, which grow throughout life. They are coated in part with enamel, like the incisors of rodents. The molars resemble those of the rhinoceros. The Syrian H. is of dark-brown colour, and the Cape H. wants the long black hairs of the former. No clavicles exist, and the tail is rudimentary.

Damar', a town of Yemen, Arabia, 120 miles N.N.W. of Aden, with 5000 well-built houses, the governor's castle, and a college for the Zeïtes, which is well attended.

Damaraland, a protectorate within German S.W. Africa, lying between 19° 30' and 23° S. lat., and extending from 20° E. long. to the Atlantic Ocean on the W. The coast-land is barren and deserted; but inland the soil is fertile and well-adapted for rearing cattle. Here is much copper, yet so far the mines have not been worked, owing to the excessive cost thereby entailed. In the centre the land is mountainous, and Omataka is the highest peak. The N. and W. parts are watered by small rivers, which run either into larger tributaries of the Zambesi, or into Lakes Ngami and Kumadan. In the S. are the Swakop and Nosob rivers. The inhabitants are of the Negro race, hardy, brave, and fairly intelligent. The imports, for 1894, into German S.W. Africa, have been estimated at £45,778, and the exports at only £6568; these proceed viâ Walfisch Bay, and the greater part enters or leaves D.; but there is a very considerable overland traffic, as to which nothing is definitely known. The productive capacity and natural resources of the country remain to be tested. The general appearance would seem to indicate a very prosperous future, should European capital be attracted to this quarter of the continent.

Damasce'ning, Damaskee'ning, Dam'asking, terms employed indiscriminately to denote the production of distinct styles of artistic ornament on iron, steel, &c., and derived from Damascus, where the manufacture of Damasked Steel (q.v.) attained great celebrity. D. is an entirely different process from that by which damasked steel is produced, being the inlaying of gold or silver threads in incisions, representing some design under-cut in metal. The threads are worked in with a blunt tool, and the whole afterwards filed and burnished. This art was successfully practised by the ancients, and during the Renaissance in Italy, Germany, and Spain, arms and armour were so enriched. Indian gold D., called *koftgari*, and produced chiefly in the Punjab, possesses great artistic excellence.

Damasce'nus, Joannes, afterwards surnamed **Chrysorrhoas** ('Golden Stream'), from his eloquence, was born at Damascus about A.D. 700, became a monk of St. Sabas near Jerusalem, and died about 760. He was the last theologian of the Greek Church, and his writings form the starting-point of systematic theology. His best-known work is *De Fide Orthodoxa*, a complete system of theology derived from the fathers. D. sought to propagate the Aristotelian philosophy, but, like most ecclesiastical writers of the times, was extremely credulous and untruthful. He has been canonised both in the Greek and Latin Churches. The best edition of his works is that by P. Mich. Lequien (Par. 1712).

Damas'cus (Turk. and Arab. *Dimishk è Shâm*), one of the oldest cities in the world, and the capital of the vilayet and the province of Syria, Asiatic Turkey, lies in the delightful plain of Chutah, at the E. base of Anti-Libanus, and at an elevation of 2238 feet above the sea. It is surrounded by gardens and orchards for a circuit of some 30 miles, and in its approach it has a splendid appearance. 'Tapering minarets and swelling domes tipped with golden crescents rise up in every direction from the confused mass of white-terraced roofs, while in some places their tops gleam like diamonds amid the deep-green foliage.' The Barrada (the Abana of Scripture) flows past D. in an easterly direction, to be joined by the Phega (anc. Pharpar) in the Bahr-el-Merj. The city is enclosed by dilapidated walls, dating chiefly from Roman and Arabic times. Its streets are gloomy and narrow, and are made hideous by uncared-for refuse-heaps and stagnant pools, and still more by crowds of vagrant, ravenous dogs. The 'street called Straight' (Acts ix. 11) runs about a mile from E. to W., and is the most spacious where all are miserably narrow. The private houses are generally mean, prison-like structures of grey mud, but the interiors of those of the better class are furnished and adorned with the most lavish magnificence. The principal public building of D. is its famous Grand Mosque, originally a Semitic shrine or temple. According to Fergusson, it is impossible to make out its original form in consequence of so much Moslem and Christian rebuilding. It occupies one side of a great square (163 by 108 yards), and the interior is portioned into nave and aisles by rows of Corinthian columns, supporting the roof in the style of the old basilicas. The quadrangle is entirely paved with tesselated marble, and is ornamented with beautiful fountains. A hospital for the sick is attached to the Mosque. Another notable building, the Great Khan, consists of alternate layers of black and white marble, and has a graceful cupola, supported on granite pillars. There are also an extensive citadel, an imposing serai or palace, besides 248 minor mosques, and many monasteries, bazaars, caravanserais, baths, cafés, &c. D. has now but a tithe of its once famous manufactures of silks, cottons, cloth of gold, jewellery, cabinet-work, leather, horse trappings, sword-blades (see DAMASCENING), &c. It is still, however, a great centre of the caravan trade, and receives from Britain calicoes, hardwares, sugar, &c., to the value of some £200,000 yearly. The September pilgrimage to Mecca, which had a strongly commercial as well as a religious character, was under Governmental protection, and cost the treasury £70,000 yearly. Consisting formerly of as many as 60,000 persons, the caravans have greatly fallen off since the opening of the Suez Canal. The pop. of D. is estimated at 198,600, of whom five-sixths are Mohammedans, and the remainder, Jews, Christians, and Druses (q.v.). The last of these occupy a quarter of the city by themselves. The exports in 1893 were estimated at £456,780, and the imports at £677,500. D. is a city of unknown antiquity. It is alluded to in Genesis xiv. 15, and for a long period was closely connected with the kingdoms of Israel and Judah. It was in the possession successively of the Assyrians, Babylonians, and Persians. Under the Persians it was made capital of the province of Syria, but it fell into the hands of Alexander the Great after the battle of Issus. During the long wars of the Seleucidæ and the Ptolemies, D. had no separate history, belonging sometimes to the one power and sometimes to the other. The Romans under Pompey subdued Syria, and made D. the capital of the province of Syria, B.C. 64. In 633 it was seized by the Caliph Omar; in 1401 Timur partly destroyed it by fire, and in

1516 it was taken by the Sultan Selim I. It has ever since remained in the hands of the Turks, except during an interval of eight years (1832-40), when it was under the rule of Ibrahim Pacha. In 1860 the Druses broke loose upon the Christians, killing some 4000, and carrying off many of the women as prizes for the harem. The French macadamised road was opened between D. and Beirut in 1863. There are now three railway projects on foot to connect D. with Beirut, Kaiffa and Acre, and the Hauran. Those between D., Beirut, and the Hauran are simply steam tramways, and are in the hands of French and Belgian companies, but the Kaiffa, Acre, and D. road is an ordinary railway. The Beirut line will shortly be opened to traffic. The D. and Hauran, or Syria-Ottoman, as it is called, railway is at present somewhat under a cloud, owing to financial difficulties which, however, may be soon overcome. See Porter's *Five Years in D.*, Addison's *D. and Palmyra*, Pococke's *Description of the East*, also article SYRIA.

Dam'ask, a woven fabric in which elaborate patterns of foliage, flowers, wreaths, scrolls, &c., are introduced, said to have been first made at Damascus. The production of the pattern depends on the arrangement of the weft and warp yarns in twill-weaving, the gloss or lustre on the weft being distinct from that of the warp threads, which run at right angles to them. In D. weaving, the design for the fabric has first to be prepared and drawn on 'point' paper, that is, paper ruled into small squares which correspond with the threads in the web. The weaving is done in the Jacquard machine (see JACQUARD), previous to the invention of which, about the beginning of the present century, the weaving of D. was effected by a very cumbrous and tedious process. Damasks are chiefly made in linen, and used for toilet and table covers, napkins and towels, but woollen fabrics and silks are also similarly woven, and used principally for furniture cloths. In furniture damasks the pattern is sometimes produced by the use of different colours, and a cheap D. for furniture and hangings is now made of a union of cotton and woollen yarns. The chief British seats of the linen D. manufacture are Belfast in Ireland and Dunfermline in Scotland, that being the staple textile industry of these two towns.

Damasked Steel. When steel presents a 'watered,' waved, contorted, or fibrous surface, as in the highly-prized Damascus blades, it is spoken of as *damasked*. The peculiar markings are due to the crystallisation of the iron and carbon from particular treatment in cooling. Carbon is present in excess of the ordinary proportions, and by the action of acids on the metal of unequal composition, and consequently of varying degrees of solubility, patterns of a certain order may be strengthened. The finely-watered blades of Indian manufacture are made of 'wootz,' or Indian steel, and of different qualities of iron, forged into bars, welded, spirally twisted, and beaten out flat. The blades are said to be hardened by being fixed while redhot to a wheel put in rapid motion. Very successful imitations of the real 'damask' have been produced by French manufacturers. Grey, black, and brown 'damasks' result by mixing quantities of platinum, silver, and palladium with the steel.

Dam'asus, a Spaniard, succeeded Liberius as Bishop of Rome, A.D. 366, after a sanguinary contest with Ursinus. He was active in suppressing Arianism and also Apollinarianism, for which purpose he held several councils and wrote a number of letters. His zeal was also excited against the Luciferians (q.v.), the Donatists (q.v.), and the Priscillianists (q.v.). In return for this his own private character was, rightly or wrongly, attacked. An edict of Valentinian's, that the clergy should not receive legacies from pious ladies, was said to have been aimed principally at him, and he was directly charged with immorality before a council held at Aquileia, but was acquitted. From 382 till his death in 384, he had Jerome (q.v.) for his secretary, who was engaged at the time on his version of the Bible. See Gibbon's *Decline and Fall of the Roman Empire*, chap. xxv.

Dambul', a village in Ceylon, 45 miles N.W. of Kandy, named from a vast rock-temple of Buddha, containing carvings of Buddha, one of which is of colossal size.

Dame (Fr. *dame*, Lat. *domina*, 'the mistress of the house'), a title of honour formerly given in England to a *lady*, understanding the latter term as the correlative of *gentleman*. It is now little used in England, but is applicable to married women of all classes. Before the time of the present system of public education there existed throughout the country districts innumerable small schools under the instruction, such as it was, of untrained, irresponsible, and imperfectly educated women. These schools were called *Dame* schools as opposed to those where the teachers had been themselves properly taught, had learned to teach, and were under the supervision of specially appointed managers. Absence of discipline, absence of proper instruction, and absence of suitable accommodation and ventilation were the chief characteristics of these *Dame* schools. *Madame*, shortened into *madam*, is still used on special occasions, and in ceremoniously addressing a lady in a letter; but it is not now the custom in England, as it was in former times, for ladies and gentlemen in addressing a lady orally to say *madame*, or *ma'am*. In France, again, it is considered discourteous to omit the title in addressing a married woman, whatever be her social rank. In Spain, it is proper to address a lady or a gentleman in the third person, by a term perhaps equivalent to 'your honour' in England. In France, the Virgin Mary was styled by way of pre-eminence *Notre Dame*.

Dame's Violet, a genus of plants of the natural order *Cruciferæ*, natives of the middle and S. of Europe. The common D. V., or white rocket, is found apparently wild in Britain, but is doubtless an escape from the many cultivated varieties. Its flowers are scentless by day but perfumed at night. It is cultivated in pots by ladies in Germany, as it was at one time in England; hence its name. Another species, the night-scented rocket, is a favourite house-flower in parts of the Continent.

Dam'iens, Robert François, was born at Tieulloy, in Artois, in 1714. His youth, passed in service, was so vicious that he earned the sobriquet of *Robert le Diable*. On account of a robbery he was compelled to seek refuge in Belgium, and there, in 1756, took his resolve to assassinate Louis XV. On the 5th of January of the following year he stabbed the King while he was leaving Trianon. D. was instantly captured. During his trial he behaved with great coolness; on hearing the sentence he only said, 'It will be a rough journey.' After frightful tortures, he was put to death, 28th March, 1757. His motive for the murder could not be determined. The people accused in turn the Jesuits, the Jansenists, the Dauphin, and the Parliament, of complicity in the crime; but the assassin revealed nothing. See *Pièces orig. et procéd. du Procès fait a Rob. Franç. D.* (Par. 1757), and *Vie de Rob. Franç. D.* (Par. 1757).

Damiett'a, called by the natives **Damiah,** Arab. *Dimiat* (anc. *Tamiathis* was four miles lower down), a seaport of Lower Egypt, in a governorat of the same name (area 4½ sq. miles; pop. 43,616), about eight miles from the mouth of the eastmost branch of the Nile. The mouth of the stream is protected by circular batteries. In the 13th c. it began to be a flourishing place, and was long famous for its manufactures of leather and cloth (it gives name to 'dimity'); but its industrial activity has long declined, and its formerly flourishing commerce has been absorbed by Alexandria. Rice and flax of excellent quality are extensively grown in the district, and there is some trade in the former and in fish. Pop. 34,046.

Damm'ar, an Oriental word signifying resin, applied in commerce to varieties of resinous substances. The gum-D. or D. resin of British commerce is, however, the produce of pine-trees, to which the generic name D. has been given. The chief of these, and the principal source of the D. of our market, is the Amboyna pine, the Oriental Dammara, a tree growing to a height of 200 feet, found in the East Indian Archipelago. It produces a beautiful, almost colourless, transparent resin, which constitutes the best portion of the resin imported as Singapore D. The Kauri pine of New Zealand, the Australian Dammara, is the source of the gum-Kauri or New Zealand D. of commerce. The tree now flourishes only in the North Island, but the resin is found in many places in a fossil condition. It is only the fossil gum which is of commercial value. It forms considerable mounds, to which annual additions are made by exudations round the trunks of living trees. Other species of Dammara in the Pacific Islands yield similar resins. Along the skirts of the Himalayan Mountains in India there exist immense forests of a valuable timber tree, *Shorea robusta*, which yields a resin called Sal D., but this is not like the dammars found in Western commerce. Black D. is produced in India from *canarium strictum*, and white D. or piny varnish exudes from *Vateria Indica*. A kind of D. is also yielded by *Popea micrantha*, a tree very common in the Malay Peninsula, Borneo, Sumatra, &c., and probably some portion of the Singapore D. of commerce is obtained from this source. The D. imported into England makes very clear, hard varnishes.

Dammara, a genus of *Coniferæ*, found in the islands of the Malay Archipelago, India, and Australasia. The Australian D., the Kauri or Cowdie pine of New Zealand, yields a hard, brittle resin like copal. In commerce it is known as Australian copal, Kauri gum, and New Zealand dammar, and is chiefly used for the manufacture of varnishes. The Oriental D. yields Indian dammar. The timber of the Australian D. is valued for masts and spars. The Dammaras of the South Sea Queen Charlotte Islands, New Caledonia, New Hebrides, and New Zealand, are all handsome trees of this genus. The last, as an inhabitant of the Moluccas, grows to the height of 100 feet, and yields a kind of fine transparent dammar.

Dammu'dah, or **Damodar,** a tributary of the Hoogly, rises in the district of Behar, province of Bengal, flows E. and S.E., and joins the Hoogly near its mouth, after a course of nearly 400 miles. Its valley, traversed for nearly 100 miles by the Calcutta and North-Western Railway, is rich in coal and iron.

Damnum, in Roman law, signifies any loss sustained in person or property. In law, *damnum absque injuria* denotes losses for which the sufferer has no legal right of compensation against the person causing his loss. Thus, where a new school is established to the detriment of one previously established, the latter sustains *damnum absque injuria*.

Damnum Fatale, a term of law denoting inevitable accident or damage for which no bailee could be held responsible, such as, loss by lightning, shipwreck, &c., by superior force, and by robbery. Loss by theft, however, did not relieve the bailee of his liability to pay damages to the owner. See ACT OF GOD.

Dam'ocles was a companion of Dionysius the Elder, tyrant of Syracuse, who, as Cicero relates, flattered that monarch by extolling his power and felicity. Dionysius placed the sycophant amidst the luxuries of a magnificent banquet, and suspended over his head by a single horsehair a naked sword. When D. observed his danger he formed a truer estimate of royal honours.

Da'mon and **Pyth'ias,** or **Phin'tias,** two Pythagoreans of Syracuse, of whom the latter was condemned to death for plotting against Dionysius I. He obtained permission to leave Syracuse to arrange his affairs, and D. willingly offered himself as a pledge for his friend's return. He returned just in time to prevent the sacrifice of D.'s life for his own, and Dionysius, struck with admiration of their friendly devotion, pardoned P., and requested to be admitted to their friendship.

Dam'per, a movable door in a flue or chimney by which the passage of air through it can be checked to any required extent. *Dampers* in a pianoforte are hammers which rest upon the strings, and thus prevent their sounding except so long as the corresponding keys are held down. A pedal is always provided, which, when pressed, lifts the whole of these dampers off the strings at once.

Dam'pier Archipelago and **Straits** are named after the celebrated navigator. The *archipelago* consists of about twenty small rocky islands, situated close to the N.W. coast of Australia, in S. lat. 20°-21° and E. long. 116°-118°. One of the *straits*, which is 20 miles broad, divides the islands of Rook and New Britain, and is situated in E. long. 148° and S. lat. 6°; while the other, which is about 15 miles broader, separates Waigiu island from the extreme N.-Western portion of New Guinea.

Dampier, William, navigator, buccaneer, and author, born of a good family in the parish of East Coker, Somersetshire, in 1652, joined a vessel at Weymouth as a boy, and sailed successively to Bayonne, Newfoundland, and in 1673 to the East Indies. He afterwards joined the naval service, and fought in two battles against the Dutch. He is next heard of as overseer of a plantation in Jamaica; but after six months' experience of this peaceable employment, he embarked in 1675 at Kingston for Campeachy Bay, where he was engaged in logwood-cutting till 1678, when he returned to London. Sailing again in 1679 for Campeachy, he joined a company of filibusters, and in 1680 he was one of a number of 360 buccaneers, who, having crossed the Isthmus of Panama, burnt the fort and town of Santa Maria, seized a number of canoes on the coast, and in these attacked and captured eight Spanish ships which were lying at anchor about two leagues from Panama. D. afterwards scoured the Gulf of Mexico, and during 1683-88 was actively engaged in buccaneering off the coasts of Africa, America, the Philippines and China, the Moluccas, and New Holland. Disgusted with the cruel and violent practices of his companions, he resolved to separate from them. Accordingly, in May, 1688, when near the Nicobar Islands, he and seven others, abandoning the vessel, sailed off in a small boat, hoping to reach Acheen. Of the eight adventurers, only D. and another reached the coast of Sumatra alive. Setting out again in search of fortune, D. arrived in England, 16th September, 1691, and published his *Voyage Round the World*, which attracted immediate attention. The Government commissioned him to undertake a voyage of discovery in the regions which he had already explored, and D. sailed from the Downs, 6th January, 1699. He explored the N. coasts of New Guinea, cleared the passage there now known as D. strait, and discovered many islands W. of New Guinea. On his return home he was wrecked. D. was never afterwards entrusted with full command, though he made at least two other voyages, the one in 1704, the other in 1708-11, as pilot. After the latter date, D. is no more heard of, and the year of his death is unknown. He is the author of *A New Voyage Round the World* (Lond. 1698), an *Account of the Philippines*, and an *Account of New Holland*. His works have considerable descriptive power and a fresh, nautical flavour, and show a clear, shrewd, and observant mind. See Pinkerton's *Collection of Voyages and Travels*, and Burney's *History of the Buccaneers of America* (Lond. 1816).

Damping off, a term used by horticulturists to express the death of plants, such as young seedlings, by an excess of moisture in the soil and atmosphere, especially in stoves and hotbeds.

Dan (Heb. 'judgment') was the fifth son of the patriarch Jacob. The tribe was the most numerous of all (62,700, Num. i., 64,400, Num. xxvi.) except Judah, although the territory it received in the land of Canaan was the smallest. It was, however, the most fertile part of the country, and tempted the Canaanite neighbours to seek to possess it, during which contest Samson appears on the scene. Perhaps on this account the tribe migrated to the N. and took possession of the town of Laish, which, under the name of D., was afterwards the northern extremity of the country.

Dan'a, Richard Henry, an American poet, born at Cambridge, Massachusetts, 15th November, 1787, and educated at Harvard University. He entered the legal profession, but soon adopted literature. In 1818 he became editor of the *North American Review*, and published the *Idle Man* in 1821. His early poems, *The Dying Raven* (1825), the *Buccaneer and other Poems* (1827), and his *Poems and Prose Writings*, have won for him a considerable reputation as a poet and essayist. Died in 1879.—**Richard Henry D.,** son of the preceding, lawyer and author, was born at Cambridge, Massachusetts, 1st August, 1815, and educated at

Harvard. He made a voyage to the Pacific as a common sailor, and gave his experience in *Two Years before the Mast*, his most popular work. D. was admitted to the bar in 1840, published *The Seaman's Friend* (1841), and contested Essex, Massachusetts, against General Butler, in 1867, for a seat in Congress, but was defeated. He edited Wheaton's *International Law* (1866). President Grant nominated him (1876) United States Minister to England, but the Senate rejected the nomination by a vote of thirty-six against seventeen. Died in 1882.—**James Dwight D., LL.D.,** an American geologist and mineralogist of European reputation, born at Utica, New York, 12th February, 1813. He graduated at Yale College in 1833, published his *Mineralogy* in 1837, accompanied Wilkes' exploring expedition in the Pacific Ocean (1838-42), and was busy for several years after in giving the scientific world the results. D. is author of a *Report on Zoophytes* (Wash. 1846), *Geology of the Pacific* (Wash. 1846), *Crustacea* (Wash. 1852), *Coral Reefs* (Philad. 1853), and *Manual of Geology* (1862). In 1855 he was appointed Professor of Natural History and Geology in Yale College, where he acquired a great reputation as a lucid and eloquent expounder of science.

Dan'aë, daughter of Acrisius, King of Argos, was confined by her father in a brazen tower to prevent the fulfilment of an oracle that a son to whom she would give birth would cause his death. But Jupiter wooed the maiden in a golden shower, and she became the mother of Perseus, whereupon Acrisius shut the mother and her child in a chest, and exposed them on the sea. Their floating prison drifted to Seriphos, where it was found by Dictys, a fisherman, who conveyed its tenants to his brother, King Polydectes. According to the common legend, Polydectes became enamoured of D., but dreading Perseus, now grown up, he sent him to subdue the Gorgons, and secure for him the head of Medusa, which he alleged he would present to Hippodamia as a wedding-gift. Perseus returned with the trophy, retired with his mother to Argos, and inadvertently slew Acrisius, thereby fulfilling the oracle.

Dan'aüs, son of Belus and Anchinoë, was originally King of Libya, while his brother, Ægyptus, ruled over Arabia. The brothers having quarrelled, D. fled in the ship *Armais* with his fifty daughters, and eventually reached Argos, of which he was chosen king. The fifty sons of Ægyptus came to Argos and asked their cousins in marriage. To this D. consented, at the same time providing each of the brides with a dagger, and enjoining them to slay their husbands on the night of the nuptials. This they all did except Hypermnestra, who spared Lynceus. D. persecuted him for a time, but became reconciled to him, and appointed him his successor. As a punishment for their crime, the Danaïdes were compelled in Hades to fill continually a vessel full of holes. From D. the Argives were called Danai.

Dan'avirke, a long wall in Slesvig, about 8 miles long, from 24 to 40 feet high, ascending from the Slei to the river Trene. Tradition says it was built in the 10th c. by King Gorm and his wife Thyra. It was restored and strengthened in 1850, but was captured by the Austro-Prussian troops in the Danish war of 1865.

Dan'by, Francis, a historical and landscape painter, born near Wexford, 16th November, 1793, and educated at the Royal Dublin Society. In 1820 he removed to Bristol, and, after residing for several years in Switzerland, settled at Exmouth. He died in 1861. Most of his works are illustrative of Scripture or profane history, such as 'The Deluge,' 'The Passage of the Red Sea,' 'Marius among the Ruins of Carthage.' His son, James D. (died 1875), was also an artist.

Dance of Death (Lat. *Chorea Machabæorum*, Ger. *Todten Tanz*, Fr. *La danse Macabre*), an allegory which took its origin in the 14th c., symbolising the sway of death over all men under the image of the dance. Visual representations of death were first made common after the spread of Christianity, and the skeleton became the most popular effigy. Monkish asceticism favoured the gloomy symbol: it was in harmony with the days of penance and flagellation. But a reaction followed the religious terrorism. Mediæval grotesquerie played with the notion and the personification of death, made the skeleton the medium of burlesque and mockery, and finally was wont to depict it in the action and posture of dancing. The allegory is presented in two forms —the dramatic and the pictorial. The drama first appeared in Germany, and was a sort of religious pantomime, being acted in the churches. Death, the centre figure, surrounded by persons of all stations, engaged in a dance, during which the characters vanished one by one, to indicate that they had died. Later, in France, this crude idea was elaborated into the *Danse Macabre*, a set of brief dialogues between Death and his companions, who were generally twenty-four in number. The title is perhaps taken from the Maccabees, the drama being performed on the festival of the seven martyred brothers, whose story is told in the seventh chapter of that book. Early in the 15th c. the drama reached Spain, under the title *Dança General de los Muertos*. The pictorial aspect of the allegory succeeded the dramatic. It arose in France, but took deepest root in Germany. England also has specimens of the pictured D. of D., received from Paris. The subject became common in painting, sculpture, and tapestry-work—the skeleton leading to the tomb a crowd of personages dressed in the fashion of the day, and typical of all classes. Very ancient specimens exist at Lübeck, in Auvergne, and at Basel. The last is said to have been painted in commemoration of the ravages of a plague. In the 15th c., when the drama was lost sight of, the pictured D. of D. assumed new forms, and entered largely into popular art. The subject was frequently used in the decoration of public buildings, as in the series of bass-reliefs on the façade of the Castle of Dresden, and the paintings in the cloister of Old St. Paul's, London. The antique idea culminated in the fifty-three designs, called *Imagines Mortis* of Holbein, the German painter. See Peignot's *Recherches sur les Danses des Morts* (Par. 1826); Douce's *Dissertation*, prefixed to Holbein's *D. of D.*; Douce's *D. of D.* (Lond. 1833); and Russell Smith's edition of Holbein's *D. of D.*, with introduction and notes (1849).

Dancette', or **Danse,** in heraldry, one of the two zigzag dividing or border lines, having an indentation larger than the other, which is called the *indented* line. In early blazonry a *fesse D.*, and sometimes a series of *fusils*, or elongated lozenges, conjoined *per fesse*, is styled simply a D.

Dan'cing may be defined as a rhythmical movement of the limbs. Among all people and in every age it has found favour with youth, and in most of the ancient nations it was an essential feature of religious worship. Moses and Miriam danced when the Israelites passed through the Red Sea. 'Praise him,' says David (Ps. l.), 'with the timbrel and dance;' and the same monarch, we are told, danced before the ark. Among the Greeks the significance of D. had a very wide range. The dance of the Eumenides or Furies typified the vengeance of heaven on the sins of earth; while certain hymns and dances in the market-places were expressive of the gratitude of man to heaven. The famous Pyrrhic dance represented the overtaking of an enemy and doing battle with him. Dances of a solemn, mystical nature were introduced into the representations of the Greek tragedies. The Romans, again, seem to have regarded D. as an effeminate amusement. In 1650 D. was prohibited in Scotland by an Act of the General Assembly. In our own time it is by some not only regarded as effeminate but as immoral. While the latter view may be regarded as a relic of that puritanical spirit which Scott has so skilfully drawn in his character of David Deans—whose righteous wrath at the notion of his daughters dancing will be remembered—it must be admitted that public D. is not always secure from the accusation. To private D. the only objection is one of hygiene. To spend the hours usually given to sleep in crowded, overheated rooms must be hurtful to health, and therefore to beauty.

Dancing and Music License.—By statute 25 Geo. II. c. 36, the keeping within the cities of London and Westminster, or within twenty miles round, without license from the

Quarter Sessions, any house, garden, or place for public dancing, music, or other public entertainment, is prohibited under a penalty of £100 on the keeper. Statute 38 and 39 Vict. c. 21 provided for the opening of such places of amusement after noon, instead of after five o'clock in the afternoon. The Local Government Act, 1888, transferred the licensing powers of the Quarter Sessions to the County Council.

An old May Day custom existed at Musgrave, in Westmoreland, according to which, at ten A.M., twelve young maidens of Brough, approved by the vicar, assembled at the foot of Brough bridge dressed in white, and crowned with rushes and flowers. Accompanied by a band, they marched through the fields to Musgrave church, where they hung their crowns on the side walls. A short service followed, the clerk and vicar retired, and then, a space being cleared near the altar, the fiddler struck up a tune, and dancing commenced, in which every one present joined till three or four o'clock in the afternoon.

One of the most remarkable dancing-parties ever recorded was that held in the Gosforth coal-mine on 2nd February, 1829, in commemoration of the finding there of coal. The ball took place at the bottom of the shaft, 1000 feet below the surface, in a room 15 by 22 feet and 48 feet high. It took place during the day, and 300 guests were present, the sexes being evenly divided.

Dancing Mania, an epidemic of frequent recurrence in the Middle Ages, and most common in the large German towns. It was a wild hysteric excitement, finding vent in convulsive gestures and delirious motion. Many only feigned to be so affected; but the disorder was to a great extent real, its victims losing all power of will, and sometimes in their madness committing suicide. The most extraordinary outburst of this mania occurred towards the end of the 14th c. It began in the city of Aix-la-Chapelle among those assembled for the Feast of St. John. Religious excitement rose to the extremes of frenzy; men and women, uttering maniacal cries, danced through the streets. The epidemic spread over all Holland and part of Germany to Strasburg and Cologne. Crowds of maniacs, their ranks joined by many pretenders, went dancing through the country, and much riot ensued. In Italy, where it was frequent in the 15th c., D. M. was known as *Tarantism*, being attributed to the bite of the Tarantula spider. The malady became known as St. Vitus's Dance, and was cured by immersion in cold water, according to the remedy of Paracelsus. It died out in the 17th c., and is now met with only in isolated cases. See Hecker's *Epidemics of the Middle Ages*.

Dandeli′on, a plant of the natural order *Compositæ*, common in pastures and by waysides all over Europe, and now naturalised in America and most other temperate parts of the world. The popular name is a corruption of *Dents du lion*—lion's teeth—and refers to the incisions on the margins of the 'runcinate' leaves. The root-stock is used as a tonic and aperient in liver complaints, and as a diuretic. The leaves, though disagreeably bitter, when blanched are sometimes used as a salad, and the rhizomes are used in the same way as chicory for mixing with coffee. The whole plant is permeated by milky juice, and contains resin, inuline, sugar, and a crystalline principle called *taraxacin*. It is eagerly eaten by rabbits and other wild animals, and in default of mulberry leaves is used to feed silk-worms.

Dan′dolo, an illustrious Venetian house, from which four Doges were chosen. The most distinguished of these was **Enrico D.,** elected in 1192. He governed with wisdom and energy, and persuaded the Venetians to furnish ships to the warriors of the fourth crusade in 1201. As the sum stipulated for the fleet was not paid by the crusaders, D. induced them to assault Zara, a town of Dalmatia in rebellion against Venice. After its capture, the crusaders and Venetians proceeded to Constantinople, which they assailed under pretence of dethroning a usurper. D., who was blind and above ninety years of age, led the attack by sea, and was the first to leap ashore. The city was taken, and the deposed Isaac and his son Alexius were restored to power, but an insurrection arising, were summarily executed, and the Byzantine Empire divided among the Latins and Venetians. D. was offered, but declined, the crown, accepting instead the title of Despot of Romania. This conquest added considerably to the Venetian dominions. He died at Constantinople, 1st June, 1205. See Andrea D.'s *Chronicle* in Muratori.

Dan′ebrog, or **Dannebrog, Order of** (Old Dan. 'banner of the Danes'), the second or red-cross order of knighthood in Denmark, is said to have been founded by King Waldemar II. in 1219. The order was revived in 1693, was reconstituted in 1808, and is conferred for eminent civil or military services on persons of all ranks and ages. The decoration is a gold cross patée, enamelled with white, and suspended by a white ribbon embroidered with red.

Dane′geld, or **Danegelt** (Old. Eng. 'Danish payment'), a tribute paid by the English to the Danes to stop their ravages. It was first raised by Æthelred II. in 991, and again in 1003, and levied after expulsion of the Danes to pay fleets for the protection of the coasts. The tax was suppressed by Eadward the Confessor in 1051, but revived by William the Conqueror, and abolished by Stephen. Every *hide* of land—that was as much as one plough could plough, or, as Bede says, as much as could maintain a family—was taxed, at first at 1s., afterwards at 7s.

Dane′lagh, properly **Denala′gu** ('Danish law'), the name given to the district in England which Ælfred ceded to the Danes under Guthrum by the treaty of Wedmore, A.D. 878. It was called D. because it was governed by Danish law. It included the greater part of England, comprising Northumbria, East Anglia, most of Essex, and most of East Anglia, or all eastern and most of central England, from the Thames to the Firth of Forth. Eadward the Elder won back Mercia, Essex, and East Anglia, but in the reign of Eadmund (940-946) Watling Street was again made the boundary between the D. and Wessex. The name D. was disused after the Norman conquest.

Danemo′ra, a small town in the province of Gotland, Sweden, 22 miles N. of Upsala, famous for its extensive iron-mines. There are seventy-nine shafts in the neighbourhood, of which seventeen are worked. The iron is of the best quality, and large quantities of it are exported to England.

Dan′iel (Heb. 'God is my judge'), **The Book of,** consists of two parts: chs. i.-vi. contain the history of D. and three other youths who had been carried away to Babylon on the capture of Jerusalem by Nebuchadnezzar; chs. vii.-xii. contain the account of four visions which occurred to D., written down by himself. The general voice of tradition has been that the first part of the book is authentic history, and that the D. mentioned was the author of the whole. Modern criticism, however, maintains that the book was composed as late as about the time of Antiochus Epiphanes (B.C.175-164), *i.e.*, three and a half centuries later than the time specified in the book, the historical narrative of D. being a disguised but unmistakable representation of the circumstances of the Jews under Antiochus, as described in the books of the Maccabees (*cf.* D. iii. with 1 Macc. i. and 2 Macc. vi. vii.; also D. iv. and v. with 1 Macc. i. 21 ff., and 2 Macc. v. 15 ff.). According to this view, the names of the four youths—D., Mishael, Hananiah, and Azariah—were found among the exiles who returned from Babylon (Neh. viii. 4, x. 2, 6, 23). See Bleek's *Introduction to the Old Testament*.

Dan′iel, Samuel, an English poet, was born in 1562 near Taunton, Somersetshire. He studied at Oxford, was tutor to Lady Anne Clifford, afterwards Countess of Pembroke, and held an office at the court of James VI. He resided generally in the country, and died at Beckington farm, in Somersetshire, 14th October, 1619. His chief work is the *History of the Civil Wars between York and Lancaster*. It is prolix and languid, with much pensive meditation and occasional bursts of eloquence. The verse is sweet and limpid, and the diction carefully sifted. D.'s style, according to Professor Lowell, is as modern as Tennyson's. Among D.'s other works are *The Complaint of Rosamund,* *Tragedy of Cleopatra*, *The Queen's Arcadia*, *Musophilus*, and *Sonnets*. In prose he wrote a *History of England* and a *Defence of Rhyme*, which Swinburne calls 'one of the most perfect examples of sound sense, of pure style, and just judgment in the literature of criticism.' D.'s poetical works were published at London in 2 vols. (1718).

Daniell, John Frederick, D.C.L., F.R.S., a distinguished chemist, was born in London, 12th March, 1790, became Professor of Chemistry at King's College, and died 13th March, 1845. He is widely known as the inventor of the galvanic cell and hygrometer which bear his name, and he is the only person that ever obtained the three Royal Society medals. His chief work is *Meteorological Essays* (1823), besides which he wrote an *Essay on Artificial Climate* (1824), an *Introduction to Chemical Philosophy* (1839), and several valuable papers read before the Royal Society.

Dan'ish Language and Literature. The D. L., an offshoot of the Scandinavian branch of the Teutonic family of speech, though spoken only by the Danish people, has been for 400 years past the written language of Norwegians also. Runic inscriptions, &c., prove that in the 10th c. one language, called the 'Danish tongue' (*dönsk tunga*), prevailed in the three Scandinavian kingdoms, Iceland, the Faröe, Orkney, and Shetland Isles, and some parts of England and Scotland. This separated in the 11th c. into two main divisions: a Norwegian-Icelandic and a Dano-Swedish, the latter distinguished by its rejection of the *h* sound before *l*, *r*, and *n*, and the substitution of single long vowels for the old diphthongs. The Danish side of this Dano-Swedish already in the 13th c. showed three dialects: (1) 'Skaansk' (Scanian), which most resembled the old language; (2) 'Sjœllandsk' (that of Zealand); and (3) 'Jydsk' (of Jutland), which differed most from the old, owing to its weakening or changing many vowel-sounds and word-forms. In the two last, inflectional endings fall off, final vowels are lost, *a*, *i*, and *u* are gradually reduced to a less distinct *a* or *æ*, while the hard mutes *p*, *k*, and *t* still remain after vowels in the 13th c., as is yet on the whole the case in Norwegian and Swedish. At this time the vocabulary was entirely of native origin, except some Greek and Latin words introduced along with Christianity; but in the 13th and 14th centuries the language reached what is essentially its present form. Based on the dialect of Zealand, it preserves the character of a distinct and homogeneous speech, whose chief characteristics are that *t* or (in pronouns) *d* is substituted for the soft *th*, and the softer *b*, *g*, *d* for the hard, *p*, *k*, *t*, and that the inflections are reduced to a few forms, substantives presenting only the possessive in *s*, and merging masculine and feminine in common gender. Verbs lose person, and generally (except in the imperative) number also, as the singular was already beginning to supplant the plural. The vocabulary of prose writers in this period received considerable additions from Low German, especially nouns in *-hed*, and verbs with the prefixes *be-*, *for-*, *und-*, and sometimes *er-* and *an-*. But these, unusual in the poetry, were even more rare in the spoken language of the 14th and 15th centuries. The influence of High German began chiefly in the 16th c., and appears in various words formed anew after the German fashion, which yet bear but a small proportion to the portion of the D. L. that has sprung from purely Scandinavian sources.

Literature.—Before the Reformation the softer and weaker dialect of the Old Norse, spoken by the people of Denmark, was not to any extent a written language, for the clergy, then almost the only educated class, naturally preferred Latin to the yet unformed mother-tongue. Of these, Saxo-Grammaticus (q.v.) wrote in the end of the 12th c. a valuable history of Denmark. The writings intended for the laity were in Danish, and consisted of (1) laws, and (2) uninteresting chronicles, partly in prose and partly versified. But, on the whole, the literature of Denmark in the Middle Ages is only of antiquarian interest, except some works of genius called *Kæmpeviser* ('Hero Songs'), which, though unwritten, passed in song from generation to generation, and are easily recognisable as true and beautiful popular poetry.

At the close of the 15th c. a university was founded and printing introduced into the country, but for a time little activity was shown, except in the printing of the laws, class-manuals, and Catholic service-books that had been used in the Middle Ages. The intellectual movement, however, that preceded and accompanied the Reformation, issued in a far more widespread literary interest, and in the publication of Danish translations of Scripture and devotional books, as well as numerous theological and polemical writings. The language, being incessantly employed, became more plastic, though, at the same time, it was greatly impregnated with Germanic ingredients. The greatest names are those of Hemmingsen in the 16th and Brochmand in the 17th c. Theology was not now confined to the clergy, but was cultivated by many of the nobles, and especially by Rosencrantz. Physical science had the celebrated Tyge Brahe, whose observations and discoveries excited the admiration of Europe; medicine, the two Bartholins and Ole Worm, also famous as a naturalist. The poetry of this whole period was of less value than its prose, for the hymns of the Reformation were more pious than poetical; but towards its close there appeared a highly-gifted poet, Arrebo.

From the Peace of Roeskilde in 1660, which gave to Sweden the Danish provinces on the other side of the Sound, the literature becomes somewhat poorer. The old nobility that had favoured learning now lost their influence, and the court showed little interest in it. Science, however, was still cultivated, and versifiers abounded, but there were two who rose above the rest, and wrote in better Danish and with purer art—Bording and Kingo.

It was Holberg who, in the first half of the 18th c., created a new era in literature and popular thought. In the separate fields of poetry Reenberg, Falster, and Helt were his successful rivals; and to this period belong also the original, though unequal, *Heltesanger* ('Songs in Praise of Heroes') of Sorterup, the lyrics of Stub, and the hymns of Brorson.

With the accession of Frederik V. in 1746 begins a higher development in literature and language, due partly to Latin being more restricted to learned works, and partly to the study of foreign models. In the Academy of Sorö, restored in 1747, Sneedorff edited the weekly *Patriotisk Tilskuer* ('Patriotic Spectator'); Kraft wrote philosophy; Schytte, political works; and Schöning, a learned history of Norway. Encouraged by the patronage of many public and private societies, and the steady liberality of the Government, every department of knowledge was now cultivated, but no one can be said to have made an epoch in any particular science.

The 19th c. inherited from the 18th great enlightenment, facility, and culture, but also a monotonous elegance of style, mock-sentiment, superficial science, and recklessness in religious and political thought. In Denmark, the last decade in particular was marked with these blemishes, but about the opening of the century there appeared a tendency towards a truer perception of nature and human life, due partly to the fresh philosophy and poetry of Germany, and partly to the influence of the French Revolution. This had already effected much in the first fourteen years of the century, which are more striking for a widely diffused scientific spirit than for any large number of learned men.

From 1380 to 1814 Norway was politically united to Denmark, and an independent, though often scarcely distinguishable, Northern element was merged in Danish literature; but since their separation, Norwegian literature has successfully claimed independence. Since 1814 Denmark has seen the complete development of the views of Grundtvig, while other theological schools have been well represented. Especially noteworthy are the remarkable Christian philosopher Martensen, the sarcastic but deeply earnest S. Kjerkegaard, the acute and orthodox Rudelbach, and the clear rationalist Clausen. Kolderup-Rosenvinge, Larsen, and Scheel wrote ably on law; Kayser and David on political economy. Grundtvig, P. E. Müller, and the learned Finn Magnusen (q.v.) have been of great service to early Danish history and mythology, as also Rafn (q.v.), Petersen, Thomsen, and Worsaae (q.v.). Mediæval and modern history were further treated by the writers belonging to the earlier part of the century, as well as by many younger men, of whom Wegener, Schiern, and Estrup merit notice. In philology, the Danish lexicographer Molbech, the Orientalist Westergaard, and the great Latin scholar Madvig (q.v.) are famous. Philosophy has been cultivated by Sibbern, Nielsen, and Brochner, and the natural sciences have had numerous students. Among the poets of this period we find Oehlenschläger, Grundtvig, and Baggesen (q.v.). Ingemann has had great power as a lyrist, dramatic poet, and novelist, and Heiberg's fine taste and keen insight are evident in his poems, but especially in his dramatic works. The latter was the father of the Danish *vaudeville*, but his *Elverhöi* ('The Hilltop of the Elves') displays quite different talent. Blicher's sketches of common Jutland life, and Fru Gyllenbourg's and 'Carl Bernhard's' tales have had great popularity. Winther, especially admired as a lyrist since the 'Ghost Letters,' has been conspicuous in all fields of poetry. Andersen (q.v.) is naturalised in every part of the civilised world. Paludan-Müller's *Adam Homo* is a striking and original work. We may also mention the comic dramatist Bögh, and among recent novelists H. F. Ewald, Goldschmidt, and the still greater Bergsöe.

Dankali′, or **Danakil** (*Afâr*), an independent Abyssinian state, to the E. of the Zabul mountains, extending along the coast of the Red Sea from the Peninsula of Buri to the Gulf of Tajura. The land is mostly flat and barren, and the inhabitants consist of 63,800 nomads and fishers. They are indolent, cruel, and fanatically devoted to Islamism.

Dann′ecker, Johann Heinrich von, a celebrated German sculptor, was born near Stuttgart, 15th October, 1758. His father was a groom in the service of the Duke of Würtemberg, who became his patron, and gave him an education. D. had early success in his art; he went to Paris in 1783, and to Rome two years after. At that city he remained till 1790, when he returned to Germany, and was appointed Professor of Sculpture in the Academy at Stuttgart. There he resided till his death, 8th December, 1841. Heathen mythology supplied D. with his earlier subjects, among which are the 'Dryad' and 'Love and Psyche.' Of his later works, chiefly Christian, the principal is his colossal 'Christ,' which the sculptor was eight years in completing. His portrait-busts are also admirable. No one could make stone express the physical lineaments of character better than he. His 'Schiller,' 'Lavater,' 'Gluck,' won him a great popularity.

Dan′té (contracted from **Durante**), **Alighie′ri,** born at Florence, 8th May, 1265, was the son of a Guelph lawyer, who was banished from Florence during the government of Novello, the *podesta* of the Ghibelline Manfred of Hohenstaufen. D. was educated by his mother, Donna Bella, and Brunetto Latini, Secretary of the Florentine Republic, and subsequently at Bologna, the '*Mater Studiorum*,' and the great Law College of Padua. In 1290 Beatrice di Portinari, whom D. had tenderly loved, but who had married into the Bareli family, died. D. then produced his *Vita Nuova*, which, with his other canzonets (he was intimate with three eminent troubadours), procured for him the name of 'the poet.' D. served in the wars against Arezzo and Pisa. After an unhappy marriage, in 1291, with Gemma, daughter of Manesso Donati, which resulted in a separation, he rose to office in the Supreme Council of *Priori* (six in number), when the civil wars between the Bianchi and Neri broke out. Charles of Valois, called in as mediator in 1302, sentenced D. to exile and an oppressive fine. Shortly after, a revolutionary tribunal sentenced him to be burned alive along with the other Bianchi, who wished to resist the extreme pretensions of the Pope. In 1309 he wrote his treatise *De Monarchia*. After wandering from one city to another, and joining in one or two forcible attempts to re-enter Florence, D. died at Ravenna, 14th September, 1321. At his death he belonged to the party of the *Verdi*, or *Democratic* Ghibellines, as distinguished from the *Secchi*, or pure Imperialists. Doubts exist as to the part actually taken by D. in public affairs at Florence, and in diplomatic missions at Rome and Paris. To the year 1305 belong *Il Convito*, in which Beatrice appears as Philosophy, and a treatise on the Italian language, *De Vulgari Eloquentia*. The *Divina Commedia* was begun in 1300, but not completed for many years. Hence events subsequent to 1300 are prophesied. Sismondi asserts that D., who was ignorant of the drama, used the word 'comedy' merely because he thought Virgil alone entitled to the word 'epic.' The poem is divided into the *Inferno*, the *Purgatorio*, and the *Paradiso*. Virgil and St. Bernard conduct D. through these divisions of the invisible world, with the view of enabling him to write a poem which shall show to Italy the true source of its misery. The extremely allegorical nature of the whole may be seen in the first canto of the *Inferno*, where a panther represents Florence, or Envy; a lion, France, or Ambition; a she-wolf, the court of Rome, or Avarice; a greyhound, our Saviour or his vicegerent, the Emperor of the Romans; Virgil, Human Wisdom; and Beatrice, Heavenly Wisdom. Hell is represented (quite differently from Milton's conception, and from the early Christian conception, which placed it in the centre of the earth), as an inverted cone from the surface to the centre of the earth, with a dark valley at the mouth called Limbo, and nine circles appropriated to different degrees of crime. Like Michael Angelo, D. uses the traditions of classical mythology to furnish these regions. He is a good Catholic, and represents the wise and good of antiquity as lying in tears and groans, caused, not by actual torture, but by the irrevocable want of baptism. Purgatory is a steep mountain in the hemisphere opposite to hell: seven rounds have to be climbed through before the seven stains of sin are washed away; the sea washes its base; at its top is the garden of Eden. Here D. meets a number of his friends (some who had been excommunicated by the corrupt Church), with whom he discusses various questions, political, social, and metaphysical. He seems to look forward to some apocalyptic judgment on the temporal power of the Pope as a cure for the ills of Italy. From Eden D. ascends with Beatrice to Paradise through the various heavens of the Moon, Mercury, Venus, the Sun, Mars, Jupiter, Saturn. The eighth heaven contains the triumph of Christ, and the Virgin and Adam also dwell there. In the ninth, or empyrean, is a manifestation of the divine essence, veiled by three hierarchies of angels. This wonderful poem is written in the *terza rima*, in which three verses are so arranged that the middle one of each set rhymes with the first and the third of the succeeding set. The verses are all endecasyllabic, generally consisting of five *iambi*, followed by a short syllable. The *Divina Commedia* speedily became a national book in Italy. The Prince of Milan in 1350 caused a public commentary to be written, and two professorships were founded to promote the study of it. Among his chief commentators are Landino, Bargigi, Bianchi, and Cotterill. Four editions of the work (those of Foligno, Jesi, and Mantora, each of date 1472, and an undated one of Naples) in the British Museum formed the basis of a magnificent reprint, published under the care of Lord Vernon and Sir A. Panizzi. The original readings of another Naples edition (1477) are given in *Sei Cento Lezioni della Divina Commedia*, &c., by Dr. Enrico C. Barlow (Williams and Norgate, 1875). The best-known translations into English are those of Cary (1814), Wright (1833), Pollock (1854), and Longfellow (Lond. 1867). One may also note an excellent prose translation of the *Inferno* by Dr. John Carlyle (1849). The *Vita Nuova* has been admirably translated by D. G. Rossetti in his *Early Italian Poets from Ciullo d' Alcamo to D.* (Lond. 1861). The *De Monarchia* (Eng. trans. by Church, 1878), written to prove that universal dominion should belong to the head of the Holy Roman Empire, is a valuable source of information regarding the Guelph and Ghibelline controversy. See Balbo's *Life and Times of D.*, translated by F. Banbury (1852), and Dean Church's *D., an Essay* (1878).

Dan′ton, Georges Jacques, was born 28th October, 1759, at Arcis-sur-Aube. The Revolution found him a briefless advocate. He joined Marat and Desmoulins in the Cordelier Club, and enjoyed the confidence of Mirabeau. His eloquence made him a power; 'his rhetorical tropes are all gigantic, energy flashes from his black brow, menaces in his athletic figure, rolls in the sound of his voice, reverberating from the domes.' He had the courage to defy the arrest issued by Le Chatelet, to denounce the ministers, and call for the deposition of the King. In 1792 D. became Deputy-Procureur of the Revolutionary Commune, incited the Marseillese to attack the Swiss Guard of the Tuileries, an event which made him Minister of Justice, in which capacity his 'Mirabeau of the Sans Culottes' and *Enfant Perdu* of the Revolution sanctioned the September Massacres. He observed that 'a revolution could not take place according to geometrical principles!' Entering the National Convention, he undertook various missions to the Netherlands, and did what he could to forward the death of Louis. He constantly urged the levy of fresh troops, and created the Revolutionary Tribunal. In the Committee of Public Safety he definitely sided with Robespierre against the Girondins, whom he wished to save from extremities. He opposed the Feasts of Reason, and passed the law for payment of forty sous per diem to the poorer deputies. After the fall of the Hébertists, Robespierre found it necessary to get rid of D., and accordingly, on the proposition of the Committees of Public Safety and General Security, the Convention sent him, along with the two Desmoulins, Hérault de Séchelle, Fabre d'Eglantine, Delacroix, Westermann, and Philippeaux, before the Revolutionary Tribunal, which condemned them to death for a conspiracy against the national representation and the Republic, and tending to restore the monarchy. D. was guillotined 5th April, 1794. The charges of private immorality and public peculation against D. have to some extent been refuted by Robinet in his *Mémoire sur sa Vie Privée* (Par. 1865), and *Procès des Dantoniens*, published in *La Politique Positive*, 1872. The notes of D.'s trial were taken down by the painter Topino-Lebrun, afterwards executed for complicity in the infernal machine.

Dan'ube, a French form of the Lat. *Danubius*, from a Celtic root *dan* or *don*, meaning water, according to Adelung, is 'the upper water' (Ger. *Donau*, Hun. *Duna*). The Greek name Ister, applied by the later Roman poets to the entire river, was given originally only to the lower part. The D. rises in the Black Forest, in Baden, 2665 feet above the sea-level, and is formed by the confluence of the brooks Brege and Bregach at Donaueschingen. Its general direction is from W. to E., its length about 1750 miles, and its basin about 250,000 sq. miles. After the Volga it is the largest river in Europe. It flows at first E. by N. through Würtemberg and Bavaria, past Ingolstadt and Regensberg, and at Passau enters the Austrian dominions. Passing Linz and Vienna, it reaches Hungary near Presburg, whence to Waitzen it continues to flow E.; then turning S. past Buda-Pesth, it holds on in this direction until joined by the Drave, when it flows S.S.E. to Belgrade, from which point to Orsova it separates Servia from Hungary. A little below Orsova it passes the 'Iron Gate,' where till 1847-49 the water formed a rapid that obstructed navigation, but by blasting the rocks this hindrance was in a great measure removed. During the remainder of its course it forms the boundary between Bulgaria and Roumania, entering the Black Sea by three main branches, of which the Sulina is commercially the most important. Till it reaches Ulm, where it becomes navigable, the D. is hemmed in by abrupt slopes. In its lower course it expands greatly, and in many places on the borders of Bulgaria is studded with islands. Its delta is covered with reeds and trees. No fewer than sixty navigable rivers contribute to swell the volume of its water, which is nearly as great as that of all other streams that empty themselves into the Black Sea. The principal affluents on the right are the Iser, Lech, Drave, Save, and Marava; on the left, the Ens, Theiss, Sereth, and Pruth. The trade of the D. is chiefly in wheat, timber, hides, tallow, and maize.

The Iron Gate of the Danube.

Danu'bian Principalities. See ROUMANIA.

Dan'zig ('the port of the Danes,' Pol. *Gdansk*), next to St. Petersburg the most important haven in the N. of Europe, and the capital of a district of the same name in the state of Prussia, German Empire, lies on the left bank of the Vistula, 2 miles from its mouth, on D. Bay, and 216 N.E. of Berlin, with which it is connected by railway. It has many fine buildings, and is intersected by the two streams of the Mottlau, a branch of the Vistula, which has previously received the Radaune—and hence it has been called 'the northern Venice.' D. is a fortress of the first rank, and one of the chief stations of the German navy, having extensive wharves, arsenals, marine depots, &c. It is an entrepot for Poland, Hungary, and parts of Lithuania, as well as for W. Prussia. Its port is Neufahrwasser, on the coast. The bar at the mouth of the Vistula impedes navigation; but, by a canal, large vessels can now approach the city. Between the two arms of the Mottlau lies the Speicher Island, which has stores capable of containing half a million quarters of grain, and which is kept uninhabited as a precaution against fire. The city is divided into the Vorstadt, Speicherinsel, Niederstadt, Langgarten, Altstadt, and Rechstadt. The older houses, which are richly ornamented with sculpture, are old-fashioned, irregular, and unique, giving to D. an appearance of quaint originality. D.

has a large Gothic townhouse, built in the 14th c., and containing a fine collection of paintings. Its Protestant Marien Kirche dates from 1343-1503, and has a clock-tower 338 feet high, 10 smaller towers, 37 beautifully painted windows (1845), and the famous so-called D. picture, a 'Last Judgment,' attributed to Jan van Eyck, but more probably the work of Hemling. The other public buildings of D. include an admiralty college, a school of navigation, a public library of 60,000 volumes, a fine Gothic exchange, several literary and art societies, and theatres. D. has large manufactures of brandy, liqueurs (*Danziger Goldwasser*), sugar, chemicals, cloths, beer, tobacco, &c., and an active trade, chiefly in grain, seeds, spirits, and timber. Petroleum is largely imported from the United States, and herrings, coals, and pig iron from Great Britain. D. has railway connection with Moscow, and *via* Warsaw with Odessa on the Black Sea. Pop. town, 120,338; district 589,176, of whom more than half are Protestants. It is mentioned as early as the 6th c., and in 995 was made the capital of Pomerania. Long an object of contention between Danes and Swedes, it was captured by the Teutonic knights in 1310, and was soon after a flourishing member of the Hanse League. From 1454 till 1793 it belonged to Poland; at the latter date it came into the possession of Prussia, and has since remained so, except during the period 1807-14, when it was one of Napoleon's short-lived duchies. The district of D. resembles Holland in its general aspect, and in the occupations and character of the people. Besides D. the chief towns are Thorn and Elbing.

Daoudnugar', or **Daudnag'ar**, a town in the executive district of Gaya, Bengal, British India, on the Son, 90 miles E. of Benares, has manufactures of coarse woollen and cotton fabrics. On the road to Gaya, about four miles distant from D., there is a splendid temple, the carving of which is very beautiful and was made at Mirzapur. Pop. 9851.

Daph'ne, a genus of shrubs or small trees belonging to the natural order *Thymeleaceæ*, the species of which are widely distributed over temperate and tropical Europe, Asia, America, and Australia. The flowers are fragrant, but the berries are poisonous, and the whole of the plants possess an acidity which in some cases even amounts to causticity. The mezereon *(D. Mezereum)* is a common shrub in gardens, and is rarely found wild in this country. The bark has been used in medicine as a sudorific and alterative. *D. Laureola*, the spurge laurel, also occurs in woods of this country, and is as acrid as the preceding, but is not used in medicine. In Nepal, the tough fibrous inner bark of *D. cannabina* and *D. Edgworthii (Edgworthia Gardneri)* is employed in making paper of a very superior quality, which does not suffer from the attacks of insects or from damp, and is tough, and not liable to break when folded. In India and China, deeds and records are made of it; as in Madagascar is the bark of *Dias Madagascarensis*, belonging to a closely allied genus. That of *Gnidia daphnoides* and *G. (Lasiosephon) eriocephala*, allied species (the bark of the latter being also used in India to poison fish), is made into ropes.

Daphne.

Among the other species cultivated in this country are *D. pontica*, *D. alpina*, *D. Cneorum* (all hardy), *D. odora*, *D. indica*, and *D. chinensis*, which can only be grown in a greenhouse. D. is pronounced *Daphné*.

Daphne, a maiden daughter of the river-god Peneus in Thessaly, was associated in numerous traditions with Apollo. When the god, enamoured of her beauty, pursued her, D. was saved by her mother, Ge, opening and receiving her, and on the spot where she disappeared the evergreen laurel-tree sprang up. According to Ovid, D. herself was changed into the laurel-tree.

D., a magnificent grove and sanctuary situated 5 miles S.W. of Antioch, was formed by Seleucus Nicator, who built in the midst of it a celebrated temple to Apollo and Diana, and around it there rose 'a stately and populous village.' The traditions of the mythological D. were interwoven with the place; the tree into which she was changed was pointed out, and one of the springs was named after that on Mount Parnassus. For many ages the grove was the resort of innumerable pilgrims, who, amid its sensuous gratifications, combined the pursuit of pleasure with the rites of religion. By the zeal of the Christians of Antioch its altar and oracle were deserted, and its complete destruction was effected, perhaps by Christian incendiaries, in the reign of Julian. Its correct site is probably at *Beit-el-Maa*, as fixed by Pococke and Richter.

Darabgherd', or **Darab'**, an old town in the province of Fars, Persia, 150 miles S.E. of Shiraz. It stands amid orange and lemon groves in a fine plain, and is encircled by some 30,000 date palms. Numerous ruins evince its former importance. A mild tobacco, celebrated throughout India and Western Asia, grows in the neighbourhood. D. sends lemon-juice and fruits to every port of Persia. Pop. 3800.

D'Ar'blay, Madame, whose maiden name was Fanny Burney, was born at Lynn Regis in 1752. She was the second daughter of Dr. Charles Burney (q.v.), the musician. Her novel of *Evelina*, published anonymously in 1778, won the young authoress great repute; and this was sustained by *Cecilia*, which appeared in 1782. After holding a post at court for some years, she married a French officer. Her later works are much inferior to the early ones, though they procured her large sums from the publishers. Madame D'A. died at Bath in 1840. Her *Diary and Letters* (1842 and 1846) preserve a picture of contemporary society, as well as of her own life. See Macaulay's *Essay on Madame D'A*.

Dardanelles' (named from the towers that guard the entrance), are the straits joining the Archipelago to the Sea of Marmora. The ancient name was Hellespont (Helle's Sea), from the fable of Helle and her brother Phryxus. The channel is 50 miles long, of an average breadth of two miles, and at one point it is only half a mile broad. The current from the Black Sea flows through it at the rate of a league an hour, and the consequent difficulty to an enemy approaching Constantinople is greatly increased by strong defences most favourably placed. In 480 B.C., Xerxes crossed the D. by two bridges from Abydos in Asia to Sestos in Europe, and in 334 B.C. it was crossed by Alexander the Great. The feat of swimming across the D. is associated in ancient times with the name of Leander, and in modern times with that of Byron.

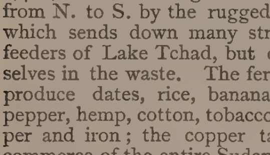
Dares, the reputed author of a pseudo-history of the fall of Troy, popular in the Middle Ages, and even in the 16th c. Chaucer places D., with Homer and others, on the highest pedestal in the house of fame, and refers to D., not to Homer, for the deeds of Troilus. The Greek version of D., at one time attributed to the D., priest of Hephæstus, mentioned in the *Iliad*, is supposed to have been the work of a

Sophist, and was extant in the 3rd c. B.C., but is now lost. A Latin prose work, *Daretis Phrygii de Excidio Trojis Historia*, has been preserved. This is either a fabrication of the 5th, 6th, or 7th century, or perhaps an abridgment from the Latin epic by Joseph of Exeter, who flourished about the 12th c. It was translated into French verse in the 12th c., and was first printed at Cologne in 1470. This work, which is of no value, was said to be a translation, by Cornelius Nepos, from the original Greek. It is generally printed along with Dictys' Cretensis. The best edition is by Diederich (8vo. Bonn 1837).

Dar Fur (*i.e.*, 'Fur land'), formerly an important native state, which became an annexed territory of Egypt, but since the Mahdi's revolt, appears to have reasserted its independence. D. F. is situated in the E. of the Sudan, and is bounded N. by the Sahara, S. by the Bahr-el-Arab, a tributary of the White Nile, E. by the Steppe of Kordofan, and W. by the forests of Wadai. Area, 198,000 sq. miles; pop. 1,420,000. It is in general an oasis-land, and is traversed from N. to S. by the rugged granite range of the Marrah, which sends down many streams, forming on the W. the feeders of Lake Tchad, but on the E. shortly losing themselves in the waste. The fertile valleys in the Marrah Hills, produce dates, rice, bananas, citrons, onions, cucumbers, pepper, hemp, cotton, tobacco, &c. There is also much copper and iron; the copper takes a prominent part in the commerce of the entire Sudan. Among the wild animals are the lion, panther, hyæna, elephant, rhinoceros, wild ox, gazelle, and monkey. The Furs are an intelligent, active, well-built people, with straight hair and thin lips, speaking a language that contains a large infusion of Arabic words. Mohammedism has prevailed in D. since the middle of the 18th c. El-Fasher is the capital (pop. 10,300), and the other chief towns are Dara, Shekka, and Gija.

Dar'gan, William, a projector of railways, born about 1800, at Carlow, Ireland. After working in a surveyor's office, and under Telford in England, he returned to Ireland, where he engaged in the chief engineering schemes, and amassed a large fortune. He was the contractor for the Dublin and Kingstown Railway, the first line laid in Ireland, and was the main promoter of the Dublin Exhibition of 1853, to which he contributed £20,000. D., who was an enterprising and public-spirited man, died 7th February, 1867.

Daric (Gr. *dareikos*), a gold coin in use in ancient Persia. On one side an archer was represented in a kneeling posture, while on the other was the royal palla. The Jews are said to have used it as money on their return from Babylon to Judæa, and reference is made to it as having been brought to Greece and Rome. The value is estimated to have been about 16s. 3d. of our money at the present day. While some hold that the name of D. is derived from Darius, others assert that it comes from Persian words signifying bow and king.



Daric.

Da'rien, or **Uraba, Gulf of,** the most southerly arm of the Caribbean Sea, United States of Colombia, 170 miles from N. to S., and 125 across. On its western side, near its southern extremity, its chief tributary, the Atrato, empties itself into the Bay of Choco. The **Isthmus of D.,** more generally known as the Isthmus of Panama (q.v.), of which, however, it is properly a continuation, is in one point only 30 miles across. Two schemes have been proposed to traverse it by a ship-canal, and thus afford direct communication between the Atlantic and Pacific Oceans, but only one has as yet been attempted. See CANAL. A railway across the Isthmus was completed in 1854. See ASPINWALL.

Darien, Scheme, The, a disastrous commercial enterprise projected on behalf of Scotland by William Paterson, founder of the Bank of England, who hoped, by planting a colony on the Isthmus of Darien, to form a connecting mart between the eastern and western hemispheres. In the year 1695, when Paterson disclosed his grand scheme, Scotland was the poorest country in Europe. The occupation of D. promised to render it a warehouse for the wealth of the East. The magnificence of the project greatly excited the people, and led them to overlook the obstacles to its execution. Colonists unaccustomed to a high temperature even in summer were unfit to endure labour under a tropical sun. It was improbable that Spain would tolerate a Scotch colony in the heart of its transatlantic dominions, or that England would incur a war with Spain for the benefit of Scotland; nor could Scotland, without the help of England, successfully oppose Spain in America. To do so, a navy required to be created, and an armed force sufficient to defend the isthmus against the vice-royalties of Mexico and Peru must be sent out. However, the Company was constituted by Act of Scotch Parliament, to which the Lord High Commissioner gave the Royal sanction on 26th June, 1695. The shares were fixed at £100 each. £400,000 was immediately subscribed for, of which £220,000 was paid. This may seem a small sum considering the national excitement; but if it be remembered that the whole amount expected to be paid into the imperial exchequer by Scotland at the date of the Union (1707) was but £151,000, the £220,000 seems sufficiently large. The Duke of Hamilton, the Duke of Queensberry, and Lord Belhaven took £3000 of stock each. The Duke of Argyll took £1,500 worth. The cities of Edinburgh and Glasgow took each £3000 worth, and the city of Perth £2000.

On 25th July, 1698, five ships with 1200 men sailed from the Forth, and on the 1st of November following anchored near the isthmus. For a few months matters went fairly; but with the approach of spring the malignity of the climate began to tell with fearful effect. Supplies gradually failed, and none were to be had from neighbouring colonies. The Spaniards began to arm against the new settlement. The French dependencies eagerly offered assistance to the Spaniards. In England, both Houses of Parliament petitioned the King against the scheme. In consequence, the governors of the English colonies prohibited all intercourse with a swarm of adventurers. Meanwhile in Scotland the mania was rising still higher. The riches of the country, in the words of a newspaper of the day, were great beyond imagination. In August, 1699, four ships with 1300 men were despatched by the Company to the New Caledonia. These were charged by the General Assembly to divide the colonists into congregations, to appoint ruling elders, to constitute presbyteries, and to labour for the propagation of divine truth among the pagans of Darien. This second expedition found, in place of a colony, a wilderness. The castle of New Edinburgh was in ruins. The huts had been burned, and the site marked out for the new capital was now a jungle inhabited by wild beasts. A fleet of eleven Spanish vessels anchored off New Edinburgh, while an army of Spaniards and Indians blockaded the fort by land. Before the end of March a treaty was signed, by which the Scotch bound themselves to evacuate Darien in fourteen days; and on the 11th April, 1699, they departed. Few of the survivors saw their native land again. Many hired themselves as labourers to the planters of Jamaica. Two of the ships were lost on the voyage home. The books and documents of the Company may be seen in the Advocates' Library, in Edinburgh. See Burton's *Account of the D. S.*, printed for the Bannatyne Club.

Dari'us (Gr. *Dareios*, anc. Per. *Dareush* or *Daryush*; the mod. Pers. *Dara* or *Darab*, means 'lord'), was the titular designation of several Persian kings, and probably meant *the ruler*.—**Darius I.,** eldest son of Hystaspes, satrap of Persia, with six fellow-conspirators, murdered the false usurper Smerdis the Magian. The conspirators determined to adopt the monarchical form of government, and D., by a well-known device of his groom, was chosen king, B.C. 521. D. strengthened his position by marrying the two daughters of Cyrus, the daughter of Smerdis, and the daughter of Otanes, the chief conspirator. He divided his empire into twenty satrapies, and settled the tribute to be paid by each—a work of great difficulty, in consequence of the previous remission of taxes by Smerdis for a period of three years. The Babylonians revolted, but after a siege of twenty months, their city was taken by the stratagem of Zopyrus, about 516 B.C. Three years afterwards D. invaded Scythia, crossing the Thracian Bosporus with immense forces, but the expedition completely failed. Incensed at the aid given by the Athenians and Eretrians to the Ionian provinces in their revolt against him, D., B.C. 492, sent Mardonius to subdue Greece, but the fleet was wrecked in a storm off Athos, and a great portion of the army was slaughtered by the Brygians in Thrace. A second expedition was despatched under Datis and Artaphernes, which reached Europe in safety, only to suffer complete defeat at Marathon, B.C. 490. D. made every effort to renew the war, but death ended his projects, B.C. 485.—**Darius II.**, surnamed successively *Ochus* and *Nothus*, was one of the seventeen bastard sons of Artaxerxes I., Longimanus. He declared war against Sogdianus, who had murdered Xerxes II., and was chosen to succeed him on the throne. D. was completely subject to his eunuchs and to his wife Parysatis; and his reign was a succession of insurrections, of which the chief was that of Amyrtæus in Egypt. D. died, B.C. 405-404.—**Darius III.**, surnamed *Codomannus*, owed his elevation to the throne to the murder of Arses by Bagoas, B.C. 336. He was distinguished alike by moral excellence and personal beauty. Bagoas, foiled in an attempt to poison his sovereign, himself perished by poison. D. vainly tried to oppose the advancing power of Alexander. After the battle of Arbela, B.C. 331, he fled before the Macedonian conqueror, and after renewed efforts to retrieve his fortunes, was perfidiously murdered by Bessus, satrap of Bactria, B.C. 330.

Darjeel'ing, or **Darjiling**, a sanitary station for British troops in an executive district of the same name, in the Rajshahi division of the province of Bengal, British India, 7167 feet above the level of the sea. Though the atmosphere is humid, and there is an annual rainfall of 120 inches, the climate is healthy. The Eden sanatorium was opened in 1883. D. has greatly increased of late years, and possesses numerous bungalows, chapels, and gardens, besides a public park. Pop. (including Jalapahar cantonment) 14,145. D. was acquired from the Rajah of Sikkim in 1835, in exchange for an annual allowance of £600.—The *district* of D. is noted for its extensive and profitable cultivation of the tea-plant, and has an area of 1164 sq. miles and a population of 223,314, of whom 171,171 are Hindus, 10,011 are Mahommedans, 40,520 are Buddhists, and 80 are Jains. The whole district is well known now for its magnificent scenery. Tea gardens are gradually covering the spurs of the lower hills, while splendid forest trees clothe the mountains up to the snow-line, above which in the background Mounts Everest and Kanchanjanga tower aloft. Coal, iron, copper, and slate are fairly abundant. Rice is the chief crop, but on the higher lands Indian corn, wheat, potatoes, and cardamoms are grown. Tea is, however, the staple product, the cultivation of which dates only from 1856. Cinchona is also successfully grown. Coarse cotton cloth is woven by the natives.

Dar'ling, a name of frequent occurrence in the geography of Australia, and derived from one of the early governors of New South Wales.—1. An important and remarkable river, formed by the confluence of the Bogan, Barwan, Bokhara, and Culgoa rivers, in about 30° S. lat., 146° 25' E. long. After its formation the D. receives scarcely any tributaries, the only noteworthy exception being the Warrego. The D. flows for 650 miles in a S.W. direction, till it unites with the Murray at Wentworth. Its banks are of soft earth, from 30 to 40 feet high, and are lined with lofty trees. The average breadth of the D. is 60 yards, but in flood time it has been known to overflow its banks for a couple of miles. It flows through a vast and arid plain of clay, varied by grassy patches and swamps. The area of its basin is about 198,000 sq. miles.—2. A pastoral county in the S.W. of New South Wales, watered by the rivers Darling and Murray, and estimated to contain an area of 1555 sq. miles, and a pop. of 2773 (white) and 111 (aborigines).—3. The D. Downs are an extensive district of splendid pastoral country, in the southern portion of Queensland. They measure about 120 miles by 50, are well watered, and will, in their best parts, carry one sheep to two acres in natural grasses.—4. The D. range of mountains in W. Australia extends N.W. from Point D'Entrecasteaux, in the extreme S.W., for 250 miles. Its highest point reaches an altitude of 3500 ft.

Darling, Grace, a heroic girl, daughter of the keeper of Longstone Lighthouse on the Farne Islands, was born at Bamborough, 24th November, 1815. When the *Forfarshire* was lost among these islands on the 7th September, 1838, Grace, then in her twenty-second year, persuaded her father to venture with her to the rescue. Amid imminent peril they gained the wreck, and saved the nine remaining on it. This noble action elicited general applause, which Grace did not long enjoy, as she died of consumption, 20th October, 1842. See *Life of Grace D.*, by Eva Hope.

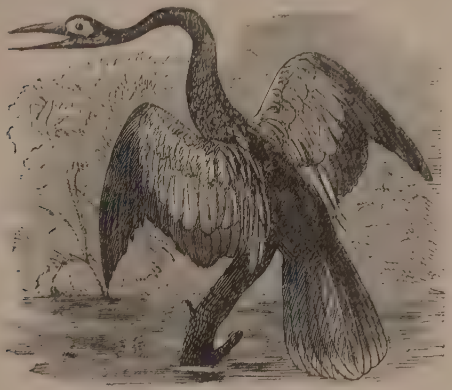
Dar'lington, or **Darn'ton**, a town in the county of Durham, on the Skerne, 17½ miles S. of Durham by railway. The streets diverge from a central market-place. The most noteworthy edifice is St. Cuthbert's Church, founded in 1169, with a spire 180 feet high. In 1874 there was established a British and Foreign School Society Training College at a cost of £15,000, and in the same year a fever hospital at a cost of £9225. The principal manufactures are carpets, flax, and wool-spinning; there are also tanneries, and brass and iron foundries. D. returns one member to Parliament. Pop. mun. bor. 38,060; parl. bor. 38,033; reg-sub-dist. 41,957; and civ. par. 35,899.

Darm'stadt, a town of Germany, the capital of the Grand-Duchy of Hessen, on the river D., 15 miles S. of Frankfurt-on-the-Main. It consists of an old and new town; the latter has two main streets, which cross each other at right angles, and contain many fine buildings; the former has narrow, ill-built streets. In the centre of the Luisenplatz, the finest public square, is a lofty Doric column, surmounted by a statue of the Grand-Duke Ludwig I. Other buildings of note are the old ducal palace, with a picture gallery containing many fine paintings, and a library of 460,000 volumes, the palace, the residence of the Grand-Duke, the opera house (burned in 1871), and the Roman Catholic church (a rotunda with twenty-eight Corinthian columns). There is a technical university which is attended by 614 students. D. has manufactures of carpets, carriages, tobacco, and machinery. Pop. with Bessungen, 56,399. D. is mentioned as early as the 5th c., but first came to Hessen in 1479, and became the residence of the Landgrafs in 1567.

Dar'nel, a genus of grasses common in cornfields in England and many parts of Europe. The grain has long been reputed poisonous, but recent researches have rather thrown doubt on this, and attribute its injurious properties to a parasitic fungus, or to some cause apart from the grain itself.

Darn'ley, Henry Stewart, Lord, eldest son of the Earl of Lennox, was born at Temple Newsome, in Yorkshire, 7th December, 1546, was carefully educated under the eye of his mother, and displayed a distinct turn for literature. In 1565 he married his kinswoman, Mary, Queen of Scots, who, it is commonly said, was attracted by his handsome appearance; but it is not improbable that the grand-nephew of Henry VIII. was reckoned a first-rate political match. He was nineteen when he arrived in Scotland to marry his cousin, she being then twenty-two and a-half. A son, afterwards James VI., was born to them, 19th June, 1566, and on the 9th February, 1567, before he had completed his majority, D. was murdered at the Kirk-of-Field, a lonely house outside the city walls, on the site of which stands the University of Edinburgh. A quaint, tender ballad ascribed to him is printed by Maidment in his *Scottish Ballads and Songs* (Edinb. Paterson, 1868). There can be little doubt that D. has been maligned by history.

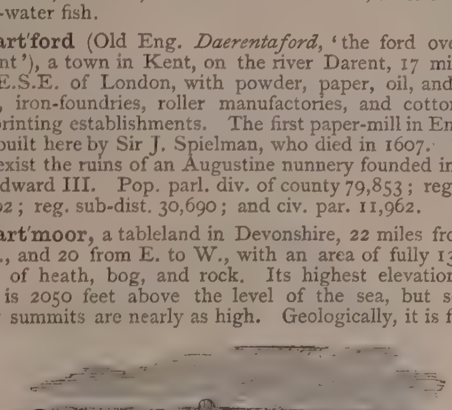
Dar'ter, or **Snake-Bird**, a genus of Natatores or Swimming birds, belonging to the sub-family *Plotinæ* and family *Pelecanidæ*. Their popular name is derived from their habit of moving their snake-like head and neck very quickly about as they rest amid the foliage of trees. They are found in Africa and America. The common D. is deep green in colour, with a brownish-white stripe running from the eye down the sides of the neck. Its average length is three feet. The bill is straight and sharp. Levaillant's D. inhabits Africa. Both are expert fishers. The black-bellied D. occurs in the S. of N. America. It somewhat resembles the cormorant in appearance and habits, and is also known as water-crow, water-lady, and Grecian-lady. Rivers, lakes, and lagoons are its favourite haunts, although it may be seen at times near the sea, where, however, it never seeks its food, as it lives on fresh-water fish.



Black-bellied Darter.

Dart'ford (Old Eng. *Daerentaford*, 'the ford over the Darent'), a town in Kent, on the river Darent, 17 miles by rail E.S.E. of London, with powder, paper, oil, and corn mills, iron-foundries, roller manufactories, and cotton and silk printing establishments. The first paper-mill in England was built here by Sir J. Spielman, who died in 1607. There still exist the ruins of an Augustine nunnery founded in 1375 by Edward III. Pop. parl. div. of county 79,853; reg. dist. 68,702; reg. sub-dist. 30,690; and civ. par. 11,962.

Dart'moor, a tableland in Devonshire, 22 miles from N. to S., and 20 from E. to W., with an area of fully 130,000 acres of heath, bog, and rock. Its highest elevation, Yes Tor, is 2050 feet above the level of the sea, but several other summits are nearly as high. Geologically, it is for the most part of granitic formation, with rich veins of tin, copper, and manganese, and strata of Devonian slate and sandstone. Much of the soil is peaty, but it affords pasture to numerous cattle, sheep, and a small breed of horses known as Dartmoor or Exmoor ponies. D. is remarkable for the number of its British remains, including cairns, barrows, kistvaens, rock-pillars, and the Grey Wethers, a circuitous Druidical temple. D. Prison, erected in 1806 for French prisoners of war, is now an important convict depot. Numerous streams rise in D., among which are the Dart (from which it takes its name), Teign, Taw, Plym, and Avon.



Dartmoor Prison.

Dartmoor Sheep are a small, hardy race, wild and restless, whose original home is in the forest and heath lands of Devonshire and Cornwall. In size they are small, their average weight on killing being about 11 lbs. per quarter. Their mutton is highly esteemed for its flavour, and commands a ready sale. Their wool is soft and long, but of little bulk. They feed upon pasture too poor for the sustenance of other sheep, have white faces and legs; and when the ewes are crossed with Leicesters, heavy lambs are produced.

Dart'mouth, a seaport and market-town of Devonshire, 32 miles S.S.W. of Exeter, with which it is connected by railway. It is built in terraces on the face of a steep rock, and has its streets connected by flights of steps. The harbour is defended by a battery, and at its entrance are the remains of a castle built by Henry VII. The streets are narrow, and many of the houses are old, and decorated with wood-carvings. The harbour is commodious and safe. Many of the inhabitants are engaged in the herring, pilchard, and stock fisheries, and the town has a good Mediterranean trade. Shipbuilding, ropemaking, and the manufacture of paper are carried on. Pop. mun. bor. and civ. par. (each) 6025; reg. sub-dist. 7500.

Dartmouth College, New Hampshire, U.S., was chartered in 1769. It grew out of an earlier Indian school, and received its name from Lord Dartmouth, president of the original trustees. In 1815-19 the college became the subject of litigation, a result of which was that the United States Supreme Court decreed the inviolability of chartered property. D. C. comprises arts, medical, and scientific schools, with an observatory.

Daru', Pierre Antoine Noel Bruno, Comte, an author and politician of the earlier Napoleonic period. Born at Montpellier, 12th January, 1767, he became a soldier at an early age, and in 1791 was made intendant of the army of Brittany. He translated the Odes, Epistles, and Satires of Horace. During the Revolutionary period he was of little account, but became a favourite with Napoleon I., and was for a time his War Minister. After the return of the Bourbons, D. devoted himself to literature, producing excellent histories of Venice and Brittany. He died 5th September, 1829.—His son, **Comte Napoleon D.,** the godson of Napoleon I. and the Empress Josephine, was born at Paris, 11th June, 1807. Throughout life D., who was one of the best of French political economists, was an Orleanist. After the *coup d'état* he retired into private life, but keenly opposed the Second Empire. In 1870, however, he became Minister of Foreign Affairs under M. Ollivier, but retired from his post when the Emperor agreed to submit his fate to a *plébiscite*. D. did his best, as a member of the Committee of National Defence, and in his own department of La Manche, to drive off the German invaders, and in 1871 was returned to the National Assembly. He wrote an important treatise, *Des Chemins de Fer* (Par. 1843).

Dar'win, Eras'mus, was born at Elton, Nottinghamshire, 12th December, 1731. After studying at Cambridge, and taking the degree of M.D. at Edinburgh, he settled at Lichfield, where he became celebrated as a physician, physiologist, and poet. He died at Derby, 18th April, 1802. His scientific speculations are mostly erroneous but suggestive. His poetry, although occasionally brilliant, is in general tedious, fantastic, and mechanical. D.'s chief works are the *Botanic Garden* (1781), in two parts—first, the economy of vegetation, second, the loves of the plants (ridiculed in Canning's *Loves of the Triangles*); *Zoonomia* (1793-96); and *Phytologia, or Philosophy of Agriculture and Gardening* (1800). See *Life of D.* (Lond. 1804), by Miss Seward.—**Charles D.,** one of the greatest English naturalists, was born at Shrewsbury, 12th February, 1809. His father was Dr. Robert D., son of Erasmus D. After studying at Edinburgh University, and taking the degree of B.A. at Cambridge in 1831, he went round the world as naturalist in H.M.S. *Beagle*, returning to England in 1836. His interesting and popular *Voyage of a Naturalist* gives an account of this circumnavigation. In 1839 he published *Journal of Researches into the Geology and Natural History of the Various Countries Visited by H.M.S. Beagle;* in 1840-43, the *Zoology of the Voyage of H.M.S. Beagle;* in 1842, *The Structure and Distribution of Coral Reefs* (later ed. 1876); in 1846, *Geological Observations on S. America;* and in 1851-53, *Monograph of the Pedunculated and Sessile Cirrepedia.* These works gave him a wide and solid reputation, which was vastly extended in 1859 by the publication of a remarkable book *On the Origin of Species by Means of Natural Selection.* D. there contends that all existing species arose from pre-existing species, and probably from a primitive germ, through *natural selection;* the organisms best fitted for surrounding circumstances surviving, while the weaker disappeared in the *struggle for existence.* (See DARWINIAN THEORY.) He published *Fertilisation of Orchids* in 1862, *Variation of Animals and Plants under Domestication* in 1867 (later ed. 1876), and the *Descent of Man* in 1871 (later ed. 1874). In this work he seeks to prove that man is descended from 'a hairy quadruped with a tail, probably arboreal in its habits.' Other works were *The Expression of the Emotions in Man and Animals*, *Insectivorous Plants* and *Earthworms* (1882). D. was a member of many foreign and British scientific societies, and received the Royal and Copley medals from the Royal Society. He died at Beckenham, 19th April, 1882, aged 73.

Darwin Mount, 6800 feet above the level of the sea, on the S.W. side of King Charles's South Land, Tierra del Fuego.—**D. Sound** is a channel between York Minster and Sandwich Rochs, on the S.W. coast of Tierra del Fuego.

Darwin'ian Theory, the theory of the origin and modifications of animals and plants promulgated by Charles Darwin. It takes as its basis the tendency to *variation* observed in the species of living beings, in virtue of which new *varieties*, merging into permanent *races*, are produced. This principle of variation will in turn affect the races, and from the variation of these latter, new races—which are so different from the original species as to entitle them to rank as new *species*—are evolved. Thus the D. T. is one of *evolution*. It holds the evolving of new races, and through these of new *species*, and thus does not allow for any secondary causes, or any purely *creative* influence. Such is the primary idea of Darwin's theory, and, as subsidiary to this idea, he introduces the principle of *natural selection*, as that whereby the new races are first indicated. Thus 'nature,' according to Darwin, 'selects' and perpetuates the individuals of a species which have any peculiarities before those which resemble the species. And in perpetuating the points wherein such individuals differ from their neighbours, nature is initiating a new race and species, for the variations become reproduced and intensified as time passes. 'Artificial selection,' as practised by man in the breeding of cattle and sheep, in fact, imitates the 'selection' of nature. Again, the numbers of animals and plants produced are held to be far too numerous for preservation; and a perpetual 'struggle for existence' (*i.e.*, for food and the conditions of living) takes place amongst the various species of animals, and amongst the individuals of each species. The individuals which tend to variation are those which nature will 'select' for preservation before the others; and this variation results in the evolution of new races and species. Then, granting that time past has been definite, there can be theoretically no reason why all the diverse and existent types of life should not have been evolved from pre-existing types and species, or primarily from a few primitive beings, or from one primeval organism. The subsidiary theory of 'sexual selection' is founded on the belief that males and females may select their mates from advantages or peculiarities in colour, &c., and that this process will give rise to variation.

The chief objections to this ingenious theory are founded: (1) on the inability of 'natural selection' to account for the *origin* or *initiatory stages* of variations; (2) that variation may be *destructive* to individuals; (3) that variations, to be perpetuated, must not occur in detached instances, but in very many cases; (4) on the occurrence, without variation, in Darwin's sense, of differences in some species; (5) that variation cannot be proved to be of *indefinite* extent, but that it is highly probable that limits to the variation of every species exist; (6) that palæontology does not supply fossil organisms to fill up the structural gaps between living species, and so complete the continuous succession of organisms required by the D. T.; and (7) that past time, as calculated by physicists, would not have sufficed for the slow evolution of the existing races.

The whole matter is as yet hypothetical in its bearings and nature. Subsequent research and the lapse of years alone can prove its truthfulness or falsity. See the works bearing on the theory, as mentioned in article CHARLES DARWIN; also Herbert Spencer's *Principles of Biology* (1864) and *Spontaneous Generation*, &c. (1870), which show the extension of the principle of the theory; and St. George Mivart's *Genesis of Species* (1876), which sets forth the most feasible objections to the Darwinian hypothesis.

Dash'kov, Ekateri'na Romanov'na, a noted Russian princess, was born 28th March, 1744. When eighteen years old she shared in the conspiracy which set the Empress Catharine II. on the throne. Her independent spirit led eventually, however, to a quarrel with the Empress, and she left Russia for European travel. In England she became known to Garrick, Blair, Robertson, and other eminent men. Having reconciled herself to Catharine, she returned to court in 1782, and next year founded the Russian Academy. On the Empress's death in 1796, the Princess lost her offices, and lived in retirement till her death, at Moscow, 16th January, 1810. Besides composing several comedies and other works in Russian, she actively assisted in the publication of the Dictionary of the Russian Academy. See *Memoirs of the Princess D., Lady of Honour to Catharine II.*, by Mrs. Bradford (Lond. 1860).

Das'yure, in natural history, a group of carnivorous marsupials forming the family *Dasyuridæ.* They are now confined to Tasmania, though their fossil remains have been found on the mainland of Australia. They differ from the opossum in their dentition, in their feet being formed for terrestrial progression, and in the tail being clothed with hair, and not prehensile. *Dasyurus ursinus*, the typical species, is 18 inches long, without the tail, and covered with coarse black hair. From its intensely savage disposition it is colonially termed the Tasmanian devil. It is nocturnal, and preys upon the smaller marsupials, but in a larger degree upon sheep, on which account it is rapidly being exterminated, and is now confined to the less accessible parts of the island. The Tasmanian wolf or tiger is a larger species of D., and resembles *D. ursinus* in its character and habits.

Common Dasyure.

Date (Fr. *date*, Lat. *datum*, 'what is given'). To preserve an exact record of a succession of events, some fixed point of time or *epoch* must be assumed as the basis of the reckoning. In Scripture, time is measured by generations, or by the reigns of kings. Some Greek historians reckoned by the ephori and kings of Sparta, or by the archives of Athens. Three generations are usually held equivalent to 100 years. Newton counts the average of a reign or succession at twenty years. Before the invention of letters, the preservation of an exact record of the events which mark the lapse of time must have been impossible; to do so even now is difficult. The Christian era is universally employed in Christian countries. It begins on 1st January in the fourth year of the 194th Olympiad, and in the 753rd year from the legendary foundation of Rome. The Mohammedan era, called the Hegira (q.v.), begins with the flight of Mohammed, A.D. 622. A knowledge of the epochs at which the world has been held to begin in different countries and ages is indispensable to the student of history. For example, the English Revolution, known as the Revolution of 1688, would have been the Revolution of 1689 had the year then begun on 1st January; the event having taken place in February of the year which would have been 1689 but for the fact that then the year began with 25th March. There was but one calendar in use in Europe, until Pope Gregory introduced the 'Gregorian Calendar' in 1582. It rectified an accumulation of error by striking ten days—5th to 15th October—out of the year 1582. The new style was at once generally adopted in Roman Catholic countries, but the 'old style,' or Julian Calendar, remained in use for a long time in Protestant countries; it is still followed in Russia and Greece, and in many Eastern countries. In Great Britain, the alteration of the style was long successfully opposed by popular prejudice; but in 1751 an Act of Parliament was passed for the adoption of the new style in public and legal transactions. The difference of the two styles, which was then eleven days, was removed by ordering the day following 2nd September, 1752, to be counted the 14th September. At the same time the first day of the legal year was changed from 25th April in England to 1st January. In Scotland, by an Act of the Scotch Privy Council of 1599, the year 1600 was appointed to begin on the 1st January; 25th March having been previously held as the first day of the year in Scotland. The following are valuable works on the subject of dates—*L'Art de Vérifier les Dates*, compiled by the Benedictines (1783-1820, new ed. 1818-44); *Playfair's Chronology* (1784); *Blair's Chronology* (new ed. by Sir H. Ellis, 1844, and by Rosse in 1856); *The Oxford Chronological Tables* (1838); Sir Harris Nicolas' *Chronology of History* (new ed. 1852); *Hales' Chronology* (1830); H. Fynes Clinton's *Fasti Hellenici et Fasti Romani* (1824-50). Dates were affixed to grants and assignments by 18 Edward I., 1290, and the custom became very general in the reign of Edward III. Before this time it was usual at least to pass lands without dating the deed of conveyance (Lewes). Numerous instruments of assignments enrolled among our early records establish this fact (Hardie). See CHRONOLOGY, CALENDAR, YEAR, MONTH, DAY, CYCLE.

Date-Palm (*Phœnix*), a genus of palms, of which about a dozen species are known, all, with the exception of two found in South-Eastern Africa, confined to Northern Africa and tropical Asia. The D.-P. (*P. dactylifera*) is largely grown over Northern Africa, and more sparingly in Western Asia and Southern Europe. In some countries it is the chief food of the inhabitants, as well as of horses and camels. The poor construct huts of its leaves; ropes and coarse cloth are made of the fibre surrounding the base of the leaves; the stalks are used for crates, baskets, brooms, and walking-sticks; houses are built of the wood; the buds are eaten as potherbs; *lagbi*, an intoxicating drink, is made from the sap, and the date-stones are ground into food for camels. *P. sylvestris*, common over India, is the 'wild date,' and by some is believed to be the parent of the cultivated one. 'Toddy' is obtained from it by cutting off the young flower-spike, and date-sugar, much used in India, by boiling this juice. It is said that 130,000,000 lbs. are annually extracted from it in India, and that 220,000,000 lbs. is the annual quantity of palm-sugar obtained. *Arrack* (q.v.) is toddy distilled. *P. paludosa*, a gregarious Indian species, covers considerable tracts. *P. acaulis*, *farinifera*, and *spinosa* are dwarf species, the first being found in the damp valleys of the Himalayas, at 5000 feet elevation. From *P. farinifera* an inferior kind of sago is extracted. The name is derived from the Fr. *datte*, Gr. *daktulos*, from its supposed resemblance to a *finger*.

Date.—Spathe, Flowers, and Fruit.

Date-Plum, a genus of Deciduous trees of the Ebony order. Above a hundred species are known, mostly natives of Asia and the Mauritius, while about a dozen are found in America, and three or four in Africa. Nearly all are confined to the tropics—a few extending as far N. as 44°. Ebony (q.v.) and the various kinds of wood known as ironwood are the produce of this genus. Others are valued for their fruit. The common D.-P., pishamin, European lotus, or date of Trebizond, is a tree 20 to 40 feet in height, a native of the coasts of the Caspian, and now cultivated in the S. of Europe for its yellow, sweet, astringent fruit, about the size of a cherry. It bears well in the S. of Britain. The persimon (probably a corruption of *Pishamin*), or Virginian D.-P. attains a height of 50 or 60 feet, and produces wood hard and elastic, though liable to split. The fruit is astringent, but when mellowed by frost is eatable. It is pounded and made into cakes with bran, from which, by adding yeast and water, a kind of beer is brewed, or by fermenting, a spirituous liquor. The bark is bitter, febrifugal, and has been employed with success in infantile cholera and diarrhœa. The Chinese D.-P., or *Kaki*, is dried and cured by the Chinese to make sweetmeats, called *Figues-caques* in France.

Datisca'ceæ, a small natural order of Dicotyledonous plants, containing four species and three genera of herbs and trees, distributed over N. America, Northern India, Siberia, the Malayan Islands, and the S.E. of Europe. Except the *Datisca cannabina* of Crete, &c., the root of which is employed in Cashmere as a yellow dye, the order has no economical qualities.

Daubenton, Louis Jean Marie, a French naturalist, born at Mont Bar, in Burgundy, 29th May, 1716. After a youth spent in the study of theology and medicine, he was associated with Buffon (whose sight was now failing) at the Jardin du Roi. D., who was made curator and demonstrator in the Cabinet of Natural History, did the measurements, the dissections, the calculations, in fact, the whole anatomical description in the part of the *Histoire Naturelle* relating to mammalia—*i.e.*, the first fifteen volumes. A coolness then arose between the two friends, which was afterwards removed. D.'s laborious accuracy was a useful check on the brilliant generalizations of Buffon. Besides arranging the large collections of the Cabinet, D. took up the subject of fossil remains. He wrote the general subject of natural history for the *Encyclopédie Méthodique*, and communicated, between 1754-64, many papers on minerals to the Academy of Sciences. He held chairs of Natural History and Mineralogy under the Revolution. He died 1st January, 1800. He interested himself in rural economy, and the introduction to France of Spanish sheep. His character was very simple and modest, but his scientific eminence is undisputed. See Cuvier, *Notice sur la Vie et les Ouvrages de D.* (in the *Mémoires de l'Institut*, t. iii).

Dau′beny, Charles Giles Bridle, M.D., F.R.S., Professor of Botany and Chemistry in Oxford University, is best known for his investigations into the chemistry of volcanic action. Most of his works relate to such phenomena, and those most worthy of mention are *A Description of Active and Extinct Volcanoes* (1826), *A Notice of the Thermal Springs of N. America* (1838), and *A Sketch of the Geology of N. America* (1838). His *Lectures on Agriculture* (1841) and *Climate* (1862) are the most valuable of his other publications. D. died 12th December, 1867.

Daum′ier, Henri, was born at Marseille in 1810. He became known in France as a telling caricaturist. Many of the happiest sketches in *Charivari* have been due to his fertile and playful genius. Among his productions are *Les Philanthropes du Jour, Idylles Parlementaires, Les Bons Bourgeois, Les Représentants Représentés*, inspired by the Revolution of 1848. He died at Valmondois, 10th February, 1879.

Daun, an old and illustrious Austrian family, originally from the neighbourhood of Trier. The ancestral castle occupied a rock near the little town of D., whence the family name. As early as the 11th c. the Dauns were conspicuous in political life. One branch of the family settled in Austria in the 17th c. Its most famous member was **Leopold Joseph Maria, Graf von D.,** Austrian field marshal, who was born at Vienna, 25th September, 1705. In the war with the Turks (1737-39) and in the later war of the Austrian succession he greatly distinguished himself, and was made field marshal for his services in the campaigns against the French in the Netherlands in 1746-48. D. reorganised the Military Academy at Vienna, and materially modified the Austrian military system. As imperial commander-in-chief in the war with Friedrich II., D. showed himself a truly great commander, triumphing over the Prussians at Kollin, Hochkirchen, &c., and compelling Friedrich to raise the siege of Prague, Dresden, and Olmutz. Ultimately D. suffered defeats at Leuthen, Torgau, Burkersdorf, Reichenbach, &c. Carlyle (*Friedrich*, vol. vi. p. 375) calls him 'an honourable, imperturbable, eupeptic kind of man.' D. died 5th February, 1766.

Dau′phin (Lat. *Delphinus*), formerly the title of the eldest son of the King of France, but originally given in the 12th c. to Guigo, lord of Vienne in Dauphiné, and continued to succeeding Comtes de Vienne. In 1349 the childless Humbert II. made Charles of Valois, grandson of Philippe VI. of France, his heir, on condition that the heir-apparent to the crown should bear the title of *Dauphin de Viennois*. The title was abolished after the Revolution of 1830.

Dau′phiné, formerly a province of France, comprising the present departments of Hautes-Alpes, Isere, and Drôme. After forming a part of the first Burgundian kingdom, the monarchy of the Karolings, and the second Burgundian kingdom of Arles, it was in 1032 bequeathed by Rudolf III. to the German Emperor, and remained along with the rest of Burgundy in the closest union with the German Empire till 1349, when Humbert II., the territorial lord, transferred the sovereignty to France. See DAUPHIN.

Dauphin's Crown, a circle of gold surrounded by eight fleurs-de-lis, and surmounted by four dolphins.

Dauw, Peechi, or **Burchell's Zebra,** a species of *Equidæ* or Horses, allied to the true Zebra (q.v.), and found in S. Africa, particularly S. of the Orange River. The stripes on the body are not so black as those of the zebra, and do not extend all down the limbs as in the latter, but are confined to the head, body, and upper portions of the legs. The D. cannot be thoroughly tamed or domesticated.

D'Av′enant, Sir William, poet and dramatist, born in 1605 at Oxford, where his father was an innkeeper, was educated at Lincoln College, and became page to the Duchess of Richmond. His first play, *Albovine, King of the Lombards* (1629), was followed by other dramas and masques. On Ben Jonson's death, in 1638, D. became laureate. He lived a chequered life until the Restoration, which secured his fortunes; and he continued to manage the theatre and write plays till his death, 7th April, 1668. D.'s merits as a poet have been somewhat overlooked. His epic, *Gondibert*, contains ingenious thinking happily expressed, and some of his lyrics are graceful and spirited. See Wood's *Athenæ Oxonienses*, and Maidment and Logan's edition of his *Dramatic Works* (Edinb. 1872-74).—**Dr. Charles D'A.,** son of the preceding, a writer on political economy, was born in 1656 and died in 1714. Among his works (a selection of which was published by Whitworth in 1771) are *A Discourse upon Grants and Resumptions* (1700), *An Essay upon the Balance of Power*, &c.

Dav′enport, a city of Iowa, U.S., on the right bank of the Mississippi, below the upper rapids. It is built at the foot of a bluff opposite to Rock Island City. The river is here spanned by a railroad bridge 1582 feet long, and 21 feet above high-water mark. D. has two colleges, one for males and another for females, flour and saw mills, breweries, foundries, coach, locomotive, soap, and candle works. The place was settled in 1836. Pop. (1840) 600, (1850) 1848, (1890) 26,872.

Davenport, Rev. John, a distinguished Puritan divine, was born at Coventry, in England, 1598. He was educated at Oxford, became minister of St. Stephen's, London, and went over sea with the first Puritan settlers of New Haven, Connecticut, in 1638. He remained their minister for thirty years, and died in Boston in 1670.

Dav′entry (Celt. *Dwy-avon-tree*, 'the town of the two rivers'), also **Daintree** ('the town of the Danes'), a municipal borough in Northamptonshire, 13 miles W. of Northampton, between the rivers Avon and Nen, and near the Grand Junction Canal. Whipmaking and shoemaking are the chief industries. Before the time of railways it was a great thoroughfare for the N.W. of England, and as many as eighty coaches passed through it daily. At Danes' Hill, half a mile from the town, is one of the largest encampments in England. In the neighbourhood is the battlefield of Naseby. Pop. mun. bor., civ. par., and ecc. par. (each) 3939; and reg. sub-dist. 7623.

Dav′id (Heb. 'the beloved'), King of Israel, was the youngest son of Jesse. He first appears on the scene when he was anointed king by Samuel (1 Sam. xvi.), and about the same time was sent for to soothe King Saul (q.v.) by playing on the harp. Yet there is another account of his *first* introduction to Saul in chap. xvii., apparently by another writer, who was ignorant of the events recorded in chap. xvi. According to the narrative, D. was admitted into the palace, received Michal, Saul's daughter, to wife, and contracted a remarkable friendship with Jonathan, his son; but owing to the jealousy and hatred of Saul, was soon obliged to flee. He fled first to Achish, King of Gath, and being discovered by the Philistines to be the slayer of Goliath, escaped their vengeance by feigning madness. After staying there about sixteen months (1 Sam. xvii. 7), he betook himself to the Cave of Adullam, gathered a band of from 400 to 600 outcasts, and led the life of a freebooter for about twenty years. (Samuel, who was alive at the time of his flight, 1 Sam. xix. 18, died in the eighteenth year of Saul's reign—Jos. Ant., vi., 13, 5; and Saul reigned forty years, Acts xiii. 21—which gives at least twenty-two years.) On the death of Saul, D. became king of his own tribe of Judah (2 Sam. ii. 4), while the other tribes elected Ishbosheth, Saul's son. Chiefly through the influence of Abner, the general of Ishbosheth's army, who deserted his master, and then by the assassination of that prince, D. became King of Israel seven years after. He fixed his capital at Jebus, hitherto held by the Canaanites, under the name of Jerusalem (q.v.), where he reigned till his death, thirty-three years after. Under D. the empire of the Israelites rose to the zenith of its power, being extended, by the conquests of neighbouring tribes, from the Euphrates to the Mediterranean, and his reign was ever afterwards looked back to by his countrymen as the golden age of the national history. D.'s complex character is the grandest in the Old Testament, though there are stains on its glory. He leaves on us the impression of a nature aglow with religious, poetic, and patriotic enthusiasm; he was capable of the tenderest and most romantic sentiments, though inflexible, and at times even cruel, in the execution of his purposes. He combined the chivalry of the hero-king with the clear insight of the statesman and the rapt fervour of the poet, the prophet, and the devotee. His lyrics hold the foremost place in devout literature. One cannot imagine a time when they will cease to be an inspiration and a solace to Christendom. The variety, breadth, and depth of religious experience which they contain furnish the best reason for regarding David, with all his imperfections, as the truest and noblest type of Christ in Old Testament history. In deep tragic knowledge of the human heart none of the Hebrew saints and sages come so near to the 'Man of Sorrows.' The whole Christian Church has practically admitted this, for, next to the words of our Lord himself, it has always reckoned the 'Psalms' (q.v.) to be its most precious heritage of spiritual truth. See Ewald's *Geschichte des Volkes Israel* (Eng. transl. 1869).

David I. (sometimes called **St. David,** though never canonised), King of Scotland, was the third son of Malcolm Canmore by the English Princess Margaret, sister of Eadgar Ætheling. He was born about 1080, and passed his youth at the English court, together with his sister Eadgyth, who was married to Henry I. of England. D.'s eldest brother, Eadgar, who died in 1107, and was succeeded by his next brother, Alexander, separated the principality of Strathclyde from the rest of the kingdom, and conferred it on D., who by his marriage in 1108 with Matilda, heiress of Waltheof, Earl of Northumberland, became Earl of Huntingdon, and was thus not only heir to the Scottish crown, but a powerful English noble. He now became intimate with the Norman knights of England, which in the sequel powerfully influenced the course of Scottish history; for having quelled an insurrection of the men of Moray, he dealt with the territory of the subjugated chief as a feudal forfeiture, and portioned it out among Norman strangers, who thus became crown vassals. In 1124 he succeeded his brother Alexander on the Scottish throne. In 1127, as Earl of Huntingdon, he swore to Henry I. to support the right of Henry's daughter Matilda to the English crown, and when Stephen of Blois seized it, D. invaded England, and took possession of all the strongholds of the N. except Bamborough. Stephen advanced to meet him with a formidable force, but an agreement was made, by which David's son Henry was invested with his English fiefs, and the claim to Northumberland left open. An insult to Henry at the English court induced D. to ravage the northern counties in 1138; but being deserted by Bruce, Baliol, and other Norman barons, his motley force of Scots, Picts, Orcadians, Strathclyde Britons, English of Lothian, and Normans, was signally defeated at the famous 'Battle of the Standard,' near Northallerton. In 1139 peace was concluded at Durham, and Prince Henry made Earl of Northumberland. Two years later D. invaded England in favour of his niece, and narrowly escaped being taken prisoner. The close of his life, otherwise tranquil, was saddened by the death of his son Henry. D. died at Carlisle, 24th May, 1153, and was buried at Dunfermline. D., like all the children of St. Margaret, was devoted to the Church. He began the establishment of the bishopric of Glasgow while he was yet Prince of Strathclyde. In his reign were founded or enlarged the bishoprics of Dunkeld, Moray, Aberdeen, Ross, Caithness, Brechin, Dunblane, and Galloway; and to the same time also belong the religious houses of Holyrood, Melrose, Jedburgh, Kelso, Dryburgh, Newbattle, and Kinloss. He increased the number of royal burghs, and granted many privileges and immunities to the burghers. Latin culture first found a home in Scotland under his munificent patronage, and to him may be ascribed the decisive completion of that civilising policy, begun by his father, which saved Scotland from the rude rule of the Celt. See *Eulogium Davidis Regis Scotorum*, by Æthelred, Abbot of Rievaulx, printed in Pinkerton's *Vitæ Antiquæ Sanctorum Scotiæ* (Lond. 1789).

David II. See BRUCE.

David, Jacques Louis, born at Paris, 31st August, 1748, was trained to be an architect. He learned painting in the studios of Boucher and Vien. In 1775 he gained the grand prize of Rome, in which city he spent the next five years, chiefly drawing from the antique. He then began to paint subjects chiefly classical: his 'Horatio' being his best before the Revolution. The Constituent Assembly and the National Assembly (of which he was a member) commissioned pictures from him for the nation, and he arranged the artistic effects in the fêtes. His friendship for Robespierre caused his imprisonment for a year in 1794. The murders of Marat and Pellétier were commemorated by D. in two pictures. In 1799 his 'Rape of the Sabines' was completed. Napoleon made D. his first painter, and sat for the famous portrait in which he is ascending Mount Bernard on horseback. His official pictures for the throne-room at the Tuileries were of inferior merit. Banished by the law of 16th January, 1816, and expelled from the Institute, D. went to Brussels, where he painted 'Mars Disarmed by Venus,' 'Cupid and Psyche,' &c., and where he died, 29th December, 1825. See Miel's *Notice sur J. L. David* (1834), and Deleçluze's *David et son École* (1855).—**Pierre Jean D.,** born at Angers, 12th March, 1789, first came into notice about 1810, when he carried off the Academy prize by a bass-relief of 'Epaminondas.' After studying at Rome, he established his reputation as a sculptor by the statue of the 'Grand Condé' for Versailles. In 1826 he became Professor at the School of Painting, and in 1831 commenced the sculptures of the Pantheon. He sat in the Constituent Assembly of 1848, and was banished temporarily in 1851. He died 5th January, 1856. Among his bass-reliefs may be mentioned the 'Marches Militaires' for the Hôtel de Ville, Paris; among colossal medallions, 'Casimir Delavigne' and 'G. St. Hilaire'; among busts, 'Washington,' 'Béranger,' 'Bentham,' 'Humboldt,' 'Göth,' 'Rossini'; among statues, 'Cuvier,' 'Jean Bart,' and 'Talma'; the tombs of Generals Foy and St. Cyr at Père la Chaise, and the monument to Botzaris at Missolonghi.—**Félicien D.,** a French musical composer, was born 8th March, 1810, at Cadenet, Vaucluse. He was educated among the Jesuits at Aix, where he became a chorister, and in 1830 was admitted to the Conservatoire, Paris, having shown his compositions to Cherubini, who was then director of that institution. D. advanced rapidly in his musical studies; and in 1831 quitted the Conservatoire, and joined the Saint-Simonians, for whom he composed several hymns. On the breaking up of that fraternity D. travelled to the East, and on returning to Paris in 1835, published unsuccessfully *Mélodies Orientales*, which he had composed during his travels. His succeeding works, such as *Le Pirate* and *Les Hirondelles*, attracted slight notice; but in 1844 his *Ode-symphonie*, *Désert*, had a brilliant reception, and spread his fame through Europe. Later he composed *Christophe Colombe* (1847); *L'Eden* (1848); *La Perle du Brésil*, a comic opera (1851); *Herculaneum*, an opera (1859); and *Lalla Rookh*, a comic opera (1862). In 1869 he was made librarian to the Paris Conservatoire de Musique. He died 29th August, 1876.

David, a prosperous town on the left bank of a river of the same name in Panama, United States of Colombia, on the frontier of Costa Rica, with exports of rice, coffee, hides, and gold-dust. Pop. 7,800.

David, St. or **Dewi,** the patron saint of Wales, was born about the end of the 5th c., and, according to Giraldus Cambrensis, was the reputed uncle of King Arthur. He succeeded Dubricius as Archbishop of Caerleon, the head of the Welsh Church, but to avoid the inroads of the English, transferred the see to Menevia, thence called St. David's (q.v.). D. founded several churches in Wales, strongly combated Pelagianism, and was famous for sanctity and eloquence. Many miracles are recorded of him, as of the ground rising beneath him while he was preaching, and of a spring at St. David's gushing forth in response to his prayer. He died about 600. Many Welsh churches were dedicated to him. See *Historia S. Davidis* by Giraldus Cambrensis.

David's, St. (the British *Mynyw* and Roman *Menevia*), a very old episcopal city, Pembrokeshire, Wales, near the rugged promontory of St. David's Head, the westmost point in Wales. About 519, St. David, the patron saint of Wales, transferred the metropolitan see from Caerleon to St. David's, which during the Middle Ages was an important city, from the numerous pilgrims attracted to it by the sanctity of the shrine, and the rich offerings brought by them. The cathedral, the bishop's palace, St. Mary's College, and some ruins, occupy a space surrounded by a lofty embattled wall more than three-fourths of a mile in circuit. The cathedral, founded in 1180, is cruciform, and generally in the Transition Norman, though Early English and later styles occur in portions. It contains the tomb of the Earl of Richmond, father of Henry VII., and monuments of Giraldus Cambrensis, Anselm, and other early bishops. Not the least distinguished of its many eminent bishops was the late Connop Thirlwall, the historian of Greece. Pop. reg. sub-dist. 5803; civ. par. 1816; and diocese 496,009. See the *History of the Cathedral of St. D.* by E. Freeman and Basil Jones.

Da'vies, Sir John, son of a lawyer at Westbury, Wiltshire, was born in 1570. He studied at Oxford, and was called to the bar in 1595. Next year he published a poem on dancing, called *Orchestra*. In 1598 his irregularities led to his expulsion from the Middle Temple, when he went to Oxford, and wrote his chief poem, *Nosce Teipsum*, treating of the immortality of the soul. In the reign of James I., D. filled the highest legal offices in Ireland, and in 1613 was Speaker of the Irish House of Commons. He sat in the English Parliament in 1620, and died 7th December, 1626. D.'s legal and political works, of which the chief is *A Discovery of the True Causes why Ireland has never been Subdued until the Beginning of this Reign*, are of high value, but his poems more markedly display his ability. His verse is harmonious, the language choice, and the thought just and often philosophic.

Dav'ila, Enrico Caterino, born near Padua, 30th October, 1576, belonged to a family driven from Cyprus by the Turks. Catharine de Medicis was his godmother. After the death of Henri III. and the capitulation of Paris, D. served five years under the banner of Henri IV. He then occupied a high military and civil post at Venice. D. was assassinated in 1631. The best edition of his *Historia delle Guerre Civili de Francia* is that of Milan (6 vols. 1807). There is a French translation from the Italian by Mallet de Grosley (1757). Although biassed in favour of his godmother, D. gives an elegant and truthful account of the period (1559-98). He stands below Machiavel and Guicciardini, but above Sarpi and Bentivoglio.

Da Vin'ci, Leonardo, the chief of the Florentine painters, and, according to Hallam, 'the first name of the 15th c.,' was the illegitimate son of Piero Antonio, a notary, and was born in the Val d'Arno in 1452. Noted from early youth for his beauty and artistic promise, he was trained by Verocchio, then the greatest artist in Florence, whom he soon surpassed in painting; and, moreover, devoted himself to sculpture, poetry, music, architecture, and mechanics. In 1483 he visited Milan, where he became designer of pageants for Ludovico Sforza, and painted his 'Last Supper' in the refectory of a Dominican church. This fresco, finished in 1497, is now only faintly visible. In 1498 the French took Milan, and D. returned in poverty to Florence. Henceforth his life was one of wandering. To the years 1498-1502, his most actively creative period, belong the works 'La Giaconda'—the 'Vierge aux Rochers' of the Louvre—his masterpiece, and the 'Battle of the Standard,' produced in competition with Michael Angelo, Raphael watching both artists as they worked. In 1514 D. revisited Rome, where, though a supreme political indifferentist, he was suspected of French sympathies by the anti-Gallican party, and accordingly turned to France at the invitation of François I., who gave him the Château de Clou in the valley of the Masse, where he died, 2nd May, 1519. There is an indefinable charm and mystery in his life and works; his genius is enigmatical as well as versatile and fascinating. He often trifled with his superb powers, losing himself in strange fancies and intricate designs. He was the leader of the return to nature in the painting of the 15th c. (see Renaissance), and fixed for ages the pictorial type of the Saviour. His paintings are marked by fondness for bizarre effects, by patient refined execution, by the subtle exotic beauty of his female faces, the modelling of which is said to be unequalled. His favourite subjects are moving waters and faces with a perplexing smile. D. undertook various architectural and engineering labours, led the water of the Adda to Milan, made a navigable canal 200 miles long, and planned vast schemes, such as the perforating of mountains and raising of great buildings. He carefully studied plants, crystals, and the stars, and anticipated many recent discoveries and inventions. His thirteen books of MSS.—written from right to left—are still unedited. See Vasari's *Le Vite de piu eccellenti Pittori, Scultori e Architette*, the first edition of 1550, and also the later edition, Florence, 1846-57, in which the history of D. is modified; Arsène Houssaye's *Histoire de Léonard da Vinci* (Par. 1867), an admirable book, the chief authority on D.; and Pater's *Studies in the History of the Renaissance* (Lond. 1873).

Da'vis, Jefferson, the leader of the greatest civil war of modern times, was born in Kentucky, 3rd June, 1808. He graduated at West Point Military Academy in 1828, and served in the Black Hawk War, 1831-32. D. became a cotton-planter and a keen advocate of that interest, entering the arena of Congress in 1845 as a 'Democrat.' He fought with distinction in the Mexican War, entered the U.S. Senate in 1847, and became Secretary of War under President Pierce (1853-57). D. had long championed state rights and slaveholding interests, and at length led on the secession of 1861. He was chosen President of the Confederate States for six years. After the collapse of the South he was taken prisoner at Irwinville, Georgia, 10th May, 1865, and detained in Fortress Monroe for two years, but was included in the amnesty of 1868. D. subsequently followed business pursuits, eschewing politics, and wrote a history of the war in which he played so conspicuous a part. He died 1890.

Davis, John, a celebrated navigator of the latter part of the 16th c., was born in the parish of Strake-Gabriel, near Dartmouth, Devonshire. He made three voyages between 1585 and 1588 in search of the N.W. Passage, discovering, in the first, the strait which bears his name. He subsequently accompanied Cavendish to the South Sea, made five voyages to the East Indies, in the last of which he was killed, 29th December, 1605, by pirates off the coast of Malacca. D. invented a quadrant, which was subsequently superseded by Hadley's, and was the author of *The World's Hydrographical Description* and *The Seaman's Secrets* (both 1595). An account of his discoveries is given in Hakluyt's *Voyages* and in Harris's *Collection of Voyages*.

Davis, Sir John Francis, born in London, 1795, went to China in the suite of Lord Amherst, 1816, joint commissioner with Lord Napier in 1834 in arranging affairs with China, and British plenipotentiary to China, and governor and commander-in-chief of Hong-Kong, 1843-48. He was created a baronet, 1845, and K.C.B., 1854. D. was one of the most authoritative writers on China, its people, and its recent history. His chief works are *Chinese Novels Translated* (Lond. 1822); *Chinese Moral Maxims* (Macao, 1823); *The Chinese, a General Description of the Empire and its Inhabitants* (Lond. 1836-57); *China during the War and since the Peace* (Lond. 1852); *Chinese Miscellanies* (1865).

Davis Strait, discovered by John Davis (q.v.) in 1585, is the southern half of that great inlet of the Atlantic running N. between Greenland on the E. and Baffin's Land on the W. It is in lat. 60° to 70° N., and it varies in width from 160 to over 300 miles. It is the gate from the Atlantic to Baffin's Bay, Smith and Lancaster Sounds, &c., and though its western shores are hampered with heavy ice throughout almost the whole year, it is freely navigated (along the Greenland coast) by fleets of whalers during the summer months.

Da'vison, John, the author of the well-known *Discourses on Prophecy*, was born at Morpeth, 28th May, 1777, and educated at Oxford, where, between 1810 and 1817, he was tutor of his college (Oriel), public examiner, and preacher at Whitehall. In 1826 he was made prebendary of Worcester, and shortly after rector of Upton-upon-Severn. He died 6th May, 1834. D. had great learning and clearness of judgment. His *Discourses* were published in 1812.

Da'vit, on shipboard, a sort of crane, with a curved arm projecting outwards, placed in pairs at the sides and stern of a vessel to facilitate the raising and lowering of boats, and on which the boats are slung ready for any emergency. A stout beam of timber, fitted to the fore channel, for hoisting the anchor to the top of the bow without injury to the ship's sides from the flukes of the anchor, receives the same name.

Davout' (commonly, but inaccurately, written **Davoust**), **Louis Nicolas,** a celebrated French marshal and lieutenant of Napoleon, was born of a noble family at Annoux, in the old province of Burgundy, 10th May, 1770. He studied at the military school of Brienne at the same time as Bonaparte, and entered the army in 1785. D. distinguished himself on numerous occasions, accompanied Bonaparte to the East, and contributed greatly to the victory of Aboukir (1799). In the Napoleonic campaigns (from 1805 to 1809), including the battles of Jena, Austerlitz, and Wagram, he played a most brilliant part, being rewarded with the titles of Duke of Auerstadt and Prince of Echmühl. Appointed Governor of Poland, he obtained an evil reputation by the harshness of his military despotism and by his personal rapacity. In the Russian campaign he gallantly supported his chief, and after the retreat from Moscow became Governor of the Hanse Towns, which office he held till the restoration of the Bourbons. After Bonaparte's return from Elba, D. was his War Minister, and commanded the army which capitulated under the walls of Paris. He was made a peer of France in 1819, and died 1st June, 1823.

Da'vy, Sir Humphry, a celebrated chemist, was born at Penzance, Cornwall, 17th December, 1778. After a preliminary education he was apprenticed to a surgeon and apothecary in his native town in 1795, occupying his leisure time with the study of science, mental and physical. His first published experiments, upon the decomposition of carbonic acid by plants, appeared in the *Contributions to Physical and Medical Knowledge, Principally from the West of England*, edited by Dr. Beddoes, who in 1798 made D. the superintendent of his Pneumatic Institute, then recently established at Clifton. Here he made his famous experiments in the respiration of nitrous oxide, nitric oxide, marsh gas, and carbonic acid, which, communicated to the Royal Society, obtained for him a great reputation as a chemist, and an appointment in 1801 as lecturer of chemistry in the Royal Institution at London. In 1806 his Bakerian lecture, *On Some Chemical Agencies of Electricity*, gave the results of his experiments in what is now known as electrolysis, and the following year witnessed the decomposition of the so-called fixed alkalies, and the discovery of the substances constituting their bases. In 1808 D. demonstrated that what Berthollet had supposed to be a compound of oxygen and muriatic acid was in reality a simple substance, which he called chlorine; and at the same time overthrew Lavoisier's theory of acids, which was in general acceptance among the chemists of that day. In 1814 he also discovered and experimented upon iodine, a substance resembling chlorine in many of its properties. D. was knighted in 1812, and received a baronetcy in 1818, while he was making his second tour on the Continent. In 1815 his attention was directed to the subject of mine explosions, and he was thus led to the invention of his Safety Lamp (q.v.), an invention which alone would entitle him to a high position among British men of science. In 1820 he succeeded Sir Joseph Banks as President of the Royal Society, but resigned in 1827, in consequence of failing health. A visit to Italy did not restore him; and he died at Geneva, 29th May, 1829, his death being no doubt hastened by his early experiments on gases. His collected works (1839-40) were edited by his brother, Dr. John D., who also published *Fragmentary Remains* (Lond. 1858). His last work was entitled *Consolations in Travel, or the Last Days of a Philosopher*. See *Life of Sir H. D.*, by J. A. Paris (Lond. 1831).

Dawall'a, a Teleostean fish belonging to the family of the *Siluridæ* or Sheat-Fishes. It occurs in the rivers of Guiana, and averages about two feet in length. The snout is elongated, and the teeth are numerous and of minute size. No scales exist. Its flesh is highly esteemed for its nutritious qualities and delicacy.

Dawk, or **Dâk,** literally the mail-post, but applied to an Indian mode of travelling in palanquins carried from station to station by relays of men, usually consisting of eleven, the stations being from 9 to 11 miles apart. There are now Government post-waggons, or the horse-D., seated for four and serving as a bed for two.

Daw'ley Mag'na, a town in Shropshire, 3½ miles S.E. of Wellington, with blast-furnaces, bar-iron mills, collieries, lime and tile works. Pop. civ. par. 6996.

Daw'lish, a village on the S. coast of Devonshire. It was formerly an insignificant fishing hamlet, but from its beautiful situation in a valley between the mouths of the Teign and the Exe has now become a favourite watering-place. Pop. civ. par. 4925.

Daw'son, Sir John W., LL.D., naturalist, was born at Pictou, Nova Scotia, in October, 1820. After studying for some years at Edinburgh University, he returned home, and wholly devoted himself to the study of natural science. He greatly increased our knowledge of the palæontology of Canada, and was the discoverer of the oldest known form of organic life, the *Eozöon Canadense*, which belongs to the Laurentian formations. D. was Vice-Chancellor of the M'Gill University at Montreal, and a member of many scientific societies of Europe and America. Among his principal works are his *Archaia, or Studies of the Cosmogony and Natural History of the Hebrew Scriptures* (1858), his *Acadian Geology* (2nd ed. 1868), and, most important of all, his *Devonian and Carboniferous Flora of Eastern N. America* (2 vols.), published by the Geological Survey of Canada. His latest works are *The Story of the Earth and Man* (1872), in which he combats Darwin's views on the origin of man, his *Dawn of Life* (1875), and *Science in Bible Lands* (1888). In 1884 D. was knighted.

Dax (the *Aquæ Augustæ Tarbellicæ* of the Romans), a town in the department of Landes, France, on the left bank of the Adour, 20 miles N.E. of Bayonne, with manufactures of pottery and liqueurs, and a trade in wine, corn, timber, hams, honey, wax, &c. Its hot saline springs, with a temperature of 158° Fahr. at their source, are efficacious in rheumatic complaints. The name D., formerly *Acqs*, is a corruption of *Aquæ*. Pop. commune 10,240; arrond. 108,801.

Day (Old Eng. *dæg*, Ger. *Tag.*, allied to Lat. *dies* and *divum*, from a Sansk. root, *div*, 'to shine'), commonly denotes the time during which the sun is above the horizon, being thus opposed to night; but the term is also applied, in astronomy, to one complete rotation of the earth, taken with reference to some celestial body. Thus the *sidereal D.* is the time which elapses between two successive culminations of the same star; and from the earliest historic period this interval of time has not appreciably altered. Its consistency recommends it to the astronomer, who divides it into twenty-four sidereal hours, and these again into minutes and seconds. The *solar D.* is similarly measured by means of the sun; but owing to the orbital motion of the earth giving rise to the apparent motion of the sun among the stars, it is longer than the sidereal D. This difference is never twice successively the same, a circumstance which arises from two causes, viz., the varying velocity of the earth in its orbit, and the obliquity of the ecliptic. The *civil* or *mean solar D.* is the solar D. which would be given by the earth moving with its *mean* velocity in a circular orbit and making 365·24235 revolutions in one Gregorian year. This mode makes the days all the same length, and the noon of the civil D. sometimes precedes, sometimes follows, the true solar noon. Most modern nations place the beginning and end of the D. at midnight—an arrangement somewhat inconvenient to the astronomer, whose observations thus frequently extend over a time embracing parts of two days.

Day, in law, is twenty-four hours, beginning at midnight. Most European nations reckon so. Every day, on which a court may sit, is called a *lawful* day. No legal execution against person or property can be done except on a lawful D. But criminal warrants, or, in some circumstances, warrants for apprehending a debtor, may be granted and executed on any D. Under statutes, various acts and contracts are rendered illegal if done or entered into on Sunday. See LORD'S DAY ACTS, SABBATH, PUBLIC-HOUSES.

Day, Thomas, a pamphleteer and tale-writer, and a man of very whimsical character, was born in London, 22nd June, 1748; studied at Oxford, and afterwards entered the Middle Temple. He sympathised with the Americans in the war of independence, and was an advocate for the abolition of the slave trade and for parliamentary reform. But he is remembered now only for his *Sandford and Merton* (1783-89) and *History of Little Jack*. He died 28th September, 1789. An interesting and amusing sketch of D.'s character and ludicrous mishaps in search of a model wife is to be found in the *Saturday Review* of 13th May, 1876.

Day-Fly, a genus of insects belonging to the order *Neuroptera* (q.v.), and not to the order *Diptera*, or that including the common flies. See EPHEMERA.

Day-Lily, a genus of Liliaceous plants, of the species cultivated in our gardens. The D.-L. of Hungary, France, Siberia, and China, and that of the Levant and France, both fibrous-rooted perennials, producë abundant foliage, which is eagerly eaten by cattle.

Day'lesford, a borough, in Talbot county, colony of Victoria, 78 miles N.W. of Melbourne. It was the centre of an important gold-mining district, but in this respect the locality has much declined; the form in which mining operations was chiefly carried on being quartz-crushing. Pop. 3839; of the electoral district, 9174. The inhabitants are engaged in agriculture and mining.

Day-Nursery, a building set apart for the reception of very young children during the day-time, while their parents are away from home on work. The system is known as the crêche system, which was first established in France, where, more than a century ago, Madame Marbeau opened a building for the purpose. This was in Paris. The system spread to Belgium, and several crêches were opened in Brussels. Mrs. Hilton, of London, visited these institutions, and on her return to England introduced the system here. She was supported by the Society of Friends, of which she was a member, and her endeavours were successful not only in England, but also in the United States, where her example was followed shortly afterwards. There are now numerous establishments of the sort throughout the kingdom. On 29th April, 1893, the Duchess of Westminster opened St. Mary's D.-N. in West Ham (London Road, Plaistow), which is believed to be the largest of its kind in this country. The building accommodates 150 children, who are fed and taken care of during the day by fifteen nurses, and is fitted with every suitable comfort.

Days in Bank are, in England, certain days in term when writs are returnable, or when the party shall appear in court upon the writ served. They are so called in contradistinction to days at *Nisi Prius* when trial by jury took place.

Days of Grace are the three additional days formerly allowed by custom, and now by the law of the United Kingdom, for payment of a Bill of Exchange (q.v.) which has come to maturity. If the third day fall on a Sunday, Christmas-day, Good Friday, or a public fast or thanksgiving day, the bill is payable the day before. If it fall on a bank holiday (other than Christmas-day and Good Friday) it is payable the day after, or when the second day is a bank holiday, and the third day a Sunday, it is also payable on the fourth day. The number of D. of G. allowed for payment of a bill in different countries varies.

Day'ton, a flourishing city in the S.W. of Ohio, at the confluence of the Mad and Great Miami rivers. Its streets are well laid out and adorned with many fine residences and public buildings; among others, the marble courthouse, after the Parthenon. It has flour, saw, oil, paper, and cotton mills, breweries, farming implements and railroad cars factories. The prosperity of D. had its origin in the Miami Canal, connecting the city with Lake Erie (1829). Pop. now 57,978, reduced by 3242 since the census of 1890, owing to the decision of the Court of Common Pleas of Montgomery County, in respect of some territory, which has been declared to be outside the limits of the town.

Days'man, an umpire. The word occurs once in the authorised version of the Scriptures, in Job ix. 33—'Neither is there any D. betwixt us, that might lay his hand upon us both.' It occurs also in Spenser in a similar sense. The word so translated in Job comes from a root meaning 'to rebuke.' The origin of the English word is found in the old meaning of *Day*—the day, *i.e.*, of settling a cause judicially.

D'Aza'ra, Don Fe'lix, a Spanish naturalist and traveller, born at Barbunales, Aragon, 18th May, 1746. After obtaining the rank of brigadier-general in the Spanish army, he was sent to S. America, as one of the commissioners to settle the boundaries of the Spanish and Portuguese possessions there. He remained in S. America for twenty years, devoting his leisure to the investigation of the natural history of the New World, and published, on his return to Europe, *Apuntamientos para la Historia Natural de los Pajaros del Paraguay y Rio de la Plata*, of which an English translation by W. Percival Hunter was published at Edinburgh in 1838. D'A. died in Aragon in 1811.—His brother **Don Joseph Nicholas D'A.** (1731-1804), was a distinguished diplomatist.

Dea'con (Gr. *diakonos*, 'an attendant'), a certain kind of minister in the Christian Church. It is generally assumed that the institution of the office is described in Acts vi., and that the duties of it in the Apostolic Church were entirely connected with temporal affairs. According to another view, the seven whose appointment is described in Acts vi. were merely special commissioners to meet a special emergency, and a class of deacons or servants existed from the first in imitation of the constitution of the synagogue with its ministers (Luke iv. 20), or even as a necessity; which seems to be indicated by the 'young men' of Acts v. But the qualities of the D., almost equal to those required for a bishop described in 1 Tim. iii., indicate that he was more than a mere lay attendant. In the Post-Apostolic Church, at any rate, deacons were regarded as ministers of the same kind as the presbyters and bishops, though of an inferior kind; they were not called priests, but ministers or Levites. Before the institution of the inferior orders—readers, exorcists, &c.—the D. performed all the duties afterwards distributed to these. His duties were—(1) to take care of the sacred utensils; (2) to receive the offerings of the people; (3) to distribute to the people the elements at the Eucharist, after these had been consecrated; (4) to direct the people in their devotions; (5) sometimes to read the Gospel, and baptize; (6) to preach when licensed by the bishop; (7) to be the bishop's almoner, secretary, and sometimes his representative, and generally to be his eyes, ears, and right hand. His dress was the alb and stole, then the colobium, and finally the dalmatic. In modern Episcopal churches the D. ranks as the lowest of the three sacred orders, and acts as the priest's assistant in divine service, but has no independent cure of souls, and is debarred from ecclesiastical promotion, so long as he continue D. Statutes 13 Eliz. c. 12 and 44 Geo. III. c. 43 provide that a man must be twenty-three years of age before he may be ordained deacon, but the Archbishop of Canterbury may admit at an earlier age by faculty or dispensation. The Bishop of London or his appointee may ordain aliens (see Statute 24 Geo. III. c. 35) to be deacons, but not to serve in the Crown's dominions.

Deaconess.—Whether or not the institution was as old as that of the deacons, there existed very soon in the primitive Church a class of female servants who performed all those offices towards the females of the congregation which the deacons did for the men. According to the primitive regulations, they had to be widows who had borne children, been once married, and sixty years of age; later they were allowed to be virgins, and only forty years old. The order gradually died out in the Western Church from the 5th c., but was retained in the Greek till the 12th. See Bingham's *Ecclesiastical Antiquities*.

Deacon of a Trade. The president for the time of certain corporations in Scotland is so called. Before the passing of the Burgh Reform Act, the deacons of the crafts were *ex officio* members of the town council in royal burghs, and represented the trades. But by the Act above mentioned it is provided that the D. shall no longer be a member of the town council in virtue of his office. The D.-Convener of the Trades in Edinburgh and Glasgow continues to be a constituent member of the town council. The D. is preses of the incorporation, and signs the record of its acts.

Dead, a word used in nautical phrases or names, and in general indicating fixedness or passivity; as *D.-eyes*—immovable blocks used for tightening rigging; *D.-lights*—wooden shutters used to replace glass windows in stormy weather, &c.

Dead, Judgment of the. In ancient Egypt the belief seems to have been that immediately after death the spirit of the departed was led before Osiris, the judge of the dead, who examined into the past conduct of the deceased, with the assistance chiefly of Thoth and Anubis, the scribe and the scale-holder. The form of trial is symbolised in the papyrus rolls found among the mummies. An ostrich feather, as a symbol of truth, is seen in one scale of a balance, and a vessel in form of a human heart in the other. Forty-two gods, each presiding over a special sin, appear as judges, while a female hippopotamus appears as prosecutor. The scales are watched by the gods Horus and Anubis, the result in each case being noted by Thoth-Hermes, the justifier. According to Diodorus there was a form of human trial. If the result of this was unfavourable, funeral rites were withheld.

Dead Freight. A merchant who freights a whole ship must pay the shipmaster for unoccupied space. This due is called the D. F. It is, strictly speaking, a sum owing as damage for loss of freight; therefore, the shipmaster has no lien over the goods on board in security of his claim, which can only be made effectual by a personal action against the freighter. But lien may be constituted by stipulation in the charter-party.

Dead'ly Night'shade. See BELLADONNA.

Dead Nettle, a genus of Labiate plants. The white D. N. and the purple D. N. are common British wayside and hedge weeds. They are sometimes used as potherbs in Sweden. The name is also applied to the allied genera *Galeopsis* and *Galeobdolon*, some species of which (*G. tetrahit* and *G. versicolor*, or hemp-nettle) share with the D. N. proper the reputation of having stinging hairs, capable of causing great irritation, especially when the plant is drying, though they are as yet unknown to the botanist.

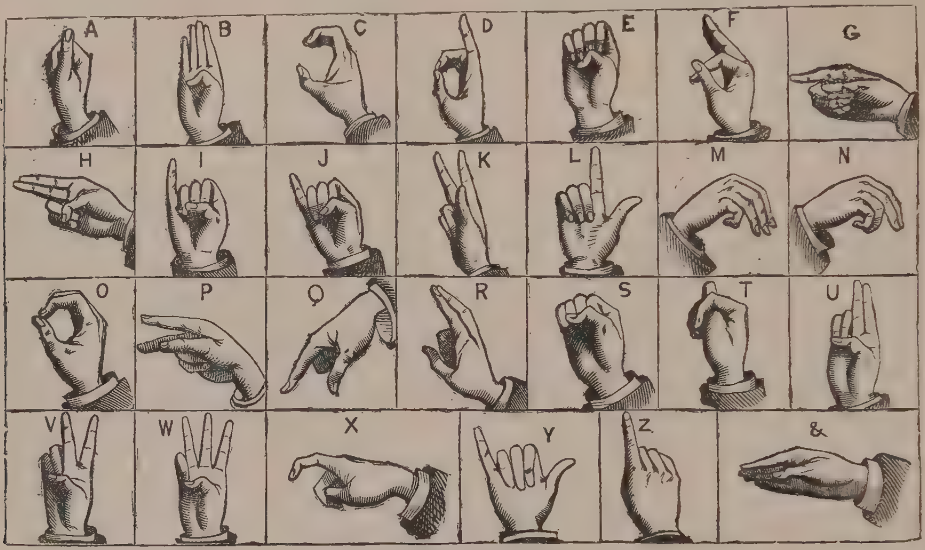
Dead Reckoning, in navigation, the calculation of a ship's position relatively to the point from which she started, by a series of consecutive observations of speed and direction independent of astronomical observations. See NAVIGATION.

Dead Sea, the *Lacus Asphaltites* of the Greeks, the *Salt Sea*, the *Sea of the Plain*, and the *East Sea* of Scripture, and the *Bahr Lût* ('Sea of Lot') of the Arabs, is situated in the S.W. of what was anciently Palestine, now comprised in the vilayet of Jerusalem. The name D. S. first occurs in Justin (*Mare mortuum*) and Pausanias (*Thalassa nekra*). The greatest length of the lake is 46 miles, its greatest breadth 10, and its area 290 sq. miles. Soundings of about 250 fathoms have been taken in its northern part; but the southern half is shallow, one-fourth of its length not exceeding 3 fathoms. At its northern end it receives the Jordan, and small variable streams enter it on each of the other sides; but as it has no outlet, its surface being 1312 feet below the level of the Mediterranean (and therefore 'the most depressed sheet of water in the world'—Stanley), its superfluous waters are carried off by evaporation, which accounts in some measure for the D. S.'s excessive saltness. The average of nine experiments, made at different times by eminent chemists, shows a specific gravity of 1·1556, that of pure water being 1·000. The water is so saturated with salt that it can take up only one-eleventh of its own weight, while that of the Atlantic can take up one-sixth. The depression occupied by the D. S. is now proved to be a volcanic crevice, and in the northern part of the region volcanic formations are found in considerable number. It is believed to be the seat of those 'Cities of the Plain' that were consumed by fire; and in the Middle Ages credulous pilgrims believed that they could catch a glimpse of Sodom and Gomorrah through the depths of the penal waters. But the Scriptural narrative forbids us to believe that the catastrophe was caused by submersion. The geology of the district, no less than the names Sodom and Bela (Zoar), suggests an earthquake or a volcanic eruption. The limestone cliffs forming the sides of the depression exhibit a remarkable regularity of height throughout their course, the western side having an elevation of 1000 feet, and the eastern of 2000. Both are nearly destitute of vegetation, except where a spring bursts from the foot of the mountain, or where a perennial stream fills the rift in the precipice with acacias. The epithet *Dead* was applied to this sea from the belief that its atmosphere was inimical to life; but there is nothing unhealthy either in the lake or its shores beyond what naturally arises from the excessive heat of the climate; and the picturesque myths that once circulated among Christians have now disappeared from literature. See Stanley's *Sinai and Palestine* (Lond. 1866).

Dead's Part is, in Scotland, that part of a man's *moveable* (personal) estate which he is entitled to dispose of by will. If he be survived by neither wife nor children, the whole moveable estate is D. P. If he leave a widow and no children, one-half goes to the widow as *Jus Relictæ* (q.v.); if he leave a child or children, but no widow, one-half goes to the children as *Legitim* (q.v.); and in either event the other half is D. P. If he leave a widow and a child or children, the moveable estate is equally divided into *jus relictæ*, *legitim*, and D. P. These legal divisions may be altered by marriage-contract, or by renunciations or discharges by the wife or children. Legacies or other gratuitous rights granted by the deceased on his death-bed affect only the D. P.

Deaf and Dumb, The, or, more correctly, **Deaf-Mutes** (Fr. *Sourds-muets*, Ger. *Taubstummen*), are those who suffer simultaneously from the want of the powers of speech and of hearing. A popular fallacy regarding this affliction is that it is twofold in its nature, implying malformation or incapacity in the speaking as well as in the hearing organs, whereas the power of articulation is undeveloped in the deaf-mute, or, in other words, he is dumb merely in consequence of his deafness. It will be observed that a perfect ear is necessary in acquiring the power of expression, since the primary means of so doing is by imitating the sounds we hear uttered by others. If a person, therefore, be unable to hear from infancy, it is impossible for him to learn the constituent elements of oral language; and if unaided, he must remain dumb even though possessed of the perfect organs of speech. Thus dumbness is the inseparable accompaniment of a congenital deafness. Also if a child lose the power of hearing before acquiring the faculty of speech, it inevitably incurs dumbness. But when the deafness is accidental, and occurs in an adult, it is not necessarily followed by a loss of utterance. The deaf man continues to speak as before; but even in such a case, when the ear no longer performs its controlling function, if great attention be not paid by others to the regulating of his voice it rapidly changes character; he speaks in a lower tone, accentuates his words badly, and eventually becomes all but unintelligible. Congenital deafness most often, perhaps, results directly from deficient action of the auditory nerve, and is generally incurable. That accruing from accident may be due to various causes; its curability depends on the nature of the cause, and the particular character and extent of the injury. See DEAFNESS.

The *statistics* bearing on the subject of deaf-dumbness, now comparatively full and authentic, do not reach further back than the year 1850. Since that year various commissions have inquired into the causes of deafness, the localisation of deaf-mutes, their social condition, education, &c. (See *Reports on the Status of Disease.*) Social science also has been directing attention to the possibility of reducing the extent of the evil by stricter conformity to hygienic discipline. It is impossible indeed to say what share the good done in this way may have had already in bringing about the favourable state of affairs to be noted in a comparison of the returns for 1851 with those of 1871-81-91. The total number of the deaf-dumb in Britain, according to the census of 1851, amounted to 17,300, or 1 in every 1590 of a population of 27,511,801; in 1871 they amounted to 18,150, or 1 in every 1742 of a population of 31,629,293.



One-handed Alphabet.

The following are the numbers as given in the census of 1881, compared with those given in the last census:—

Division.	Deaf and Dumb.		Proportion to the Population.	
	1881.	1891.	1881.	1891.
England and Wales	13,295	14,192	1 in 1953	1 in 2043
Scotland . . .	2,142	2,125	1 in 1744	1 in 1894
Ireland . . .	3,993	3,365	1 in 1296	1 in 1398
British Isles . .	88	82	1 in 1577	1 in 1803

In the United Kingdom the average in 1881 was 1 in 1794, and in 1891 it had sunk to 1 in 1916. Each division maintains its relative position with regard to the others. In 1881 Ireland and the British Isles showed the higher averages, and these they maintained, though somewhat modified, in 1891.

The distribution of deaf-mutes in England, as clearly shown by the returns, is not only disproportionate in the various districts, but is fixedly so, in a manner indicating a connection between the prevalence of deafness and the physical character of a country. And on a closer examination of the statistical evidence, it is at once seen that deafness is decidedly more common in mountain regions than in level districts, in rural parts than in cities and industrial centres. It would also appear that one of the commoner causes of its prevalence is the malaria arising from swamps or stagnant waters, or, indeed, any general impurity of the atmosphere. The elucidation of such facts as these is all-important, as showing that the evil is not altogether inevitable, and as pointing out a path for modern science and philanthropy.

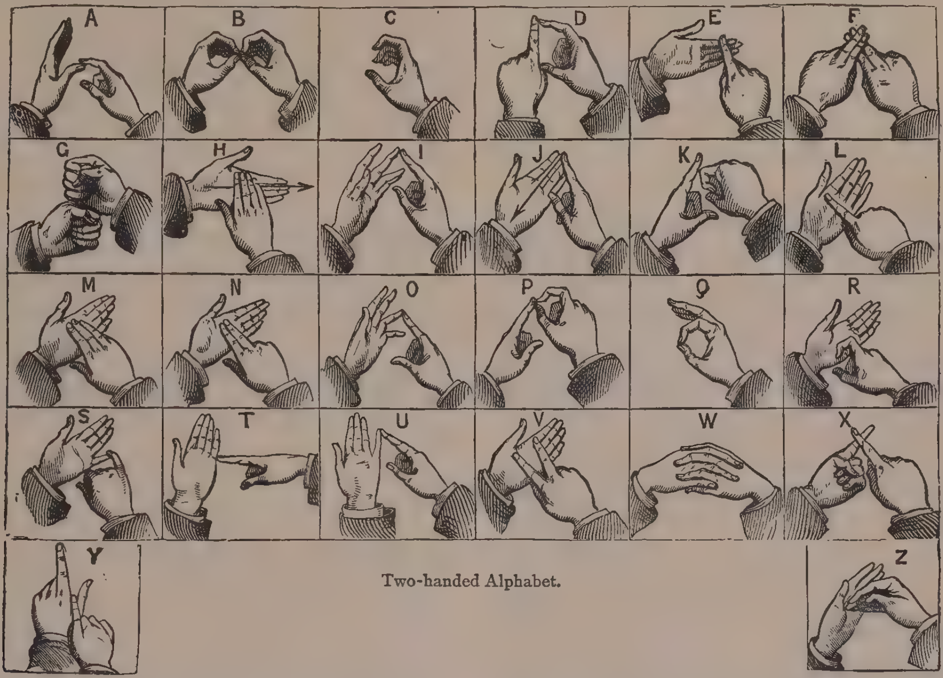
The number of institutions for the education of the deaf and dumb in each country, and the dates of the foundation of the earliest institutions, are as follow:—

	No. of Institutions.	Earliest foundation.
Australia and New Zealand .	4	1860
Austria (including Hungary) .	17	1799
Belgium	10	1822
Brazil	1	1867
Canada	6	1848
Denmark	4	1807
France	62	1765
Germany	90	1817
Italy	36	1801
Japan	2	1878
Mexico	2	1873
Netherlands	3	1790
Norway and Sweden . . .	24	1812
Portugal	1	1870
Russia	8	1806
Spain	7	1805
Switzerland	11	1822
United Kingdom of Great Britain and Ireland	40	1792
United States of America .	55	1817

From this it appears that France was the first country to recognise the necessity of supplying an educational establishment for the deaf and dumb, and five-and-twenty years elapsed before the lead was followed by the Netherlands. Two years later the Old Kent Road institution was opened in England, and in 1799 a similar establishment was founded at Vienna.

The *education* of deaf-mutes is encompassed by inconceivable difficulties. Not only is the deaf-mute destitute of all ideas derived from or connected with sound, but he is deprived of the very means by which instruction is usually conveyed, and is entirely ignorant of the power of words. To him the speaking voice is a nonentity. He can only hold converse by means of a few imperfect natural signs. His knowledge is confined to what he may have seen; the conception of past ages, distant countries, of a future world, or of a Deity, are all beyond his grasp. In the education of such an one the teacher has to communicate the medium of a complete language, as well as the entire mass of ideas, to a mind in a state of utter infancy.

The methods employed in the education of deaf-mutes are principally three in number—as named by the French, *mimique, phonologique, graphique*. Of these, the first deals in signs, and consists of (1) dactylology, or the art of spelling with the fingers; and (2) mimology, or the language of gestures. The second method is distinguished by the employment of oral means of instruction; it is divided into (1) phonology, or 'artificial speech;' and (2) labiology, or 'reading on the lips.' The graphic method, which is not less important as an end than as a means, comprehends alphabetic writing and the notation of gestures. The advocates of the sign-system can point to its great practical success, and are supported by the fact that instructed deaf-mutes generally employ it when conversing among themselves. The oral system is viewed by many as a higher form of tuition, inasmuch as it enables the deaf-mute to hold intercourse with society at large. Germany, the home of the latter system, is, however, almost the only country in which it extensively prevails, although it is also taught in a modified manner in a few of the schools of England, France, &c.



Two-handed Alphabet.

The language of natural signs or gestures, the 'mother-tongue' of the uneducated deaf-mute, is an important auxiliary of the teacher. The deaf and dumb take evident delight in its use, and by its means they can give life and force to their ideas. Their only resource when unprovided with instruction, it is carried to a wonderful degree of expressiveness, capable of rapidly conveying question and answer, or even the sustained flow of ideas in a lengthy narrative. 'To this rude though powerful mode of intercourse, which all the deaf possess in a higher or lower degree, those who are intelligent add signs of description by which they are able to explain facts and circumstances that have been brought under their observation. The teacher takes advantage of this method of communication to add to their stores of knowledge, to enrich and extend the sphere of their thoughts. . . . Thus a conventional language is formed which assists in their intellectual culture.' But such intercourse leaves the pupil entirely ignorant of the structure of sentences, and therefore it must be made subsidiary where the object is to teach a syntactical language.

Dactylology, or the finger-language, is based on the 'manual alphabet,' and, in the words of Degérando, gives to material writing the movableness of speech. There are a one-handed and a two-handed alphabet; the latter is that in common use in England, the former on the Continent of Europe and in America. George Dalgarno (q.v.), a Scotchman, issued the first English alphabet in his *Didascotocophus* (1680). Either of those now employed may be learned by an hour's practice; they are often taught to the deaf and dumb, together with the written alphabet, in a few days.

The office of phonology is to give to the deaf-mute the power of articulating the language that he cannot hear. To impart this power is a task requiring the greatest patience, and a knowledge of the vocal organs. Only one pupil can be taught at a time. The teacher proceeds by slowly uttering the vowel and consonant sounds, carefully showing how the mouth and tongue are disposed, and, as progress is made, gradually rising to syllables, words, and short sentences. At first the pitch and intonation are faulty, the high sounds amounting to a scream, the low ones little better than a growl, while others are nasal or drawling. In a report on the subject, the Rev. George E. Day, of America, says, 'This process is correctly called by German writers *mechanical speaking;* much time must necessarily be devoted to it, and with the greatest efforts only a defective utterance can be reasonably expected.' It is certainly true that those who are born deaf rarely if ever acquire correctness or fluency.

Reading on the lips is the counterpart of phonology, as it enables the deaf-mutes to ascertain what is said by others. It is performed solely by the assistance of the eye, and is liable to certain restrictions, *e.g.*, that the deaf-mute be near the speaker, that there be plenty of light, &c. Dr. Johnson, at the close of the *Journey to the Western Islands*, speaking of Braidwood's pupils, remarks that 'it is an expression scarcely figurative to say that they hear with the eye.' The manner of teaching to read on the lips is somewhat similar to that of training the deaf to speak, and it may be said that the process is more successful as a rule. But the aptest pupil is unable to take part in a general conversation, or to follow a public speaker.

After all, it is of far greater importance that the deaf and dumb can be taught to read and write than that they should be able to speak or follow the conversation of others imperfectly. Reading alone will bring within their reach the hidden treasures of knowledge, while writing affords an accurate means of communication where finger-language fails.

The *history* of the educational treatment of the deaf and dumb is little else than a page from the record of modern philanthropy. Various nations of early times regarded the deaf as labouring under the curse of heaven. Aristotle declared that they could not participate in knowledge. The Roman code incapacitated those born deaf of making a will, and placed them under various other civil disabilities. St. Augustine in the 4th c. excluded this class from the Church, interpreting in too literal a sense St. Paul's *fides ex auditu*. We are told by Bede that a deaf man was taught to repeat words and sentences by St. John of Beverley in 685. Eight centuries elapse before we read in the works of Rodolphus Agricola of Groningen of another deaf-mute who was taught to read and write. Fifty years later the versatile Professor of Pavia, Jerome Cardan (1501-76), founded the theory on which the education of the deaf and dumb rests, announcing that, as written characters and ideas may be connected together without the intervention of sounds, as in hieroglyphics, the instruction of the deaf is not impossible. Soon afterwards, Pedro de Ponce, a Benedictine at Oña (1520-84), gained a wide reputation for teaching deaf-mutes to speak and write. In 1620, Juan Paulo Bonet, a Spaniard like Ponce, and a monk of the same order, invented a one-handed alphabet. Henceforth the subject began gradually to receive more attention; various systems were tried and discarded, and fresh books continued to announce new theories. Among the more distinguished writers and workers in connection with the subject were Dr. John Bulwer (1648), Dr. William Holder (1669), Dr. John Wallis (1670), and George Dalgarno (1680), in England; Van Helmont (1667), and Johann Konrad Amman, a Swiss physician (1690), in Holland; Karger (1710), Georg Raphel (1718), Arnoldi (1778-1841), and Samuel Heinicke (1729-90), in Germany; Rodrigue Péreire, a Portuguese (1715-80), the Abbé Deschamps (1779), the Abbé de l'Epée (1784), and the Abbé Sicard (1742-1822), in France. The earliest schools established were those of L'Epée at Paris (1760), and of Thomas Braidwood at Edinburgh (1760). These were followed by the foundation of similar institutions at Vienna, Berlin, Prague, &c. Heinicke, like Braidwood, was an able teacher of the articulation school. The management of the schools of Paris and Bordeaux was transferred to the state in 1791. See Dr. Joseph Watson, *Instruction of the Deaf and Dumb* (Lond. 1820); Rev. George E. Day, *Report on the Various Systems in Europe*, &c. (1846); Pickard, *Théorie des Signes pour l'Instruction des Sourds-muets* (Par. 1808, new ed. 1828); Bébian, *Manuel d'Enseignement Pratique des Sourds-muets* (Par. 1827); Dr. Blanchet, *La Surdimutité* (1850); Reish, *Der erste Unterricht des Taubstummen* (Leipz. 1834); and Heil, *Der Taubstumme und seine Bildung* (Hildburgh 1865). The *Organ der Taubstummen und Blinden Anstalten* has been issued by Mathies since 1855.

Deaf and Dumb, Law Regarding. By the Roman law, those born deaf were held incapable of entering into a contract. In England and in Scotland their legal capacity (see CAPACITY, LEGAL) is a question of fact which will be determined, if necessary, by a jury. By the law of England, a child born deaf and blind is regarded as an idiot. But it is not to be supposed that the law would continue to hold this view if the child was capable of education and received it. For a complete account of the legislation relative to the deaf and dumb from the earliest times down to 1824, with a list of authors, see the work, in Latin, of C. Guyot of Groningen. As to when a deaf and dumb person may be competent as a witness, see *Taylor on Evidence*.

Deafness can only be understood by careful study of the anatomy of the ear and of the complicated organs of hearing. It is very common, and may exist at any age. It is sometimes congenital—often results from fevers, especially measles, scarlet fever, &c., and is generally present to a greater or less degree in the aged. All degrees of D. occur, from the slightest impairment of the sense of hearing to complete insensibility to the vibrations of sound. Speaking generally, it may be caused by anything which interferes with the consciousness of the impression of sounds, by some obstruction in the auditory passages, by disease of the organs of hearing, or of the brain, rendering the person unconscious to the impression produced on the Auditory Nerve (q.v.). A common cause is some obstruction in the *external* ear, as any foreign body, introduced by accident or otherwise, interfering with the passage of the air to the *membrana tympani*. A still more frequent cause is a Polypus (q.v.) growing in the external ear. But the most frequent cause of all is accumulation of wax (*cerumen*). This is fortunately one which is easily removed, by syringing the ear with tepid water, and not by using the finger, a twisted towel, or any hard instrument, which only causes the wax to cake. In some cases, it is desirable to previously soften the wax with almond oil or an alkaline lotion. Inflammation of the membrane of the ear, or *drum* as it is popularly called, is another cause of D., especially when the inflammation ends in ulceration and perforation of the membrane. Such inflammation is to be treated by appropriate remedies; and when there is rupture of the membrane from this or any other cause, a simple but very effective remedy is to introduce daily a small piece of cotton wadding, or to use an artificial *membrana tympani*. This artificial membrane consists of a thin piece of caoutchouc, round which is attached a small silver wire. In either case the ear requires to be washed out daily and the substance reintroduced. Not unfrequently the cause of D. is some defect in the tympanum or middle ear. This cavity is normally filled with air through the Eustachian Tube (q.v.), and during each act of swallowing air enters into the middle ear, so that when this tube is obstructed by inflammation, the sense of hearing is greatly destroyed. Disease of the bones of the middle ear, or impairment of their mobility, due to rheumatism or gout, sometimes causes D. The obstruction in the Eustachian tube may be removed by passing the Eustachian catheter, or by other appropriate means. Again, D. may result from disease of the *internal* ear, inflammation spreading to it from the middle ear. The term *nervous D.* is applied to all obscure forms of D. It ought to be limited to that kind of D. due to an affection of the auditory nerve or disease of the brain. Probably in old age the nerve of hearing becomes incapable of transmitting to the brain impressions produced by sound—a paralysis of the nerve not unlike that condition of the optic nerve causing that kind of blindness called amaurosis. This kind of D. is incurable. More frequently, however, it is due to functional disorder of the nerve caused by a blow, a fall, by a loud noise, by a medicine, or by congestion of the brain.

Deák, Francis, the constitutional liberator of Hungary, was born of a noble Magyar family, at Kehida, in Szalad, 17th October, 1803. He studied at Komorn and Raab, and after gaining some reputation as a barrister, became a member of the National Diet in 1832. In breaking down the exclusive privileges of the Magyar aristocracy, and in opposing the extension of imperial absolutism to Hungary, he first attained distinction as a sagacious and patriotic statesman. As Minister of Justice in the liberal Batthyanyi ministry, he strove vainly to avert the revolutionary war of 1848. While the conflict raged, and the Empire seemed crumbling to pieces, he held aloof, siding as little with Kossuth's republican violence as with the Austrian Government and its Slavic malcontents. On the suppression of the Hungarian insurrection D. withdrew into private life, and did not return till the Franco-Italian war extorted concessions from the fears of Austria. Solferino and the loss of Lombardy are traceable to the just disaffection of Hungary. Following on the peace came

(1860) the offer, through the Schmerling Ministry, of a constitution common to the whole monarchy. But for five years this was unflinchingly resisted by D., now representative of Pesth, and leader of the Moderate party. His claims were the constitution of 1848, a Hungarian ministry responsible to the National Diet alone, the release of the revolutionary exiles, and the restitution of their property. After the further lesson of Sadowa (1866), and acting on the advice of Baron von Beust, Franz Joseph at last granted the whole of these demands. The ancient independence of his country was recognised, and D. asked no more. The last ten years of his life were spent in loyal service to that Austro-Hungarian monarchy which in no small measure owes to him its harmonious prosperity and strength. D. died 28th January, 1876. His obsequies were attended by the legislature, by representatives of the Emperor, and by all ranks and sections of his countrymen. His chief characteristics were honesty of purpose, sagacity, and strength of will, rather than the more brilliant qualities of the diplomatist and orator. But above all, he was inspired by a love of justice and of his country.

Deal (the 'valley,' a form of *Dale*), a municipal borough, seaport, and watering-place in Kent, 8 miles N.N.E. of Dover, on the coast between the N. and S. Forelands, and consisting of Upper and Lower D. The inhabitants are mainly occupied in boatbuilding, for which D. is famous, sailmaking, piloting, and victualling. D. is one of the Cinque Ports, and the official residence of the Lord Warden of the Cinque Ports is Walmer Castle, a mile to the S., which, with D. Castle, built by Henry VIII. in 1539, and Sandown Castle, at the N. end of the town, defended the neighbouring coast. Until 1885 D. united with Sandwich and Walmer in returning two members to Parliament. The borough is now included in the Eastern or St. Augustine's parliamentary division of the county of Kent. Pop. reg. sub-dist. 15,135; mun. bor. and civ. par. (each) 8891.

Deal'fish, the name of a genus of Teleostean fishes included in the family *Trachypteridæ*, and distinguished by an elongated body destitute of scales and of compressed form, by a single long dorsal fin, by the absence of a hind fin, and by the tail fin not being in a line with the axis of the body, but rising vertically. Large ventral fins exist. The body is so compressed that a specimen three feet long may not exceed a paper knife in thickness. The colour is silvery-white. Six feet is not an uncommon length of these fishes. The best-known species is the Vaagmär of the Northern Seas.

Deals (Old Eng. *dælas*, 'parts,' from *dælan*, to 'deal' or 'divide'), a term properly applied to the thicknesses to which any piece of timber is cut up, but now generally restricted to pine wood, and to the particular sizes in which it is imported from Baltic ports. The size of such D. is 3 inches thick and 9 inches wide. They are sold by the 'hundred,' in which there are 120 pieces.

Dean and Chapter are, in England, the council of the bishop to advise him in religious matters, and to confirm leases of the temporality and offices made by the bishop in the diocese. The chapters, consisting of canons or prebendaries, are sometimes appointed by the sovereign, sometimes by the bishop, and sometimes elected by each other. Deaneries and prebends may become void, like a bishopric, by death, deprivation, or resignation. Statute 3 and 4 Vict. c. 113 gives the direct appointment of deans on the *old* foundation to the Crown and enacts that a priest must have been at least six years in orders before he can be appointed dean, and must 'reside' eight months at least in the year.

Dean, Forest of, comprises 22,000 acres, between the Severn and the Wye, Gloucestershire. It belongs to the Crown, and about the half of it is enclosed for the growth of navy timber. It is divided into six walks. The inhabitants, who had formerly many privileges, and have still the liberty of pasturage and fuel, and the right of mining—a royalty on the produce being reserved for the Crown—are chiefly miners. D. F. is in the hands of the Commissioners of Woods and Forests who have the control of the mining, timber privileges, &c., and under whom various officials are appointed and serve in reference to the woods and the mines beneath them.

Dean of Faculty. The corporation of advocates or barristers in Edinburgh is called the *Faculty of Advocates*, and the D. of F. is elected annually to preside at their meetings and to sign their acts. Usually the dean is re-elected till he is promoted to the bench. See ADVOCATE.

Dean of Guild, in Scotch burghs, was originally the head of the guild brethren or merchant company. He was also a judge in mercantile and marine causes within the burgh. His duty is now limited to the care of buildings. He must see that they are sufficient, and that they are erected according to law. His judgments are liable to review by the Court of Session. In Edinburgh the D. of G. court consists of the dean and the former dean, and a council of merchants and tradesmen annually chosen. No building can be erected, taken down, or materially altered, without sanction of this court, which has also jurisdiction in regulating weights and measures.

Deans of the Chapel Royal. The chapel royal in Scotland was a collegiate church founded by the Scottish kings for their own use, the superior of which was called Dean of the Chapel Royal. This benefice was after the Reformation conferred first on the Bishop of Galloway, and afterwards annexed to the See of Dunblane. On the abolition of Episcopacy in 1690, the revenues fell to the crown, the sovereign bestowing them on one or more of the clergymen of the Church of Scotland, who were called *deans* and *chaplains*, and held the appointment at the royal pleasure. In accordance with the recommendation of the Universities Commission (1858), the revenues have been divided, and have been attached to the chairs of Divinity and Biblical Criticism in the Universities of Edinburgh, Glasgow, Aberdeen, and St. Andrews.

Death (Ger. *tod*, allied to Gr. *thanatos*). The body is composed of various tissues and organs, each of which acts to a certain extent independently of the others. In the performance of its functions, each tissue undergoes a certain waste of material, and each organ undergoes a certain loss by the D. of its component tissues. Each tissue may also be said to have a life of a certain definite duration. It is developed, grows, reaches maturity, declines, and dies. It is evident therefore, that we may have two forms of D.—(1) *Molecular* or the D. of individual tissues; and (2) *somatic*, or the D. of the whole body. Molecular D. is the consequence of the stoppage of that interplay between the tissue and the fluid pabulum, the blood, containing not only nutritious matter, but also oxygen, without which the maintenance of life is impossible. This form of D. is continually taking place in the body, and, unless it affects a large portion of the fabric, it does not interfere with the general life of the body, or what may be termed the *somatic* life. At some period or other, however, somatic or general D. takes place from the failure of action of some important organ or organs. Thus *somatic D.* will follow stoppage of the heart's action; but the tissues live for some time afterwards, and *molecular D.* slowly supervenes. The various forms of somatic D. are as follow:—

(1) *Syncope*, or failure in the propulsive power of the heart. This occurs, for example, in D. by fainting. The individual becomes suddenly pale, drops down, and expires.

(2) *Asthenia*, or slow failure of the heart's action from deterioration of its tissue by fatty degeneration, or from deficiency of blood, as after excessive hæmorrhage.

(3) *Asphyxia*, or D. resulting from some obstruction to the aëration of venous blood in the lungs. This may be caused in many ways. For example, occlusion of the air passages, pressure on the chest so great as to prevent its expansion, puncture of the pleural cavities, or the breathing of irrespirable gases. In asphyxia venous blood is sent to the brain, and so affects its functions that unconsciousness speedily ensues.

(4) *Coma*, or D. resulting from interference with the functions of the brain. Pressure on the brain, or the circulation through its capillaries of certain poisons, such as alcohol, may cause D. by coma.

(5) *Necræmia*, or D. of the blood, as happens occasionally in malignant fevers.

Thus D. may commence at the heart (sudden, syncope; gradual, asthenia); at the lungs (asphyxia); at the brain (coma); or in the blood (necræmia).

D. may sometimes be simulated, as in 'trance' or 'catalepsy,' where we find all the functions of the body so feebly performed as to be scarcely perceptible. The surest test by which to distinguish real from apparent D. is the condition of the muscular system. After real D., muscle gradually loses its irritability, so that it does not contract when excited by electrical or other stimulation. Loss of irritability is followed by cadaveric Rigidity (q.v.), and this in turn is followed by putrefactive changes. So long as a muscle remains irritable it is not dead; loss of irritability and stiffening is a sure indication that D. has taken place.

Death, Legal. See CIVIL DEATH.

Death, Punishment of. See CAPITAL PUNISHMENT.

Death-Bed, Law of (in Scotland). By this law, which was peculiar to Scotland, the heir of the heritage was entitled to reduce any deed by which he was injured, if granted by his predecessor within sixty days of D., provided he was suffering from the disease of which he died at the date of the deed, and did not subsequently go unsupported to kirk or market. If the maker of the deed was, at its date, suffering from one disease, and died of another or by accident, the deed was not reducible. In counting the sixty days, the day of signing the deed was not reckoned; but it was sufficient that the grantor had survived until the running of any part of the sixtieth day. It 1871 it was enacted that no deed, made after the date of the Act, should be liable to challenge or reduction on these grounds.

Death's-Head Moth, a species of moth belonging to the family *Sphingidæ* or Hawk-Moths, and distinguished as a genus by the non-angulated sharp wings, by the short proboscis, and by the antennæ or feelers being hooked at their tips. The hinder wings are small. The popular name of the moth is derived from the whitish patch on the back of the thorax, resembling exactly a human skull and collar-bone. The front wings are blackish-brown above, with stripes and markings of black and red colour at the edges. The hinder wings are yellowish, with two bluish-grey bands. The chest is blackish-brown, with the skull-like marking. The caterpillar of this moth, which may attain a length of five inches, is yellow, with a tuberculated body, and is marked on its sides with seven oblique bands of a green colour. The back is spotted black and blue, and the tail bears a prominent horn-like process. The moth, which is found in almost every part of the Old World, attains an expanse of wing measuring five or six inches. It makes a grating noise, probably by grating the abdomen against the chest, and has long been dreaded by the ignorant and superstitious.

Deaths, Registration of. See REGISTRATION.

Death-Watch, the name properly given to certain insects belonging to the *Coleoptera* or Beetles, and to the family *Ptinidæ* (section *Pentamera*) of that order, from their producing a rapping sound by knocking their heads against woodwork. This sound, dreaded by the superstitious, is the signal of the insect to its neighbour. The striated, the tenacious, and tesselated D.-W. are familiar species, and are also termed Borers (q.v.) from their habit of infesting wood. The tesselated attains an average length of a quarter of an inch, and is of a dull grey colour. Its rapping is heard most frequently towards the end of spring.

Death-Watch.

1, Striated; 2, Tesselated; 3, Tenacious.

Débâc'le (Fr. 'a breaking up') is used in France to denote the breaking up of the ice in a river or harbour, and by English geologists to denote the sudden irruption of a flood which leaves its path strewn with promiscuous debris.

Deba'table Land. A tract of country on the border of England and Scotland was so called, from having formerly been the subject of contention between England and Scotland. In 1542 commissioners, appointed by the two crowns, divided it by a line drawn between the rivers Esk and Sark, the northern division being given to Scotland and the eastern to England. It continued for long to be the haunt of freebooters.

De Be'ne Ess'e, a term of English law, signifying the admission that something done may be allowed to stand for the present; but that it must ultimately stand or fall by the result of future examination. The Rules of the Supreme Court, 1883, Order 37, provide that a witness or person may be examined on oath before an officer of the court or any other person duly appointed at any time and in any place when the court or judge so orders it, being of opinion that the purposes of justice demand it. This evidence so taken must be filed in court and may be produced in evidence according as the court or judge directs.

Deben'ture (lit. 'the acknowledgment of a *debt*,' from *debēre*, 'to owe'). A written instrument charging Government with payment of a specified sum is so called. A *Customhouse D.* is a certificate authorising an exporter of excisable goods to receive a Drawback (q.v.) equal in value to the excise duties which have been paid on them. To forge a customhouse D. is felony. A *Railway D.* is a deed of mortgage given by a railway for borrowed money. Again *D. Stock* may be issued by a public company pretty well on the same terms as D.; it is often irredeemable, and (by any special act or by statute 26 and 27 Vict. c. 118) is preferable, both as regards payment of the interest as it falls due and as regards repayment of the principal sum at the stipulated date, to any claim on account of any kind of shares. Railway debentures are usually, therefore, a safe and legal investment for trust funds. They are transferable without trouble or expense, the original expense, including brokerage, being paid by the company. Interest warrants or Coupons (q.v.) are attached to the deed. The usual rate of interest on a railway D. is 4 per cent. in England.

Deb'itum Fun'di is in Scotch law a debt attached to land, and having a *lien* over it. A *Feu-Duty* (q.v.) and arrears of feu-duty are *debita fundi*. Rents, tithes (*teinds*), and similar burdens, though dues connected with land, are not *debita fundi*. Debts constituted by this title may be made effectual by Poinding of the Ground (q.v.), and 'may be ground of adjudication which is preferable to all adjudications or other diligencies intervening between the date of the right and of the adjudications deduced on it.' See Erskine's *Principles of the Law of Scotland* (edited by Rankine).

Déblai' (Fr. 'excavation,' from *déblayer*, 'to clear away,' originally corn from a field, but afterwards earth), in fortification, denotes the earth dug from the ditch to form the parapet. The *remblai*, again, is the earth and other materials used in constructing the rampart and parapet.

Deb'orah (Heb. 'a bee'), a prophetess who judged Israel (Judges iv. v.), and under whose direction Barak (q.v.) delivered the northern tribes from the oppression of Jabin, King of Hazor. She accompanied to battle the ill-armed band Barak had collected, and her exalted enthusiasm was the means of their gaining a great victory over the Canaanite host. The pæan which she and Barak sing together quivers at once with grateful devotion and vengeful glee. It is a miracle of Eastern poesy and passion.

Debou'ching (Fr. *déboucher*, 'to pass out,' from *bouche*, 'the mouth'), in military language, is to march out from a wood, defile, or other confined position.

Deb'reczin, the capital of the comitat of Bihar, and, next to Buda-Pesth, the chief trading town in Hungary, 120 miles E. of Buda-Pesth by railway. The streets, though broad, are filthy, and stately public edifices contrast oddly with surrounding hovels. There are several churches and a fine cathedral. The Reformed College has a library of 20,000 volumes, twenty-four professors, and 2000 students. The Honvéds who fell at the battle of D. in 1849 are commemorated by a monument, and a statue was erected in 1871 to the poet Csokonaij. D. is the seat of a Roman Catholic and of a Greek bishop. The chief manufactures are coarse woollens, leather, soap, tobacco-pipes, earthenware, and articles of cooperage. There is a large trade in horses, cattle, bacon, wine, corn, oils, ewe-milk cheese, tobacco, water-melons, &c. D. has four annual fairs and the largest swine-market in Hungary. Pop. 56,940, of whom two-thirds are Magyars, and the greater number are Protestants. D. was the seat of Kossuth's government in 1849.

Debruised', in heraldry, an animal or any other charge bruised out or debarred by a bar or any other ordinary. An ordinary may debruise an ordinary.

Debt. In English law, debts are classified as *specialty* debts and *simple* debts. The former are constituted by deed, or by a record or judgment of court, or by a Recognisance (q.v.). The latter are those arising without intervention of deed or of judgment. D. constituted by deed bears interest from its date. D. under judgment bears interest from date of judgment at 4 per cent.; it is effectual against land which a defendant may possess, and, if duly registered, it is effectual against a purchaser. The registration must be renewed every five years. Simple D. bears no interest. In Scotland, the main division of D. is into *heritable* and *moveable*. Regarding the former, see article BOND.

Moveable Debt is in Scotland *liquidated* (Scot. 'liquid'), *contingent*, or *future*. The first is D. constituted against the debtor by written obligation or by decree of a court; the second is D. depending on an event which may or may not happen (see CONTINGENT DEBTS); the third is when the liability is certain, but when the time for payment has not arrived.

Debt, National. The N. D. of England at the Revolution of 1688 was £664,263. It was chiefly in the form of terminable annuities, specially charged upon certain branches of the revenue. The system of borrowing on annuities for terms of years and lives was continued by Government until the magnitude of the debt rendered the method no longer practicable. At the Peace of Ryswick in 1697, the N. D. was found to be nearly £15,000,000, and the revenue was deficient £5,000,000. At this time, from the irregularity with which the interest on the floating debt was paid, Exchequer orders were at 40 per cent. discount. On the death of Queen Anne in 1714, the debt had increased to £36,175,460, bearing an annual charge for interest and annuities of £3,063,135. On 31st December, 1748, after the treaty of Aix-la-Chapelle, it was £75,812,132. During the short interval of peace which followed, Government was enabled, on 29th November, 1749, by the rise in the price of stocks, to reduce the interest on the 4 per cents. to 3 per cent. In 1751 various stocks were consolidated into one fund, and between 1748 and 1756 the N. D. was reduced by £1,237,107. This was the origin of the present consolidated 3 per cent. annuities, or *consols*. The Seven Years' War, beginning in 1756, added to the debt £58,141,024; and by the end of the American war in 1784, the total was £243,063,145. At the Peace of Amiens in 1802, it was £537,653,008; and at the Peace of Paris in 1815, it had reached the enormous total of £861,039,049. At the commencement of the Crimean War it had become reduced to £769,082,549, but during the war an addition of £39,026,173 was made to it. On 31st March, 1894, it was £669,104,024 (with an annual charge of £25,200,000), made up of Funded Debt £587,631,096, estimated capital of Terminable Annuities £57,076,898, and Unfunded Debt £21,446,300. On 16th September, 1895, a Parliamentary paper was issued, in which the N. D. (gross) was shown to have been reduced by £8,943,417 between 31st March, 1894, and 31st March, 1895. The enormous reduction had been brought about owing to the arrangements connected with Section 41 of the Finance Act, 1894, which specially provided for liquidating the debt incurred under the Imperial and Naval Defence Acts, and for that purpose, under the authority of the Sinking Fund Act, 1875, the N. D. commissioners held over until August, 1894, the greater part of the new Sinking Fund of 1893-94.

The difference between 'funded debt' and 'unfunded debt' is that the state does not undertake to pay the former. In place of repayment they give a perpetual or terminable annuity; nevertheless the name of the creditor is entered in the books of the Bank of England as holding so much Government stock. This stock is transferable by entry in the books of the Bank. The N. D. is, approximately, £17 per head of the population and the annual charge is about 12s. per head.

British Government stocks are as follow:—*Three per Cent. Consols.* (See above.) *Debt due to the Bank of England*, £11,015,100. (See BANKS, BANKING.) *New 3 per Cent. Annuities.* This stock originated in 1830 by the conversion of the new 4 per cents. which had been formed in 1822 from the navy 5 per cents. *New 5 per Cent. Annuities* originated at the same date and in the same way. *New 3½ per Cent. Annuities* were created in 1853, as were also *New 2½ per Cent. Annuities*, the *Irish Funds*, *Savings' Bank Annuities*, By the Act of 1864, £24,000,000 of 3 per cent. stock, standing in the names of the Commissioners for the reduction of the N. D. in the books of the Bank of England, was ordered to be cancelled, and in place of it was created a perpetual charge on the Consolidated Fund (q.v.). *Annuities of Terms of Years*, created under 59 Geo. III. c. 34. *Annuities Terminable in* 1885; these were created 16th April, 1855, and expired 5th April, 1885. *Red Sea Telegraph Company's Annuity* of £36,000 was created by 25 and 26 Vict. c. 39, and expires 4th August, 1908. *Life Annuities* under various Acts. See *Fenn on the Funds*, a new edition of which valuable work is issued every two years. In 1888 there was carried out an important conversion of the *New 3 per Cents.*, *Consolidated 3 per Cents.*, and *Reduced 3 per Cents.*; the new stock issued in their place to bear 2¾ per cent. interest till 1903, and thereafter 2½ per cent. On 5th December, 1893, was passed the N. D. Redemption Act, which provided for the redemption of the stock, created in 1853 and described in N. D. Act of 1870 as New £3 10s. per Cent. annuities (subject to redemption by Parliament at any time after 5th January, 1894). The stock amounted to about £225,000, and the money required for the redemption was authorised to be provided out of the New Sinking Fund.

Formerly Exchequer bills were the only form of unfunded debt. They were first used as currency to supply the want of metallic money during the great re-coinage of 1695. Another kind of unfunded debt, called *Exchequer bonds*, was introduced by Mr. Gladstone in his scheme for commuting some of the public stocks in 1853. The Exchequer bonds, to the value of £6,000,000, issued during the Russian war (1855-56), as well as those issued since, are of a different character; having been made absolutely payable at par, at fixed periods varying from three to six years. These have been properly treated as unfunded debt. Since the creation of the 3 per cent. consols, their lowest price has been in 1799, when they fell to £52 5s. 8d. In 1844, 1845, 1852, and 1853 they rose above par; the highest price, £102, having been in 1852.

For long the N. D. of the United Kingdom was the largest in the world. It is now exceeded by that of France, which on 1st January, 1893, was stated to be £1,224,467,405 (capitalised), or about £31 18s. per head of the population and with a charge of £1 6s. per head. The debt of the United States of America was (on 30th June, 1894) £184,546,600, rather more than half of which is at 4 per cent., while the remainder is at 2 and 5 per cent. The debt of Italy was £474,499,651 on 1st July, 1893, or £15 8s. 10d. per head of population, with a charge of 15s. 5d. per head. The debt of Austria and Hungary was estimated at £606,400,600 in 1893; while that of Spain on 1st January, 1893, stood at £285,455,804, the greater part of which was at 4 per cent. In September, 1893, the Ottoman debt stood at £164,555,958, which included £32,000,000 due as war indemnity to Russia; most of this is at 6-4 per cent. The debt of Russia is estimated at £523,240,809; that of Holland at £93,516,704; and that of the German Empire at £87,042,125.

Some regard the N. D. of England as a huge financial incubus, which ought to be got rid of at any cost of extra-taxation or reduction of expenditure; others, again, regard it as a national blessing, in so far as it is a safe means of investing trust funds. It would unquestionably have been better that the debt had never been incurred—that is, that state expenditure had always been fully met by revenue. But the debt represents the bygone fact of so much waste of human labour; and this fact can never be undone. In spite of the immensely greater debt, the country is immeasurably richer than it was two centuries ago; but it would have been so much richer still had it not spent so many hundred millions in fighting. Yet the one aim of a country ought not to be the accumulation of wealth. If our forefathers have bequeathed to us a huge debt, from them we inherit the British Empire, laws, and institutions, by whose means we have created a commerce and wealth never before known in the world.

The plan of paying the debt by a *Sinking Fund* (q.v.) is transparently fallacious. The expediency of paying it by extra taxation depends on the moral nature of the people. In so far as the extra taxation would be met by extra economy, there would be gain, but no further than this. See UNITED STATES.

Debtor and Cred'itor, Laws of. With the progress of civilisation the power which law gives to the C. over the D. diminishes. In the earlier stages of society, the view which the law takes of the relationship between a man and his family is that the latter is merely a part of the property of the former. Even in ancient Rome a father had power of life and death over his children. He could sell or resign them, instead of paying damages incurred through their fault. The acquisitions of a son were called Peculium (q.v.), the term applied to the portion of a slave. Hence it logically followed that the law which gave a C. power over the person of his D. gave him power over the D.'s family, the family being regarded as merely property. According to the law of Moses, a poor man might be sold to a rich one, and compelled to serve him as 'an hired servant' (Lev. xxv. 39).

With the progress of civilisation and commerce, these laws gradually relax, until in the final stage it is seen that a C. ought to have no direct power over the person of his D., and that this power ought to be vested in a judge. In commercial failures it is found that the fault is often with the creditors themselves quite as much as with their D. With regard to changes which have taken place in England in the L. of D. and C., see DEBTS, RECOVERY OF. See also STAPLE.

Debtors Abscon'ding. (See DEBTS, RECOVERY OF.) Absconding shareholders, or shareholders intending flight, may be arrested, or their effects seized, under the provisions of the Joint Stock Companies Act. Debtors in Scotland intending to abscond may be dealt with under a warrant of *Meditatio Fugæ* (q.v.).

Debtors, Impris'onment of, abolished in Scotland, except on failure to pay rates and taxes, to implement decree *ad factum præstandum*, and wilful refusal to payaliment.

Debts, Recov'ery of. The rule of law which allows only *taxed costs* to a successful litigant, leaving him to pay the difference between them and the law charges of his legal adviser, may be on the whole the best rule which can be adopted; but its operation often results in great hardship in the case of a person suing for a debt of moderate amount. He may gain his case *with costs* (Scot. law, *expenses*), and yet find the value of the subject of litigation greatly exceeded by his own share of the expense. And if his opponent who has lost is ruined by the result, he must pay even the costs which the law has awarded to him. In such questions the aim of the law should be simplicity and quickness of operation; because it is better that there should be a *chance* of some injustice being done in ascertaining on whose side the right is, than that injustice should *certainly* be done in making the party, on whose side the right is, pay more than the right is worth in order to make it effectual.

By 1 and 2 Vict. c. 110, the power to arrest in Mesne Process (q.v.) was abolished. The Act 7 and 8 Vict. c. 96, abolished the arrest on *final process*, and prohibited imprisonment upon any judgment obtained in any court where the debt recovered did not exceed £20, exclusive of costs.

These two Acts being found somewhat unfair in their operation towards certain classes of creditors, especially towards retail tradesmen, an improvement was attempted in the session following the passing of the last Act referred to. By 8 and 9 Vict. c. 127, it is provided that any creditor obtaining a judgment or order from any court of competent jurisdiction in England, in respect of a debt *not exceeding* £20, besides costs of suit, may obtain a summons against his debtor from any commissioner of bankruptcy or from any inferior court for the recovery of small debts having jurisdiction in the district in which the debtor resides. After procedure, if the court find for the plaintiff, it will order payment of the debt in instalments, or otherwise; and the court may, in case of fraud or contumacy, commit the debtor to prison. An Act passed in 1869 abolishes imprisonment for debt, except in certain cases, but it does not affect the power of the court to commit a debtor to prison as above noted; this power being not to imprison for the debt, but for fraud or contumacy; and the imprisonment is at the instance of the court not of the creditor. The Act of 1869 makes many other important provisions in the relationship of debtor and creditor. Any debt not exceeding £50 may be sued for in the county courts of England. If a plaintiff bring his action before a superior court for a debt not exceeding £20, or not exceeding £5 in an action of Tort (q.v.), he will have no costs awarded, unless by special order or certificate of the court. See COUNTY COURTS.

In Scotland, debts not exceeding £12 may be sued for in the sheriff's small-debt court. If a creditor or debtor appear by agent, it must either be by consent of parties, or by permission of the sheriff. No record of evidence is taken, and the whole procedure is rapid—we might say, often hasty and superficial. Doubtless it is better to have a question of £10 or £12 so disposed of—the expense of which, even to the loser, does not exceed a few shillings—than to have the value of the original question wholly merged by the first legal step in the question of expenses, as would surely be were the case entangled in a lawsuit before the superior courts. But might not there be a legal tribunal by which, in a small matter as well as in a great one, evidence could be exhaustively gone into and weighed with deliberation, without the intervention of a country agent, a town agent, and counsel—and without the enormous, and usually disproportionate, expense of so complex, and, as it seems to us, unnecessary machinery?

The Debts Recovery Act of 1867 has made many important alterations in the law of Scotland regarding R. of D. Debts between £12 and £50, which would prescribe if not sued for in three years (see PRESCRIPTION), may now be sued for before the sheriff's small-debt court. In actions of this class, agents are allowed to appear. If the debt does not exceed £25 there is an appeal from the sheriff-substitute to the sheriff; and if the debt exceed £25 an appeal may be made to the Court of Session. Where the debt does not exceed £12, there is no appeal from the judgment of the small-debt court.

Debts, Recovery of, Abroad.—It is a very common error that foreign tribunals take no cognisance of suits between persons who are not subjects of their country, and that a debtor may consequently reside abroad in defiance of his creditor. A debtor may be proceeded against in any country whose law allows it, and most Continental countries do so, and many others.

Débu't (Fr. *début*, 'the first throw at play'), a French word adopted into English, denoting the first appearance of an actor, public speaker, or any individual whose influence depends on personal presence. It is almost exclusively applied to appearance on the stage, the words *débutant* and *débutante*, for actor and actress making a D., having also been introduced into English.

Deca'dence (Fr., from Lat. *de* and *cadere*, 'to fall away'), a period in which the art or literature of a nation, after a brilliant maturity, begins to wane, is called a time of D. Thus Greek sculpture after the age of Pericles, Latin literature after the age of Augustus, and Italian painting from the 17th c. downwards, are said to belong to the Greek, Latin, and Italian decadences. In French literature, the years from 1770 to 1800, or, according to some, till the Romantic movement of 1830, are called the French D. A period of D. is generally marked in literature by an overstrained and over-coloured style, as in the late Latin poets, and in art by complicated refinements, as in the Byzantine school. Individual works belonging to a D. are not necessarily inferior to those of earlier times.

Dec'agon, a geometrical figure with ten sides and ten angles. A regular D. has all its sides and angles equal, and is inscribable in a circle. If r be the radius of the circle, the side s of the D. is $s = \frac{1}{2} r (\sqrt{5} - 1)$.

Decais'nea, a genus of plants of the natural order *Lardizabalaceæ*, named in honour of the French botanist Decaisne. There is only one species (*D. insignis*), found in the Himalayas at the height of from 6000 to 10,000 feet. Its fruit is sweet and wholesome, and eaten by the Lepchas and other Himalayan tribes.

Dec'alogue (Gr. 'the ten words') is the name given by the Greek fathers to the law of the two tables received by Moses from the hand of God on Mount Sinai. The commandments have been variously divided and distributed to the two tables. 1. In the catechisms of the Greek, Anglican, and all the Reformed Churches (except the Lutheran), following Origen, ver. 2 of Exod. xx. is made merely a preface; the first commandment is ver. 3; the second, 4-6; the third, 7; the fourth, 8-11; the fifth, 12; the sixth, 13; the seventh, 14; the eighth, 15; the ninth, 16; and the tenth, 17. 2. According to the Talmud and the modern Jews, Exod. xx. 2 is the first commandment; the second is 3-6, and the rest as above. 3. The Masoretic division, which is that followed in the Lutheran and Trent catechisms, makes vers. 3-6 the first commandment, and then divides the last into two; so that the ninth is, 'Thou shalt not covet thy neighbour's house' (otherwise 'wife,' which is first in Deut. v. 21); and the tenth, the rest. As to what belonged to each table, Philo gave five to each; the opinion in the Greek and Reformed Churches is that the one contained the first four, or our duty to God, and the other, the last six, or our duty to man; according to the Masoretic arrangement, the division being made at the same place, the tables contain three and seven respectively.

Decamps, Alexandre Gabriel, a French painter, born at Paris, 3rd March, 1803. He studied under Abel du Pujol, travelled in the East, was made a Chevalier of the Legion of Honour in 1839, and died at Fontainebleau, 22nd August, 1860. He painted landscapes, animals, and genre and historical subjects, and was remarkable for boldness, variety of style, loftiness of conception, and genuine humour.

Decandolle, Augustin Pyrame, an illustrious French botanist, born at Geneva, 4th February, 1778, was descended from an expatriated family of Protestant Provençals, to which the printer of the Caldorian Press belonged. He gave signs of poetical genius when young, but the teachings of De Saussure and Bonnet at Geneva inclined him to physical science. Coming to Paris in 1796, he was placed at the Jardin des Plantes, and devoted himself to the study of geographical botany and physiology. He enjoyed the friendship of Cuvier, Humboldt, Lamarck, Berthollet, and other distinguished *savans*. For Lamarck he edited the *Flore Française*, completed in 6 vols. in 1815. *The Histoire des Plantes Grasses* (1799—1803) was, however, his first important work. The popularity of his lectures on botany at the Collége de France, and an essay on the fertilisation of the Dunes on the Netherland coast, secured him an important Government mission (1806-12), viz., to report on the agriculture and botany of the territories on the Rhine and in Italy which had been added to France. In 1813 D. succeeded Broussonet in the chair of Botany at Montpellier, but was obliged, in 1817, to return to Geneva, where he taught natural history, and latterly became a member of the Representative Council and of the Helvetic Diet. He died 9th September, 1841. D. is the historical successor of Jussieu. Of wide scientific vision, he has left behind him, in his *Regni Vegetabilis Systema Naturale* (Par. 1818-21), a colossal attempt to describe all the varieties of plants, with their synonyms, and references for drawings and description of localities. His *Prodromus* of the same subject has been completed (1826-46) by his son **Alphonse** (born 28th October, 1806), to whom he bequeathed his herbarium of 70,000 specimens. See *Mémoires et Souvenirs* of the father by the son (1862). Alphonse, who has also written on the *Laws of Botanical Nomenclature* (1867), and on the *Geographical Distribution of Physical Groups in the Vegetable Kingdom* (1874), succeeded Agassiz as a member of the French Institute.

Decapita'tion. See CAPITAL PUNISHMENT.

Decap'oda (Gr. 'ten-footed'), the highest order of *Crustacea* (q.v.), represented by the crabs, lobsters, shrimps, &c. The D. are distinguished by the general development of the 'shell,' by the walking legs numbering five pairs, by the first and, sometimes, other pairs of legs being provided with *chelæ* or nipping-claws, and by the mouth appendages being numerous, and modified for mastication. The (1) *Anomurous* decapods are represented by the hermit or soldier crabs; and (2) *Brachyura* by the ordinary crabs; and (3) *Macrura* by the lobsters, shrimps, &c. See also CRAB and CRUSTACEA.

Decap'olis (Gr. 'the region of the ten cities'), a district of Palestine, lying chiefly E. of the Jordan, but including a small part of Galilee, was so named from containing ten cities, which are generally given as Damascus, Philadelphia, Rhaphana, Scythopolis, Gadara, Hippos, Dios, Pella, Gerasa, and Canatha. These cities probably held privileges from the Roman Senate, and seem to have been free from Jewish authority. D. was fully 200 miles long, with a breadth of 60.

Decazes', Élie, Duc, a French statesman, born at St. Martin-du-Laye, Gironde, 28th September, 1780. After holding various civil offices, he was made a cabinet-councillor by Napoleon in 1807; in 1814 became a captain in the National Guard, and fought at the siege of Paris; held office under Louis XVIII.; was made Comte in 1816, and in 1818 Minister of the Interior, in which capacity he gave great attention to commerce and manufactures. In 1819 he was made President of the Council, and shortly afterwards Duc D. After the Revolution of 1830 he devoted himself to the advancement of manufactures and art. He died 24th October, 1860. D. was sagacious, tolerant, and free from the intense party spirit of most French politicians.—His eldest son, **Louis Charles Élie Amanieu, Duc D.,** was born 19th May, 1819, served as French Minister and Envoy at the courts of Spain and Portugal, and was elected to the Conseil Général in 1867, and to the Assembly in 1871. In 1873 he was appointed Minister of Foreign Affairs, which post he held until 1877. Formerly a leading member of the Right Centre, he greatly contributed to the wise and moderate foreign policy of his country. He died 16th September, 1886.

Decazeville, a town in the department of Aveyron, France, not older than 1830. It owes its existence and prosperity to its ironworks, said to be the largest in France. Pop. of commune, 8871.

Decc'an (Sansk. *Dakschina*, 'the south'), the geographical name of the portion of the Indian Peninsula S. of the Vindhya Mountains, forming a plateau from 1400 to 3000 feet high between the E. and W. Ghâts. The principal rivers are the Kistna, Godavari, Pennar, and Kaveri (Cauvery). In 1338 the Mohammedans completed the subjugation of the D. In 1706 it fell to the Mahrattas, and later various

European powers established settlements on its outskirts. The D. is now the presidency of Madras, part of Bombay, and native states, such as Hyderabad, Mysore, Travancore, &c.

Deceb′alus, a title of honour among the Dacians, probably equivalent to the English *king*. The D. mentioned by Dion Cassius was, during the reigns of Domitian and Trajan, a dangerous enemy of Rome. Between 86 and 90 A.D. he defeated the Roman generals in Mœsia, and frightened Domitian into purchasing a dishonourable peace. Trajan, however, restored the honour of the Roman arms, and after suffering several disastrous defeats, D. committed suicide, A.D. 105.

Deceit′. See FRAUD.

Decem′ber (Lat. the 'tenth month' or 'period'), with us the last month of the year, but with the Romans, before the reformation of the calendar by Julius Cæsar, the tenth (hence its name), their year beginning with March.

Decem′viri, a title of various public functionaries at Rome. (1) The first and most celebrated, the *D. Legibus Scribendis*, according to the Roman legend which passes for history, entered on office, B.C. 451, for the purpose of framing a code of laws on the return of the three commissioners who had been sent to Greece to collect the laws of the different states, in accordance with the *Lex Terentilia*. Previous to their election, a dispute as to whether the 'Ten' should be patricians or plebeians, was settled in favour of the former. On their appointment all other magistrates were suspended, and the D. were intrusted, in addition to their legislative powers, with the sole government of the state, civil and military, during their year's tenure of office. They drew up a body of laws, which, after receiving the approval of the Senate and Comitia, were engraven on ten metal plates, and hung up in the comitium. At the year's end new D. were appointed, only one of the former ten, the notorious Appius Claudius, being re-elected. Their tyrannical conduct was in striking contrast to the moderation of their antecessors. Whereas before only the presiding magistrate had the fasces carried before him, each was attended now by twelve lictors, bearing not the fasces only, but also the axe, the emblem of sovereign authority. At the end of their term they refused to resign; but an unjust and shameful decision of Appius Claudius in the case of Virginia led to an insurrection of the Plebs and the downfall of the Decemvirs, B.C. 449. Two additional tables of laws were the result of their labours, which, with the ten above mentioned, formed the famous Twelve Tables—the basis of all the Roman law. (2) *D. Litibus* (or *Stlitibus*) *Judicandis*, magistrates who dealt with civil cases, were instituted about 292 B.C. Of the early history and jurisdiction of this court very little is known. Augustus gave them the presidency of the *Centumviri;* but they maintained a separate existence to the latest days of the Empire. (3) *D. Sacris Faciundis*, or *D. Sacrorum*, were members of an ecclesiastical college, and held office for life. Their chief duties were the care and inspection of the Sibylline books, and the celebration of the games of Apollo, and of the secular games. The number of these oracle-keepers was originally two (*Duumviri*), increased to ten, B.C. 369, of whom, after 367 B.C., five were patricians and five plebeians. Their number was increased by Sulla to fifteen. (4) *D. Agris Dividundis*, were occasionally appointed for dividing the public lands.

Decep′tion Island, one of the South Shetland group, Antarctic Ocean, so called from presenting to persons looking at it from a distance a striking resemblance to a ship. D. I., which is volcanic, and abounds in hot springs, is a mere ring of land, composed of alternate layers of ashes and ice, surrounding a deep circular lake, 5 miles in diameter, and communicating with the sea by an opening 600 feet wide.

Decid′uous Trees. See LEAF.

Decimæ Garbales, the tenth sheaf of the cut corn, which the rector of the parish had a right to take from the ground.

Decimæ Inclusæ, Teinds (q.v.), which have never been separated from the stock, and which are not demandable by the titular (see TEINDS) or minister.

Decimæ Restoriæ, parsonage tithes, due from all kinds of grain produced by culture.

Decimæ Vicariæ, vicarage tithes, due only, according to use and wont, from certain articles—wool, grass, fish, eggs, &c.

In England (by statute 6 and 7 Will. IV. c. 71, and other amendment acts) a charge was made on the land in place of the tithe or charge on the produce of the land formerly payable in kind to the Church as the tenth part of the annual increase arising from the profits of the land, or from the labour of the persons living thereon, or from their stock. The Tithe Act of 1891 makes this charge payable by the owner, not the tenant, of the land to the owner of the tithes.

Dec′imal Fraction is a fraction whose denominator is any power of ten. Thus $\frac{12345}{1000}$ is a D. F., and may be written $12\frac{345}{1000}$, or simply 12·345—in which latter case it is called a *decimal*, the *point* indicating where the digits stop. The decimal portion is a mere continuation of the integral portion. Thus, in the number above, we have tens and units before the point, and tenths, hundredths, thousandths, after the point. Accordingly, the ordinary rules for addition, subtraction, &c., apply as in the case of integers. A common fraction is reduced to a D. F. by multiplying numerator and denominator by such a number as will make the latter a power of ten; thus, $\frac{1}{2} = \frac{5}{10} = \cdot 5$; $\frac{3}{4} = \frac{3 \times 25}{4 \times 25} = \frac{75}{100} = \cdot 75$; $\frac{2}{3} = \frac{2 \times 333}{3 \times 333} = \frac{666}{999} = \dot{6}$. In this last case there is no power of ten divisible by three; but the farther we take the multiplier 3333 . . . we can make the denominator nearer a power of ten than by any given difference; and accordingly we say $\frac{2}{3} = \cdot\dot{6}$; where 6 means 6 repeated as often as necessary for the approximation.

Decimal fractions seem to have been introduced by Regiomontanus, in 1464; but the first treatise on the subject is the *Pratique d'Arithmétique* of Steirnus (1582). This mode of calculation is now almost universally practised in the civilised world.

Dec′imal Notation. See NOTATION.

Decimal Sys′tem of weights, measures, and coins, is a subject which has of recent years attracted great attention, both at home and abroad. On account of the facilities which it offers for calculation, it will no doubt in time supersede all the old and cumbrous methods; and when that is effected throughout Europe, it will be the first step towards establishing a universal and international system. The most perfect example of the D. S. is found in France, though the same principle obtains in the coinage of the United States, Belgium, Italy, Spain, Portugal, and other countries. The French unit measure of length is the *mètre* (= 39·3709 inches): the superficial unit is the *are* (100 sq. mètres); the solid measure, the *stère* (1 cubic mètre); the liquid or dry measure, the *litre* (1 cubic decimètre); and the unit of weight is the *gramme*, being the weight of a cubic centimètre of pure water at a temperature of zero centigrade. The *déca-*, *hecto-*, *kilo-*, *myria-gramme*, &c., represent respectively 10, 100, 1000, 10,000, &c., grammes; while *déci-*, *centi-*, *milli-gramme*, &c., are respectively 1, ·01, ·001 parts of a gramme. The same prefixes are similarly used with the other measures. The unit coin is the *franc ;* the *décime* and *centime* being respectively ·1 and ·01 of a franc. The former, however, is not now used—accounts being kept simply in francs and centimes.

Decima′tion (Lat. *decem*, 'ten'), a military punishment, by which every tenth man was selected by lot for death, when a large body of men had in concert committed some grave military offence.

Dec′imi, in music, a name sometimes used for the interval of a tenth, or octave and a third.

Deci′sion. The D. of a court is its pronounced judgment in a cause. In Scotland, the word is usually applied to the printed reports of cases decided in the Court of Session. In England the decisions of courts of law carry greater authority in determining the law than they do in Scotland; though in the latter country, two or more consecutive decisions of the Court of Session, not changed by the House of Lords, are held to determine the law—'an uniform tract of the judgments or *decisions* of the Court of Sessions is commonly considered as part of our (Scotland) customary law.'

De'cius, the name of a plebeian family famous in Roman legend through the heroic self-sacrifice of two of its members. **Publius D. Mus,** one of the consuls in the Latin war of 340 B.C., at a battle near Vesuvius, when his troops were wavering, sought death in the ranks of his enemies after solemnly devoting himself and them to the infernal gods. The sacrifice was accepted, and victory remained with the Romans. His son, also **Publius D. Mus,** imitated, with the same happy result, the paternal example on the battle-field of Sentinum, B.C. 295, and closed a brilliant career with a patriotic death. Among the later emperors one bore the name of D. His full name was **Cajus Messius Quintus Trajanus D.,** but he was a Pannonian by birth, and no relation of the old Roman family. Elected emperor by the soldiers of Mœsia in A.D. 249, he ruled vigorously for two years, but in 251 fell in battle against the Goths. His reign is chiefly memorable for a fierce persecution of the Christians.

Deck (Old Eng. *decan*, 'to cover'; comp. Ger. *decken*, allied to the Lat. *tegere*, and Gr. *stegein*), the planked floor or platform of a ship, laid on transverse beams and half beams, and longitudinal carlings supported on pillars, and intimately secured to the sides of the vessel. Besides providing accommodation and shelter, decks are of great structural value in binding together the sides of the ship, and in maintaining its proper form. They are slightly curved transversely to facilitate the free flow of water to the scupper holes. A large vessel is usually constructed with upper, main, lower, and orlop decks; the last named being lowest, and used for stowage of cables, &c.; and over the upper deck, at opposite ends of the ship, are the forecastle and quarter-deck.

Deck'er, Sir Matthew, was a Dutchman naturalised in London, where he began business in 1702, received a baronetcy for his commercial eminence in 1716, and entered Parliament in 1719. He died 18th March, 1749, having served only four years in Parliament. In 1739 D. wrote an essay on the causes of the decline of foreign trade, consequently of the value of the lands of Britain, and of the means to restore both. In 1743 appeared the pamphlet, which reached a seventh edition in 1756, containing what is known as D.'s scheme. It is best described by the title:—*Serious Considerations on the several High Duties which the Nation in General* (*as well as Trade in Particular*) *Labours under; with a Proposal for Preventing the 'Running' of Goods, Discharging the Trades from any 'Search,' Raising all the Public Supplies by one Single Tax.* This was a house-tax, which D. calculated would bring in £6,000,000 per annum.

Declara'tion, in English law, was the pleading in which a plaintiff in an action at common law stated his case against the defendant. A. D. is no longer made use of in actions; a *statement of claim* has taken its place.

Declaration, Dying. In England and in Scotland the general rule of law is that secondary or hearsay evidence is inadmissible in a trial; but testimony given by any one *in the belief of impending death*, who does not live to be examined at the trial, is an exception to the rule. The person must believe he is dying although not expecting *immediate* death. His evidence may be proved by parole evidence; but will probably have greater weight if written and duly tested. In case of murder the D. D. of the murdered man weighs heavily. Evidence of this kind is admissible in favour of the accused as well as against him.

Declaration in Criminal Procedure. In Scotland the statement, if any, made by a prisoner, on being apprehended and brought before a magistrate, is called his declaration. It is the duty of the magistrate to inform the prisoner that it is optional for him to make a declaration or not, but that, if he does, it may be used against him at the trial. If the prisoner chooses to make a statement, and be in a fit state of mind to do so, and does not appear to be under the influence of promises or threats, his narrative and answers on examination are written, and read over to him, who, along with the magistrate, must sign each page of the document. The accused may have his agent present at the time of making his declaration, and has a right to postponement, to give time for agent to be communicated with and to appear. If the prisoner cannot write, the magistrate must sign on his behalf. The examination is commonly conducted by the Procurator-Fiscal, but any magistrate may take it (q.v.). The declaration not being on oath, has no force against any one but the prisoner.

Declaration in Place of Oath. Quakers, Moravians, and Separatists objecting on religious grounds to take an oath were, in civil and criminal cases, allowed by statute to substitute a declaration or *Affirmation* (q.v.). Several statutes were enacted, from the reign of Geo. IV. down to 1871, in reference to the declaration in place of oath. Finally, in 1888, by statute 51 and 52 Vic. c. 46, every person is now allowed to *affirm*, when he objects to be sworn, for all purposes and in all places where an oath is required by law.

Declaration of Title. By Act 25 and 26 Vict. c. 67, persons having an interest in land (not of copyhold or customary tenure) in England may, under certain circumstances, obtain a judicial declaration of their title, so as to enable them to give an indefeasible title to a purchaser for a valuable consideration. The declaration is asked for by petition to the Chancery Division of the High Court of Justice. Appeal and petition against declaration are allowed. Similar procedure is competent under Scotch law by what is called Declarator (q.v.).

Declar'ator, a form of action before the Court of Session in Scotland, by which judicial recognition is sought of some right which the pursuer (plaintiff) supposes himself to possess. Where the declaratory conclusions regard property, they are generally, though not necessarily, followed by petitory or possessory ones. In an action of D., the pursuer must show the consequent right which will accrue to him on the court making the declaration asked for. The form of action is a common one in questions of constitution of marriage. (See MARRIAGE.) Declaratory action is a valuable and important form in the law of Scotland. See DECLARATION OF TITLE.

Declen'sion (Lat. *de*, 'down,' and *clino*, Gr. *klino*, 'I bend'; literally the *bending down* of a word's terminal letters), is the system of the changes of form or cases by which nouns, pronouns, and adjectives express their various relations to other words. These cases are distinguished by changes in the word to be declined, or by using separate words (prepositions); and from one point of view there might be as many cases as prepositions in a language. In the Aryan tongue the case-endings have been formed by the fusion of separate words, and their origin is almost unknown. Languages tend to simplify D. In the oldest Aryan (q.v.) tongues we find a rich system of declensional forms, which gradually disappears from more modern tongues. No fewer than eight cases occur: the *Ablative*, denoting the relation *from*, and ending in *t* or *d*—*e.g.*, old Latin *ecquod*, from a horse; the *Locative*, denoting the relation *in*, and ending in *i*; the *Instrumental*, denoting the relation *with* or *by*, ending in *a*; the *Dative*, the relation of *for* before a noun, ending in *ai*; the *Genitive*, denoting possession, ending in *asya* or *as*; the *Accusative*, ending in *m*, and denoting that the word is the object of the action of a verb, or is governed by a pronoun with the sense of motion towards; and the *Vocative* or interjectional case, identical in form with the Nominative, which originally ended in *s*. In Latin we find the Locative and Instrumental fused with the Dative and Ablative. In modern Romanic languages the declensional endings have almost vanished. Old English had Nominative, Genitive, Dative, Accusative, Vocative, and Instrumental cases (see

ENGLISH LANGUAGE), and several plural endings, *as*, *an*, *u*, *a*, *o*. Now there are only three cases—*Nominative* (Lat. *nomino*, ‘I name’), the form in which a noun is used when it is the subject of a sentence; the *Possessive* (Lat. *possideo*, ‘I possess’), the form denoting possession; and the *Objective* (Lat. *objicio*, ‘I throw towards’), used when a noun is the object of the action of a verb, or comes after a preposition. The Possessive expresses a relation by the suffix *’s*, a contraction from the Old English genitival ending *es*. The difference between Nominative and Objective is determined solely by the sense and position of the words. See Morris's *Historical Outlines of English Accidence* (1873), Whitney's *Lectures on Language*, and Latham's *English Language*, (Lond., 1865).

Declina′tion, in astronomy, is the angular distance of a heavenly body N. or S. of the celestial equator, and is measured along the arc of a great circle passing through the body and the poles. It corresponds to *latitude* in geography.

Declination of the Magnet′ic Nee′dle is the angle of deviation from the true astronomical end of a magnet, suspended so as to have free motion in a horizontal plane. This deviation is, of course, due to the change in position of the magnetic pole, and is undergoing a continual alteration for each locality. From observations made at Paris since the year 1580, the D. has altered from 11° 30′ E. to 20° 20′ W. in 1852, a total variation of 31° 50′. In 1663 the needle pointed due N., the D. being then zero. The magnetic meridians are so drawn that the tangent to the curve at any point represents the direction in which the D. needle points; and these meridians all converge towards the spot where Sir J. C. Ross found the angle of inclination to be 89° 59′, or nearly perpendicular. (See DIPPING-NEEDLE.) The D.-needle for measuring this variation is a highly-magnetised needle delicately suspended in a closed box, which is surmounted by a telescope for ascertaining the true astronomical N.

Declin′ature, a term of Scotch law denoting objection to the jurisdiction of a judge. This may be on the ground of his being interested in the suit, or of the case being beyond his province, or of his bearing enmity to one of the parties, or of his being too nearly related to one of them.

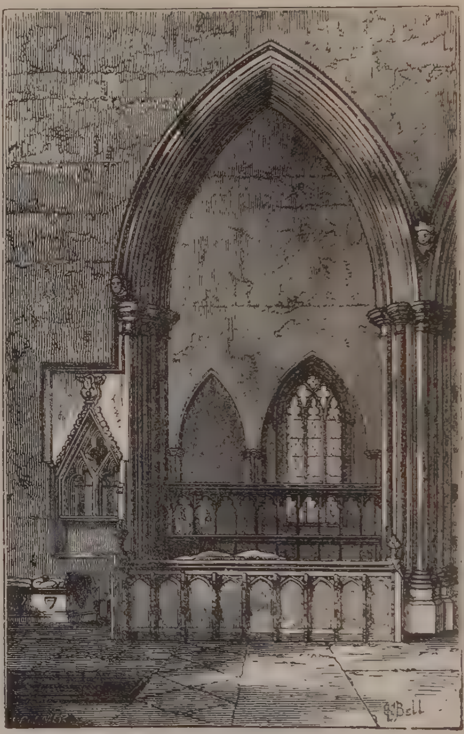
Decoc′tion (Lat. ‘a boiling down’), a medicinal preparation obtained by boiling, for a longer or shorter period, some vegetable substance in water. See INFUSION.

Decomposi′tion, in chemistry, signifies the breaking up of a compound into its elements, or into substances of a less complex nature than itself. Thus the passage of the electric current through water (slightly acidulated to make it conduct) causes its D. into the elements of which it is composed, viz., oxygen and hydrogen. Again, the action of a high temperature on chalk (carbonate of lime) is to cause its D. into lime and carbonic acid.

Double Decomposition is an expression used by chemists to signify the change which occurs when two compound substances act upon one another in such a manner that the groups of which each may be considered as composed are mutually interchanged. Thus, when solutions of nitrate of baryta and sulphate of potash are mixed, a white precipitate of sulphate of baryta is produced, and the solution (which may be filtered from this precipitate) contains nitrate of potash. The nitric acid, before combined with baryta, has now become transferred to the potash, before combined with sulphuric acid, whereas the sulphuric acid has left the potash, and has combined with the baryta. Both of the original compounds have been decomposed, and in their place two new ones have been produced. Such changes are of frequent occurrence.

Decomposition of Forces. See COMPOSITION, &c.

Dec′orated Style, also called the Middle, Pointed, or Edwardian style of Gothic architecture (Fr. *ogival secondaire*), arose naturally out of the Early English, First Pointed, or Plantagenet style, and as naturally led to the Perpendicular, Third Pointed, or Tudor style. These three styles of Gothic may be said—without meaning to affix precise dates—to have flourished in England during the 13th, the 14th, and the 15th century respectively. Decorated English, the architecture of the 14th c., flourished, according to Rickman, from 1307 to 1377, and according to Fergusson, from 1272 to 1377. During this period, and for some time previously, all the artistic genius of the country seems to have found expression in the noble buildings which arose everywhere. The amount of mental activity and enthusiasm striving after perfect architectural form during this time resulted in the erection, during the D., or Middle, period of Gothic, of the most perfect mediæval structures in England. From the D. period, Gothic architecture declined, and gave way, eventually, to the classical Renaissance. The arrangement of buildings remained the same in the period under consideration as in the First Pointed or Early English period, distinguished by the greater variety, freedom, and richness of the ornamentation. The arches of the windows were still pointed as in the First Pointed style, but the head of the arch was decorated with richer and much more intricate and delicate ornamentation. The vaulting was also richer and more intricate. This richness was obtained by the introduction of intermediate ribs, which, crossing each other, produced stars and other figures at the points of intersection. In the earlier part of this period the window tracery was geometrical, consisting of circles, triangles, &c.; in the latter, flowing curves were introduced into the window tracery. In D. Gothic, mullions were employed instead of pillars and shafts for windows, and in the carving of capitals a greater freedom of execution and wealth of lavish ornament are observable. New mouldings and new applications of carvings and foliage were introduced; decorations in colour, painted glass, and mural paintings were carried to an astonishing degree of perfection. This marvellous development of architecture in England took place by the exercise of



Decorated Arch (Gothic), Dorchester, Oxfordshire.

native genius alone, and was in no sense due to imported art or extraneous aid of any kind. In some instances, the traditions of French arrangements were adhered to, as at Westminster Abbey; 'but even there,' says Fergusson, 'the design is carried on in so English a manner, with details so purely English, as to make us feel even more strongly how essentially native the style had become.' Lincoln Cathedral, the W. front of York Minster, parts of Ely, Lichfield, Worcester, Winchester, Norwich, and Canterbury Cathedrals, and Hexham, Howden, Dorchester, Adderbury, Stanton-Harcourt, and Bloxam Churches, may be mentioned as characteristic examples of this style. See Fergusson's *History of Architecture in all Countries* (Lond. 1874).

Decou'plé, or **Uncoup'led,** in heraldry, means parted or severed; applying, for example, to the ends of a Chevron (q.v.).

Decree', in England, was the decision of a court of equity, and was the same as judgment at common law; but now, by the Judicature Acts of 1873 and 1875, *judgment* is used in all the divisional courts. In Scotland, D. or *decreet* is the final judgment of a court. Decrees are either *condemnator* or *absolvitor*; the former is the term when decision is in favour of the pursuer, the latter when in favour of the defender.

Decree in Absence, in Scotland, is equivalent to nonsuit against a plaintiff, or 'judgment by default' against a defendant in England. Where a D. in A., in the Court of Session, is sought to be reduced, the party seeking reduction must pay the expenses, £2 2s., within ten days; and if he obtains the reduction, he is not entitled to repayment of these previous expenses. The same rules, modified to some extent, are in force in the sheriff's court.

Decrees of God, in the language of theology, are 'his eternal purpose, whereby he hath foreordained whatsoever comes to pass.' The doctrine (as *dogma*) originated with Augustine, and rests on the two postulates of Original Sin inherited from Adam in consequence of the fall, and the irresponsible Sovereignty of God. From these premises Augustine argued that an absolute election of certain individuals to eternal life, though resulting purely from the divine will, is not unjust. For since, both by original and actual sin, all are transgressors of God's law, it were no injustice if all had been left to perish; therefore there is no injustice in the free election of some to eternal life. The complement of which is, that since the number of the elect can neither be increased nor diminished, all the rest of mankind are personally reprobated to eternal damnation. But, even among those who are agreed as to the nature of the D. of G., there have been two views as to the order in which they took effect: the one called the Supra-lapsarian, the other the Sub- or Infra-lapsarian. According to the first, Election and Reprobation preceded the purpose to create the world and permit the fall, and therefore God created some men to be saved and some to be lost. According to the second, God decreed—1st, the creation of the world; 2nd, the fall; 3rd, the election of some to eternal life; 4th, the redemption of the elect; 5th, to leave the residue of mankind to suffer the just punishment of their sins. See Hodge's *Systematic Theology*.

Decrepita'tion (Lat. *de* and *crepitare*, 'to crackle'), is defined in Johnson's Dictionary as 'the crackling noise which salt makes over the fire.' This crackling sound is often observed when other salts are heated. It is caused by the sudden conversion of small quantities of water contained within the crystals into steam, which bursts them in pieces.

Decrescen'do (Ital. 'diminishing'), a mark of expression used in music to indicate a gradual decrease of loudness unaccompanied by any alteration in speed.

Decre'tals, The, form the second and smaller part of the Corpus Juris Canonici of the Church of Rome. It was added in 1230 under Pope Gregory IX., and comprised all the additions to the canon law, in the shape of judicial replies by ecclesiastical authorities to cases submitted to them, which had been made since the publication of the *Decretum*, or first part, in 1150. See Blunt's *Dict. of Doctr. and Hist. Theology*.

Decretum et Decretalia. The body of the canon law consists, first, of the *Decretum*, which is a collection of the opinions of the fathers, popes, and Church councils made by a Benedictine monk towards the close of the 12th c., in imitation of the Roman Pandects; and secondly, of the *Decretalia*, which were collected by Pope Gregory IX. nearly a century afterwards from the decretal rescripts or epistles of the popes. See CANON LAW.

Decussa'tion, a term used in anatomy to denote the crossing of fibres from one side to the other. Thus we have the D. of the fibres of the optic nerves, and the D. of the motor fibres of the Spinal Cord (q.v.) in the *Medulla oblongata* (q.v.).

Ded'imus Potesta'tem ('we have given power') is a writ of Chancery authorising commissioners to take an examination. When a justice intends to act under a commission of the peace, he sues out a writ of D. P. from the clerk of the crown in Chancery, empowering persons named in the writ to administer the oaths previously required. Attorneys in any action or suit were not permitted to appear without D. P., but now either by the plaintiff or by the defendant an attorney may be appointed without the writ of D. P.

Deduc'tion is a species of reasoning, of which the most important examples are to be found in mathematics and general physics. D. starts from a known truth, law, or proposition, and passes to a previously unknown, *i.e.*, previously unexplained, truth. The premise in D. may be in the shape of a universal proposition: its generality, of course, varies with the more or less abstract nature of the subject-matter. The conclusion may be in the shape of a particular proposition, but may also be a principle of wide application; sometimes of precisely the same width as the premise. D. is generally opposed to induction, or the inference of a general conclusion previously unknown from a comparison and sifting of particular instances. Practically the modes differ, and are, indeed, opposite: but substantially, and in the end, the mental process is the same; it is the identification of similars under the variety of conditions. The assumption which underlies D. as well as induction, and which renders their conclusions true in fact as well as formal in logic, is that from identical conditions, positive and negative, the same result invariably follows. Hence the rules of the syllogism which have been contrived to test the validity of inferences, and which by Hamilton, Ueberweg, and others, are applied to induction as well as D., must not be confounded with the act of inference itself. By the use of symbols sufficiently abstract and significant the principal forms of inference may be adequately represented (as by Jevons) in the equation or substitution of similars by a logical engine (exhibited at the Royal Society), or (as by Boole) by means of a special mathematical formula. The type of D., however, will always be: All A is B; C is A, ∴ C is B. But the combination of two general propositions, where their joint result admits of being calculated, leads to still more important results. In such inexact sciences as history, all that D. can accomplish is to explain and make rational the previous empirical generalisations or inductions.

Dee (probably connected with the Cymric *dyfi*, 'smooth'), the name of several rivers in the island of Britain, of which the most notable are—1. The D. in England, which, rising in Merionethshire, traverses parts of Denbigh, Salop, Flint, and Cheshire. From Chester, where it is 100 yards broad, it is conveyed by an artificial tidal canal, 9 miles long, and navigable for ships of large burden, into the noble estuary which connects it with the Irish Sea. It has a course of 80 miles. Its waters were deemed sacred by the ancient Britons. Drayton, in his *Polyolbion*, calls it an 'ominous flood'; and Milton, who refers to it (in *Lycidas*) under the name of *Deva*, speaks of its '*wisard* stream.'—2. The Aberdeenshire D., which has its sources in five wells near the summit of Braeriach, and after a course of 96 miles falls into the German

Ocean at Aberdeen. About 6 miles above Castleton of Braemar it rushes through a narrow cleft called the Linn of D. Twelve miles of its course is through Kincardineshire, after which it retouches Aberdeenshire, and thenceforward forms the boundary between the counties. Balmoral Castle is on the D.—3. The Kirkcudbrightshire D., which rises in the N. of the county, pursues a south-easterly course of about 4 miles, and then unites with the Ken. After a further lake-like course of 10 miles, it falls into the sea at Kirkcudbright. It is navigable for 7 miles from its mouth.

Dee, John, a celebrated mathematician and astrologer, was born at London, 13th July, 1527, studied at Cambridge and Louvain, at the latter of which places he took the degree of Doctor of Civil Law. He returned to England, obtained Church preferment, and a pension under Edward VI., nearly lost his life in the reign of Mary, and acted as Queen Elizabeth's 'intelligencer' or political agent. Meanwhile he had gained the reputation of a sorcerer, and in 1574 his country residence of Mortlake was 'wrecked' by a mob, himself and his family escaping with difficulty. How far D. claimed to be an astrologer is doubtful, but it is certain that he was an alchemist, and along with a man named Kelly visited various Continental courts pretending to raise spirits. Returning once again to England, he became Warden of Manchester College, and held the office for nine years. D. died, December, 1608, in great poverty, leaving behind him many works, chiefly of a scientific character, which in manuscript are embedded in the Cottonian and other collections. In 1842 D.'s private diary was published by the Cambridge Society. See *Athenæ Cantabrigienses.*

Deed, in law, is a formal written instrument, executed and authenticated according to certain technical forms (see COMMON FORMS), setting forth the terms of an agreement. Every D. requires a party or parties capable of contracting obligation, and subject to no legal disqualification, actual or presumed. See CONSENT, IDIOT, PUPIL, MINOR, MARRIAGE; DEATHBED, LAW OF; BANKRUPT, CONJUNCT, CONFIDENT, FRAUD. A D. must be founded upon a valuable consideration (see CONSIDERATION), not on fraud or collusion to deceive purchasers or creditors. The last requisite to a D. is the attestation or execution of it in presence of witnesses, though this is in most cases only required for preservation of evidence, the attestation not being an essential part of the D. For manner of execution in England, see SIGNING, SEALING, and DELIVERY. For Scotland, see TESTING-CLAUSE, WITNESS, REGISTRATION OF DEEDS AND WRITS, HOLOGRAPH.

It is not essential to a D. that it should be dated, but it is necessary that the wording of the D. should be intelligible and clear without punctuation, &c., and legally sufficient. Where no date is inserted, the time will be reckoned from the delivery. See CHARTER, WILL, DISPOSITION, INDENTURE, DELIVERY OF A DEED.

Deed Poll, in the law of England, is a deed made and executed by one party. The etymological derivation of the term is that a D. P. is *close cut* or shaved, while an Indenture (q.v.) is indented at the top.

Deem'ster, Dempster, or **Doomster** (orig. *Demer* or *Demere*, 'a judge,' from *deman*, 'to judge,' mod. 'deem'-ster (orig. *stre*), being a feminine termination), the name given in Scotland to the officer who formerly pronounced the doom (Old Eng. *dom*) or sentence of death on condemned prisoners in the High Court of Justiciary. His office of D., to which was superadded that of public executioner, no longer exists. In the Isle of Man and in Jersey the word retains its primary meaning, for there the 'deemsters' are *judges*, chosen from among the parties themselves, and they decide all contested cases in those places without process or in any charge to the parties. *The Dempster* is the chief judge of a Tinwald Court in the Isle of Man.

Deer (Old Eng. *deor*, any wild animal or beast; comp. Ger. *thier*, Lat. *fera*, Gr. *thēr*), a family of *Ungulata*, or hoofed quadrupeds, belonging to the Ruminant (q.v.) division of that group. The D. are *Artiodactyle* ungulata, that is, possess an even number of toes. The horns or antlers of the D. are, firstly, of solid nature; and, secondly, are deciduous, or shed annually. This first character distinguishes them from the Antelopes (q.v.), which belong to the family *Cavicornia* or 'hollow-horned' ruminants, and which are not in any sense to be confused with the *Cervidæ* or D. The antlers are more or less branched; the number and complexity of the branches increasing as the animal advances in years. They are shed and reproduced at the breeding season, and are borne on the frontal bone. They are reproduced by a process resembling that of the production of new bone in man. A sensitive, hairy, and vascular skin, named the 'velvet,' at first covers the antlers, but as growth proceeds is worn off. The horns of the *Cervidæ* are borne, with the exception of the reindeers, by the males alone. The other characters of this group comprise the presence of a *tear-pit*, *larmier*, or *lachrymal sinus*, a gland of sebaceous nature, situated beneath each eye. This structure secretes a waxy substance, the function of which is undetermined, although from its strong odour it has been thought to be associated with the sexual instincts of these animals. The teeth generally number thirty-two, and, as in all ruminants, no upper incisors exist. The lower incisors number six, the lower canines two, the præmolars and molars six in each jaw. In some D. (*e.g.*, Muntjak), upper canines exist. D. are found all over the world, save in Australia and S. Africa. The antelopes, indeed, take the place of the D. in the latter continent. The more important species of D. will be described in special articles (*e.g.*, CARJACOU, REINDEER, STAG, ELK, &c.). The American D. is a very graceful and useful animal. Its colour in summer is tawny, in autumn lead-hued, in winter dark brown. The length of body averages about $5\frac{1}{3}$ feet and the height from the ear downwards is $5\frac{1}{2}$ feet. The flesh is very good eating. Good bow-strings are made of the sinews. All sorts of clothing are made from the hide, and the horns are fashioned into handles for cutlery. The Musk D. (q.v.), (*Moschidæ*), it may here be noted, form of themselves a distinct family. They are distinguished from the *Cervidæ* chiefly by the presence of canine teeth in both jaws, and by the absence of horns in both sexes. The canines of the males form tusks, but those of the females are of small size.

American Deer.

Deer, or **Deir, Old** (Gael. *dér*, now *deur*, 'a tear,' from Drostan's tears at parting with Columba; or more probably *dair*, 'an oak'), a parish of Buchan, Aberdeenshire. St. Columba and St. Drostan planted a church here about 580. Two miles W. of the parish church stood a Cistercian abbey, founded by William Cumyn, Earl of Buchan, about 1219. The land, now largely peat-moss, was once covered with oaks. For local culture, a Club of D. was formed in 1868. See Peter's *Peat-Mosses of Buchan.*

Deir, Book of. After the Reformation, some MSS. of the Abbey of Deir found their way to the library of Cambridge

University. H. Bradshaw, of that library, discovered in 1860 among them the B. of D., containing the Gospel of John, with parts of the other Gospels, in Latin, in the writing of the 9th c.; also Visitation of the Sick, with a Celtic rubric of a later date. In writing of the 12th c. are various Celtic notes, relating that Columcille and Drostan came from Hi to Aberdour, and received a grant of Deir. This rare and authentic Gaelic memorial sheds much light upon that period. See Stuart's *B. of D.* (Spalding Club, Edinb.).

Deerhound, or **Staghound,** a variety of dog closely allied to the Bloodhound (q.v.), and believed to result from the interbreeding of the latter with the greyhound. The D. is a large dog, with hair of moderate length, and generally of light-brown or tawny colour. It possesses great speed, strength, and powers of endurance. Its scent is also powerful, and it is courageous enough to often master an infuriated stag at bay. When stag-chasing was in vogue, this breed of dogs was much cultivated, but latterly it has been much neglected. The D. used in Deerstalking (q.v.) is either the staghound proper, or a breed in which this latter variety is represented.

Deer-Mouse, or **Jumping-Mouse,** a genus of *Rodentia* found in America, recognised by the great relative length of the hind-limbs, and by the want of hairs on the tail. They also differ from the ordinary mice in some insignificant details in their dentition. The best-known species—the Canadian J. M. and that of Labrador—hybernate in winter.

Deerstalking, the art of tracking deer for the purpose of shooting them. The hunter is obliged to resort to a series of manœuvres on account of the delicate sense of smell and cautious instincts of the game. Typical D. is only practised in the Scottish Highlands. A perfect knowledge of the entire 'forest' or deer-ground is the first essential in the sportsman or his guide, since advantage may sometimes have to be taken of the most apparently trifling feature which the ground may present. The dogs or deerhounds employed must be trained to perfect silence and obedience. The deerstalker is greatly at the mercy of the wind and weather. The fine scent of deer necessitates the hunter's advance up or against the wind; whilst concealment, through wearing a dress of much the same colour as the ground, and by cautiously moving about under shelter, must be attended to. Advance from *higher* to *lower* ground upon the game is generally preferred, as the deer are apt to look to the low ground as the source of danger; and in valley and low-ground stalking, frequently advance has to be made in the prone position. The deerstalker may at length arrive within a hundred yards of the quarry, and selecting the finest animal of the herd, aims for the shoulder, or slightly behind this point. When the deer is not mortally wounded, the hounds are slipped, and chase is begun. The attendant 'gillies' disembowel the dead deer; this process, termed *gralloching* in hunting parlance, being supposed to keep the flesh from becoming tainted. 'Driving' the deer towards certain points is employed when a large party of shooters are present, but this latter procedure has none of the finesse of true 'stalking.'

Deer-Stealing. This offence, if committed in the enclosed portion of any forest, chase, or purlieu, or in any enclosed land where deer are usually kept, is by statute felony, punishable by two years' imprisonment with hard labour, &c. If the deer be in unenclosed ground, the punishment for the first offence is a fine not exceeding £50; furthermore, a second offence is felony, and the penalty imprisonment for any term not exceeding two years, &c. Suspected persons found in possession of venison or deer-snares, and not accounting for such possession satisfactorily, are liable to a fine of £20, or, if they cannot be convicted, the person from whose hands the venison or snares originally came is liable to the same fine, if he cannot account for his possession satisfactorily. In Scotland, shooting deer in a park without permission is regarded as theft; if the deer is outside the park, the offence is punishable by fine. A proprietor is not entitled to kill deer trespassing on his property, but he may drive them off.

De Facto is, in law, a thing actually done or existing. A king *de facto* is one in possession of sovereignty. A king *de jure* is one who is considered to have a right to a crown, but is not in possession.

Defama′tion. See Libel.

Default′ is an English law-term usually held as expressing the fact of non-appearance in court on the day assigned, though the term is applicable to any omission. If a plaintiff makes D. in appearance, he will be nonsuited. D. on the part of a defendant ensues in 'judgment by default.' In either of these cases, the party may be reponed on payment of expenses within the time limited by the rules of the courts.

Defeas′ance, Deed of, in English law, is a deed which counteracts the operation of another deed. A provision in a deed which modifies the main provision is called a *condition*; when the modification is by a separate deed it is called a *defeasance*, which may be held fraudulent, but is not necessarily so. The Scotch deed, which was called absolute disposition with a back bond, effected a conveyance of land almost identical with D. of D. in England.

Defen′ces, in Scotch law, is the general name given to the pleas offered for the defender for cutting away the grounds of an action. Such pleas are generally all stated in the first paper put into process for the defender; and in the judicial procedure in ordinary actions that paper is called the D.

Defen′dant. In English law, he who begins an action is termed the *plaintiff*; the person against whom it is brought is termed the *defendant*. A person indicted for a misdemeanour is also called a D. In Scotch law, the name used is *defender*.

Defen′der of the Faith, a title conferred on Henry VIII. by Pope Leo X. in 1521 for the vigour of his orthodoxy. Though recalled on the King's espousing the cause of the Reformation, it has been confirmed by statute and used by English sovereigns ever since.

Defila′ding, in fortification, is divided into horizontal and vertical. The object of the first is to direct the faces of a work so that the enemy cannot enfilade the lines or take them in reverse; and of the last, so to arrange the height of the rampart that the enemy cannot see into it, and that the interior may be safe from direct fire.

Defile′ (Lat. *filum*, 'a thread'), in military language, any passage so narrow that troops can traverse it only in *file*, or with a small number abreast.

Defini′tion (Gr. *horismos*) is the complete and orderly statement of the contents of a notion. It must at least contain the superordinate or genus notion, and the specific difference which makes the species distinct. D. is so used as a powerful weapon of dialectic by Plato in the *Gorgias*, where he defines rhetoric, and in the *Republic*, where he defines the virtues. The Greek terms used in the *Theætetus* for genus and species are *koinon* and *diaphora*. Aristotle calls D. the exact knowledge (*gnōrismos*) of a substance. 'Specific difference' is a translation by Boethius from Aristotle's phrase *diaphora eidopois*. The rule is, that D. should mention the proximate genus, but this is not always followed—*e.g.*, a circle is never defined as a conic section, but as a plane figure. The connection in which a D. is given will often suggest that a remoter genus and a larger specific difference should be used. Opposite views of D. are to be found in Hegel, who merges D. in the dialectical genesis of the notion, and Mill, who maintains that D. is merely of the meaning of names, and not of things. All names, even those denoting a single abstract quality, which have a meaning, may therefore be defined, if not from their content or connotation, then from their causes. Mill, therefore, does not recognise the ordinary division of real and nominal definitions. The meanings of substantial and genetic, essential and attributive D. will be found in works on formal logic. D. obviously merges into exposition, description, and explanation, and different definitions of the same notion are possible where a reciprocal dependence of essential attributes exists; as in the various definitions of a circle by the curve of the straight line which produces it, by the equidistance of points in the circumference, and by the section parallel to the base of the right cone. The great faults of D. are too great width or narrowness, redundancy, tautology, figurative expression, or mere negations, or reference to subordinate notions. The circle or *dialēllon* occurs where A is defined by B, and then B by A—*e.g.*, 'A feeling is pleasant when it is desired because of itself.' Plato's D. of the idea of good as the sun in the kingdom of ideas is a splendid specimen of figurative D.

Deflec'tion, a name applied generally to mean a change of direction of motion. In optics it is synonymous with Diffraction (q.v.).

Deflux'ion. See CATARRH.

De Foe, Daniel, an English classic, was born in London in 1661. He was intended for the Dissenting ministry, but, after leaving Newington Green School, became an agent in the hosiery trade. He began writing pamphlets at the age of nineteen, joined Monmouth's rising in 1685, traded to Spain for wool, became bankrupt in 1692, started a pantile manufactory, and in 1695 was made accountant to the commissioners of glass-duties, an office which he held until 1699. In 1701 his *True Born Englishman,* a satire in favour of William III., won him that king's good-will, but in 1703, the irony of his *Short Way with the Dissenters* being misunderstood, he was imprisoned until 1704, when he was liberated through the influence of Harley, and taken into Government service. In 1706 he was sent to Edinburgh as a secret agent to promote the Union—a mission which he skilfully executed. On the accession of George I., D. did not, as was once supposed, retire from his connection with Government, but was employed to write under Jacobite colours, and thus, as he said, 'take away the sting' from an obnoxious journal. During his later years he betook himself to fiction, publishing *Robinson Crusoe* in 1719, and *Moll Flanders, Journal of the Plague, Colonel Jack, Captain Singleton, Duncan Campbell,* and *Roxana* between 1720 and 1724. He wrote also *Memoirs of a Cavalier* (undated). He died at London, 6th April, 1731. D. was a patriotic controversialist, honest in his aims, if not very scrupulous in his means. His voluminous writings amount to 210 works in prose and verse, but his fame as a novelist has led to forgetfulness of his labours as a pamphleteer. His style is homely, graphic, and perspicuous, and his vocabulary is of almost Shakespearian richness. His novels are autobiographic in form, and characterised by an irresistible air of veracity, due to his skilful manipulation of minute and prosaic incidents. *Robinson Crusoe* is a universal source of delight. See Lee's *Life of D.* (1869), Masson's *British Novelists,* and *D.'s Works,* edited by Sir Walter Scott, in Bohn's *British Classics.*

Deforce'ment, a term of English law, denoting the holding of any land or tenement to which another has the right. The party wrongfully keeping possession is called the *deforciant.* In Scotch law, D. is an act of contempt of the law, consisting in violent opposition of a duly empowered officer in the execution of his duty.

Defraud'ing of Credit'ors. Creditors may be defrauded by the funds of their debtor being concealed, by their being conveyed to favourite creditors, or by the undue increase of debts against the estate of the debtor. Creditors have redress by common law and under the bankruptcy statutes of England and Scotland. See BANKRUPTCY.

Defrauding the Revenue.—Any contrivance by which an imperial tax or duty is evaded constitutes this offence. By the treaty of Union between England and Scotland, the law regarding it is the same in the two countries.

Degeran'do, Jos. Marie, Baron, a French philanthropist and philosopher, was born at Lyon, 29th February, 1772, and after various vicissitudes served in the army of Massena as a common soldier. While thus employed he wrote, among other philosophical treatises, *Histoire comparée des Systèmes de Philosophie, relativement aux Principes des Connaissances Humaines* (Par. 1803), which is considered one of the best French works on the philosophy of history. In 1804 he was admitted into the Académie des Inscriptions et des Belles Lettres, while he also rose high in office under Napoleon. D. was a philanthropist as well as ethical philosopher, writing *Le Visiteur du Pauvre* (Par. 1820), *Éducation des Sourds-Muets de Naissance* (Par. 1827), and *Des Progrès de l'Industrie* (Par. 1841). He was made a peer in 1837, and died 10th November, 1842.—His son, **A. Degerando,** attained some repute as a writer on historical subjects.

Degg'endorf, a town of Lower Bavaria, on the Danube, near the spot where it is joined by the Kolbach, 29 miles N.W. of Passau. The river is here crossed by a wooden bridge 1200 feet long. To one of the fine churches of the Geiersberg thousands of pilgrims yearly repair, when its 'doors of grace' are opened. The town has linen and pottery manufactories, wax refineries, and trade in cattle, fruit, and wood, and some river traffic. D. was conquered and destroyed by Ottokar II. of Bohemia in 1266, was the scene of a massacre of the Jews in 1337, suffered severely in the 'Thirty Years' War,' and was reduced to ashes in 1743 during the Austrian War of Succession. Pop. town 7026; district 37,483.

Deglut'ition is the act of swallowing. Two stages are distinguished:—(1) The bolus of food is pushed backwards towards the anterior arch of the fauces by the application of the tongue to the hard palate. (2) When the bolus has passed between the anterior pillars of the fauces, these are closed by the contraction of two small muscles termed the *palato-glossi,* and at the same time the root of the tongue approaches the soft palate. Thus the bolus is prevented from passing forward into the mouth. The entrance to the posterior apertures of the nostrils is occluded by the closure of the posterior pillars of the fauces, the elevation of the soft palate, or *velum pendulum palati,* so that its free border touches the back of the pharynx, and by the uvula filling up the little chink or gap between the posterior pillars of the fauces. At the same time the hyoid bone and the larynx are approximated, and drawn forward and upwards by the action of various muscles, so that the root of the tongue is bent backwards and pressed, along with the epiglottis, upon the opening of the larynx. The food is prevented from entering the larynx by the approximation of the true vocal cords, and by the apposition of the epiglottis to the opening. Thus it is prevented from passing into (*a*) the mouth, (*b*) the nose, (*c*) the larynx, and it has no way left for it but to pass into the œsophagus or gullet, into which it is propelled by the action of the constrictors of the pharynx. While the bolus is in the neighbourhood of the tonsils, it is covered over with mucus, so as to facilitate its passage. D. is a purely automatic action. To excite it a stimulus must be applied to the fauces. Once the mechanism has been set agoing, no effort of the will can arrest it. D. is also performed when the will is in abeyance, as during sleep, in profound coma, or after removal of the cerebral hemispheres. It is an excellent example of a reflex action, the centre of which is situated in the *medulla oblongata.* The sensory impressions are conveyed to the centre chiefly through the glosso-pharyngeal nerves, branches of the fifth to the fauces, and the superior laryngeal branches of the pneumo-gastric to the pharynx. The motor impressions travel along the pharyngeal branches of the pneumo-gastric, branches of the hypoglossal to the muscles of the tongue, motor filaments of the recurrent laryngeals of the pneumo-gastrics, branches of the fifth to the elevator muscles of the lower jaw, branches of the facial, and lastly, branches of the cervical plexus.

Degrada'tion, a term of English law, denoting an ecclesiastical censure by which a clergyman is divested of his holy orders. *Summary D.* is by word only. *Solemn D.* is by stripping the offender of the insignia of his office. A nobleman or knight may be similarly degraded, when attainted of treason.

Degra'ded, in heraldry, having steps or placed upon steps; said of a Latin cross, or *cross calvary,* on steps, which diminish as they rise towards the centre.

Degree′, in angular measure, is the 90th part of a right angle; and, as a circular measure, is the arc comprised by two radii which make such an angle between them. A whole circumference, then, is divided into 360 degrees, each of which is made up of sixty minutes, and each minute is subdivided into sixty seconds. The French, however, have introduced the Decimal System (q.v.) here, as in all their methods of measure, a right angle being made up of 100 degrees, each D. of 100 minutes, and each minute of 100 seconds.

Degree, in music, a term sometimes used in reference to the relative position of two notes upon the staff.

Degree, University, originally implied a *licentia docendi*, or license to teach within the university, as is still the case with the *privat-docent* of modern German universities. The modern D. is recognised by public legislation outside the university as qualifying, when other conditions are fulfilled, for the exercise of certain learned professions; but *per se* it is merely a formal statement by the university that the graduate has passed through a certain course of study, and shown a certain proficiency, ascertained by examination. The conferring of degrees and the appointment of examiners were generally in the hands of the Chancellor, who, in the case of an Episcopal city, was often the bishop or his nominee. The *licentia docendi* in the schools sometimes attached to universities was a different matter, and was often sold to incompetent persons. The earliest degrees known are probably those in Arts conferred by the University of Paris, and which, according to De Boulay in his history of that university, were introduced by Iruerius into the University of Bologna in 1150, and thence transferred to Paris. In theory all degrees are conferred by the crown, or in early Catholic times by the Pope, through the universities empowered to that effect in bulls or charters; the qualifications being ascertained by each *Faculty*, or body of teachers or graduates, who were privileged to lecture and make statutes. The first degrees given at Paris were in Arts; the inferior D. (given with a robe to the medical student of two years' standing who had passed an examination, and to the student in canon law of three years' standing) was that of Bachelor (q.v.). The term is said to have been first introduced to universities by Gregory IX., and has been extensively adopted. The names *Master* and *Doctor* at first referred indiscriminately to all teachers in the university who had obtained graduation; but later Doctor was applied to the teachers of law, theology, and medicine, and Master restricted to teachers of philosophy, classics, mathematics, &c. It was a condition of even the imperfect D. of Bachelor to read a course of lectures under some Master of the Faculty in which the D. was taken. This obligation continued when a full D. was taken; hence the phrase of 'necessary regency' or period of compulsory teaching, after which graduates, if they pleased, might become honorary regents. At Paris there was an earlier stage than that of Bachelor—viz., that of *Determiner*, who, after two years' study in grammar and philosophy, made certain declarations that he would complete the three and a half years' study required for Bachelor in Arts. The Bachelor was distinguished from the Master by a round cap, in place of the academical hood. A second period of three and a half years' study was gone through before the full D. was obtained; and there was a further ceremony by which the *magister* became a *socius* of the Faculty. At Paris, peculiar solemnity attached to the D. of 'D.D.,' fifteen years' study being necessary. At Bologna, the granting of degrees had in the 12th c. been monopolised by separate colleges of canon law, philosophy, and medicine doctors, which had each a prior, and held public examinations and conferred degrees in the cathedral. In all universities the various Faculties must have attained some degree of similar organisation. Originally at Bologna the terms *magister*, *judex*, and *doctor* merely signified, as at Paris, teacher. Later a formal admission or ceremony of *co-optation* was used, but as the unrestricted exercise of the right to admit was abused by the doctors, Pope Honorius III. decreed that all promotions to degrees should be under the superintendence of the archdeacon. The name given to the second or public examination was *conventus;* prior to which the candidate, having passed the *examen* by vote of the Faculty, was called a licentiate, having a right to lecture with the permission of the rector. Even unlicensed students might after a period of study get license of teaching, and by an exhaustive thesis or exposition gain the title of Bachelor. Bologna is remarkable for the fact that women have there received degrees and lectured in several subjects. The graduates had to bear the expense of the magnificent procession which preceded graduation. The *legentes* of Bologna, or those who actually lectured, correspond to the regents of other universities. In modern times, the examination generally proceeds by public examiners together with representatives of the universities. Such degrees as the Oxford B.A., M.B., and B.C.L., are obtained by fees, residence, and examinations; others, as the Oxford M.A., M.D., and D.C.L., by fees and 'name on books.' Generally, at Oxford, a certificate is required from two of the schools of *literæ humaniores*, natural science, mathematics, law, natural history, &c.; *literæ humaniores* being one. In *Arts*, twelve terms' residence is required for D. of B.A., and when this is obtained the Bachelor may proceed to take his M.A. without further residence or examination in the 27th term since that of his matriculation, provided his name has been on the books of an University College or Hall for 26 terms. In *Music*, neither residence nor academical standing is required, and a Bachelor of Music may proceed to the Doctor's degree, provided he be able to produce a properly authenticated certificate that he has been studying or practising music during five years since he became a Bachelor. In *Medicine*, a B.A. may become a Bachelor of Medicine so soon as he passes the examination. A Bachelor of Medicine may take his degree of Doctor in the 39th term from his matriculation, provided his name has been on the books, &c., for 26 terms. In *Surgery*, a Bachelor of Medicine is *ipso facto* admitted also to the degree of Bachelor of Surgery, and he may become a Master of Surgery in his 27th term since his matriculation, provided his name has been on the books. In *Civil Law*, a B.A. may become Bachelor of Civil Law on passing the examination in his 27th term from matriculation, provided his name has been on the books, &c., for 26 terms. A B.C.L. may become a D.C.L. at the end of five years since he became Bachelor. In *Divinity*, a M.A. may be admitted to the degree of Bachelor at the end of three years from his admission to regency, and a B.D. may become D.D. four years after he has taken his Bachelor's degree. In Arts the examinations are responsions, 1st public exam. before Moderators, and 2nd public exam. before the Public Examiners; in divinity, two dissertations to be read before the Regius Professor; in medicine, 1st exam. in Organic Chemistry, Human Anatomy, Human Physiology, and Materia Medica and Pharmacy. 2nd exam. in Medicine, Surgery, Midwifery, Pathology, Forensic Medicine, and Public Health. In the latter certificates of instruction in Infectious Diseases and Mental Diseases, and attendance on Labours and proficiency in practice of Vaccination are required. In music two examinations are followed by a composition. At Cambridge there are a few points of nominal difference. The first examination is called the 'Little Go,' and the honours examinations are called the mathematical, classical, moral science, &c., triposes respectively. Every D. must be signed by the Master of the College to which the candidate belongs, and before the D. is conferred by the Vice-Chancellor a grace or *supplicat* must have been obtained from the Senate. The boards of theological, legal, and medical studies control the examinations for degrees in these subjects respectively. The distinctive feature of the University of London is that it examines and confers graduation on persons who have received instruction in such institutions at home and in the colonies as have satisfied a Secretary of State with regard to their *curriculum*. This university also has and exercises a power of examining for degrees persons who have not been at any institution. At Durham degrees are conferred by the Warden and Convocation. In Scotland the *curricula* for degrees were affected at the time of the Reformation by the principles on the subject laid down in the *First Book of Discipline*, and as regards Glasgow in the *Nova Erectio*, or charter granted by James VI. Their constitution was beneficially changed by the Universities Scotland Act, 1858. At Dublin University the undergraduates are classified into junior and senior Freshmen and junior and senior Sophisters; and after taking the first D. the graduate becomes successively a junior, middle, and senior Bachelor. By payment of money, an ordinary student or pensioner may become a Fellow-commoner and associate with Fellows. The *sizars* are bursars who by examination have earned a right to enjoy their commons free.

Degree of Kindred. By the law of England, a man may not marry his mother or step-mother, his sister, his son's or daughter's daughter, his father's daughter by his step-mother, his aunt, his uncle's wife, his son's wife, his brother's wife, his wife's daughter or sister, his wife's son's daughter, his wife's daughter's daughter. Marriages within the prohibited degrees are not merely voidable, but they are absolutely void if solemnised after passing of the statute 5 and 6 Will. IV. c. 35, and the children of the connection are illegitimate. (See MARRIAGE.) The prohibition applies to relationship by Affinity (q.v.); see also AGNATE, CONSANGUINITY. A judge within a certain degree of relationship to a party to a lawsuit is disqualified from acting. See, in Scotch law, DECLINATURE. For effect of D. of K. in bankruptcy, see CONJUNCT AND CONFIDENT; in marriage, see DIVORCE.

Degrees of Lambeth. Under a statute of Henry VIII. (25 Hen. VIII. c. 21) the Archbishop of Canterbury is authorised to confer all degrees which can be given by the Universities of Oxford and Cambridge; but a degree of Lambeth does not bestow the privilege of a university degree. In former times the Pope had the power so transferred to the archbishop.

De'i Gra'tia is a pious formula which has been much in favour among the dignitaries of church and state, as indicating that they hold their office or position by 'the grace of God;' from which it will of course follow that man has no right to deprive them of it. This tenure of office is still by courtesy held to be that of our own sovereigns; but 'the divine right of kings to govern wrong,' which received a rude shock at the execution of Charles I., was in England conclusively abolished at the Revolution of 1688. See DIVINE RIGHT.

De'ism (from Lat. *Deus*, 'God') ought to mean the same thing as Theism (Gr. *theos*, 'god'), viz., a belief in God, whatever the character of the God believed in may be, and on whatever kind of evidence the belief may be based. Both words, however, have acquired special significations. Theism now means the philosophical and religious affirmation of God on grounds of natural reason: in general (as in the case of Theodore Parker and Martineau, who may be called absolute theists), on the ground of *à priori* evidence, contained in the religious and intellectual intuitions of human nature, but sometimes, as in the case of so-called Christian theists, on the ground of the design and beneficence exhibited in nature, confirmed and enlarged by the revelation of Christ. D., on the other hand, although sometimes loosely used to express dislike or alarm, or to excite these feelings against one's opponent, has a definite historical meaning. It means the principles of the English freethinkers of the 17th and 18th centuries, who argued for natural, as against revealed, religion, and to whom Locke, Addison, Bentley, Berkeley, Campbell, Chandler, Clarke, Conybeare, Derham, Ditton, Foster, Gerard, Hoadley, Jenyns, Jortin, Lardner, Leland, Parker, Ray, West, and above all, Bishop Butler, replied. Toland, the disciple and translator of Giordano Bruno, the author of *Christianity not Mysterious* (1696), of *Amyntor*, *Nazarenus*, and the *Origin of the Jewish Nation*, &c., was perhaps the most learned and acute of the theological deists. He was expelled from the English Church. Anthony Collins, more a philanthropist than a theologian; Thomas Woolston, who was tried for blasphemy, and died in prison for resolving the Christian miracles into allegories; Matthew Tindal, the author of *Christianity as Old as the Creation*; Chubb and Morgan, the authors of various tracts which once enjoyed a great popularity—are also among the deists. Lords Bolingbroke and Shaftesbury, and in the earlier part of the 17th c. Lord Herbert of Cherbury, contributed less directly to the same school of thought. The two positions of D. are these—(1) an intellectual scepticism as regards the Christian miracles, and generally as to the value of miraculous evidence; (2) a vehement desire for *intelligible* religious truth, such as involves nothing contrary to human reason and morality. Butler's famous reply, which has always since been regarded as the mainstay of English orthodoxy, consists in admitting the objections made against revelation (which, like his follower Mansel, he holds to be essentially mysterious), and in pointing out that similar objections may be urged against natural theology, which has no miraculous evidence to support it. A generous estimate of the Deists, from the Christian point of view, will be found in Herder's *Adrastea*.

Dekk'er, Thomas, an Elizabethan dramatist, born about 1570, died probably about 1637. He was satirised by Ben Jonson in the *Poetaster*, and retorted happily in his *Satiromastix*. His plays—of which the best is *Old Fortunatus*—contains passages of exquisite pathos and of almost infantile simplicity and beauty. He wrote in conjunction with Webster, Ford, and Middleton, and was active as a pamphleteer. Hazlitt said he could not show his admiration for D. sufficiently, and Lamb pronounced his character of *Orleans* to be almost as poetical as *Romeo*. See Hazlitt's *Elizabethan Literature*, and Ward's *English Dramatic Literature*.

Del, a species of tree allied to the Bread-Fruit (q.v.), a native of Ceylon, and the wood of which is employed in shipbuilding, &c.

De la Beche, Sir Henry Thomas. See BECHE.

Delabec'lea, a genus of north-eastern Australian trees belonging to the natural order *Sterculaceæ*. *D. rupestris* is the bottle-tree, so called on account of the middle of the trunk being bulged out like a bottle. It yields a mucilaginous gum like gum-tragacanth, which is nutritious, and used by the aborigines in times of scarcity. The wood is remarkably loose in texture.

Delacroix', Ferdinand Victor Eugène, the son of the Secretary to the Council of Ancients, was born at Charenton-Saint-Maurice, near Paris, 26th April, 1799. After becoming known as an art critic, he began his career as a painter by producing, in 1822, 'Dante and Virgil in Hell,' the subject of which is the description in the third canto of Dante's *Inferno* of the poet's crossing Acheron in Charon's boat. This was followed by the 'Massacre of Scio,' which commemorates Turkish cruelty in the Greek insurrection of 1822; 'Sardanapalus Dying in the Midst of the Slaughter of his Wives'; 'Liberty guiding the People on the Barricades of 1830'; and, among others, two pictures on subjects taken from Scott's novel of *Quentin Durward*. A Government mission to Marocco supplied D. with the materials for his greatest colour-picture, 'The Women of Algiers' (1838). Later came 'Medea Fleeing from Jason after the Murder of Creusa'; 'Cleopatra Preparing for Death'; 'A Shipwreck,' in which the crew are drawing lots for death. These are merely the leading subjects among a number and variety probably unsurpassed by any other single artist. D.'s great allegorical pictures of 'Justice,' 'War,' 'Agriculture,' and 'Industry' are well known. Besides many decorations of public buildings, he produced lithographic illustrations of 'Hamlet,' 'Macbeth,' and Göthe's 'Faust.' He died 13th August, 1863. It is for his vehement expression and brilliant contrast of tints that D. is admired; his drawing is loose. He is considered the head of the French Romantic school of the 19th c., and he has himself described his position as opposed to that of the classical Louis David (*Revue des Deux Mondes*, July, 1854). See T. Gautier's *Histoire du Romanticisme*, and C. Baudelaire's *L'Art Romantique*.

Delago'a Bay, an almost landlocked inlet on the S.E. coast of Africa, between C. Colatto and Komati river, much frequented on account of its safe and ample anchorage, and is under Portuguese government, forming, as it does, the S. and W. extremities of the Portuguese province of Lourenço Marques. It receives the Pongola and Assagai (combined, Maputa), Komati, and Crocodile or Limpopo (into which Olifants flows), and other rivers, and its shores are low, swampy, and malarious in summer. The discovery of gold in the Transvaal greatly increased its trade. A railroad has been constructed from D. B., running inland 57 miles towards Pretoria, the remaining 290 being in the hands of the Netherlands Company, and of this distance 116 miles are now open. Caoutchouc, ivory, oil-seeds, and nuts are the chief commodities exported from D. B. at present. The acquisition of the port by the British has been strongly advocated by the progressive party in Natal, but the proposal has not been entertained by the Home Government.

Delam'bre, Jean Baptiste Joseph, a French astronomer and mathematician, was born at Amiens 19th September, 1749. His first work in astronomy was the construction of tables for Uranus, then recently discovered by Sir W. Herschel. His *Tables du Soleil, de Jupiter, de Saturne, d'Uranus, et des Satellites de Jupiter* (1792), secured his election as a member of the Académie des Sciences; and soon after, with Méchain, he undertook the measurement of the arc of the meridian from Dunkirk to Barcelona, the results of which appeared in his *Base du Système Métrique Décimal* (1806-10). In 1807 he succeeded his friend Lalande in the Collége de France, and in 1814 published his *Traité d'Astronomie*. He subsequently wrote several histories of his favourite science during the ancient, mediæval, and modern periods, a task for which his fine scholarship eminently qualified him. D. died at Paris 19th August, 1822.

Delane' or **Delaine, John Thaddeus,** son of W. F. A. D., for many years financial manager of the *Times*, was born in London in 1817. After graduating at Oxford, D. entered the editorial department of that journal, succeeding the late T. Barnes as editor in 1841. It was largely due to his energy, tact, and knowledge of men and of society, that the *Times* became the most powerful newspaper in the world. He retired in 1877; died 22nd November, 1879. D. was called to the bar in 1847, but never practised.

Delaroche', Paul, a brilliant French painter, born at Paris in 1797, was the son of a valuator of art products at the Mont-de-Piété. A pupil of Baron Gros, he struck out for himself a middle path between the romantic and classical schools. Hence he has been called the modern Eclectic, and the Casimir Delavigne of painting. His style is marked by elevation and simplicity of conception, picturesque colouring without exaggeration, and scrupulous care in details. Among his earliest pictures (1824) may be mentioned 'St. Vincent de Paul preaching on Behalf of Deserted Children before the Court of Louis XIII.,' and 'The Examination of Jeanne d'Arc.' Later came 'Cromwell Looking at the Corpse of Charles I.,' 'The Execution of Lady Jane Grey,' and the 'Death of the Duke of Guise.' D. spent four years in his decorative painting of the saloon of the Palais des Beaux Arts; it contains more than eighty figures of great artists of all ages, in appropriate costume. Nearly all his subjects are historical: one of his latest (1851) being that of 'Marie Antoinette before the Revolutionary Tribunal,' when she made her famous appeal to the mothers of France. D., who was for many years Professor at the Fine Arts School, died 4th November, 1856. See De Loménie's *Gallerie des Contemporains Illustres*, vii.

Delavigne', Jean François Casimir, a famous French lyrist and dramatist, born at Havre, 4th April, 1793, was the son of a merchant in humble circumstances. Through the kindness of the Comte de Nantes, who gave him a sinecure in a public office, D. was able to cultivate his poetical taste. His pieces, *Waterloo* and the *Devastation du Musée*, better known as the *Messéniennes*, protests against the concessions granted to the Allies by the government of Louis XVIII., made him, after Béranger, the most popular poet in France. Four dramas, *Les Vêpres Siciliennes*, *Les Comédiens*, *Le Paria*—suggested by Demaistre's *Lepreux d'Aoste*—and *L'École des Viellards* (played by Talma and Mademoiselle Mars), procured his admission to the Academy in 1825. The insurrectionary movements in Greece and Italy afforded him subjects for a second set of *Messéniennes;* the Revolution of 1830 inspired his splendid march-song, 'En avant! marchons contre leurs canons, à travers le fer, le feu des bataillons. Courons à la victoire!' The Polish insurrection produced *La Varsovienne* and the *Dies Iræ* of Kosciusko. His severe labour in producing his dramas of *Louis XI.* (1832), *Don Juan d'Autriche* (1835), and *La Fille du Cid* (1839), ruined his health. He died 10th December, 1843. Like Béranger, D. was a thoroughly conscientious man of letters, and more than once refused the tempting offers of Charles X. His chief friend was the comic dramatist, Scribe. There are numerous editions of D.'s works; that of 1845 contains a biography by his elder brother, Germain, himself a prolific writer of *vaudeville* and *opéra-comique*.

Del'aware, one of the smallest of the original thirteen states of the Union, forms part of the peninsula between the Chesapeake and the D., and has an area of 1960 sq. miles, and a pop. of 168,493, of whom 28,386 are described as persons of African descent; 37, as Chinese; and 4, as civilised Indians. The D. river and bay bound it on the E. Much of the soil is poor and sandy. Bog-iron ore and shell marl are found, and porcelain clay abounds. The total annual value of the mineral products of D. is estimated at $500,000. D. has a large school-fund and one college—13 teachers and professors, and 90 students. It sends one member to the House of Representatives, and two to the Senate. Before the war D. was a slave state. Dover (pop. 3061) is the capital, Newcastle (pop. 4010) the seaport, and Wilmington (pop. 61,431) the largest town. D. derives its name from Lord De la Warr, who entered the bay in 1610. In 1627 it was colonised by Swedes and Finns, whose descendants still survive. The Dutch seized it in 1655, but gave place to the English in 1664. It formed part of Penn's colony of Pennsylvania. There are over 590 manufacturing establishments in Wilmington, and in these over $20,500,000 are invested, and over $24,500,000 worth of products are manufactured annually. The principal manufactures are cars and steam railroad stock, foundry and machine-shop products, iron and steel, morocco leather, and shipbuilding generally.

GREAT SEAL OF THE STATE OF DELAWARE
LIBERTY AND INDEPENDENCE

Seal of Delaware.

Delaware River (Ind. *Makeriskiton*) rises on the W. of the Catskills in New York, and flows in a very sinuous course southward for 300 miles till it enters D. Bay. It separates New York and Pennsylvania, and further on bounds New Jersey on the E., and Pennsylvania and Delaware on the W. The upper part, between New York and Pennsylvania, presents varied and striking scenery; and southward, as the river pierces the mountains at the Water Gap, the views are unique and grand. The largest ships can ascend to Philadelphia, and steamboats to Trenton, the head of tide water.—*Delaware Bay*, into which the river enters, is 65 miles by 30, and forms a highway for vessels of every size. There is a large breakwater near the entrance, at Cape Henlopen, to protect shipping.

Deleb'. Palm, a palm found in great abundance near Lake Tchad, and other portions of the interior and W. of Africa, believed to be a species of *Borassus*, allied to the Palmyra Palm (q.v.). The fruit is prized by the natives, who also extensively use as an article of food the tender roots produced by the young plant.

Delec'tus Perso'næ (Lat. 'choice of person'). When certain legal relationships are entered into, it is understood by law that one of the parties has some special qualification in the opinion of the other; and, therefore, that he who has the special qualification is not entitled to put another in his place. D. P., in Scotch law, denotes this legal doctrine. Thus, under a contract of Society (q.v.), or Partnership (q.v.), the admission of a new partner by succession or alienation is barred by D. P., unless the contract stipulates that partners are to be succeeded by their heirs, or empowers partners to assign their shares. In Scotland, a tenant under an agricultural lease, unless its term be longer than that of ordinary human life, is barred by D. P. from subletting. In leases, however short, of urban subjects there is no D.P., consequently these may be sublet, unless there is a stipulation to the contrary. See LEASE.

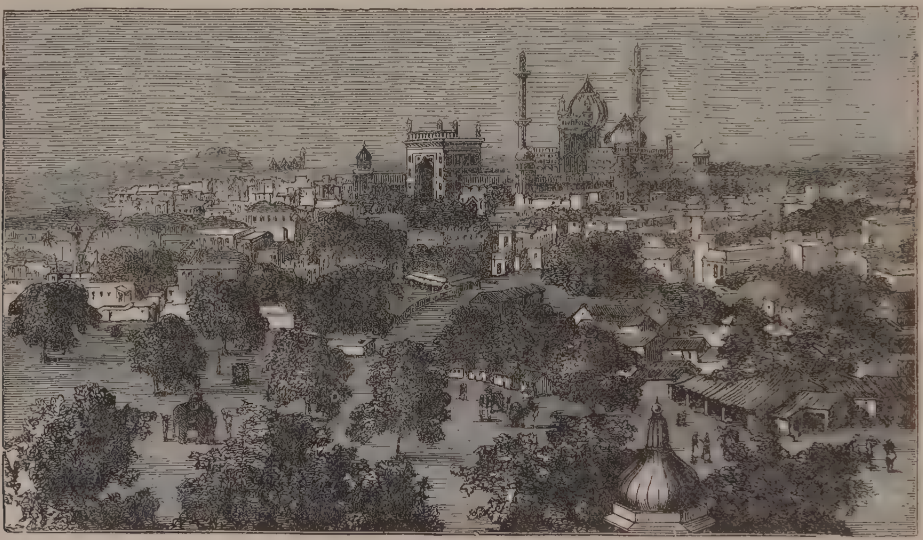
Delega'ted Jurisdic'tion, as contradistinguished from *proper* jurisdiction, is that which is communicated by one judge to another. Jurisdiction cannot be delegated without express power given in the grant. See DEPUTY.

Del'egates, Court of. In England, the supreme court of appeal in ecclesiastical and maritime causes was formerly constituted by a statute of Henry VIII., forbidding appeal in ecclesiastical causes to the court of Rome. The C. of D. was abolished by statute in the reign of William IV., and its functions transferred to the Judicial Committee of the Privy Council. See PRIVY COUNCIL, JUDICIAL COMMITTEE OF.

Delf (Old Eng. 'a delving'), is used in heraldry to describe a block of turf or coal. A *D. tenné* is said to be the proper abatement for one who has revoked a challenge, or departed from his word. See ABATEMENT, TENNÉ.

Delft ('a canal', from Dutch, *delven*, 'to dig'), a very ancient town of S. Holland, on the Schie, 10 miles N.W. of Rotterdam by rail, intersected in every direction by canals crossed by 69 bridges, generally of stone. It was formerly famous for its potteries, whence D.-ware is still a name for certain kinds of earthenware. Tobacco-pipes are largely manufactured. The most interesting edifices in D. are its churches. The Old Church, of the 11th c., contains the monuments of Admirals Tromp and Hein, and of Leeuwenhoek the naturalist; the New, of Prince William I. of Orange (who was assassinated at D. in 1584), and of Grotius. D. is the seat of the state arsenal, and has a new and important polytechnic school. Pop. 30,079.

Its harbour is *Delfshaven*, a town on the right bank of the Maas, 2 miles W. of Rotterdam, defended from inundations by strong dykes and flood-gates. D. has distilleries, breweries, sawmills, shipbuilding yards, and iron-foundries, and considerable shipping. Pop. 12,049.



Delhi.

Del'hi (Moham. *Sháhjahánábád*), formerly the largest and finest city of India, and the residence of the Great Moguls, now the capital of a division and district of the same name, province of the Punjab, British India, is situated near the W. bank of the Jumna, 934 miles N.W. of Calcutta, and 390 miles from Allahabad on the East Indian Railway. It is 5½ miles in circumference, and is surrounded by a grey granite wall 30 feet high, strengthened in 1803, and again in 1838, and which is pierced by ten gates opening on the river, and on the land side. The streets are narrow and crooked, with the exception of two, which are respectively 90 and 120 feet broad, and each about a mile long. These run from the palace, the one to the Agra gate, the other to the Lahore gate, and are both supplied with water in stone channels of red granite raised above their level; but are disfigured, like the other streets, by the occurrence of small blocks of houses planted irregularly in their centre. D. is divided into a Hindu, Mohammedan, and European quarter. The Mogul's palace, now called 'the fort,' a miniature town in itself, on the water side, surrounded by a wall of more than a mile in circumference, is one of the most beautiful monuments of Indo-Moslem architecture. This building contains the white marble Mosque of Aurungzebe, splendidly ornamented with sculpture, has an open audience-hall, also of white marble, rich in mosaic and relievos, and is embowered among beautiful gardens, in which are many fine baths and fountains. The chief building within the city is the Mosque of Shah Jehan (1631-37), famed throughout the East as the most beautiful in India. It stands on a rocky elevation of some 30 feet, and is built of marble and red sandstone. The Hindu temples are comparatively mean and diminutive. Near D. is the pyramid Kutab Minar, 280 feet high. In the European quarter there are the official palace, a Protestant church, the college, the arsenal, and barracks. The College of D., once a celebrated oriental school, founded in 1792, and affiliated to the University of Calcutta, has been abolished, Government having withdrawn its grant, which raised its revenue to £4058 yearly, in order to concentrate its assistance upon the central institution at Lahore. The chief manufactures of D. are cotton cloths, exquisite embroidery, rare gold and silver wares, and delicately-carved ivory. It receives British manufactured goods, large quantities of fruits, indigo, chemicals, salt, horn, hides, and Cashmere and Cabul shawls for embroidering. In recent years several printing-presses have been established at D., which are producing many valuable old works, especially in Persian and Arabic. The modern D. was founded by Shah Jehan in 1631. Beyond its walls are the desolate ruins of the ancient city of the Patan kings. Pop. (with cantonment) 192,579, of whom 108,058 are Hindus; 79,238 Mohammedans; 3256 Jains; 1700 Christians; 31 Parsees; 289 Sikhs; and 6 are Jews. D. is said to have been founded by a certain rajah, Dilu by name, from whom it received its name. In the *Mahabharata* it is called Indraprastha, the residence of the mythical Pandus, or Children of the Sun. D. was long occupied by native Indian kings. In 1011 it was stormed and sacked by Mahmud of Ghuzni, and in 1193 the Ghuridish Sultan Mohammed, founder of the first Afghan dynasty, made it the capital of an empire extending to Bengal. Timur took D. in 1398, but on his death followed a long period of bloodshed and anarchy. In 1450 the Lodi dynasty, of Patan or Afghan origin, conquered the empire, but were displaced in 1526 by Babar, a descendant of Timur, and the first Great Mogul. D. rose to its greatest prosperity in the times of Akbar and Aurungzebe. It was taken and plundered by Nadir Shah (1738), who is said to have taken away booty valued at £9,000,000; after which it never recovered its splendour. The British under Lord Lake captured the city, and relieved the Emperor from the tyranny of the Rohillas and Mahrattas, 14th March, 1803. During the Mutiny it was seized by the Sepoys, 10th May, 1857, and after a siege of seven days, was retaken on the 21st of September.—The *district* of D., which lies between the Ganges and the deserts of Multan, is only in parts well irrigated and fertile, and has an area of 1290 sq. miles and a pop. of 638,689, among whom are 479,057 Hindus; 382 Sikhs; 7613 Jains; 149,741 Mohammedans; 1858 Christians; 31 Parsees; and 6 Jews. Much of the soil, except near the Jumna and Jumna Canal, is hard and unfertile. Cotton, sugar-cane, rice, Indian corn, tobacco, barley, indigo, and oil-seeds are the principal products. The land revenue is over £620,000 from the whole of the D. division. Commerce and manufacture are centralised in the city of D.

Delict′ and **Delin′quency.** The law of Scotland, following that of Rome, divides delinquencies, as grounds of civil claim for reparation, into *delicts* and *quasi delicts*, the former being offences committed with criminal purpose, the latter being offences arising from gross negligence. Offences belonging to the latter class do not, like the former, always afford ground for criminal prosecution, as well as for action for Damages (q.v.), but they very often do. See CRIME, CULPA, DOLE.

Deli′lah (Heb. 'the languishing'), a personage mentioned in Judges xvi., and famous in connection with Samson (q.v.).

Delille′, Jacques, a French poet and professor, was born at Aigues-Perse, in Auvergne, 22nd June, 1738. He was educated at the Collége de Lisieux, Paris, and finally became Professor of Belles Lettres in the university of that city, was presented by the Comte d'Artois with the revenues of the abbey of Saint-Severin (30,000 livres a year), went to Constantinople in 1784 in the suite of the Comte de Choiseul-Gouffier, became Professor of Belles Lettres in the university of Paris on his return, lost his fortune and nearly his life at the Revolution, and quitted France for Switzerland after the Reign of Terror, but returned in 1801, and resumed the duties of his chair. He died 1st May, 1813. D.'s finest work is his charming translation of Virgil's *Georgics* (1769). Besides this he produced many elegant, harmonious, and felicitous poems of a didactic and descriptive character, of which the finest are *Les Jardins* (1774), *L'Homme des Champs* (1800), and *La Conversation* (1812). A complete edition of D.'s works was published in 1824 (later ed. 1844).

Delir′ium (Lat. from *delirare*, 'to wander in mind,' *de* and *lirare*, 'to go out of the straight line in ploughing'; 'to err, wander, go wrong'), a state of mind in which the ideas are wild, irregular, and unconnected, or do not correspond with the truth or with visible external objects. D. may be caused by whatever tends to disturb the healthy functions of the brain, and is a frequent symptom of a great variety of diseases and injuries. It varies in intensity from mild incoherence to the most exalted forms of frenzy. Injuries of the cranium, morbid growth within its cavity, diseases of the brain-tissue and its vessels, and serous effusion may result in D. It is also caused by the action of poisonous ingredients in the circulation, and is a common symptom of fevers and several acute diseases. Violent mental excitement, either of a depressing or elevating nature, may give rise to an attack of acute mania. D. is also frequently caused, more especially in the case of females, by reflex action from the terminal distribution of the nerves. D. is not a disease *per se*; so that the treatment to be adopted is not uniform, but must depend upon the nature of the disease with which it is associated, and of which it is a symptom.

Delirium Tremens is a form of delirium accompanied with tremors or trembling, principally of the hands and arms. This condition may be a symptom of organic disease of the brain or nervous system, of apoplexy and sun-stroke. It is occasionally caused by excessive and prolonged mental excitement from overwork of the brain in connection with literary pursuits, business, speculations, gambling, and such like; or it may be the result of certain acute diseases which act on the nerves or nerve-centres, as fevers, or of accidents and surgical operations followed by shock. In such cases it is sometimes called *delirium nervosum*. The term D. T. is generally applied to such cases as are caused by the excessive abuse of alcoholic stimulants, and the disease may be produced by a single but prolonged debauch, or by a long-continued course of dissipation. In the former case it depends on blood-poisoning from alcohol; and in the latter there is, in addition, saturation of the brain substance, and admixture of the serum of its ventricles with alcohol. Alcohol is absorbed directly by the blood-vessels, without change or decomposition, and passes rapidly into the circulation, acting as a direct poison upon the nervous tissues through which the infected blood circulates. It is cumulative in its action, and has been detected, by analyses, in the blood, bile, the fluid of serous membranes, the brain substance, the liver, &c. The long-continued presence of alcohol in the brain results in organic disease of that organ; and D. T. depends on the effect produced on the nervous centre, the pathological changes being, in some instances, softening; in others, induration of the cerebral or cerebellar substance with increase of the sub-arachnoid serum. There is also steatomatone degeneration of the small arteries of the brain, causing atrophy of its convolutions and also œdema. The nerve substance of the brain becomes poisonously affected, resulting in a permanent loss of cerebral power. The disease is sometimes called *delirium è potu*, or *delirium ebriositatis*.

The symptoms of D. T. are both mental and physical, and the following, which are the more prominent, are invariably present. There is great agitation and loss of control of the mental functions, and of certain muscles of the body. In addition to delirium, more or less vivid, there is a morbid anticipation of impending danger, with hallucination and spectral illusions, rendering the patient dangerous to himself, as he may endeavour to leap from a window to escape from imaginary foes in pursuit of him. In the early stages the patient is usually coherent when the attention is fixed, but incoherent when left to his own thoughts. In the later stages there is incessant muttering delirium. The prominent physical symptoms are, loss of control over certain of the voluntary muscles; the tongue, when protruded, is tremulous; there are convulsive movements of the extremities; the hands and arms tremble, and shake, so that it is impossible to hold a pen or convey a cup of liquid to the mouth; there is also, frequently, *subsultus tendinum*, and complete deprivation of voluntary motion. There is, generally, sleeplessness; but when sleep is procured it is accompanied with frightful dreams, and, when the patient is awake, the ocular spectra have the most horrible and repulsive forms.

The treatment proper for such cases consists in the stoppage of the stimulant which has been the cause of the malady, the judicious administration of opiates to calm the nervous system and procure sleep, nourishing articles of diet, and the gradual elimination of the poison. One attack leaves the brain permanently weakened, and predisposes to a second; and repeated attacks result in a state of fatuity or death. The only safety, therefore, consists in total abstinence from alcoholic stimulants.

Delitzsch', an old town of Prussian Saxony, on the right bank of the Löbber, 15 miles N. of Leipzig, with which it is connected by railway. It has manufactures of woollen cloth, hosiery, and tobacco, and several important annual fairs. Pop. 58,090.

Delivery of a Deed. While a deed or writing remains in the custody of the grantor or of his agent, never having been delivered, it is not binding. To make it so, it must have been delivered either to the grantee, or to a third party, although then it may be only upon some condition being performed; when put into the hands of a third party, the legal presumption seems to be that it has been delivered to him unconditionally for behoof of the grantee, but this presumption may be overcome.

Dell'a Cruscan School, a name adopted by certain English residents at Florence, who began about 1785 to publish affected, frigid, and silly verses in two English daily newspapers. Their effusions produced a host of imitators, equally fluent and equally intolerable, and the journals were flooded by verses in the style of Pope's *Song by a Person of Quality*. This literary nuisance was at length abolished. Horace Smith ridiculed it in the *Rejected Addresses;* and Gifford, in his *Baviad* (1794) and *Mæviad* (1796), extinguished the pestilent versifiers as completely as the follies of the Hôtel de Rambouillet were extinguished by Molière.

Dell'ys, a seaport in the arrondissement of Tizzi-Ouzou, Algeria, 49 miles E. of Algiers, identified by Bartle with the *Rusucurrium* of Pliny. The climate is healthy, and the vine and olive flourish. D. has trade in grain, oil, and salt, and is the chief mart of the Kabyles. Pop. 13,104.

Delolme', Jean Louis, was born in 1740 at Geneva. He became an advocate, but had to flee to England on account of the political opinions expressed in his *Examen de Trois Parts des Droits*. D. published his *Constitution de l'Angleterre, ou État du Gouvernement Anglais comparé avec la forme Républicaine et avec les autres Monarchies de l'Europe*, at Amsterdam, in 1771, and his English translation in 1772. After suffering great poverty he returned about 1775 to Switzerland, where he died, 16th July, 1806. Besides the *Constitution de l'Angleterre*, a sensible though superficial book, once popular, but no longer considered an authority, D. wrote a *History of the Flagellants* (1782), *An Introduction to Defoe's History of the Union*, and *Observations on the Window-Tax*.

Delorme', Marian, a noted character in French history, was born about 1612 near Châlons-sur-Marne. Going to Paris, and making no attempt to live virtuously, she won numerous lovers by her beauty, while her fondness for intrigue led her to take an active interest in the politics of the time. She espoused the side of the *Frondeurs*, and incurred the hostility of Mazarin, who was even on the point of throwing her into prison, when she died, at the age of thirty-nine. Long after this event, a curious report got afloat, and was widely believed, that she had escaped to London, returned to Paris, and after marrying three husbands, lived to the age of 129. D. is the subject of one of Victor Hugo's most powerful dramas.

De'los, called also Ortygia, Cynthus, &c., the central isle, and the smallest, of the Cyclades in the Ægean Sea. According to the common Greek myth, D. appeared on the deep at the stroke of the trident of Poseidon (hence its name), and was fixed by Zeus to afford a resting-place for Latona, as she fled from the wrath of Herè on the eve of the birth of Apollo and Diana. The island was originally inhabited by Ionians; was the seat of an Amphictyonic Council, and the centre of the worship of Apollo, whose festival was celebrated here with unusual splendour. Its sacred character was respected by the Persians, and in 477 B.C. it was chosen as the seat of the treasury of the confederacy against Persia. It was purified by the Athenians B.C. 426, when all tombs and human remains were removed from it, and it was declared pollution for a dog to enter, or for a human being to be born or to die on the island. Four years after, deeming the purification incomplete, the Athenians banished all the inhabitants also. The bronze and bronze vessels of D. were famous. After the destruction of Corinth by Mummius, B.C. 146, D. became a great commercial centre, and it continued to flourish till the Mithridatic war, when it was pillaged and crippled beyond recovery. Numerous fragments of marble structures lie scattered over the island; the remains of the temple and colossal statue of Apollo may still be traced, but the architectural glories of D. were carried off centuries ago to adorn Venice and Constantinople.

Del'phi, a town of Phocis, situated in the vale of the Pleistus, and enclosed behind by a rocky barrier, through a cleft in which issues the Castalian spring, was famous as the seat of the oracle of Apollo. The original name of this oracle was Pytho, and the sanctuary was at first superintended by the town of Crissa. On its decline, D., whose population had come from the Dorian town Lycoreia, became an independent state, and through the oracle rose rapidly in influence and wealth. Its affairs were administered by the noble families of the town; and whenever the oracle was to be consulted, the Pythia took her seat upon a tripod, placed above an opening in the ground, in the centre of the temple of Apollo, through which arose an intoxicating smoke. This smoke so affected the Pythia's brain that she became delirious, and in that state gave utterance to sounds that were believed to express the reply of the god to those who had come to consult the oracle. The answers still extant are generally in hexameter verse and in the Ionic dialect. The Pythia was a native of D., in early times a maiden, but subsequently always above fifty years, and generally taken from

Site of Delphi.

some family of poor country people. Innumerable benefactors loaded the shrines with gifts, and even in the 8th c. B.C. the fame of the oracle was widespread. The first celebration of the Pythian Games took place in 586 B.C. In 548 B.C. the temple was destroyed by fire, and was rebuilt at a cost of £115,000 sterling. In succeeding centuries it was frequently plundered—as, for example, by the Phocians at the time of the Sacred War, by Sulla, and by Nero. The oracle was closed in the general extirpation of pagan rites by Theodosius. The site of the ancient town is now occupied by Castri, a wretched village.

Delphinap'tera, a genus of *Cetaceæ* or Whales, belonging to the Dolphin family (*Delphinidæ*), and represented by such forms as the 'right whale porpoise' of the S. Seas, by the *D. Commersonnii*, by *D. Borealis* of the N. Pacific, and by other species. The species of this genus have no dorsal fin, and have the jaws prolonged to form a rostrum or beak, flattened from side to side. The first-mentioned species averages five feet in length. Numerous teeth exist.

Delphin Classics, an edition of the Greek and Roman classics, chiefly edited by Huet, tutor to the Dauphin, son of Louis XIV., for the use of his pupil—'in usum Serenissimi Delphini.' Thirty-nine eminent scholars aided in the preparation of the work, which is now, however, of little value. Valpy's *Variorum Latin Classics* (in 141 vols. Lond. 1819-30) contain the Delphin notes and *Interpretatio*.

Del'ta, in geology, the name given to the roughly triangular space—resembling the Greek letter Δ (delta)—formed near the mouth or estuary of a river by the dividing of its main channel. The apex of the triangle points up the river, and marks the point at which the division takes place. A D. land is a great receptacle of the detritus or debris brought down by the river, and hence it frequently occupies hundreds of square miles covered with alluvial soil, and with vegetable and other matters. The D. is frequently extended seawards by increasing deposits of the river. Deltas occur most typically in lakes and tideless seas, such as the Mediterranean. D. formations are of the highest interest to the geologist, as explaining, in some aspects at least, the process of coal formation and other allied points.

Del'uge, The, as commonly understood, is the flood which drowned the whole human race but Noah and his family. The biblical narrative, literally interpreted, requires us to believe that this was a flood which covered the whole earth, and so it was always understood till the increasing light of science and criticism revealed the objections to such a belief.

The chief of these are the smallness of the ark, the present distribution of animals on the globe, the varieties of human language, the ash-cones of extinct volcanoes, which, older than the supposed time of the flood, could not have been touched by it, the quantity of water required, the necessary destruction of most marine animals, as well as all in the ark, owing to the change of climate, and of freshwater fish and plants by the water, &c.

For a time it was thought that all these difficulties were avoided by supposing merely a partial D. But this question has been entirely superseded by the Assyrian discoveries, which appear to show that the Hebrew record is only a national form of a widespread Semitic legend. The Babylonian version, indeed, points in the direction of a solar myth. It is on a tablet, which is one of twelve, containing myths corresponding to the months of the year and the signs of the zodiac, and all relating to the solar hero, Gisdubhar. The story of the flood is on the eleventh, corresponding to the month called in Accadian 'the rainy,' our January, over which Aquarius presided. See Smith's *Assyrian Explorations and Discoveries* (1875), and *Chaldæan Account of Genesis* (1876). See also article CUNEIFORM.

Delun'dung, a genus of Carnivorous mammalia inhabiting Java and Malacca, and belonging to the *Viveridæ* or Civet-cat family. It is allied to the genus *Viverra* itself, but differs from the civets in having a very slender body, long legs, and elongated 'whiskers.' It does not possess any scent-pouches. Its colour is greyish, with four broad saddle-shaped bands of brown crossing the back. The sides are variegated with brown, the legs are spotted, and the tail encircled with alternate brown and grey rings. The muzzle is pointed. The D. is by no means common, and its habits have not been thoroughly ascertained.

Delvi'no, a fortified town in the vilayet of Janina, Albania, European Turkey, the seat of a Greek bishop, with olive plantations in the vicinity, and a trade in oil and other local produce.

Demand' and Supply'. It is a question among political economists whether, as a rule, the demand for anything creates the supply, or whether the supply precedes the demand. We shall endeavour to answer the general question by considering the two following questions as illustrative:—1. Does the earth produce wheat because men want bread, or do men eat bread because the earth produces wheat? 2. Do men wish to travel fast because locomotives have been invented, or were locomotives invented because men wished to travel fast?

In the production of wheat there are two concurrent agencies—human hunger, and the natural power of the earth for producing wheat. If we must determine which is antecedent, we must certainly hold the earth to have had power either of producing wheat or other fruit capable of sustaining human life before human life came. Finding wheat good and nutritious, the natural supply is augmented by art and industry. In answer to the second question, it is plain that the demand—that is, for speedy passage from one place to another—is antecedent to the supply; locomotives not being the produce of the earth, but of human ingenuity. Human necessities and wants are the demand, supply is the result of this force acting on human ingenuity and on the physical capability of our planet; and if the capability to sustain life had not preceded it, then life could not have been. These forces act and react on one another.

Adam Smith has shown that it is the man who saves money, not the man who spends it, who adds to the wealth of his country. Plainly the more wealth a man produces, or is the means of producing, and the less he consumes, the richer does he become; and what is true of the individual is true of men collectively; but while demand is the force which, acting on capability, produces supply, consumption is, in most articles, a necessary concomitant of demand. Thus, were men to cease from *drinking* wine, but to continue buying it, there would be a continuous accumulation of the wine—that is, so much accumulation of wealth; but then, if they ceased to drink the wine, they would certainly cease to buy it, and production would stop and wealth diminish.

Dem'avend, Mount, an extinct volcano, on the borders of Irak-Ajemi and Mazanderan, Persia, 18,600 feet above the level of the sea. It is the loftiest peak of the Elburz chain, is conical in form, and the top is entirely composed of a soft rock from which sulphur is dug. At its base there are several hot springs. D. in Persian tradition occupies a place corresponding to that of Ætna in the myths of Greece.

Dem'bea, a mountainous district, in central Abyssinia, the lower lands of which border the Lake of Tana, extending along its shores from Dagossa to Begemeder. Several small rivers descend from the D. heights, and passing through the plains enter the lake, whence the Bahr el Azrek or Blue Nile flows to the S.E. On the northern slopes of the D. plateau are some of the streams which form the river Menna, a tributary of the Dika or Takazze.

Dembin'ski, Henry, a Polish general born near Cracow, 16th January, 1791, joined the Polish army in 1809, shared in the French invasion of Russia, and distinguished himself at the battle of Leipzig in 1813. After the fall of Napoleon he returned to Poland, was appointed commander of a brigade in the Polish revolution of 1830, and shone conspicuous at the battles of Leiv and Kuflew. After his repulse of the Russians on the Narar, and his able retreat through Lithuania, in 1831, he was made general of the Polish forces. When Warsaw surrendered, D. took refuge in France, visited Egypt in 1833 in the expectation of a war with Russia, in

1849 transferred his services to the Hungarians against Austria and Russia, and was made general of the Hungarian army by Kossuth. After the defeat of Kapolna and resignation of Kossuth, D. fled to Turkey, and returned to Paris in 1851, where he died, 13th June, 1864. See D.'s *Mémoires sur la Campagne de Lithuanie* (Strasb. 1832) and *D. in Ungern*, by A. H. Danzen (Lond. 1875).

Demera'ra, a river of British Guiana, with a northerly course of 200 miles, falls into the Atlantic at Georgetown, where it is nearly two miles broad. Its embouchure, though obstructed by a bar, furnishes a spacious harbour, and the river is navigable for ships of considerable burden for nearly 100 miles. For D. settlement, see GUIANA, BRITISH.

Demesne' (Old Fr. *demaine*, Lat. *dominium*, 'lordship'). Lands next to the lord's mansion, and which he kept for the support of his household, were in old times called the D. In our day it denotes the right of an owner of land in Fee Simple (q.v.). See also DOOMSDAY BOOK.

Deme'ter. See CERES.

Demet'rius, the name of three kings of Syria.—1. **D. Soter,** grandson of Antiochus the Great, spent his early years at Rome as a hostage, whence he fled, partly through the help of Polybius, when twenty-three years old, and established himself on the throne of Syria. He conciliated the senate and secured his recognition as king, but acted so despotically towards his neighbours, that the Jews under Judas Maccabæus took up arms and defeated his general. D. fell in battle (B.C. 150) against an impostor named Balas, whose claims were supported by the Romans, the Jews, and Attalus, King of Pergamus.—2. **D. Dicator,** son of the preceding, after remaining in exile for some years, recovered the kingdom from Balas, by the assistance of Ptolemy Philometer, but the infant son of Balas being set up as a pretender against him, D. lost Antioch and a great part of Syria, and withdrew to Babylon. His army was soon after destroyed by the Parthians, and himself taken prisoner (B.C. 138). After a captivity of ten years he was re-established on the throne, but his soldiers and subjects having become disaffected, he was assassinated at Tyre, B.C. 125.—3. **D. Eucærus,** grandson of the preceding, held with his brother for a time the whole of Syria. War, however, broke out between the brothers, and Philip, having blockaded D. in his camp, compelled him to surrender at discretion. He remained in honourable captivity with Mithridates, King of Parthia, until his death. His coins bear date from 218 to 224 of the era of Seleucidæ, *i.e.*, from 94 to 88 B.C.

Demetrius, or **Dmitri,** son of Ivan IV. ('the Terrible'), Czar of Russia. On his father's death, in 1584, D. was exiled by Boris Godunoff to Ouglitch, and there died. The authorities proclaimed that he had killed himself in an epileptic fit, but the people believed he was assassinated by Boris, who usurped the throne in 1598, on the death of Fedor, Ivan's other son. The unpopularity of the usurper at length prompted a succession of romantic deceptions. Four persons came forward, two of whom declared themselves to be the son, and two the grandson of Ivan.

The *first* pseudo-D. appeared in 1603. He was a servant of Prince Adam Wizniowiecki, and was aided by his master, by the Palatine of Sandomir, and by Sigismund III., King of Poland. Boris had grown unpopular; and though he declared this D. to be an apostate monk, called Grishka Otrepiev, had to yield in 1604. D. ruled wisely, but his marriage with Marina, daughter of the Palatine, and his Polish leanings, cost him the throne. He was slain at Moscow in 1606, in a riot stirred by Prince Vassilii Shuiski, who became Czar.

The *second* impostor appeared in 1607, declaring himself to be D., and that he had escaped from the Moscow riot. He is said to have been really a Jew, but was accepted by Marina as her husband, and found supporters. He was put to death in 1610. A like fate befel the *third* pseudo-D., who pretended to be the son of the first. The *fourth*, who did the same, was executed at Moscow in 1613. These false Demetriuses have formed a favourite theme for poets and novelists; a dramatic fragment by Schiller deals with one of them. See Prosper Mérimée's *Épisode de l'Histoire de Russie.*

Demetrius, Phalereus, so called from his birthplace at the demos of Phalerus, was 'the Admirable Crichton of his time, the last of Attic orators, statesman, poet, and warrior.' D. was born B.C. 345, educated at the school of Theophrastus, and, on the death of Phocion (B.C. 317), placed by Cassander over the administration of Athens, which he conducted for ten years with so much success that the Athenians erected no fewer than 360 statues in his honour. Success, however, rendered him reckless; and on the approach of Demetrius Poliorcetes to Athens, B.C. 307, D. was compelled to flee. He lived for many years at the court of Ptolemy Lagi at Alexandria, and it is believed that by his influence the foundation was laid of the famous Alexandrian Library. The successor of Lagi sent D. into exile in Upper Egypt, where he died about 283 B.C. His works, which are enumerated by Diogenes Laertius to the number of fifty, have all perished.

Demetrius Poliorcetes. See ANTIGONUS.

Dem'i, or **Dem'y** (Fr. 'a half'), in heraldry, the upper, front, or dexter half, as a *D.-lion-rampant.* D. usually, but not always, indicates the dexter half *per pale* in inanimate objects.

Demi-Bas'tion, in fortification, a half-bastion, consisting of one face and one front, and usually terminating the faces of a crown-work or horn-work.

Demi'doff, a celebrated family of Russian capitalists, founded by **Nikita D.,** born a serf in Peter the Great's time. He amassed enormous wealth, first by the manufacture of arms, and then by Siberian iron-foundries, which he first established in 1699. He was raised to the rank of a noble in 1720, and left two sons, one of whom, **Akinfij D.,** worked still more extensively the metals of the Ural range, and established the ironworks of Nijni-Tagilsk, still the greatest in Siberia. In recognition of his labours and riches he was made Counsellor of State. See Spasskij, *Shisneopisanie Akinfija D.* (Petersb. 1833).—**Procopij, D.** (died 1786), son of the preceding, founded the School of Commerce at Moscow, which was removed to St. Petersburg in 1800.—**Paul Grigorjevich D.** (died 1821), nephew of Akinfij, was the founder of the D. Museum at Jaroslavl.—**Nikolaj Nikititch D.** (born 1774), nephew of the preceding, was both soldier and author. He raised a regiment against the French in 1812, and did good service. He died in 1828, and two years later his works were published at Paris under the title, *Opuscules d'Économie Politique et Privée.*—**Anatoli D.,** son of Paul, was distinguished as a literary man, a savan, and a philanthropist. Both Russia and other countries, especially Italy, in which he long resided, owe to him many useful educational and charitable institutions. A translation of his *Travels* was published at London in 1853. D. married Princess Mathilde, daughter of Jerome Bonaparte, in 1840, but their union was dissolved five years after. D. possessed one of the most splendid art collections in Europe. He died at Paris, 29th April, 1870.

Demi-Lune, in fortification, a work composed of two faces, forming a salient angle towards the outside of the fort, and intended to cover its curtain or wall, as well as the shoulders of the adjoining bastions. It is surrounded by a ditch, and has two demi-gorges near the counterscarp. See LUNETTE, RAVELIN.

Demir'-Hissar' ('iron castle'), a fortified town in Rumili, European Turkey, 46 miles N.E. of Salonica, with less than 3000 inhabitants. It takes its name from an old fort which crowns the hill at the foot of which it is built.

Demise', in English law, is the term applied to the conveyance of an estate in fee, or for life, or a term of years.

Demise of the Crown. By the law of England the sovereign never dies; for on the death of the reigning monarch the royal dignity vests, and the kingdom is *eo instante*, in legal language, *demised* to the heir to the crown.

Dem'isemi'quaver, in music, a note of which the duration is half that of a semiquaver, or one-eighth that of a crotchet. See NOTATION.

Dem′iurge (Gr. 'a workman,' lit. a workman of the *demos*, or people), according to the Gnostics (q.v.), was the creator of the world. All the Gnostics maintained a twofold creation; one evolved directly out of the Divine essence, and another produced by God's plastic power out of pre-existing matter—the framer of the latter lower creation not being the author of the higher world of animation, but the D., a being far inferior to the supreme God. Some believed the D. to be the representative of the supreme God on this lower stage of existence, and the highest of all emanations from his substance; others regarded him as absolutely hostile to God, and identified him with Jehovah, the God of the Jews. See Neander's *Kirchengeschichte*.

Demmin′, a town in the province of Pommern (Pomerania), Prussia, lies in the valley of the Peene, 75 miles N.W. of Stettin. It consists of D. proper, which is walled, and three suburbs; has manufactures of woollens, linens, hosiery, leather, and tobacco, distilleries and breweries, and a trade in corn and malt. D. is one of the oldest Slavic towns in Pommern, and as early as the time of Karl the Great is mentioned as an important seat of trade. In the fierce struggles between the Teutonic and Slavic race, that occupy a great part of the Middle Ages, D. suffered severely, and again in the Thirty Years' War. Pop. 11,462.

Democ′racy is a Greek word meaning the power or rule of the general body of the people, not of the mob or poorest classes. Thus at Athens there was a D. as distinguished from the tyranny of a noble family, and the oligarchy of a wealthy, priestly, or military class. But the Athenian D. did not contain the *metœci*, or the slaves. Nor among the free citizens who enjoyed the various political franchises and discharged the political duties was there complete equality of rights, any more than equality of conditions. The Solonian Constitution, as much as the Servian Constitution at Rome, recognised classes of citizens, whose rights, or some of them, were measured by their property. The degree in which the *demos* participates in the government of itself, directly or indirectly, is, however, not so fundamental a question as this—On what principle is the government conducted? It is of course humanly possible that even a despot could be found of sufficient intelligence and benevolence to ensure the happiness of the great mass of his subjects. But this is not sufficient for permanent security. The despot dying, either his son or an elected successor would reign, or there would be a revolution. In any event, there would be no indisputable record that government was to proceed according to the ascertained interests of the many; there would be no free constitution. Hence the argument of democrats is, that by the universal experience of history it has been found that constitutions in which the mass of the people has no power, direct or indirect, except the extremely indirect menace of revolution, have tended to the exaltation of the family or class having power, and to the debasement and denial of rights of the unenfranchised, unrepresented class. This is generally conceded, and hence the idea of representative government—viz., that the people are to govern themselves. In modern times the business of government has become so multifarious, and so much of it is entrusted to local machinery, by the permissive system, that the argument for D. as a means of elevating the moral tone and developing the mental energies of the people is very powerful. The great dangers of D. are a low grade of intelligence in the representative body, and in the popular opinion which controls it, and class legislation. This has always been a real difficulty in human affairs. No doubt one policy reconciles all the legitimate interests of a nation, but a social class may be as grievously in error about its own interests as about the interests of another class; it may even forget the interests of all other classes, and identify itself with the nation. These chances are increased when a class is not only numerically the strongest, but intellectually and morally the weakest. The commonest method of preventing these evils is the restriction of the suffrage to those whose material position is supposed to guarantee in some measure their moral and intellectual fitness for the franchise. Such a restriction rests on deeper grounds than the constitutional maxim, 'No representation, no taxation;' the unenfranchised must depend on the patriotism of those who represent the enfranchised. But D., as frequently practised, is unequal in favour of the predominant class which happens to be enfranchised. In all constituencies (which are not framed on a logical plan, but, as burghs, counties, &c., are the result of historical growth), very often only a numerical majority is represented, but the minority is never represented. Hence a vote of delegates returned on this principle may represent the wishes of an actual minority of the nation. The necessity of a representation of minorities is partly concealed by the fact that nowhere is the suffrage extended to all men and women in the area of voting. Another plan suggested for use in Great Britain is that of the three-cornered constituency, by which a minority, equalling or exceeding a third of the constituency, would be able, if it attempted no more, to return one out of three members, the voters having only two votes. Garth Marshall has advocated the cumulative vote, which has been successfully worked in school board elections. Such plans, however, leave untouched the case where a minority is made up of several constituencies. The most comprehensive suggestion on the subject is that of Thomas Hare. He takes as his unit of representation, not equal electoral districts (the plan which is being largely adopted in Europe and America), but the quota of electors reached by dividing the enfranchised population by the number of seats. Every candidate obtaining that quota would be returned, and every elector would be entitled to vote for all the candidates in an order of preference, his vote being counted for only one (Hare's *Treatise on the Election of Representatives*). This system of personal representation, as it is called, would entirely supersede the necessity of what have been called *fancy franchises*, viz., privileges of voting conferred on bodies who are supposed to have special intelligence or special interests to protect. The objections which have been made to it are chiefly practical: the suspicion to which the central office for analysing the votes would be exposed; and the risk of the American 'ticket' system, or mass-voting on a prepared list, being introduced. The fallacy consists in supposing that the entire voting would be revolutionised by a device which has for its object the special organisation of minorities. Hare's plan is in operation in Denmark (where it had been thought out independently by Andrae). It would probably be necessary to limit the number of secondary or contingent votes to be given. But so many strong beliefs and entire schools of thought are unrepresented by the present system, that probably some form of personal representation will ere long become general.

Democ′ritus, a celebrated philosopher, born at Abdera, in Thrace, about 460 B.C., disciple of Leucippus, travelled extensively in quest of knowledge, and after spending his inheritance, returned home in great poverty. He visited Babylon and Meroë, spent a considerable time in Egypt, and even, according to some, reached India and Ethiopia. He was a man of upright character, of great modesty and disinterestedness, and of such immense diligence and acquisitiveness, that he excelled in range of knowledge all the earlier Greek philosophers. For his worth and wisdom his fellow citizens greatly honoured him; while his sterling merit is said to have secured for him even the good opinion of the arch-scoffer Timon, whose tongue spared no man else. According to a tradition, he put out his eyes that he might pursue his studies unmolested; but it is much more likely that he lost his sight by severe application to study. From his irresistible inclination to look at the comical side of things, and to laugh at human follies, he acquired the name of 'the laughing philosopher.' He studied and wrote on physical science, mathematics, grammar, music, and philosophy; but only a few fragments of his voluminous writings remain. D.'s system of philosophy was an expansion of the atomic theory of Leucippus—that the universe, material and mental, consists of minute, indivisible, and impenetrable atoms. These atoms he assumes as the ultimate ground of nature; necessity as the cause of all existence. In other words, he ignores design, but admits the reign of law. Gods and men are alike the aggregates of atoms. This theory was adopted by Epicurus and ardently advocated by Lucretius. Inward peace, a conscience without reproach, freedom from fear and passion, he considers as the ultimate objects of human endeavour. D. died about 357 B.C. A good collection of the fragments of his writings was published by Mullach (Berl. 1843).

Demo′dex, a peculiar genus of mites, represented by the species *D. folliculorum*, which inhabits the sebaceous follicles of the human skin, especially near the nose. This parasite is of minute size and thoroughly harmless.

Demoiselle, the name of a species of Crane, sometimes known as the Numidian crane. This bird occurs in Africa, Asia, and E. Europe. Its graceful movements have procured for it its French sobriquet. Its height is about 3 or 3½ feet. The colour is a bluish-grey; the ear-tufts are white, and the head itself is a deep black colour. The breast has a tuft of deep iron-grey plumes, and the secondary feathers form a prominent upper tail, which droops over the primaries and tail-feathers. The nostrils are narrow. To this genus the Stanley crane of the E. Indies also belongs. The name D. is also given to the *Libellulidæ* or Dragon-Flies (q.v.).

Demoi′vre, Abraham, a mathematician, known best by the formula in analytical trigonometry which bears his name, was born at Vitri in Champagne, 26th May, 1667, but passed most of his life in England, where he had taken refuge after the revocation of the Edict of Nantes. The appearance of Newton's *Principia* stimulated his mathematical studies, and he soon acquired a high reputation in the science. An intimate friend of Newton, Leibnitz, and Bernouilli, he was nominated by the Royal Society to decide the famous controversy between the first two. D. died at London, 27th November, 1754. His chief works are his *Miscellanea Analytica* (1730), *Doctrine of Chances* (1716, 1738, 1756), *Annuities on Lives* (1724, 1740, 1750), and several memoirs in the *Philosophical Transactions.*

Demoli′tion, the art of destroying a structure, is part of the professional education of a military engineer. Under this head he is taught how to destroy works and buildings; what quantity of gunpowder or other explosive is required to blast masonry of a given thickness; how to determine the line of least resistance; and similar matters in military operations.

Demo′niacs, persons believed to be possessed by Demons (q.v.). It was the popular belief of the Jews (except the Sadducees) at the time of Christ, and of many other nations centuries before, that demons, especially the spirits of bad men, entered the bodies of men to torment them. It was believed that a man's soul could go in and out of his body during sleep, and also that demons could be drawn in with the breath, of which yawning and sneezing were proofs. Along with this there was the belief that diseases were due to supernatural causes; a belief which had two phases; first, that diseases, pestilences, &c., were due to the anger of God (2 Sam. xxiv. 15); and secondly, according to dualistic ideas (see DEVIL), that these were the work of the devil and his agents. So firm a hold had this belief on the human mind, that it was not till the 17th c. that it even began to be checked by writers on medical science. From the fusion of these two beliefs resulted a firm conviction that those diseases especially which were more mysterious in their symptoms, as insanity, epilepsy, St. Vitus's dance, dumbness, &c., were caused by demons who had their abode in the persons afflicted.

In the New Testament Christ is represented as 'casting out demons;' and as science now finds it difficult to recognise in the manifestations of the infirmities of D. any evidence of a superhuman cause, except in the sense in which all things are *originally* of divine origination, various interpretations of the cures have been offered, of which the most rational is that the language used concerning them represents the popular belief, probably that of the evangelists too, who looked at the phenomenon only from a *religious* point of view, and is therefore not to be interpreted as inculcating scientific knowledge. After all has been said that can be said on the scientific side, it remains credible that physical evil had its primary origin in *sin*, and sin—apart from personality—is a meaningless term.

De′mons (Gr. *daimones*, 'divine intelligences,' 'deities') are evil spirits; but that they are exclusively evil is peculiarly a Christian notion. By pagan writers the word was applied to every order of beings superior to man, or was confined to the inferior deities, or to a class of beings between gods and men, some of whom were benevolent and some malignant. The dualistic idea (see DEVIL) of the Indians, Persians, Egyptians, &c., was not known to the Israelites in the earlier stage of their religious development. Jehovah was the author of all evil as well as all good (Isa. xlv. 7). The plagues and disasters, and even the temptations of men, were all the work of God and his angels (Exod. vii. 3; 2 Sam. xxiv. 1). In the apocryphal books the influence of Persian and Alexandrine ideas is unmistakably apparent in the increasing abundance of good angels and their development into a hierarchy, and perhaps even more plainly in the belief in wicked spirits. The earliest form of the belief that these were *fallen* angels appears in the Book of Enoch. Satan by this time had a distinct kingdom and a residence in the subterranean hell, from which tens of thousands of fiends constantly streamed obedient to his behests. Their favourite haunts were deserts and wildernesses, but there they grew weary, and as they wandered about finding no rest, their great resort was to take up their abode in a human body. See DEMONIACS.

In the New Testament there is distinct reference to a hierarchy of evil spirits as well as of angels (Eph. vi. 12, &c.); and the figurative language of St. Paul (1 Cor. x. 20), in speaking of the heathen gods as devils, perhaps led to the theory of later writers that they were literally D. At any rate the whole heathen Pantheon was transformed into a Pandemonium. The belief in a parallelism between the powers of light and the powers of darkness also multiplied devils to match the multiplication of saints. These holy men were continually assailed by them, but were uniformly able to vanquish them by the sign of the cross, a drop of holy water, or an appeal to the Virgin. The period including the 13th and four succeeding centuries has been called 'the devil's own,' from the extent to which the belief in evil spirits then prevailed. Every destructive or terrifying phenomenon of nature, every pain or disease which afflicted man or beast, every accident, the most trifling as well as the most serious, all were the work of the devil, his imps, or his agents. (See WITCHCRAFT.) In a book published about the middle of the 16th c., giving the popular notions regarding the infernal hierarchy (Weir's *Pseudomonarchia Dæmonum*), seventy-two princes are named, and their subjects estimated at 7,405,926 devils. See Lecky's *History of Rationalism in Europe* (1865); Maury's *Histore de la Magie* (Par. 1860); Farrar's *Life of Christ* (1870).

Demonstra′tion (Lat. *demonstrare*, 'to point out'), in mathematics or logic, is the process by which a result is shown to be a necessary consequence of pre-established premises.

Demonstra′tion, an exhibition of military force to check or deceive an enemy, and by causing a division of his troops, to weaken him at a point where the real attack is intended.

De Mor′gan, Augustus, the son of Colonel De M. of the Madras army, was born on the island of Madura, near the coast of Java, 27th June, 1806. He entered Trinity College, Cambridge, in 1824, and took his B.A. degree as fourth wrangler in 1827. In 1828 he was elected Professor of Mathematics in London University, an office resigned in 1831, but resumed in 1836, and held till his death 18th March, 1871. His extensive knowledge, combined with his clear, logical, and, when necessary, sarcastic style of writing, rendered him a powerful controversialist. He wrote a treatise on almost every branch of pure mathematics, on arithmetic, algebra, trigonometry, probabilities, &c., and his *Differential and Integral Calculus*, published by the Society for the Diffusion of Useful Knowledge, is the most complete treatise on the subject ever produced in England. His numerous articles in the Penny Cyclopædia make up nearly one-sixth of the whole twenty-seven folio volumes. His *Budget of Paradoxes*, which originally appeared in the *Athenæum*, is full of quiet chuckling humour. His treatment of the most celebrated claimants to the discovery of perpetual motion and the squaring of the circle is particularly delightful.

Demos'thenes, the greatest orator of antiquity, and one of the noblest characters in history, was born in the Attic borough of Pæania, B.C. 385. When he came of age, he prosecuted his guardians for their mal-administration of the property bequeathed by his father, and, after much delay, obtained a verdict against them, with ten talents (£2400) damages. Stimulated by his loss of fortune, and encouraged by his success in the courts, D. devoted himself to a public career, and assiduously strove to overcome the physical disadvantages of his feeble constitution and stammering speech. In 358 B.C., Philip of Macedonia commenced the attack on the northern allies and possessions of Athens, which was his first step towards the overthrow of the liberties of Greece. The unflinching and patriotic, though unsuccessful, opposition of D. to the Macedonian aggression is embodied in his famous orations against Philip, the first of which was delivered, B.C. 352; and in the three Olynthiac orations he endeavoured to avert the fate of Olynthus, which fell before Philip, B.C. 348. The peace of Philocrates followed, from the benefits of which the unhappy Phocians were basely excluded, and Philip passed Thermopylæ. Notwithstanding the opposition of Athens, he became a member of the Amphictyonic League, and steadfastly pursued his plans for the subjugation of Greece. He was elected general-in-chief of the Amphictyonic army, B.C. 339, and, in the next year, Greek independence was completely destroyed in the disastrous battle of Chæroneia. Æschines, the rival of D., and the leader of the Macedonian party in Athens, endeavoured to prove the illegality of the proposal of Ctesiphon, that D. should receive a crown in recognition of his noble public career; and D. triumphantly replied in an oration that has been justly ranked as the masterpiece of ancient eloquence. The death of Philip, B.C. 336, and of Alexander, B.C. 323, afforded delusive grounds of hope to the Greek patriots; and on the latter event D. was recalled from the exile into which he fled when punished for his alleged protection of the rebel Harpagus. The Macedonian power, however, was still in the ascendant. Antipater marched to Athens, and D. fled to the temple of Neptune, in the island of Calaurea, where he took poison, and died, B.C. 322.

Demot'ic Alphabet. See HIEROGLYPHICS.

Demot'ika, a town in the vilayet of Adrianople, province of Rumili, European Turkey, 22 miles S. of Adrianople, with manufactures of silks, woollens, and pottery. It is defended by a citadel, and contains a palace, in which several Sultans resided before the Turks captured Constantinople. Karl XII. of Sweden found an asylum here for some time after his defeat at Pultowa. Pop. 14,080.

Dem'pster, Thomas, a learned professor and voluminous writer, was born at Muiresk, Aberdeenshire, about 1579, and educated at Aberdeen and Cambridge, whence he repaired to France. Here he assumed the title of Baron of Muiresk, and obtained a professorship in the College of Beauvais, which was afterwards exchanged for one at Nîmes. Repairing to Italy, he taught first at Pisa and afterwards at Bologna and at Butri, in the neighbourhood of which he died, 6th September, 1625. The best known of D.'s works is his *Historia Ecclesiastica Gentis Scotorum* (1627), which, though in some respects a valuable and learned work, is justly discredited on account of its deliberate falsehoods and misrepresentations. A reprint was made for the Bannatyne Club in 1829.

Demul'cents (Lat. *demulceo*, 'I soften') are medicines for internal use, taken for the purpose of lubricating the mucuous membranes when these are inflamed. D. are given for inflammation of the stomach, the air passages, &c. Examples—Mucilage, marsh mallow, and linseed tea.

Demurr'age (from the Fr. *demeurer*, Lat. *demorari*, 'to delay'), in mercantile law, is the allowance paid by the exporter or importer of goods to the owner of the vessel, when it is obliged to wait beyond her *levy* or *running* days (days allowed to load or unload a ship), either before or after the voyage, or while she is waiting for a convoy. During loading or unloading, the risk of delay lies with the freighter; after loading or unloading, it is with the shipowner. Rate per day of D. is usually stipulated for in the charter-party.

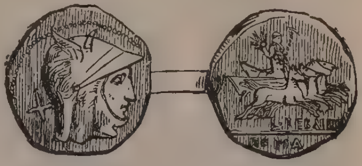
Demurr'er, an English law-term, denoting a legal difficulty which must be determined by the court before an action can go further. A D. therefore is an issue on a point of law. It concludes an allegation, but denies or questions the inference sought to be drawn from it. D. is usually taken advantage of in civil matters, although it may be resorted to in criminal proceedings.

Demy', a size of paper frequently referred to. For printing paper it measures 22½ inches by 17½; for drawing, writing, and account-book papers, 20 by 15½. D. blotting-paper is 22½ inches by 17¾.

Denain', a town in the department of Nord, France, on the left bank of the Scheldt (here navigable), and 6 miles W. of Valenciennes. It occupies the centre of a coalfield, and coal and iron are extensively raised. D. has several blast-furnaces. Pop. 18,258.

Den'ary Scale. See NOTATION.

Denar'ius (Lat. *deni*), the principal silver coin among the Romans, was first coined, B.C. 269. It originally contained ten, and afterwards sixteen *asses* (see AS), and was in value equivalent to about 8½d.



Roman Denarius (exact size).

Denbigh (Welsh *Din-bach*, 'little fortress'), the capital of Denbighshire, near the centre of the vale of the Clwyd, 30 miles W. of Chester. It is situated on the sides and at the base of a limestone hill, which is crowned with a ruined castle, built in 1284 by Henry de Lacy, on the site of one still more ancient. D. consists mainly of one street. There is a free grammar school (1727), an orphan school for 55 girls, founded in 1860 with funds left in 1540, and a church, St. Mary's (1875), built at a cost of £11,000. Leather, wool, shoes, and gloves are manufactured. D. unites with Ruthin, Holt, and Wrexham in returning one member to Parliament. Pop. district of parl. bors. 24,216; reg. sub-dist. 9023; mun. bor. 6412; and civ. par. 4507.

Den'bighshire, a maritime county of N. Wales, having the Irish Sea on the N., Flint, Chester, and Salop on the E., Caernarvon on the W., and Montgomery and Merioneth on the S. Chief towns are Denbigh, Wrexham, Llangollen, and Ruabon. Its general character is mountainous, but in the N. there are some level tracts, and the vales of Llangollen, of the Conway, and of the Clwyd are noted for their beauty and fertility. On the hills sheep, ponies, and goats are reared; barley, oats, and potatoes are grown on the uplands; and the valleys produce heavy wheat and pulse crops. Of the 424,435 acres, representing the total area of land and water in D., 51,779 acres are under Corn Crops (oats 28,272), 14,312 under Green Crops (potatoes 3383), 38,169 under clover, sainfoin, and grasses in rotation, and 167,399 under permanent pasture, &c. Bare fallow is estimated at 487 acres, and Small Fruit is cultivated on 525. Mountain and heath-land account for 61,955 acres, while 20 are laid out in Nursery Grounds, and 17,961 are occupied by Woods and Plantations. The chief mineral products are coal, iron, slates, lead, and copper. D. possesses numerous British remains of the Roman period or earlier, as tumuli, barrows, forts, &c. To later times belong Offa's Dike, and Watt's Dike which runs parallel to it on the E., works consisting of a ditch, with forts at intervals, and constructed to protect the English of Mercia from the irruptions of the Welsh. Area 662 sq. miles; pop. anc. county 117,872; adm. county 118,843; and reg. county 116,698. D. is divided into two parl. divs., each of which returns one member; eastern pop. 47,317; western pop. 46,339.

Den'derah (the *Tentyra* of Strabo, and the Coptic *Tentoré*, Thy-n'-Athor, *i.e.*, the abode of Athor, a contracted form of Aphrodite), a ruined town of Upper Egypt, on the left bank of the Nile, celebrated for its temple, the best-preserved structure of its kind in the land. It was dedicated to Athor, and its oldest portion dates from the period of the later Ptolemies. It contained sculptured portraits of Cleopatra and her son Cæsarion, and the names of the Cæsars from Tiberius to Antoninus Pius (A.D. 14—161). It is 220 feet long by 50 broad, and has a portico (erected by Tiberius) supported on twenty-four columns, ranged in four rows, with quadrangular capitals. On the ceiling of the portico is the sculpture called by the French savans the zodiac of Tentyra, which seems to represent mythological and emblematic figures.

Ruins at Denderah.

A smaller sculpture of mythological figures on the ceiling of one of the lateral chambers was, in 1821, by the permission of Mehemet Ali, cut out by Lelorrain, and brought to the Paris Museum. Other buildings were a temple of Isis and a Typhonium, all enclosed with a brick wall, in some parts 35 feet high and 15 feet thick, forming a square with a side of 1000 feet.

Den'dermonde ('the mouth of the Dender'; Flem. *Termonde*), a town in the province of E. Flanders, Belgium, at the confluence of the Dender and the Scheldt, 18 miles E. of Ghent by rail. It has a citadel built in 1584. The church of Notre Dame contains two pictures by Vandyk. Principal manufactures, woollens, lace, pottery, &c. By opening sluices of the rivers, D. compelled Louis XIV. to raise the siege in 1667, but it was taken by Marlborough in 1706, and again by the French in 1745. Pop. 9298.

Dendrer'peton (Gr. 'the tree-lizard'), a genus of fossil and extinct Amphibians, belonging to the order *Labyrinthodontia*, and found within the trunks of *Sigillariæ* (q.v.), or certain fossil trees in Nova Scotia. The genus is founded on several small bones discovered in a *Sigillaria* trunk, two feet in diameter, and wholly converted into coal. D., according to Owen, shows affinities with *Archegosaurus* (q.v.), from the plicated structure of the teeth, the sculpturing of the cranial plates, and the relations, size, &c., of the bones of the limbs.

Den'drite (Gr. *dendrites*, having the property of a *dendron* or tree), the name applied to the hydrous oxide of manganese, occurring in limestones, trachytes, and other rock-substances, and which from its peculiar branching or plant-like crystallisation is sometimes mistaken for fossilised plants and mosses.

Dendrograp'sus, an important fossil genus of *Hydrozoa* (q.v.) or Zoophytes, exclusively found in the Upper Cambrian and Lower Silurian rocks. The species of this genus have been referred by palæontologists to the modern order of the *Sertularidæ* (q.v.), or 'sea-firs,' as well as to the extinct order of the *Graptolitidæ*, or Graptolites (q.v.). *D. Hallianus* is a familiar species, and exists in the form of a plant-like organism, springing from a stout footstalk, which was probably attached to some fixed object, like our modern zoophytes. The branches bear on one side a series of cups or *cellules*, resembling the 'thecæ' of living sea-firs, each of which cups must have contained a little *polypite*, or single member of the zoophytic colony. In D. the cups, like those of graptolites, partially overlap each other.

Den'drolite (Gr. 'tree-stone'), a general term applied to the fossilised trunks of trees, characteristic more especially of the Carboniferous age. The trees belong to various groups of the vegetable world, but chiefly to the acrogenous and endogenous divisions of the plant kingdom. Since the more intimate study of fossil botany or *Palæophytology* has been undertaken, fossil plants of all kinds have been directly referred to their respective groups; and the use of such collective and general terms as D. is now greatly done away with.

Dendrophyll'ia, a genus of compound *Sclerodermic* (q.v.) corals belonging to the *Zoantharia Sclerodermata*, and ranked among the 'deep-sea' corals and reef-building forms. The species of D. derive their name from their branching tree-like shape. *D. nigrescens* is a familiar species. It is regularly branched, possesses deep cells, and the tentacles of the polypes are cleft or divided in a longitudinal manner. It is found in the tropical seas.

Den'drophis (Gr. 'tree-snake'), and **Dendroph'idæ** a genus and family of Colubrine (q.v.) snakes, so named from their habit of frequenting trees. In this family, which occurs in Africa and S. America, the body is long and slender, five-sided, and the upper jaw is larger than the lower. The *scuta* or head-shields are long and regular, and the scales are narrow. *Bucephalus* and *Ahætulla* are familiar genera.

Deneb', a brilliant star of the first magnitude, in constellation Cygnus, forming with Vega and Polaris an evident right-angled triangle. Near it is the small double star 61 of Cygnus, interesting as having a large proper motion, and being one of the nearest stars to our system—according to Bessel 650,000 times more distant than the sun is from the earth.

Den'gue [*Kisuaheli*, E. African, from *ki-dingi*, the prefix *ki* being the diminutive or personal form. The term *dinga* is now obsolete in E. Africa, except as the designation of this disease; and as such it is used with the word *pepo*, an evil spirit. 'D.' or 'Denge' is a Portuguese form of the E. African term *kidinga-pepo*, signifying a disease marked by the sudden accession of cramp-like pains, which are supposed by the natives to be caused by an evil spirit]. *D. scarlatina rheumatica* has been defined as 'a peculiar febrile disease conjoined with sudden severe pains in the small joints, which swell, succeeded by general heat of skin, intense pain in the head and eyeballs, and the appearance of a cutaneous eruption on the third and fourth day.' D. has occasionally appeared as an epidemic disease in the E. and W. Indies, the Southern U.S., the ports on the Gulf of Mexico, and even as far N. as New York. In America it is called the *Break-bone Fever*, and was epidemic there in 1824-28, 1847, 1850, and 1860. The disease has probably been derived from E. Africa in connection with the slave trade. D. has never appeared as an epidemic in Europe. The latest epidemic of D. broke out at Zanzibar in 1870, and spread thence over Arabia, India, and China along the lines of human intercourse. D. is usually accompanied with obstinate constipation. Quinine has no influence over the disease, except during the febrile stage, but the exhibition of iodide of potassium is attended with the most favourable results. The disease has been described by Drs. Twining, Mouat, and Goodeve, and since then by Dr. Christie, of Zanzibar (*Trans. of the Med. and Phys. Soc.*, Bomb. 1871).

Den'ham, Sir John, an English poet, was the son of the Chief Baron of the Exchequer in Ireland, and was born at Dublin in 1615. After an education at Cambridge, he studied law in Lincoln's Inn. In 1641 his tragedy of *The Sophy* appeared, and was hailed with plaudits which are now as forgotten as the play itself. '*Cooper's Hill*, a pleasant descriptive poem still worth reading, was produced in 1643. Previously to the Restoration, D. had to leave England, but his later life was prosperous, and spent in the King's service. He died 10th March, 1668. Pope's praise has made D. a permanent name in English literature; and those to whom the smooth vigour of *Cooper's Hill* is quite unknown still remember the line—

> 'Where Denham's strength and Waller's sweetness join.'

Deni'al, in law, imports no more than *not confessing*. It does not amount to a positive assertion of the falsehood of that which is denied. The term for D. is usually *traverse*. See CONFESSION, CONFESSION AND AVOIDANCE, CONFESSION, JUDGMENT BY.

Deni'na, Carlo Giovanni Maria, a well-known Italian historian, was born at Revello, in Piedmont, 28th February, 1731. He studied at Turin, and in 1754 was appointed Professor of Humanity at Pignerolo, but lost his seat by writing a comedy which offended the clergy. Subsequently D. was appointed Professor of Rhetoric in Turin University. This office he lost by giving provocation to the monks in his *Discorso sull' Impiego delle Persone* (Flor. 1777), and being banished from Italy, he went, in 1782, on the invitation of Friedrich the Great, to Berlin. There D. lived and wrote till 1804, when Napoleon appointed him his librarian. D. died at Paris, 5th December, 1813. He was the author of numerous works, mainly historical. D. also wrote a heroic poem, *La Russiade* (Berl. 1799-1800), in honour of Peter the Great.

Denis, St., a town in the department of Seine, France, on the rivulets Croud and Rouillon, 6 miles N. of Paris, and within the outer line of the fortifications. The Abbey Church, built by Dagobert I. on the site of the chapel that covered the remains of St. D., became the mausoleum of the kings of France. The National Convention decreed its destruction in 1793, when its tombs were rifled, and the royal dust thrown ignominiously into ditches. Napoleon I. commenced its restoration, which was completed by successive governments, with so much care that it is now one of the most splendid ecclesiastical structures in France. The crypt contains statues of the French kings from Hlodowig to Louis XVI. St. D. has dyeworks, printfields, bleacheries, flour-mills, and chemical works, and an active inland trade. Pop. town 50,992; arrond. 403,956.

Denis, St., or **Denys, St.,** the patron saint of France, the founder of the Gallican Church, and the first Bishop of Paris, was a Christian missionary who came from Rome to Lutetia (Paris) in 251, where, after making many converts, he was martyred by command of the Roman governor, Pescennius. His body was taken from the Seine by a heathen lady, Catulla, who became a Christian, and buried the saint in her garden, on the spot where the Abbey of St. D. (q.v.) now stands. D. has been confounded with Dionysius the Areopagite (q.v). The *Acts of St. D.* are a forgery of the 7th or 8th c. *Mountjoye St. D.*, was long the war-cry of France. See De Launoy's *De Duobus Dionysiis*.

Deni'zen (Old Fr. *deinzein*, one who is *deins;* Mod. Fr. *dans;* Lat. *de intus*, 'from within,' *i.e.*, 'the city') was an alien born who had obtained letters of denization, which entitled to purchase and transmit lands, though not to inherit them. The right to grant letters of denization was a prerogative of the crown. See ALIEN.

Deniz'li, a town of Asiatic Turkey, vilayet of Aidin, 100 miles S.E. of Smyrna, has many large bazaars, and some manufactures of leather (morocco), silks, articles of dress, &c.

Den'mark (Dan. *Danmark*), the smallest of the three Scandinavian kingdoms, in the N. of Europe, embraces the peninsula of Jutland, and the islands Zealand, Möen, Fünen, Laaland, Falster, Bornholm, Faröe, &c. It is bounded N. by the Skagerak, an inlet of the N. Sea, E. by the Cattegat, the Sound, and the Baltic, S. by Slesvig, and W. by the North Sea. Its lat. extends from 54° 32′ (Gjedserodde, the S. point of Falster) to 57° 45′ N. (Cape Skagen in Jutland), and its long. from 8° 5′ (Blaavands Huk, 'the horn,' on the W. of Jutland) to 12° 45′ E. (the island of Saltholm in the Sound). The divisions, areas, and populations are as follow:—

Counties.		Area in sq. miles.	Population.		Chief Town.
In Jutland—					
	Hjörring	9,743	110,361	942,120	Frederikshavn.
	Aalborg		104,490		Aalborg.
	Randers		110,444		Randers.
	Thisted		69,407		Thisted.
	Ringkjöbing		98,623		Ringkjöbing.
	Viborg		100,777		Viborg.
	Aarhus		157,191		Aarhuus.
	Veile		111,904		Veile.
	Ribe		78,623		Ribe.
In the Islands—					
Zealand	Frederiksborg	5,024	84,684	917,401	Helsingor.
	Copenhagen		152,706		Copenhagen.
	Holbek		94,235		Holbek.
	Sorö		88,990		Skagelso.
	Præstö (includes Möen)		100,649		Præstö.
	Bornholm		38,761		Rönne.
Fünen	Odense		136,117		Odense.
	Svendborg		120,707		Svendborg.
	Maribo (Laaland and Falster)		100,552		Maribo.
City of Copenhagen		7·7		312,859	
Faröe Islands		514		12,782	
Total		15,288·7		2,185,162	

The great island groups lie to the S.E. of Jutland, and in the entrance to the Baltic. By far the largest island is Zealand, separated from the Swedish coast by the sound (*Ore Sund*, 'Ear Sound,' from its shape), which narrows to 24 miles at Helsingor. In the Sound are the islands Amager and Saltholm, and to the S. of Zealand lie Möen, Falster, Laaland, and several of smaller size. The Great Belt passes between Zealand and another group, consisting of Fünen (*Fyen*), Langeland, Arrö, Taasinge, &c. To the N. of the Fünen group are the islands Hesselö, Seierö, Samsö, Hjelm, Thunö, and Endelave, and to the N., in the Cattegat, Anholt, Läsö, and Hirsholm. These islands have generally rugged, rocky coasts, and are pointed in a southerly direction. Some 95 miles E. of Zealand is the solitary island of Bornholm. D. has an entire coast-line of 3855 miles. Copenhagen (q.v.) is the capital, and chief among the other towns are Aarhuus, Randers, Odense, and Helsingor. Foreign possessions are Iceland, Greenland; St. Croix, St. Thomas, and St. John, in the W. Indies. Estimated pop. of colonies, 116,599.

General Aspect.—The surface of mainland and islands alike is singularly flat, and is elevated but little above the level of the sea. The greatest heights in Jutland are Himmelsberg (530 feet) near Silkeborg, and Eiers-Bavnehöi (522 feet) in a central sandy range forming the watershed between the N. Sea and the Baltic, and terminating in the extreme N. in Cape Skagen, or Skagen's Odde. In the W. of the peninsula there are stretches of sandy heath (*dunes*) and swampy morass, alternating with more or less fertile parts. The E. is a rich corn-land of fine valleys, with here and there forests of beech, elm, birch, alder, and pine. Zealand is also well wooded, and in the S. is very productive. D. is richly watered by small streams, of which the most important are the Guden-Aa (87 miles), entering the Baltic Sea near Randers, and the Ribe-Aa, Varde-Aa, and Stor-Aa, flowing into the North Sea. There are numerous lakes, as the Arre, Fure, Esrom in Zealand, and the Fjil, Tastum, Lang, Juul, Mos See, &c., in Jutland, none of which are of any great depth or size. The coast is greatly indented, and is generally sandy and shelving; the inlets, or fjords, occasionally form good harbours. In the N. of Jutland, Hjorring and Thisted have been insulated by the Lymfjord breaking through the isthmus Harboöre-Tange into the North Sea (in 1825). The principal inlets besides the Lymfjord are the Isefjord in the N. of Zealand, the Odensefjord or Stegestrand in Fünen: and on the E. of Jutland the Mariagerfjord (20 miles long), the Randersfjord (15 miles), the Horsensfjord (10 miles), and the magnificent Veilefjord, which can admit ships of war. The Lymfjord, which is the most extensive of these arms of the sea, varies in depth from 27 to 53 feet, and sends off several branches, as the Aggersund, Skivefjord, Hjarbukfjord, Feggesund, Vilsund, &c. It contains the islands Mors, Fuur, Livö, Oland, &c., and its waters, which are saltish, are subject to a regular tide. The W. coast of Jutland is one of the most dangerous in the world to shipping, owing to its shifting sandbanks and frequent mists (*Havgufen*). In the N. it forms the expansive Bays of Tannis and Jammer, and further S. is broken by the Lymfjord, Nissumfjord, Stadilfjord, and Ringkjöbingfjord. The most northerly of the N. Frisian islands, Fanö, Manö, &c., which belong to D., lie off the coast of Ribe.

Climate, Geology, Botany, &c.—The climate of D. is somewhat severer than that of Britain, but milder than that of N. Germany. It is free from violent extremes. From March to September winds from the W. and N.W. prevail; during the other five months S.W. and W. are the most common winds. The cold piercing N.W. wind, which, in the beginning of the year, sweeps over the N. of Jutland and along the W. coast, is called the Skai. For about one-fifth of the year (69 days) the sky is quite clear; in winter the W. districts are frequently shrouded in thick mists. In the course of the year Copenhagen has 157 days of rain, and a fall of 23 inches; Ringkjöbing on the W. coast of Jutland has 200 days and a fall of 29½ inches. The former of these places is fairly representative of the rest of D., and has a mean temperature of 31°·1 F. in winter, 43°·7 in spring, 63°·5 in summer, and 49°·1 in autumn. With the exception of Bornholm, which is partly covered with volcanic rocks, like the adjoining coast of Sweden, D. consists almost entirely of Tertiary formations. Chalk comes to the surface in Möen, in the S. of Zealand, and in many parts of Jutland. D. is singularly devoid of minerals. Bornholm yields annually some 40,000 tons of an inferior coal, but peat is the fuel in general use. Blue marble, sandstone, and potters' clay are found in various parts. On the W. coast of Jutland there is a slight yield of amber. The subsoil usually consists of layers of dark-blue clay (*blaalaer*), or beds of peat-moss. On several of the islands the clay is of a reddish colour, being mixed with fine sand. It is generally rich in vegetable remains, but contains no trace of large land animals. The upper soil contains much sand, and is often of a fine gravelly nature. In the islands, and in parts of Jutland, there are tracts of rich marshy loam, composed chiefly of bituminous marl. D. is on the whole a fertile country. Some three-fifths of the inhabitants are engaged in agriculture. The most productive parts are Möen, Laaland, Falster, Zealand, and Fünen; the W. of Jutland has been greatly improved by assiduous cultivation during the last twenty years. The annual produce is averaged at 26,400,000 bushels of oats, 18,500,000 of rye, 4,500,000 of wheat, 20,700,000 of potatoes, and 17,500,000 of barley. There is also some production of hemp, lint, and tobacco. In the S. of Zealand, Möen, and Fünen gardening is a favourite occupation, and the chief fruits produced are apples, pears, cherries, &c. The indigenous vegetation is almost identical with that of N. Germany. Of the 9,352,761 acres (exclusive of lakes and rivers), which are the area of the country, 559,256 are occupied by woods and forests, while 3,029,404 are under corn crops (oats, 1,050,456, and wheat only 119,691); 128,849, under potatoes; 5599, under flax, hemp, hops, caraway seeds, and tobacco; 456,585, under clover and grasses in rotation; and 2,625,865, under meadow and permanent pasture. Gardens occupy 69,737 acres, and 637,696 are under bare fallow. In 1894 the wheat crop was valued at £520,425; rye, barley, and oats at over 7¾ millions; beetroot at £168,670; clover and hay at 2¼ millions; and potatoes at £1,693,082.

Zoology.—The wild animals of D. have almost entirely disappeared since the decline of the large forests. The wild boar, however, still exists, and among the animals that abound are the deer, the polecat, the fox, the hare, &c. All the ordinary domestic animals of Europe are reared successfully. Jutland has a celebrated breed of horses, admirably adapted for light cavalry. Great attention is paid also to the rearing of horned cattle, and there is a fair export of live stock and horses. In 1893 and 1894, owing to the closing of the English market in 1892, no cattle were exported to Great Britain, but 65,439 sheep and lambs, and 1802 horses were landed at British ports. Of birds, the chief are the eider-duck, wild-goose, partridge, thrush, and snipe. The Lymfjord abounds in swans. From 60,000 to 70,000 men are engaged in the fisheries, and among the fish caught are the turbot, torsk, salmon, herring (*stromming*), mackerel, cod, flat-fish, and eels. Along the E. of Jutland occur large oyster-beds.

Industries and Commerce.—As might be expected from the comparative absence of coal and iron, the manufactures are few and of no great importance. As a rule, the peasantry are self-supplied with the ordinary articles of clothing and furniture. Copenhagen is the chief seat of the manufactures, which are mainly silks, cottons, leather, porcelain, tobacco, and chemicals. Randers is the centre of the glove industry, and Tondern is noted for its lace. There are also large breweries, distilleries, paper-factories, sugar-refineries, &c. D. has an admirable position for commerce, lying in the great trading highway of N. Europe. Its trade is chiefly with Germany, Great Britain, Sweden, Russia, Brazil, France, the United States, and the W. Indies. The principal exports are cattle, prepared meats, grain, flour, hides, leather, and gloves; imports, coffee, raw metals, coal, worsted, and cotton goods, oilcake, dye-stuffs, sugar (beet), raw tobacco, and timber. The imports, in 1893, were estimated at £17,794,161; and the exports in the same year were valued at £13,061,996. The merchant navy consists of about 3500 vessels, a very large proportion being vessels under 300 tons.

Railways and Finance.—In the absence of good roads the railway system in D. is of greatly increased importance. It now extends throughout Jutland to Aalborg and Frederikshavn in the N., and is connected with the Slesvig-Holstein Railway, while Fünen, Zealand, and Falster are also traversed by lines of various lengths. In 1894 there were open 1292 miles of railway and 3674 miles of telegraph lines transmitting over a million messages. There are also many important canals. The budget revenue for 1895-96 was £3,485,773; the expenditure, £3,431,524. In 1893-94 there was a deficit of £226,511. The cental system of coinage was adopted on the 18th of January, 1875. Of this system the unit is the *öre*, of which 100 make a *krone* (crown), 18 of which are equal to the English pound sterling. The English *ton* has also taken the place of the old *taēst* as the unit of tonnage.

Government, Army, Navy, &c.—According to the Liberal constitution of 5th June, 1849, modified in 1855 and 1863, but restored in an amended form on 28th July, 1866, D. is governed by a hereditary monarchy, and by a National Assembly or *Rigsdag*. Executive power is vested in the king, who must belong to the Evangelical Lutheran Church, the religion of the state, and his responsible ministers. The Rigsdag is composed of two Houses—the *Landsthing* (Senate), a body of sixty-six representatives of the wealthier classes, of whom twelve are chosen for life by the king, the others being elected for eight years; and the *Volksthing* (House of Commons), consisting of one hundred and two members (one to every 16,000 of the inhabitants), elected for three years by universal suffrage. During the annual session of the Rigsdag, a financial budget is submitted by the ministry. Each member of the Rigsdag receives 6s. 8d. a day, together with his travelling expenses to and from Copenhagen. The Senate appoints from its members assistant judges to the Supreme Court (*Höiesteret*), which sits in Copenhagen, and which admits appeals from all the lower courts. Civil cases are tried primarily before courts of conciliation, composed of persons of local position and influence. For army, &c., and navy, see articles ARMIES, MODERN, and NAVIES, MODERN.

Ethnography, Religion, and Education.—The Danes belong to the Scandinavian branch of the Teutonic family. They are a strong, muscular people, with regular features, light hair, and blue eyes. In disposition they are patient and plodding, and are rather distinguished for sincerity and sense than for wit or sprightliness. The established religion is Evangelical Lutheran, but complete toleration prevails. The Reformed religion, to which the king must adhere, was introduced in 1536. There are seven bishops, who are nominated by the king. In 1890 there were of other creeds 4080 Jews, 3647 Roman Catholics, 941 Mormons, 4556 Anabaptists, &c. Education is compulsory for children between the years of seven and fourteen, and the system is in many other ways admirable. Every adult in the kingdom is said to be able to read and write. The number of state or parish schools is 2940, while there are also 53 lyceums, many academies, and training colleges for teachers in the public schools. Besides the university (founded 1478), with its 40 professors and 1300 students, the capital has a military high-school since 1830, an academy of agriculture and veterinary science, with 22 professors, and an art academy (7 professors), founded in 1754. A college of pharmacy was founded in 1892, with 7 teachers.

History.—It is probable that some part of Jutland was the original home of those Cimbri (q.v.) who, along with the Teutones, ravaged Gaul and threatened Italy in the time of Marius (B.C. 113-101). At any rate, the peninsula was known to Roman writers under the name of the *Chersonesus Cimbricus.* Of this prehistoric period there are many interesting remains, as tumuli, cromlechs, &c., which have been carefully examined by the antiquarians of N. Europe. From the S. of Jutland, as well as from the N. of Germany, came those Saxons, Angli, Frisians, and Jutes, who, in the 5th and 6th centuries, invaded and possessed the island of Britain. Their numerous emigrations, extending over more than a hundred years, greatly depopulated the peninsula, into which now poured the Danes, who had hitherto been restricted to Zealand and part of the Swedish coast. These new comers subdued the whole mainland as far S. as the Eyder on the Saxon border, and formed among themselves a group of 'gaus,' or states, ruled by petty kings (*smaâ kongar*), one of whom, Gottrik or Gottfried, even ventured to make war on Karl the Great (804-810). In 826 Ansgar (q.v.) entered S. Jutland with the news of Christianity. Gorm, the Old, rose against the new faith, and succeeded in conquering the territories where it had taken root before his death in 936. His son, Harald Blaatand ('Blue-tooth'), did homage to the German Emperor Otto I., was converted to Christianity (965), and made Norway a fief of the Danish crown. The old Odin worship maintained a footing in D. for 200 years longer, and its later heroes were fabled in the Kæmpeviser (see DANISH LANGUAGE AND LITERATURE) and the Eddas (q.v.). England was completely conquered by Knud (Old Eng. Cnut), a grandson of Gorm, who died 1035. Civil war, which had meantime been disturbing D., was stamped out by Valdemar I. the Great (1157-82), and his son Knud VI. (1182-1201) subdued Holstein and Pommern. Valdemar II. added to the kingdom Lauenberg, Mecklenburg, and Esthonia. Erik, Valdemar's eldest son, was killed in battle (1250) by his brother Abel, who made himself Duke of Slesvig or S. Jutland, and later King of D. (1326-30). Valdemar IV. Atterdag (1340), granted Slesvig in fief to the Duke of Holstein (1386). (See SLESVIG-HOLSTEIN.) His daughter Margaret (q.v.), a great queen, wife of King Hakon of Norway, conquered Sweden (q.v.) in 1389, and left the three Scandinavian kingdoms to be ruled by her favourite grand-nephew, Erik of Pommern. The three countries, bound together by the Calmar Union, 20th July, 1397, were soon lost by Erik. The Swedes achieved independence in 1448, and the Danes in the same year raised Christian of Oldenburg, a descendant of the old royal line, to the throne. Christian I. (q.v.), who founded the long line of Oldenburg, was also chosen by Norway, 1450, and by Slesvig-Holstein, 1460. From Christian II. (q.v.), 'the Wicked' (1503-23), the crown was transferred to his uncle, Frederik I., who again united D. with Norway and Slesvig-Holstein (1523-33). Christian III. (q.v.), son of Frederik (crowned 1536), united Slesvig-Holstein in perpetuity to D., codified the laws in the 'Recess of Kolding,' and introduced the Reformation (1536), but had little control over the lawless nobility. Frederik II. (1559-88) fought against Sweden for seven years, and Christian IV. (1588-1648) also made a vigorous effort to hold the kingdom together, which was partly frustrated by the arrogance of the nobles. Under Frederik III. (1648-70) the Swedish possessions were seized by Karl X. (1657), and the fiefdom of Slesvig was lost. On 8th September, 1660, Frederik was granted supreme power by the three estates. Christian V. (1670-99) instituted serfdom, and greatly oppressed the middle classes. In the reign of Frederik IV. the disputed claim to Slesvig was recognised (1720), and in the same year Sweden ceded to D. the right of receiving the Sound dues. A long period of tranquillity follows, chiefly marked by the restriction of the aristocratic privileges, the abolition of servitude (1787), and the general improvement of art, trade, and agriculture. In the beginning of the 19th c. Frederik VI., regent from 1784, king 1808-39, by his attitude towards Napoleon, involved D. in a ruinous war with Sweden, England, Prussia, and Russia — the chief events of which were the battle of Copenhagen under Nelson (1801), the storming of the capital itself (1807), when the entire fleet was surrendered to the English, and the subsequent cession (1814) of Norway to Sweden under Bernadotte. Christian VIII. (1839-48) made an effort to convert all the Danish possessions into one united state, and his scheme was taken up by his son, Frederik VII. (1848-63). In 1848 the Duchies of Slesvig and Holstein, with the connivance of Prussia, broke into open revolt on the subject of the succession, aggravated by the mutual dislike of the German and Danish inhabitants. But after a severe struggle the rebellion was eventually quelled by a victory at Jndsted, 25th July, 1850. The direct Oldenburg line, founded in 1448, expired on the death of Frederik VII., 15th November, 1863. Prince Christian of Slesvig-Holstein-Sonderburg-Glücksborg received the crown through his wife, a niece of Christian VIII., in conformity with 'the treaty of London' of May 8th, 1852. Again the question of the accession in the duchies was revived in all its force. The Prince of Augustenborg, styling himself Frederik VIII. of Slesvig-Holstein, renewed a spurious claim that had been disposed of in 1848. He was directly aided by Germany, and it soon became apparent enough that the Confederation was working for the sole possession of the duchies. On the 1st of February, 1864, an Austro-Prussian force crossed the Eider, and subsequently laid waste the country as far N. as the Lymfjord. The Danes, who had unhappily been led to expect the assistance of England, were soon overwhelmed in the unequal contest, and by the treaty of Vienna (30th October, 1864) had to surrender Lauenborg, Holstein, and Slesvig to the discretionary disposal of Prussia and Austria. The future of the duchies were made a question which led to the struggle for supremacy in the Confederation between the two great powers. Since the war of 1866 Slesvig-Holstein has ranked as a German province. The Slesvigers made a futile attempt to rouse public feeling on the subject in 1875. For history, see Allen's *Haandbog i Fädrelandets Historie*, and Dahlmann, *Geschichte von D.* to 1523 (Hamb. and Gotha, 1840-43).

Denn′ewitz, a village in the province of Brandenburg, Prussia, 42 miles S.S.W. of Berlin, where, on 6th September, 1813, General Tauentzien with 45,000 Prussians (mostly *landwehr*), after desperate fighting, forced 70,000 French, Saxons, and Poles, commanded by Marshal Ney, to commence a retreat. At this decisive moment Bernadotte, Crown-Prince of Sweden, joined the Prussians with upwards of seventy battalions of Russians and Swedes. The defeat of the French was instantly turned into a rout. They lost from 15,000 to 20,000 men, and 43 pieces of cannon; the allies from 5000 to 6000 men.

Denn′is, John, the son of a saddler, born in London in 1657, was educated at Cambridge, and after travelling on the Continent, settled at London as a professional critic. He produced numerous plays, poems, and tracts, joined the Whig party, and assailed his political and literary opponents with rancorous abuse. In return, Swift satirised him with merciless wit, and Pope 'executed' him in the *Dunciad*. He is now chiefly known through the terrible retaliation which his 'frenzied' strictures provoked. In his blind and poverty-stricken age a play was acted for his benefit, to which Pope, forgetful of former strifes, contributed a prologue. D. seems to have been of a sour and suspicious nature, but to have possessed some critical insight. He died 6th January, 1734. See D'Israeli's *Calamities of Authors*.

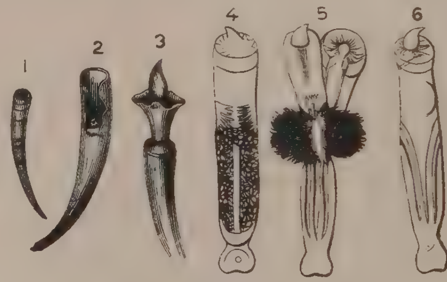
Denon, Dominique Vivant, Baron, was born at Châlons-sur-Saône, 4th January, 1747. For a time he was, ostensibly, a student of the law, but really of the fine arts, a page of the chamber and a gentleman-in-ordinary to Louis XV. His great artistic powers, however, came out after the Revolution, when he accompanied Bonaparte to Egypt, and in 1802 published his *Voyage dans la Basse et la Haute Egypte*, the engravings in which were greatly admired. Bonaparte was much attached to him, and made him Inspector-General of Museums, and D. accompanied him on various of his expeditions, the result being the addition of the art treasures of more than one conquered city to the Louvre. The celebrated Vendôme Column was constructed under his direction. D., who was an editor of considerable merits, was dismissed from his offices in 1815 after the fall of his master. He died 27th April, 1825, much respected for his excellent personal qualities as well as for his high taste in art. His most important work, left unfinished at his death, was completed by Amaury Duval, and published in 1829 under the title *Monuments des Arts du Dessin chez les Peuples tant Anciens que Modernes* (Par. with 315 plates).

Dénoue′ment (Fr. from *dénouer*, 'to untie'; Lat. *de* and *nodare*), strictly the unravelling or discovery of a plot, but generally applied to the catastrophe of a play or romance. A D. should rise naturally out of the plot, and should be recondite enough to exercise agreeably the reader or hearer's ingenuity.

Dens, Peter, a once famous Roman Catholic scholar and theologian, was born at Boom, a small town near Antwerp, in 1690. His life is almost unknown, the epitaph on his tomb at Malines being our only source of information regarding his career. We learn from it that D. was for twelve years theological reader or professor at Malines, where he likewise became canon, penitentiary, priest of St. Romuauld's, and for forty years president of the college. He died 15th February, 1775. His great work is his *Theologia Moralis et Dogmatica*, a minute and curiously casuistic vindication of Roman Catholic tenets in ethics and theology. It has no scientific merit, but is well known on the Continent, and is the favourite theological text-book in Roman Catholic colleges. An edition of this work was published at Dublin in 1832.

Den′sity (Lat. *densitas*, from *densus*, 'thick') of a body is the quantity of matter comprised in unit volume; or is given by the equation $V\rho = M$, where V is the volume, M the mass, and ρ the density of the body in question. It is *practically* the same as Specific Gravity (q.v.).

Denta′lium, or **Tooth Shell,** sometimes called the 'Elephant's Tusk' from its shape, belongs to the *Gasteropodous* class of molluscs, and to the family *Dentalidæ*, in which the shell is tubular, symmetrical, and of curved shape, open at both ends, and with an entire (*holostomatous*) circular aperture or mouth. The foot is pointed, and has symmetrical *Epipodia* or side lobes. Huxley placed D. in the class *Pteropoda*, from its possessing a rudimentary head, a neural flexure of intestine, the presence of the epipodial lobes of the foot, and from its development. *D. arcuatum* is the familiar species. Fossil species of D. occur in the Devonian, Carboniferous, Mesozoic, and Tertiary formations.



Dentalium.

1, Shell of Dentalium; 2, Shell magnified and fractured (animal contracted); 3, Animal advancing from the shell; 4, Animal magnified (abdominal aspect); 5, Animal magnified and cut open (internal formation); 6, Animal magnified (dorsal aspect).

Denta′ria, a genus of herbaceous perennial plants belonging to the natural order *Cruciferæ*, and more commonly known by the popular name of Toothwort, of which their scientific one is the Latin translation. There are many species, natives of temperate America and Europe. The roots of *D. diphylla* (Pepperwort) have a pungent taste, and are used by the settlers in the region of America where it is found as a substitute for mustard. *D. bulbifera* is a native of the southern portion of England.

Denta′tus Man′ius, according to some **Marcus Curius,** the most famous of the Curii, was said to have derived his surname of D. from having been born with teeth. He was of Sabine descent. After holding the office of tribune of the people, he was elected consul in 290 B.C., and compelled the Samnites to sue for peace after they had waged war against Rome for forty-nine years. Immediately after, he subdued the Sabines, and thus celebrated two triumphs in his first consulship. In his second consulship (B.C. 275), D. defeated Pyrrhus, King of Epirus, near

Beneventum, as he was returning from Sicily, and obliged him to quit Italy. His triumph was distinguished by four elephants, the first ever seen at Rome. The booty taken from Pyrrhus was wholly given up to the republic. Elected consul for a third time (B.C. 274), he brought the final war with the southern Italians to a successful issue. In 272 B.C., during his censorship, D. built an aqueduct which brought the water of the Arno into Rome. He also dug a canal, by which the waters of Lake Velinus were precipitated into the river Nar from a height of 140 feet. This is the famous Cascata del Marmore, which inspired the splendid stanzas of Byron (*Childe Harold*, Can. iv. st. 69-72). He then retired to his Sabine farm, to devote the rest of his life to agriculture. D. is the type of the old Roman simplicity and valour, and many anecdotes finely flavoured with a spirited patriotism and unselfish honour are recorded of him.

Den'tex, a genus of Teleostean fishes included in the family *Sparidæ* (Sea-Bream, &c.). This genus, of which the common D. is a familiar species, is found in the Mediterranean Sea, and occasionally on the S. British coasts. It has a compressed body, somewhat resembles the perch in shape, has a single continuous dorsal fin, scaly cheeks, and numerous minute teeth, with several larger teeth of pointed conformation. The common D. was the D. of classical writers. Its average length is from 3 to 4 feet, and its weight from 18 to 30 lbs. It is eaten both fresh and pickled in the Levant.

Den'tifrices (Lat. *dens*, 'a tooth,' and *frico*, 'I rub') are preparations for cleansing the teeth. The daily cleaning of the teeth is of the greatest importance, which should be early inculcated on children. If teeth were regularly cleaned and examined for incipient decay, not only toothache, but many more remote evils would be averted, for much imperfect digestion arises from imperfect mastication. Many preparations are puffed as wonderful D., but one tooth-powder is as good as another, provided there be nothing contained therein injurious to the teeth or the gums—any hard substance which may destroy the enamel of the tooth, or any matter which may loosen the gums or cause them to retract. If the taste be not objectionable, soap rubbed on the tooth-brush is a perfect dentifrice. The best tooth-powder is finely ground chalk mixed with a very little soda, to which some aromatic ingredient, such as orris powder, is added, together with an astringent for action on the gums. Above all things, the teeth should be cleansed before bed-time, so that no particle of injurious matter may rest upon a tooth during the hours of sleep, when the tongue and lips are still and cannot be employed in removing the decaying obstruction. There is also another reason for this course, when tooth-powder is used. Whatever medical property may exist in the D., it will have more opportunity of doing good to the teeth or the gums throughout the night, when no food or drink is taken, which, of course, carries away any of the powder remaining within the mouth after use. The common habit of washing away the powder is an absurd one—wash and brush the mouth and teeth thoroughly with water first, then use the powder in moderate quantity, and allow it to remain on the teeth and perform the duties for which it is employed; not the least important being one of counteracting the action of the acids arising from the stomach. The movement of the tooth-brush should be always from the gum and not against it, as the latter should never be encouraged to recede.

Den'tine, a tubular structure forming the chief part of the Teeth (q.v.).

Dentiros'tres (Lat. 'tooth-beaked'), one of the four sub-orders of the order *Insessores*, or Perching birds, chiefly distinguished by the upper mandible being notched in its lower margin near the tip. Most of the D. are insect-eaters. The chief families are the Shrikes, Fly-catchers, Thrushes, Tits, and Warblers.

Den'tistry, as comprising dental surgery and dental mechanics, is the art of one who treats diseases of the teeth, and who fashions artificial sets. Both branches of D. have been greatly advanced of late years, the surgery branch having been formulated into a regular course of academic instruction, and the mechanical section having been entirely reformed by the application of scientific inventions.

Dental Surgery.—The chief operations in dental surgery are (1) scaling; (2) regulating; (3) stopping; and (4) extracting.

Scaling is the removal of *tartar* from the base of the teeth by means of small pointed steel instruments, and is a most necessary operation, as the accumulation of this substance absorbs and irritates the gums, and gradually loosens and decays the teeth. As a preservative, it ought to be undergone periodically, especially when the teeth are not regularly cleaned. *Regulating* is the restoring of overcrowded or displaced teeth to their proper position, by the gradual pressure of 'regulating plates.' Teeth that have been regulated required to be maintained in their new position for some six months.—*Stopping*, or *Stuffing*, is a process performed by filling in the hollow of a decayed tooth, so as to stay the progress of decay and save the nerve from exposure. It is often necessary, however, to destroy the nerve before stopping, and this is best done by applying a pellet of cotton wool steeped in arsenious acid, chloride of zinc, or carbolic acid, for a period of at least twelve hours. The decayed hollow must then be carefully scooped out with the 'excavators' till the hard wall of dentine is laid bare. For a temporary stopping the substance commonly used is gutta-percha; the chief permanent stoppings are gold, white enamel fillings, and amalgams. After the hollow is well dried, the stopping is pressed firmly in, and the plug is smoothly finished off at the proper height of the tooth. In gold stopping, which is by far the most difficult process, the strips of gold-leaf or pellets of 'sponge-gold' are packed so that their ends, and not their flat surfaces, shall present at the top of the cavity. The gold would be apt to peel off if laid in, like the other plugs, in layers. The top is finished off by burnishing.—*Extracting* ought to be the last remedy of the dentist, as it is also the operation he is oftenest called upon to perform. It requires the use of, at least, some five pairs of forceps, and of an elevator or tooth-punch; the forceps are adapted to the variety in size, form, and situation of the different teeth. The tooth to be extracted must be carefully seized by a sound part, and its detachment from the socket should be by a lateral or semi-rotary motion in the direction in which it will offer the least resistance. This necessarily presupposes, on the part of the operator, a knowledge of the anatomical peculiarities of the teeth.

To arrest the progress of decay in the teeth is the first object of the dentist, and hence the importance of scaling and stopping. But when a tooth is too much decayed to admit of stopping, and is occasioning pain, it is to be removed altogether. It may be well to state that a skilled dentist can best decide whether a tooth should be treated by stopping. In the extraction of teeth, anæsthetics, local and general, are now widely used; chloroform and ether giving place rapidly to nitrous oxide gas. This last, although it requires to be used cautiously, like other anæsthetics, may be safely employed, except on children under seven years of age, or when the patient is very old, or of plethoric habit, or when he suffers from hæmoptysis or pulmonary disease.

Dental Mechanics.—This department of D. mainly deals with the replacement of lost teeth by artificial ones. It also embraces the treatment of deformities of the mouth, as in cleft palate. (See PALATE.) The manufacture of the teeth employed by the dentist has risen into an independent industry of great importance, in which there is a strong competition between the great producers, basing on various inventions, and holding as secret their different processes. The composition of which the teeth are generally made consists of certain proportions of kaolin (white clay), silex, and felspar; none of these minerals are fusible at a low temperature, nor, when fused, are they acted upon by acids. After an elaborate system of moulding, enamelling, and baking, the teeth receive their colours and shades from a delicate manipulation of metallic oxides. The main operations of the dentist are—(1) taking an impression of the mouth in beeswax, plaster of Paris, or in certain compositions; (2) casting a model from the impression in plaster or in zinc, occasionally with a counterdie in lead; (3) forming, by means of the dies, a vulcanite base, a celluloid base, or plates in gold, dental alloy, or in alloys of gold, copper, silver, platinum, &c.; and (4) adjusting and fixing the teeth upon the base or plate.

The dentures may be either partial or complete, *i.e.*, may either embrace a few or an entire set of teeth. Single teeth are usually fixed in a peculiar manner. A pivot attached to the artificial tooth is passed into the natural pulp cavity, which has been previously prepared; when a wooden pivot is used, it is maintained in position by the swelling of the wood, when of metal, the pivot is properly fastened with mastic, &c. The vulcanite base is in more general use than the gold plate, and its construction necessarily is now carried to great perfection. The celluloid base above mentioned consists of collodion, a preparation of camphor and gun-cotton, and was first produced in 1871. It is easily prepared, and is light and comfortable to wear, while its pink is natural in appearance. See Tomes' *System of Dental Surgery*, Oakley Coles' *Dental Mechanics*, and Sewill's *Anatomy and Dental Surgery.*

Denti'tion, the name applied to the process of tooth-development and succession, and also to the arrangement and description of the various teeth found in the mouth, particularly of *Mammalia* (q.v.). Most mammals have two sets of teeth, and are hence termed *diphyodont;* those in which one set only is developed are termed *monophyodont.* The first set is named the *milk, temporary*, or *deciduous* set. The teeth in mammals are never united by bony union or *ankylosis* with the jaw-bones as in lower forms; and they are confined to the jaw-bones, being developed from *alveoli* or *pockets.* The different kinds and structure of teeth are described in the article TEETH (q.v.), and their functions under the head of DIGESTION (q.v.). Naturalists express the arrangement of the teeth in any animal by a *dental formula.* The dental formula of man runs as follows:—

$$\text{I. } \frac{2-2}{2-2} \quad \text{C. } \frac{1-1}{1-1} \quad \text{P.-M. } \frac{2-2}{2-2} \quad \text{M. } \frac{3-3}{3-3} = 32$$

And that of the sheep, for example, is thus stated:—

$$\text{I. } \frac{0-0}{3-3} \quad \text{C. } \frac{0-0}{1-1} \quad \text{P.-M. } \frac{3-3}{3-3} \quad \text{M. } \frac{3-3}{3-3} = 32$$

The meaning of these convenient formulæ is readily understood. The letters stand for the various kinds of teeth (incisors, canines, præmolars, and molars). The figures *above* each line indicate the teeth in the *upper* jaw; those *below* the line indicating the teeth in the *lower* jaw; whilst the further division of the figures, above and below each line, indicate the number of teeth in each side of each jaw respectively. We read the D. formula of man, then, as expressing that he has 2 incisors in each side of each jaw; 1 canine in each side of each jaw; 2 præmolars in each side of the upper, and the same number in each side of the lower jaw; and 3 molars in each side of each jaw—making a total of 32. Similarly in the sheep, there are no incisors and no canines in the upper jaw, but 6 incisors (3 in each side) and 2 canines (1 in each side) of the lower jaw; and then there are 6 præmolars and 6 molars in both upper and lower jaws. In man the teeth are developed in little sacs (*dental sacs*) formed in the gums, the little *papilla* or process enclosed in each sac becoming encrusted, as it were, by the hard structures of the tooth, and the papilla itself forming the pulp of the future tooth. The temporary or milk-teeth are gradually pushed out by the permanent teeth, or they may decay or be absorbed. The milk-teeth of man number 10 in each jaw, and thus comprise 4 incisors, 2 canines, and 4 molars. These 10 teeth are replaced by the permanent teeth, and in addition 6 other teeth appear in the permanent set of each jaw, the latter being the true molars, which are thus not represented in the milk set. The permanent teeth are being developed during the formation of the milk teeth, each permanent tooth being, in fact, developed in a little sac partitioned off from the dental sac in which its milk predecessor is formed. In the seventh month after birth, the central (lower) milk incisors generally appear, the molars about the thirteenth month, and the milk set may be completed from the eighteenth month to the second or even third year of life. The permanent teeth appear about the seventh year of life; the first true molar generally being developed before the other teeth, and being soon followed by the permanent central incisors. The permanent canines appear about the twelfth year of life; and the last molars, or 'wisdom teeth,' may vary in their development from the sixteenth or seventeenth, to the twenty-first or twenty-third year of life.

D'Entrecasteaux', the name given in memory of a French navigator to an archipelago, cape, and channel in Australasia.—1. The *archipelago* lies in the S. Pacific, E.S.E. of New Guinea, in S. lat. 10°, E. long. 151°.—2. The *cape* is on the S.W. coast of W. Australia, in S. lat. 34° 52', E. long. 116° 1'.—The *channel*, about 40 miles in length, and from 3 to 9 miles in breadth, divides Bruné Island from the S.E. coast of Tasmania, its centre being in S. lat. 43° 25', and E. long. 147° 6'. It contains several excellent harbours.

Denuda'tion (Lat. 'the making *nude* or bare'), in geology, the term applied to the wearing away of rock masses, and to the consequent laying bare of underlying rocks. The chief agents which effect D., are rivers, glaciers, and ice action generally, rain, atmospheric action, &c. D. is thus another name for the reconstruction of rocks, since from the matters taken from the land new sedimentary formations are produced. The consideration of D. leads the geologist to study how the features of our earth have been sculptured out. The process of D. may be divided into *subaërial D.*, as effected by rivers, ice, &c., and *marine D.*, as effected by the sea and its tides. Subaërial denudations cut down the land surfaces into valleys, whilst marine D. tends to form plains.

Deob'struents (from Lat. *de*, 'away,' and *obstruere*, 'to obstruct') are medicines which remove any abnormal enlargement or tumour. Certain medicines, when taken internally, or when rubbed on the skin, cause absorption of enlarged glands and other tumours. Among the most powerful of these are iodine, bromine, and mercury, with their several preparations.

Deoband', a town of British India, district of Saharanpur, N.W. Provinces, 20 miles S.E. of Saharanpur, between the Hindun and Kali Nadi, branches respectively of the Jumna and the Ganges, and on the railway from Saharanpur to Muzaffarnagar. Pop. 19,250, of whom 8049 are Hindus, 10,871 Mohammedans, 324 Jains, 3 Christians, and 3 are Sikhs. The Mohammedans are in the ascendant, and possess over 40 mosques, but D. is really a Hindu town, dating back some 3000 years, and was called the 'Sacred Grove,' where a religious festival took place at certain times. Grain, oil, and sugar, together with fine cloth, are the chief exports from D. and the surrounding country.

De'odand. Formerly, by the law of England, any personal chattel (see CHATTEL) which by accident caused the death of a human being was forfeited to the crown or lord of the manor, that it might be sold, and the proceeds distributed among the poor. No forfeiture, however, took place when the victim was an infant under the years of discretion, and the horse, cart, &c., which had caused the death, was not in motion at the time. D., as the name imports (*Deo dandum*), was originally an atonement to God for the untimely death of one of his creatures. Deodands are abolished by 9 and 10 Vict. c. 62.

De'odar. See CEDAR.

Deodar', or **Diodar,** a protected independent state, in the N.W. of Guzerat, India, with an area of 440 sq. miles, and a pop. of 24,061, mostly Kolis and Rajputs. The revenue is estimated at £2500. The country is simply an open plain, where no system of irrigation exists, owing to the absence of streams and springs. Butter is the only export. There is no army. Each village forms the capital of an independent community. D. having become a haunt of robbers, the East India Company assumed the protection of it in 1819.

Deo'dorisers are chemical substances which have the power of destroying odours. D. may or may not be Antiseptics (q.v.) or Disinfectants (q.v.).

D'Eon, The Chevalier, a famous diplomatic agent, was born of an ancient family at Tonnerre, Burgundy, 2nd October, 1728. He was employed on a mission to St. Petersburg in 1755, was aide-de-camp to Marshal Broglie in the campaign of 1762, in 1763 accompanied the Duc de Nivernois to England as secretary, whose place he filled when the Duc left this country, till he was superseded by the Comte de Guerchy. In 1771 his sex began to be doubted, since he had, from caprice, or from purposes of intrigue, dressed as a female. He returned to France in 1777, when he assumed the female dress at the request of the queen, and in 1785 revisited England, where he died, 21st May, 1810, when medical inspection put the question of his sex beyond doubt. D. wrote various historical and political works, which were published in 13 vols. in 1775.

Deoxida'tion, or **Reduc'tion,** signifies the removal of oxygen from a substance. Most metals are separated from their ores by D., for, in the majority of cases, the ore is an oxide of the metal, or is converted by roasting into the oxide. (See METALLURGY.) The deoxidising agent employed in the extraction of metals generally contains carbon—an element having, at a high temperature, a strong affinity for oxygen. When the oxide is heated with carbon, the latter abstracts its oxygen, and combines with it, forming carbonic oxide, or carbonic acid. Carbonic oxide is itself a powerful reducing agent, being prone to take up oxygen and pass into carbonic acid. Thus carbonic oxide is often purposely produced (by burning carbon in a limited supply of air) for the purpose of reduction, instead of acting on the substance to be reduced with carbon alone. This is the case in Iron Smelting (q.v.).

Depart'ment (Fr. *département*), a name widely applied in England to a section of the administration, as the Home D., the Education D., &c., but used to designate a territorial division of France since 1789. After the abolition of the aristocracy, Mirabeau suggested that, as the existence of large provinces tended to prevent centralisation and to foster local power, a subdivision should be made, and this was followed by the redistribution of the thirty-four provinces into eighty-three departments by decree of the Assembly, dated 16th February, 1790. These departments, named usually after geographical features, were subsequently increased to 140, but were again reduced to eighty-three at the peace of 1814. Their number has varied greatly with the vicissitudes of the nation, and now amounts to eighty-seven. They elected their own governors till Napoleon I. took away the privilege, and established the right of the head of the state to place over each a *préfet* and a *conseil de préfecture*. The D. is divided into arrondissements, each of which is under a *sous-préfet*, while the arrondissements are subdivided into cantons, and these again into communes, corresponding somewhat to our parishes. Several of the states of Central and S. America have adopted a division into *departimientos*, which correspond, however, only in name to those of France.

Depen'ding Action. In Scotch law, an action is held to be in dependence from the moment of the Citation (q.v.) until the final decision of the House of Lords, should an appeal be made to that tribunal. During dependence, the pursuer is entitled to use Inhibition (q.v.), or Arrestment (q.v.), as security for fulfilment of the decree by the defender, should judgment be against him.

Dephal, a tree, a native of India, the fruit of which, though eaten, is inferior to that of its congeners, the Bread-Fruit (q.v.) and Jack (q.v.). The wood is used for building, the root for dyeing, and the thick, tenacious juice for birdlime.

Depil'atories, or **Epil'atories** (Lat. *de*, and *e* or *ex*, 'from,' and *pilus*, 'a hair'), are substances used to remove hair from the face or body. The safest D. are made with quicklime and other ingredients, as sulphate of sodium and starch, made into a paste and applied to the part. Sulphide of barium has been used for D. instead of quicklime. Orpiment, the yellow sulphide of arsenic, is sometimes mixed with lime to form D. D. containing arsenic are dangerous. Orpiment one ounce, quicklime one pound, starch ten ounces, and sufficient water to make a paste, is supposed to constitute the famous D., the *Rusma* of the Turks.

Deploy' (Fr. *déployer*, 'to unfold'), in military nomenclature, means to form or extend troops from column into line.

Depos'it (Lat. 'a laying down'), in geology, a name given to sedimentary or aqueous rocks made by the Denudation (q.v.) and 'laying down' of other formations. Deposits are *marine* when formed in the sea, *lacustrine* in lakes, *fluviatile* in rivers, &c.

Deposit, in English law, either a monetary payment to bind the sale of real estate, &c., or a bailment of goods to be kept by the bailee, without reward, and delivered according to the object and purpose of the trust. The principles of the Roman law regarding D. have been adopted by modern nations; and in Scotland the name of the contract is preserved. He who deposits is called the *depositor;* he who receives, the *depositary*. The contract is completed by delivery of the subject. The right of property and risk remains with the depositor, on whom, if the subject is injured or destroyed accidentally, the loss falls. The depositary, until the subject is demanded back, is liable only for gross negligence; but if he unduly delay to re-deliver the subject after requisition, he will be liable for an accident. There are special kinds of D. See CONSIGNMENT; NAUTÆ, CAUPONES, STABULARII; TRUST, STOPPAGE IN TRANSITU.

Deposi'tion, in English and Scotch law, signifies the testimony of a witness taken in writing. Information given on oath, and the evidence of witnesses before magistrates and coroners, are put into writing in the words used by the witnesses, or as nearly so as possible. The person who makes oath judicially is called a *deponent*. Evidence in the Court of Chancery was formerly taken in written answers to written questions. By the Law of Evidence (q.v.) a D. cannot be received where the witness can be himself produced, unless he has become insane since giving his testimony; but may be used when he cannot be found, or is without the jurisdiction of the court. In criminal proceedings, by 11 and 12 Vict. c. 42, the deposition, or evidence taken down in writing of a witness at the preliminary hearing may be read in court when the witness is dead or unable to be present, should the prisoner have had full opportunity of cross-examining the witness at the time of the deposition. Under 30 and 31 Vict. c. 35, a deposition may be taken of the evidence of a witness who is dangerously ill, by a justice of the peace, and the deposition may be read at the trial should the witness be dead or in a state which renders him incapable of travelling or giving evidence at any time, provided prisoner has had the opportunity of cross-examination. See DYING DECLARATION.

Deposition is an ecclesiastical sentence on a clergyman for crimes, scandalous immorality, or promulgating doctrine contrary to the standards of his church, or for farming or trading in contradiction to the law after being twice previously convicted, &c. It amounts to degradation from his office—that is, a total and perpetual suspension of the power and authority committed to him in his ordination, reducing him to the condition of a layman, and removing all emoluments he may enjoy as a clergyman. In churches which hold the indelible nature of Orders, the clergy may be *deprived* but cannot be *degraded*. See Bingham's *Ant. of the Christian Church*, and Blunt's *Dictionary of Doctrinal and Historical Theology*.

Depot (Fr. *dépôt*, from Lat. *de*, 'down,' and *positum*, 'placed'), in military language, a place where army stores are kept and recruits trained. The term is now usually applied to that portion of a brigade which remains at home while the rest are upon foreign service. The regimental D. system has existed in the British army since about 1825, but it was not completely developed until 1872, when Great Britain and Ireland were distributed into military districts and sub-districts, each of the latter apportioned to a brigade with a D., and having a lieutenant-colonel appointed to it. The sum of £3,500,000 was voted by the House of Commons in 1872 to provide for the development of the D. system. Formerly a man enlisted into a regiment or a battalion of the line, he now enlists into a brigade, and is drafted off as required. Canterbury is the cavalry D. for the whole country, and under the Localisation of Forces Act, there is an infantry D. for each sub-district. The brigade depots and districts were afterwards called regimental districts, and in this way they are now known. The regimental districts have also been renumbered; the number of the district being that of the first battalion as it was before the changes. Thus the regimental district No. 34 is the district of the regiments which were formerly numbered 34 and 55; the former being now the 1st, and the latter the 2nd, battalion of the new 'Border Regiment.' The depot is at Carlisle, and it is to Carlisle that all the recruits for the Border Regiment have to be sent. See DISTRICTS, MILITARY.

Depres'sion, Angle of, in trigonometry, is the angle which the line drawn from the spectator to an object *below* him makes with the horizontal plane. Hence the D. or dip of the horizon is this D. from the true horizontal plane, due to elevation of the observer above the surface of the earth. This is the *true dip*, with which the observed dip never agrees, on account of the refractive power of the atmosphere. The true dip in minutes gives the distance to the observed horizon measured in nautical miles, an exceedingly convenient rule for the mariner, to whom the dip is of the greatest importance.

Depriva'tion is an ecclesiastical censure whereby a clergyman is deprived of all the revenues and privileges of his benefice, and all control over it. It may be temporary or perpetual. Perpetual D. necessarily forms a part of Deposition (q.v.), along with degradation, and temporary D. is one of the forms of Suspension (q.v.).

De Profun'dis ('out of the depths'), the first words in the Latin Vulgate of the 130th Psalm, forming part of the burial service in the Roman Catholic Church. It is appropriately sung at the moment when the body of the dead is committed to the 'depths' of the earth, and the hearts of pious mourners can only be cheered by the closing assurance of a 'plenteous redemption.'

Dep'tford ('the deep ford'), a town partly in Kent and partly in Surrey, on the right bank of the Thames, at the mouth of the Ravensbourne, 4 miles E. of London. Most of the inhabitants are employed in the works and shipbuilding yards. The Master and Brethren of the Trinity House of D. Strond have a hall and two sets of almshouses here. In 1885 D. was constituted a parliamentary borough, returning one member to Parliament. It consists of the par. of St. Paul, Deptford (Kent), and Hatcham (Surrey), and has a pop. of 101,286.

Deptford Dockyard was established for shipbuilding purposes by Henry VIII. in 1513, and was subsequently used also as a victualling depot for the British navy. In 1865 shipbuilding was discontinued, the slips being unfit for the large war-ships, and D. D. was for a short time the principal victualling yard for the British navy at home and foreign stations. It also supplied clothes, bedding, and other naval stores. On 31st March, 1869, it was purchased by the City of London Corporation for £94,640 to be used by them as a market for foreign cattle. It was opened for this purpose on 28th December, 1871.

Dep'uty (Fr. *deputé*, from Low Lat. *deputo* = Class. Lat. *delego*, 'I send or place in the stead of another'), one who exercises an office under another. The principal is liable for the acts of his D., but the grantor is not liable for the acts of his assignee. No judge has the power to appoint a D. unless authorised to do so by the grant to himself. A D. appointed by a D. is usually called a substitute, but this can be done only under special authority, since a D., as a rule, cannot appoint a D. See ASSIGNS, SHERIFF, &c.

De Quin'cey, a great English prose writer, was the son of a Manchester merchant, and was born at Greenhay, near Manchester, 15th August, 1785. He received his early education at Bath and at Manchester, and was a student at Oxford from 1803 to 1808. Thenceforth until 1829 he resided chiefly at a cottage in Grasmere in the Lake country, becoming intimate with Wordsworth, Coleridge, and Southey, and contributing largely to journals, especially to the *London Magazine* and *Blackwood*. During this period he became a confirmed opium-eater, having at first indulged in the drug to allay physical pain. In 1816 he was taking 8000 drops a day, but, after several years of suffering and mental lethargy, he, to a great extent, renounced the habit. Little is known of his life until 1843, when he settled at Lasswade, near Edinburgh. He died at Edinburgh, 8th December, 1859. D. was an exquisite writer and scholar, and a fascinating conversationalist, but his fragmentary works are evidently the outcome of a fitful and relaxed though powerful genius. They are distinguished by imaginative grandeur, subtle originality, and a luxuriance of erudite diction, and are unsurpassed for the stately pomp and artful melody of the sentences, but are occasionally marred by a wayward fondness for paradox. D. claimed to have introduced 'a new *mode* of impassioned prose,' in which the writer's individual experiences are rendered interesting by the splendour of the literary setting, as in his *Confessions of an English Opium-Eater*, his *Autobiography*, and in the dreamy, fiery, rhapsodies of the *Suspiria de Profundis*, the finest of all his works. His other writings comprise critical essays on Homer, Milton, Shelley, Wordsworth, Greek tragedy, the Greek orators, &c.; biographies of Shakespeare, Pope, Göthe, and Schiller; superb historic or visionary descriptive pieces, such as *The Cæsars*, *Joan of Arc*, *The Revolt of the Tartars*, *The English Mail-Coach*; and miscellaneous articles on the most varied subjects —*The Theban Sphinx*, *Political Economy*, *Judas Iscariot*. His peculiar humour is shown in his *Murder Considered as one of the Fine Arts*. D. was among the first writers who leavened English literature with German thought. See his *Life and Writings*, by H. A. Page.

Derajat' (from *dera*, 'a camp'), a division, under a Commissioner, of the Punjab between the Suliman Mountains and the Indus, 250 miles in length, with a maximum breadth of 60 miles. It is watered in the N. by the Gannil. The chief towns are Kulachi, Edwardesabad, Leia, Rajanpur, and Lakki. D. embraces the districts of Dera Ismail Khan (area 9440 sq. miles; pop. 486,201), Dera Ghazi Khan (area 5606; pop. 404,031), and Bannu (area 3847; pop. 372,276). Much of the division is occupied by barren tracts and forest reserves. Iron, copper, and lead are found. Coal of good quality exists but is not worked. Wild game is abundant. Indigo, opium, cotton, wheat, barley, and hides are the chief products.

Der'bend, or **Derbent** ('the shut-up gates'), capital of the government of Daghestan, Trans-Caucasia, Asiatic Russia, on the W. shore of the Caspian. It lies at the mouth of a defile, is in the form of a parallelogram, three miles long by half a mile broad, and is surrounded by a massive wall with two large gates. D. is the ancient *Albaniæ Pylæ*, and is said to have been originally fortified by Darius I. as the key of the Persian Empire on that side. Much saffron is grown in the neighbourhood, and there are manufactures of copper and iron vessels and woollen stuffs. Pop. 24,380.

Derby, the county town of Derbyshire, on the right bank of the Derwent, at the fringe of a mining district, and 132 miles N.N.W. of London by railway. It stands in a beautiful and fertile valley, and is built mostly of brick, the chief buildings being the town-hall, market-hall, corn exchange, free library (1876), infirmary, theatre, county lunatic asylum, and School of Art (1877). The chief churches are All Saints (rest. 1876), and St. Alkmund. In 1867 T. Bass presented the municipality with a recreation ground. Its grammar-school was founded in 1162. There are large markets here on Tuesdays and Fridays. The chief manufactures are silk, cotton, iron chemicals, paper and porcelain. The famous *D.*

China, distinguished for its beautiful flower-painting, has been manufactured here since the middle of the 18th c. (See *Old D. China Factory*, by J. Haslem.) The cutting and polishing of Derbyshire marble or flint spar is also a large industry. The name D. is derived either from *Deoraby*, the name which the Danes gave the English *Northweorthige*, or from *Derventio*, the Roman station, or, most probably, is a contraction from Derwentby, the village on the Derwent. D. returns two members to Parliament. The parl. bor. of D. comprises the old bor. of D., the townships of Litchurch and Little Chester, and parts of Normanton, Littleover, and Markeaton. Pop. county bor., co-extensive with parl. bor., 94,146; reg. dist. and reg. sub-dist. (each) 95,077. See Bemrose, *Derbyshire Guide*.

Derbend.

Der'by, the titular name of a great English family, which took its rise in the lordship of Stanleigh (Stony Lea), in the county of Derby, afterwards exchanged for another property in Staffordshire. The most distinguished of the earlier members of the family are **Thomas Stanley**, whose father was made Lord Stanley in 1456, and who, at the battle of Bosworth, by espousing the side of the Earl of Richmond against Richard III., ensured the success of the former, and crowned him as Henry VII. He was in 1485 rewarded with the dignity of Earl of D. and the position of Lord High Steward of England.—**James Stanley**, seventh Earl of D. who took the Royalist side during the civil war, having been taken prisoner at the battle of Worcester in 1651, was beheaded at Bolton in the same year. His widow, Charlotte, daughter of the Duc de Tremouille, is famous for her gallant defence against the Parliamentary forces of Latham House and the Isle of Man, which through marriage had come into the possession of the Stanley family. She had in the end to yield, but lived to see the restoration of Charles II. To the present century belong two illustrious members of the family. **Edward Geoffrey Smith-Stanley, 14th Earl of D.**, was born at Knowsley Park, Lancashire, 29th March, 1799. He was educated at Eton and Christchurch, Oxford, where, in 1819, he gained the Latin verse prize. D., then known as Mr. Stanley, threw himself keenly into politics on the Whig side, was returned for Stockbridge in 1820, and subsequently for Preston, Windsor, and N. Lancashire. In 1830 he became Chief Secretary for Ireland under the administration of Earl Grey, took an important part in the passing of the Reform Bill of 1832, and carried two important measures, the one relating to Irish Church temporalities, and the other giving national education to Ireland. At the same time he reached the first rank among parliamentary speakers by his fiery eloquence, which, aided by a singularly fine presence, gained for him the title of the 'Rupert of Debate,' and by his quickness of retort, which has been compared to an instinct. He was looked upon as the ablest opponent of O'Connell in his movement for the repeal of the Union. In 1833 he became Colonial Secretary, and carried the measure for emancipating the slaves in the West Indies. In 1834 D. seceded from the Cabinet on the Irish Church question, and subsequently was identified with the Conservative party. He became Colonial Secretary in the Peel administration of 1841; in 1845, when Sir Robert Peel brought in his bill for the repeal of the corn laws, he withdrew from it, and became the chief of the Protectionist party. D., after his succession to the earldom in 1851, thrice became premier—from February to December, 1852; from February, 1858, to June, 1859, when he was overthrown on the question of parliamentary reform; and from June, 1866, to February, 1868, when, with the help of Disraeli, he carried a Reform Act, which, however, was so completely modified by the Liberal opposition, that, according to the unimpeachable testimony of the Duke of Buccleuch, nothing was left of the original bill but the word 'whereas.' In February, 1868, failing health compelled him to resign office, and he was succeeded as Premier by Disraeli. He died 23rd October, 1869, his last public act being to protest in the House of Peers against Gladstone's bill for the abolition of the Irish Church. D. was a man of high scholarship, as is shown by his translation of Homer's *Iliad* into unrhymed iambics (Lond. 1864), which has received just praise for its elegance and exact rendering of the original. But it is not poetry: it is only admirable verse, expressed in faultless English. In 1852 D. was elected to succeed the Duke of Wellington as Chancellor of the University of Oxford. In 1825 he married the second daughter of the first Lord Skelmersdale, by whom he had a considerable family.—**Edward Henry Smith-Stanley, 15th Earl of D., K.G., D.C.L., LL.D., F.R.S.**, eldest son of the above, was born at Knowsley Park, 21st July, 1826, and educated at Rugby and Trinity College, where he took a first class in classics, in addition to other honours, in 1848. In December of the same year, and while absent in America, Lord Stanley, as he was then styled, was elected M.P. for King's Lynn, and in 1850, after a tour in the West Indies, made his mark in the House of Commons by a speech upon our sugar colonies. In the course of a tour in the East, D. was appointed, March, 1852, Under-Secretary for Foreign Affairs under his father's first administration. D., who at this time was thought by many to be more of a Liberal than of a Conservative, was in 1855, on the death of Sir William Molesworth, offered the seals of the Foreign Office by Lord Palmerston, but declined to quit his party. In 1858, under his father's second administration, D. became, first Colonial, and then Indian, Secretary. It was while he held the latter office that the Indian mutiny was suppressed, and the management of our Indian Empire transferred from the East India Company to the Home Government. In his father's third administration of 1866, and in the succeeding administration of Disraeli, D. held the seals of the Foreign Office, and obtained (at the time) much popularity by his settlement of the Luxembourg difficulty. He greatly assisted Disraeli in carrying through his Household Suffrage Bill. D., who succeeded to the peerage in 1869, again became Foreign Secretary in February, 1874, on the accession to power of Disraeli. This office he held till 1879. In 1881 he seceded from the Conservative party, and was Secretary of State for the Colonies in Gladstone's second ministry; but on the introduction of the Home Rule for Ireland Bill in 1885, Lord D. joined the section of the Liberal party now called the Liberal Unionists. He was a member of the Cambridge University

Commission, 1856-60; chairman of the Commission on the Sanitary State of the Indian Army in 1859-61. He was installed Rector of the U. of Glasgow, 1st April, 1869, and on 18th December, 1875, Rector of that of Edinburgh. D. was strangely unlike his perfervid and chivalrous sire. He was the reverse of eloquent, was distinguished simply by strength and sobriety of judgment, by the practical philosophy of his singularly lucid speeches, and by freedom from sentimentality. He died 21st April, 1893, and was succeeded by his brother, Frederick Arthur Smith-Stanley, who, as a Conservative, represented, in the House of Commons, Preston (1865-68), N. Lancashire (1868-85), and Blackpool div. of Lancs. (1885-6); and was a Lord of the Admiralty (1858), Financial Secretary, War Office (1874-77), Financial Secretary, Treasury (1878), Secretary for War (1878-80), Secretary for Colonies (1885-86), President of the Board of Trade (1886-88), and Governor-General of Canada (1888-93). The present peer is the 16th Earl of D., and sat in the House of Lords as Baron Stanley of Preston before the death of his brother, the late Earl of D. He is also a Baronet, G.C.B., and P.C.

Derby-Day, the second day of the Summer Meeting at Epsom, when the Derby stakes of 50 sovereigns each, instituted by the Earl of Derby in 1780, are run for. It falls on the Wednesday after Trinity Sunday, and is the great London holiday. Formerly, even Parliament was adjourned over D.-D., but such is not the case now. For hours the road from London to Epsom presents a throng of vehicles of every kind, and the humours of the road resemble the Roman Saturnalia. Trains arrive at the station at short intervals, and, before the event of the day comes off, the Downs are covered with pleasure-seekers of all ranks. Frith's well-known picture of the D. has commemorated some of the peculiar features of the spectacle on the course.

The primary entrance-money, paid by the nominator of a horse, is £5; this is increased to £25 if no declaration of withdrawal be made on or before the first Tuesday in the January of the year previous to that in which the race is to be run; and if another year is allowed to pass, then the liability is raised by £25 more, so that every runner in the Derby costs his nominator or assignee £50. The stakes run for are now £6000, of which the owner of the winner receives £5000; that of the second horse, £300; that of the third horse, £200; and the nominator of the winner, £500. A horse is withdrawn on the death of his nominator. The distance is about 1½ mile.

Derbyshire, one of the N. midland counties of England, having York on the N., Nottingham on the E., Warwick and Leicester on the S., and Stafford and Chester on the W. Its greatest length is 56 miles; its greatest breadth, 34. The S. and S.E. parts of D. are comparatively level, and generally fertile and well-cultivated, but the N. and N.W. portions are rugged and hilly, and remarkable for the romantic beauty of the scenery. Precipices and caverns abound, and the streams sometimes disappear among the cavities of the limestone formations. The hills seldom exceed 1800 feet; the Peak, the highest elevation, is only 2000. The chief river is the Trent, with its tributaries the Derwent and Dove. The scenery of the latter is pre-eminently beautiful. Smaller streams are the Wye and the Rother. There are warm mineral springs at Buxton and Matlock, and numerous calcareous springs in various parts of the county, which incrust substances immersed in them. D. is rich in minerals; coal, iron, lead, zinc, manganese, copper, mineral oil, marble, fluor spar, alabaster, pipeclay, and chert being found. It is intersected by six canals and various railways. The climate is cool and moist, especially in the higher parts; wheat, barley, and oats are the principal crops, but much of the land is in pasture. Of the 657,550 acres, which are the area of D., 51,607 are under corn crops (oats, 29,165); 20,279, under green crops (potatoes, 2391); 22,882, under clover, sainfoin, and grasses in rotation; and 410,615, in permanent pasture. Small fruit is grown on 520 acres, and 2169 acres are occupied by bare fallow and uncropped arable land. Of the mountain and heath-land, 28,766 acres are used for grazing; and 25,428 are given over to woods and plantations. (See also articles CATTLE, HORSE, PIG, and SHEEP.) There is much dairy farming. The manufactures are cotton, silk, worsted goods, porcelain, spar and alabaster ornaments. Chief towns:—Derby, Ashbourne, Buxton, Chesterfield, and Belper. There are many British and Roman antiquities. Pop. anc. county 528,033; adm. county 426,768; and reg. county 432,414. There are seven parliamentary divisions of D., each of which returns one member — Chesterfield, 61,294; High Peak, 60,740; Ilkeston, 69,192; Mid, 59,769; N.-Eastern, 61,995; Southern, 63,910; Western, 56,987. See Bemrose, *D. Guide*.

Derbyshire Spar. See FLUOR SPAR.

Derec'ské, a town of Hungary, 12 miles S. of Debreczin. Near it are four lakes from which soda is obtained, and in one of which small pearls are found. Lake Fingoto, in the neighbourhood, is celebrated for its baths. Pop. 8272.

Dere'ham, East (Old Eng. *Deorham*), a town in the centre of the county of Norfolk, 16 miles W.N.W. of Norwich, with a spacious market-place. The poet Cowper was buried in the old church. D. has manufactures of agricultural machines, and an active trade in corn and cattle. Pop. reg. sub-dist. 8476; and civ. par. 5524.

Der'elict (Lat. *derelictum*, 'anything abandoned'), an English law-term signifying anything forsaken, or left, or wilfully cast away. D. lands suddenly left by the sea belong to the crown; but if the sea recede gradually, the gain goes to the owner of the adjacent lands. (See ALLUVION.) A ship does not become D. until she has been abandoned by her master and crew without intention of returning. When D., first comers are entitled to take possession of her and claim Salvage (q.v.) from the owner or person having right to the wreck. Under the Merchant Shipping Act of 1854 (17 and 18 Vict. c. 104), the Board of Trade is, with consent of the Treasury, authorised to appoint in any district a receiver of wreck, who has due power to fulfil the duties of his position. Articles washed ashore must be delivered to the receiver, who has power forcibly to suppress disorder or plundering. Description of wreck is to be without delay affixed to the nearest customhouse; and if the value of the wreck exceed £20, a description must also be sent to *Lloyds* (q.v.). If no one proves himself the owner within a year from the receiver taking possession, then the wreck, on payment of salvage and expenses, is to be given to the person having the right to it, which may be the lord of the manor, the mayor, the admiral, or the crown.

Derelic'tion, a term of Scotch law nearly equivalent to the English term *Derelict* (q.v.). Stray cattle, if ownership is not proved within a year, are escheated to the crown; but if the thing found be inanimate, the owner may reclaim within forty years. (See, regarding land left by the sea, article ALLUVION.) The word is also used in the law of Scotland regarding *teinds* (tithes) relative to valuations.

Derg, Lough (Gael. 'the red lake'), in the S. of Donegal county, 3 miles long by 2½ broad, has many small islands, one of which, Station Island, is famous as a place of pilgrimage. Between 10,000 and 15,000 pilgrims visit it annually from 1st June to 15th August. It is only 3 r. 26 p. in extent. There were two small chapels on it, with a house for the officiating priests, and some cabins, but the abodes are tenantless now, for the island is uninhabited. The river Derg flows from Lough D. for 17 miles to the Foyle.—Another and a much larger *L. D.* is only an expansion of the Shannon. It lies between Tipperary on the S.E. and Galway and Clare on the N.W., and is 24 miles long and from 2 to 6 broad.

Deriva'tion, in medicine, a term used by the older physicians, signifying the drawing of *humours* from one part of the body to another, and thereby effecting a cure. It is not much used by modern writers. A good example of what is meant consists in placing a blister behind the ear to benefit an affection of the eye.

Der'ma (Gr.), the name given to the true skin. The skin consists of two layers, an upper or epidermis, and a lower or D., or *cutis vera*. See SKIN.

Dermatol'ogy (Gr. *derma*, 'the skin,' and *logos*, 'a discourse') is that branch of medicine which treats of diseases of the Skin (q.v.).

Dermat'ophytes, low forms of Fungi (q.v.), which grow parasitically on the skins of man and other animals, producing Ringworm (q.v.), Favus (q.v.), and similar forms of skin-diseases. The best application for destroying them is sulphurous acid.

Dermes'tes, a genus of Coleoptera or Beetles, belonging to the family *Dermestidæ,* and to the section *Pentamera.* The antennæ are shorter than the thorax, and are club-shaped. The best-known species is the bacon-beetle, the larvæ of which are found in bacon, cheese, &c. This beetle is about one-fourth of an inch long, the colour being black. *D. murinus, D. vulpinus,* and *D. paniceus* are also well-known species.

Dermop'terous Fishes (Gr. 'skin-finned'), a term, not now generally used, for fishes (*e.g.*, lampreys) in which the rays of the medium fins are very soft.

Derr'ick, a kind of Crane (q.v.), much used in stone-yards, and generally when a great height of lift and varying radius are required. It is fitted with a moveable jib, jointed at its lower end to a mast supported by stays, and weights can be laid down at any point within the height and swing of the machine. The angle of the jib is varied by turning a barrel, or drum, connected with the jib-head by a chain which passes over a pulley at the apex of the crane. The machine may either be worked by hand or steam power. Of moveable derricks, or those capable of transporting a load from one place to another, the floating are the most important. They are of immense power, and are extremely effective in raising vessels, placing machinery, &c.

Der'vish (Pers. *Dervêsch,* 'a poor man or beggar,' from *derew,* 'to beg'), the name of a class of Mohammedan devotees, very numerous in Turkey and Persia, who considerably resemble the monks of Europe. In Hindustan they are called *Fakirs* (q.v.). They live partly in monasteries, partly as vagrants, and are divided into various orders, each of which imposes its peculiar novitiate and religious exercises, which are strictly observed, and are very severe. They engage in frequent fastings, mortifications, and circular dances. Their dances, which are accompanied by violent cries and contortions, are often prolonged until the performers faint. In their frenzies they burn and gash themselves with red-hot swords. They are accredited with great sanctity, and with power to heal diseases and interpret dreams.

Turkish Dervishes.

Der'went, a principal river of Tasmania, near the centre of which it rises in Lake St. Clair. After a winding S.E. course, it falls into D'Entrecasteaux Channel by an estuary varying from $1\frac{1}{2}$ to 4 miles in breadth. Hobart Town (q.v.) is situated on its right bank, 13 miles from its mouth, and for 9 miles higher up the D. is navigable for ships of any size.

Der'wentwater (Celt. 'the bright or clear water), also **Kes'wick Lake,** the most beautiful of all the English lakes, lies in the S. of Cumberland, and is formed by an expansion of the Derwent, $3\frac{1}{2}$ miles long by $1\frac{1}{2}$ broad, with steep banks, and dotted with wooded islands, of which Vicar's Island, Lord's Island, and St. Herbert's are the largest. At the foot of the lake, in the gateway of Borrowdale, are Scawfell, Great End, Glaramara, and Castle Crag. Sometimes there floats on the surface a mass of soft earthy matter known as the 'Floating Isle.' D. abounds in trout, pike, and perch. Keswick stands on its N. shore, and the Cataract of Lodore (celebrated by Southey), with a fall of 100 feet, is near its S.E. corner. D. has a depth of 72 feet, and lies 222 feet above the sea.

Derwentwater, James, Earl of, a gallant but unfortunate Jacobite leader, was born in 1688. His father died in 1705, and D., who had been educated in France, returned to the family seat of Dilston, in Northumberland, where, becoming known as a Jacobite, warrants were issued for his apprehension in 1714. He threw himself into the rising of 1715, was taken prisoner at Preston, removed to London, and beheaded, 24th February, 1716. D., for whom much sympathy was felt by the public, was the last Earl of the name.

Derza'vin, Gabriel Romanovicz, a Russian lyric poet, was born at Kazan, 14th July, 1743. He studied at the gymnasium there, joined a regiment of Guards in 1762 and for his skill in drawing and mathematics was placed in a military school by Count Schuvalov. His talents soon became known, and under the Empress Catharine, and the Emperors Paul and Alexander I. he filled some of the highest offices of the state. In 1804 he withdrew from public life, and till his death, 21st July, 1816, devoted himself entirely to poetry. His best-known ode, addressed *To God* (translated into English by Bowring and others), owes something to Young's *Night Thoughts;* but his other works are free from imitation. His sentiments are pure and his ideas lofty; but his language is too richly metaphorical, and sometimes passes into Oriental extravagance. His collected works (St. Petersb. 1810-15) were republished by the Russian Academy of Sciences in 1864-65. His posthumous memoirs were published at Moscow in 1860.

Desaguade'ro (Sp. 'the channel') is the name of several waters in S. America, of which the most important are:—1. A river of Bolivia, which rises in Lake Titicaca at a height of 12,850 feet, and after a course of 180 miles enters Lake Aullagas, 12,280 feet above the sea. This is probably the highest river in the world.—2. A river of the Argentine Confederation, which is fed by a multitude of streams from the E. side of the Andes, and flowing through lakes and salt marshes, is lost in Urre Languen or the Bitter Lake, among the deserts of the interior, about 500 miles from the source.—3. A lake in the S. of Chili, 35 miles long and 5 broad, with an outlet to the Pacific.

Désaix' de Veygoux', Louis Charles Antoine, a celebrated general of the days of the first French Republic, was born of a noble family in Auvergne, 17th August, 1768, and entered the army as a second lieutenant at the age of fifteen. Always a skilful and intrepid leader, by 1796 he became commander of a division of the Army of the Rhine, and defended Fort Kehl for nearly two months against the Austrians, until forced to surrender. In 1798 he accompanied Bonaparte to Egypt, accomplishing the conquest of Upper Egypt in about eight months, and from his power of conciliation, as well as his just administration, obtaining from the natives the title of *The Just Sultan.* Returning from Egypt, D. fell, 14th June, 1800, at the battle of Marengo, by a musket-ball, while leading a great and ultimately triumphant attack on the Austrian line. See Beker's *Étude Historique sur Désaix.*

Des'cant, or **Discant** (Sp. *discante*, from Lat. *dis*, 'apart', and *cano*, 'I sing'; a variation in singing, or part-singing), in music, a second part sung along with, and as an accompaniment to, the plain song or church melody. It was the first form in which the Church seems to have allowed the Gregorian melodies to be harmonised, and was probably introduced from the northern countries, where singing in parts seems to have been natural to the people from very early times. D. was permitted by the Church in the 11th c., and was at first improvised, but gradually it came to be written down and developed into *Counterpoint* (q.v.).

Descarte's, René, one of the most renowned philosophers of France, was born at La Haye, in Touraine, 31st March, 1596, and was the son of a French officer who had fought against the Huguenots. Educated by the Jesuits of La Flèche, he served as a volunteer at the siege of La Rochelle, and afterwards in Holland under Prince Maurice, where he also wrote a treatise on music and some mathematical papers. He next served in Bohemia and Hungary. After wandering for several years through Europe, he settled at Paris in 1626, the year of Bacon's death, and for some time discussed the principles of his new philosophy against the scholastics and peripatetics whom he met at Richelieu's salon and elsewhere. In 1629 he went to Holland, where, under Egmont, greater freedom of thought prevailed, and where he remained for twenty-five years, until Voet, the rector of Leyden, accused him of atheism, when he returned to Paris, and was shortly afterwards invited to the court of Stockholm by Queen Christina, who called him her 'illustrious master.' There he was carried off by pneumonia, 11th February, 1650. He died professing the Catholic religion. In 1793 the National Convention ordered his remains to be transferred to the Pantheon. There is a complete edition of D.'s works by Cousin (Par. 1824-26), and a convenient selection of the philosophical writings by Jules Simon (Par. 1865). The latter consists of the famous *Discours de la Méthode pour bien conduire sa Raison et rechercher la Verité dans les Sciences* (1637); the *Meditationes de Primâ Philosophiâ* (1641), with D.'s replies to the objections of Gassendi, Hobbes, Arnauld, Caterus, De Mersenne, and others; and *Traité des Passions de l'Âme.* In his *Principia Philosophiæ* (1644) he takes up the subject of general physics, and states his theory of *vortices*, by which he explained the formation of the stars in the centre, and the gradual generation of planets and comets. This theory (which is entirely discredited) has nothing in common with the modern theory of vortex rings in molecular physics. D. applied his 'Method' in three scientific works on Dioptrics, Optics, Meteorology, and Geometry. In the last, he first applied algebra to the geometry of curves, explained the formation of his 'ovals,' and laid down a general rule for the determination of tangents to curves. The Cartesian equation will be found in all works on algebra. In a posthumous work, D. states the theory of animal spirits, or of the nervous system, as a hydraulic mechanism, which Huxley and Clifford have revived as at least an accurate general conception of the automatism of the human body and brain. The same train of thought runs through the treatise of the Passions, in which most grotesque physical explanations are given of the several emotions. As a metaphysician, D. admitted as fundamentally true the idea of self as a thinking substance. All equally distinct ideas would also be true, unless God impressed on them a false appearance. It thus becomes important to prove the existence and the character of God. There must be as much reality in the cause as in the effect; and existence cannot be separated from the idea of the essence of God, for non-existence would be imperfection. In this way mind and matter, being distinct ideas, are proved to be distinct in reality as substances, otherwise God would be wanting in power. This is the famous argument *à priori*, which has been much more logically stated by Spinoza and the Rev. Moses Lowman, but which in substance is as old as the Eleatic school of Greek philosophy. This distinction of mind and matter into substances led to the theory of occasional causes, according to which all phenomena (especially those where matter apparently acts on mind, and *vice versâ*) were produced by divine volition, determined by the assemblage of physical or psychical conditions. The courageous scepticism of D. was of good example as a mental attitude, but he added nothing to positive psychology and he introduced into modern philosophy the fallacy that there is an absolute test of truth besides verification by experience. The Scotch Common-sense School have confounded his position with that of Locke and Berkeley, with whom he had nothing in common except the truism that what the mind immediately knows is a mental modification. See Baillet's *Vie de D.* (Par. 1691), and Bordas-Dumoulin's *Le Cartésianisme* (Par. 1843).

Descham'ps, Eustache, a French poet, was born at Vertus, in Champagne, about 1340. He studied at Orleans University, travelled into Italy, Germany, and Hungary, and, according to his own statement, was for some time captive among the Saracens. He was a great court favourite, but always poor, and his property in Champagne was pillaged by the English, whom he heartily abuses in his ballads. He died about 1409. 'He is,' says Besant, 'the most *real* French poet of his century.' His works, comprising 90,000 verses, display grim humour and fierce satiric energy, and give a valuable picture of his times. He resembles Jean de Meun, from whom he occasionally borrows. Morley suggests that Chaucer may have taken the idea of the *Flower and the Leaf* from one of D.'s ballads. See *Poésies Morales de D.*, edited by Crapelet (Par. 1832), Besant's *French Humourists* (Bentley, 1873), and *Early French Poets*, and Gidel's *Histoire de la Littérature Française* (Par. 1875).

Descen'dants are all those descended from a common ancestor. See Collateral Succession, Conquest, Descent, Heir, Succession.

Descent'. By the law of England, real property can only be acquired by D. or by purchase. (See Purchase of Estates.) D. or hereditary succession is the title by which real property devolves by law on the heir from his ancestors. D. at common law is lineal or collateral. Lineal D. is from the father to son, and from son to grandson, and so on. (See Collateral Succession.) The person next in the line of succession is the Heir-Apparent (q.v.), or the Heir-Presumptive (q.v.).

Des'eret. See Utah.

Des'ert (Lat. *desertus*, 'solitary,' 'waste'), the general name of a flat, unproductive region, or uninhabited wilderness. According to Ami Boué, a D. properly so called always indicates the site of a large gulf or inland sea of comparatively recent geological time. Although the word is specially applied to the Sahara (q.v.), a D. is not necessarily a sandy waste, but may bloom with vegetation like the prairies, llaños, pampas, and selvas of America. Other varieties are the salt plains, as of Cashgar (q.v.), and stony or rocky deserts, like those of Arabia, Labrador, Patagonia, &c. One of the characteristics common to all 'deserts where no men abide,' is the scarcity of food and water. It is impossible to say, notwithstanding what has been done in Algeria, whether the discovery of the Artesian Well (q.v.) will ever materially augment the number of oases. As effecting the conditions of climate, the D. plays an important part, acting, so to speak, as a great heat-reservoir. It was calculated that, had the Sahara been flooded, as projected in 1875, there would have followed a fall of several degrees of the temperature of S. Europe. Mineral riches are not unfrequently found in waste regions, as in the case of the 'D. of Atacama,' in the N. of Chili, where valuable deposits of silver and copper have been discovered. See G. von Humboldt's *Ansichten der Natur.*

Deser'tion, in martial law, is the offence of a soldier or a sailor quitting the army or the navy without being discharged or having leave of absence. By the articles of war, framed under powers granted by the Army Act of 1881, military D. is punishable with death, or such other punishment as a court-martial may award. Inducing any one to desert from the army was formerly punishable with death. The punishment is now, by statute, penal servitude. In the navy, by the Naval Discipline Acts of 1861 and 1869, 'every person who shall desert, or entice others to do so, shall suffer death, or such other punishment as a court-martial shall think fit.' In the merchant service a seaman who deserts the ship forfeits his wages, and renders himself liable to imprisonment. But it is not held to be D. if the seaman forthwith enter into Her Majesty's service. Neither is it D. if the master compel the seaman to quit the ship by harsh treatment.

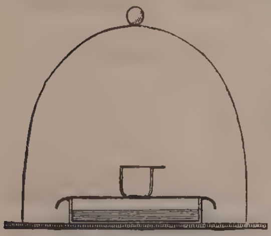
Desertion of Spouse. In England, under statute 20 and 21 Vict. c. 85, a sentence of Judicial Separation (q.v.) may be obtained by husband or wife, on the ground of desertion without legal cause, for two years and upwards, and an order may be made for the protection of the property of a wife deserted by her husband. Under statute 49 and 50 Vict. c. 52, a wife deserted by her husband may, by application to the justices of the peace, obtain an order that her husband pay her a weekly allowance (not to exceed £2). During the continuance of the protecting order, the wife is, relative to property and contracts, on the same footing as if she had obtained a decree of judicial separation.

In Scotland, wilful D. on the part of husband or wife of the other may be the ground of an action of adherence or of divorce under the statute of 1573, c. 55. If the wife desert her husband she forfeits her claim to Aliment (q.v.). It is questionable if she would, on his death, have a right to Terce (q.v.), the statute enacting that offenders shall 'tyne and lose their tocher, *et donationes propter nuptius*.' An offending husband must restore to the wife her *tocher*, and fulfil to her all provisions, legal or conventional. As in England, a wife deserted by her husband can now in Scotland obtain protection of her earnings or other acquisitions; but the process for obtaining it is more difficult in Scotland than in England.

Desertion of the Diet. See DIET, DESERTION OF.

Desertion of a Tenant. In Scotland, when a tenant neglects to cultivate his land, the landlord is entitled to eject him, and to resume possession. The action is valid by common law, but as the fact of D. may be questionable, the action ought to be laid on the Act of Sederunt of 1756.

Desicc'ants (from Lat. *desicco*, 'I dry up') are medicines used to dry up some watery secretion by being dusted over a part.



Desiccator.

Desicca'tion is the process of drying. The desiccator is an apparatus much used in chemistry and physics, and usually consists of a bell jar placed over a vessel containing sulphuric acid or chloride of calcium; this vessel is covered with wire-gauze, and on the gauze is placed the substance or apparatus to be dried. Owing to the strong attraction for water possessed by the two substances mentioned, complete D. is rapidly accomplished.

Design' (Lat. *designo*, 'I mark or trace out') denotes, in a general sense, any intention, scheme, or plan of action. That which bears traces of constructive forethought is said to be a work of D. Hence the adaptation of means to ends observable in nature, and the general harmony and order of the universe have been advanced as confirmatory evidence of an intelligent designer. This argument is admirable as an inference from the character of the effect to the nature of the cause; but it postulates a belief in the divine existence. See Paley's *Natural Theology*, the *Bridgewater Treatises*, the *Burnett Prize Essays*, and Ueberweg's *History*, i. 383.

Design, in art, signifies either a tentative sketch, or the composition of subject-matter, as opposed to the execution of a finished picture. In the latter sense, the ancient Greek sculptors and the great Italian painters excelled in the striking boldness and exquisite grace of their designs, as seen especially in the marbles of the Parthenon, in the statues of Michael Angelo, and in Raffaelle's famous cartoons.

Designs, Copyright in. This is mainly regulated by the Designs Act, by which the grant of copyright is given to any original design, whether applicable to the ornamenting of any article of manufacture, or of any substance, artificial or natural, or partly artificial and partly natural. The application of the design is not necessarily for protection to be within the United Kingdom; and the protection is given though the inventor and proprietor be foreigners. See COPYRIGHT, LAW OF.

De'sio, a small town in the province of Milano, N. Italy, 11 miles N. of Milan, and a station on the Milan and Como Railway, lies in the midst of gardens and vineyards, and is beautified by fine trees and fountains. The inhabitants are engaged for the most part in tillage and the breeding and pasturing of cattle.

Desirade', or **Deseä'da,** one of the Leeward Islands, W. Indies, belonging to France, 6 miles long and 2 broad. It lies 4 miles E. of Guadeloupe, of which it is a dependency. Pop. 1391. D. was the first island discovered by Columbus in his second voyage, 1493.

Des'man. See MUSK RAT.

Desmid'ieæ, or **Desmidia'ceæ,** a natural order or sub-order of green-spored (chlorospermous) Algæ, remarkable for their mode of reproduction and many curious forms. 'The more typical species of the group,' writes Berkley, 'as the name implies, consist of a chain of connected joints, increasing by the continued addition of two new half-joints in the centre, so that the two extreme members of the chain are the oldest, and the two in the centre the youngest. In the majority of instances, however, the disarticulation takes place on the formation of the first new half-joints, in such a manner that the two new individuals consist of half the old plant connected with half of the new, a mode of increase which obtains also in the *Diatomaceæ* (q.v.). Fructification takes place, though rarely, by the conjugation of two individuals by means of lateral tubes or simple contact, as in *Conjugatæ*, the spore affecting interesting forms, and being often strongly spinulose, the spines being occasionally complicated in structure. The new individual is produced from this by the formation of a vertical partition in the centre, and the subsequent formation of two new half-joints, so that the proper form of the species is not attained till the third generation, if so soon.' D. differ from *Diatomaceæ* in their green colour and the absence of silex; hence they shrivel up and lose their natural form in drying. Pools and running streams are their favourite habitats; they are sometimes found in brackish, but never in salt water. None are applicable to any economic purpose. See CONJUGATION and SWARMING.

Desmon'cus, a genus of tropical American palms, resembling the calami in general appearance. The Jacitara, a common species of the Amazon or Rio Negro, owing to the sharp curved spears in the leaf-stalks, obstructs the traveller by catching hold of his garments. The Indians manufacture various implements of it; among others, the strainers used in squeezing the mandioc juice are plaited out of strips of the stem.

Desmou'lins, Camille', one of the most typical and brilliant of the early French Revolutionists, was born at Guise in Picardy, in 1762, and studied for the bar, but never practised. He was seized with the revolutionary fever, and wrote some works advocating the establishment of a republic in France of the ancient or classical type. D.'s fiery utterances were mainly instrumental in leading the population to destroy the Bastille on the night of the 14th July, 1789. His first idol had been Mirabeau, but after the death of the latter he attached himself to Danton. Next to Danton and Marat he was the most influential member of the Cordeliers Club. He became a member of the National Convention, voted for the death of Louis XVI., and although in reality more in sympathy with the Girondins than with the Jacobins, pelted the former with ridicule, of which he was a master, in his

Histoire des Brissotins. After he saw what excesses the reign of the Terrorists was leading to, he attacked the members of the Committee of Public Safety. In consequence he was arrested, along with Danton, 30th March, 1794, and was executed with him, 5th April, saying, when asked his age, that 'he was of the same age as the *bon sans-culotte* Jesus, thirty-three years, an age fatal to Revolutionists.' A fortnight afterwards his wife, Lucile D., who had attempted to arouse popular feeling in his favour, was also executed. D. was a writer of powerful imagination and great humour, although deficient in moral resolution; in quieter times he might have been a great wit, if not a great poet. An edition of his works appeared in the *Bibliothèque Charpentier.* See *Camille D., Lucile D., Étude sur les Dantonists*, by Jules Claretie (Par. Plon, 1875), and an English translation of his Memoirs (Lond. 1876).

Des'na, a river of Russia, an affluent of the Dnieper. It rises 50 miles S.E. of Smolensk, traverses the governments of Smolensk, Orel, and Tchernigov, and after a course of more than 500 miles, falls into the Dnieper near Kiev. It is navigable to Briansk.

Des'potism (from Gr. *despotēs*, 'lord or master') is a form of government having its origin in superstition, under which the welfare of a community is subordinated to the interests of a class or individual. In the latter case, if the individual clothed with 'the divinity that doth hedge a king' is of a strong moral and intellectual nature, the form of rule is not without something to recommend it. Under the direction of one wise man the practical force of a people is greater than when they are free. This fact was acted on by the ancient Romans, by the creation of a Dictator (q.v.) in times of great public peril. England was, perhaps, never so powerful as when its whole energy was directed by the wisdom and iron will of Oliver Cromwell. Nevertheless a free form of government is to be preferred; the despotism of a weak or narrow-minded ruler being an unqualified evil.

Dess'alines, Jacques, one of those extraordinary characters whom the circumstances attending, or following, the French Revolution brought into prominence, was born about 1760, on the Gold Coast of Africa, and became a slave to a free black in Santo Domingo. After the liberation of the slaves there in February, 1794, he took an active part in the disturbances that occurred in the colony. He became lieutenant to Toussaint l'Ouverture, and, after his capture, leader of the insurgents, and finally drove the French out of the island, October, 1803. When the people declared themselves independent, D. was proclaimed Emperor of Haiti, under the title of Jean Jacques I. His tyranny and cruelty, however, provoked hatred, and on the 17th October, 1806, he fell a victim to a conspiracy by a negro named Christopher (q.v.), who succeeded him as Emperor Henri I. of Haiti.

Dessau', a town of Northern Germany, capital of the Duchy of Anhalt, on the left bank of the Mulde, about 3 miles above its confluence with the Elbe, and 80 miles S.W. of Berlin by rail. It is walled on three sides, and protected on the fourth by the river. Its principal building is the ducal palace (1748) with a picture gallery and an extensive library containing numerous MSS. of Luther. The manufactures are woollen and linen cloth, leather, hosiery, and tobacco. Mendelssohn was a native of D. Pop. 34,658.

Destina'tion. In Scotch law, the series of heirs called to the succession of heritable or moveable property by provision of law, or to moveable property under a will, is termed a D.; but the term is usually limited to a nomination of successors under a will. For rules of succession in heritable and moveable property by provision of law, see SUCCESSION. For rules as to destination of moveables by will, see LEGACY, TESTAMENT, LEGITIM, JUS RELICTÆ. By the law of Scotland heritage cannot be conveyed in form of a last will and testament. Regarding execution of a settlement, including heritage as well as moveable estate, see article WILL. An absolute proprietor of heritage is under no legal restraint as to the distribution of his property. He may put a daughter in place of a son, or a younger child in place of an elder one, or he may exclude all his children in favour of some one else.

Desu'etude (Lat. *desuetudo*, 'disuse'), a term of Scotch law indicating the legal doctrine that a statute may lose its force by the gradual establishment of usage contrary to its provisions, without these being repealed by the legislature. Mere non-usage, however, even for the greatest length of time, will not abrogate a statute; continued intention of the community to repeal by contrary practice must be shown. In England the rule of law is that a statute remains in force, however unsuited to the altered condition of society, until repealed expressly, or by implication, by another statute. In the latter case, the repeal, according to Blackstone, 'is to be understood only when the matter of the later statute is so clearly repugnant that it necessarily implies a negative. As, if a former Act says that a juror upon such a trial shall have an estate of £20 a year, and a new statute afterwards that he shall have 20 marks.' For a remarkable instance of the extremity to which this doctrine of English law has been carried in recent times, see article BATTEL, TRIAL BY. Since 1869 an edition of the English statutes has been published, containing only those statutes, or parts of statutes, which are in force. The rule of D. in Scotland applies only to statutes made previous to the Union, and even to them its application is uncertain.

Detach'ment (Fr. *détachement*, from *détacher*, 'to disengage'), in military language, a comparatively small number of troops detached from the main body for some special duty. In naval language, also, a D. of one or more ships under a separate command is spoken of.

Detain'er, in English law, the name of a writ which was lodged with the sheriff against any one in his custody, or, formerly, lay against prisoners in the Marshalsea or Fleet Prison, directed to the marshal or the warden, directing him to detain the prisoner until lawfully discharged.

Deter'minants, a symbolic method of modern mathematical analysis, by which, among other things, the solution of equations of several unknown quantities becomes a mere matter of inspection. A determinant may be defined as the algebraic sum of all the possible products obtained by permuting the suffixes of the expression $a_1b_2c_3d_4\ldots$, the sign being changed for every *single* permutation. Thus the determinant of the third order is

$$a_1b_2c_3 - a_1b_3c_2 + a_2b_3c_1 - a_2b_1c_3 + a_3b_1c_2 - a_3b_2c_1,$$

and is usually written thus :—

$$\begin{vmatrix} a_1, & b_1, & c_1 \\ a_2, & b_2, & c_2 \\ a_3, & b_3, & c_3 \end{vmatrix}$$

The properties of D. are very numerous; but for these the student is referred to works on the subject, such as Salmon's *Higher Algebra*, Dodson's *D.*, and Balzer's *Theorie und Anwendung der Determinanten.* A short treatise, with some of the commoner applications, is also given at the end of Todhunter's *Theory of Equations.*

Det'inue, in English law, the name of an action against one who refused to restore goods entrusted to him. (See DEPOSIT, and the articles there referred to.) When the plaintiff seeks a return of the actual chattel, a course is open to him provided by the Rules of the Supreme Court, ord. 48, by which he obtains a writ of delivery, and this is sent to the sheriff to distrain on the defendant till he returns the chattel.

Det'mold (originally *Theotmalli*, 'the people's *mall* or place of assembly'), the capital of the principality of Lippe, Germany, on the Werra, E. of the Teutoburger-Wald, and 47 miles S.W. of Hanover. It consists of an old and a new town, and is encircled by pleasant promenades. The principal buildings are the palace, the gymnasium, and the theatre. There are several charitable institutions, a military hospital, and a public library, established in 1781. D. is supposed to be the ancient *Teutoburgium.* On the Grotenburg, about two miles from D., is the Hermann Memorial, a colossal copper statue erected to the memory of Hermann or Arminius, who defeated Varus and his legions (B.C. 9). Pop. of D. 9735.

Detona'tion signifies a sudden explosion.

Detri'tus (Lat. 'worn down'), in geology, denotes a natural accumulation of debris or fragments of disintegrated rocks.

Detroit' (Fr. 'the strait'), the chief city of Michigan, stands on the right bank of the D. river, opposite Windsor, in Canada, 526 miles N.W. of Washington. The city extends along the river several miles, and the site rises gradually to a height of 40 or 50 feet. Its chief public buildings are the courthouse, customhouse, post-office, the Roman Catholic cathedral, the insurance bank, and the churches. D. is the great centre of commerce, banking, and produce in the state, railroads connecting it with all parts of the States and Canada, and the river giving it the unequalled waterway of the lakes. The industry comprises many steam sawing-mills, shipbuilding, foundries, with copper-smelting in the vicinity. D. has a medical college, St. Philip's College, and many public and private schools. Eight great lines of railway centre here, diverging into all parts of America. In 1858 the debt was $300,000, which has increased to $2,215,226, less sinking fund. Over 45 millions of dollars are invested in the manufactures of D., of which the chief annual outputs are cars and steam railroad stock ($10,000,000), foundry and machine shop products ($7,631,103), tobacco ($4,742,412), &c. D. was first visited by the French in 1610, settled by them in 1701, and taken by the British in 1760. Pop. (1870) 79,577; (1890) 205,876.—*Detroit River* flows S. from Lake St. Clair 25 miles to Lake Erie, with a breadth of three-quarters of a mile, and is deep and navigable.

Dett'ingen ('the people's home or town'), a village of Lower Franconia, Bavaria, on the right bank of the Main, about 8 miles N.W. of Aschaffenburg, notable only for the victory gained here on the 27th of June, 1743, by the allied army of English, Hanoverians, Austrians, and Hessians, amounting to 40,000 men, and commanded by George II. of England, over the French, 58,000 strong, under the Duc de Noailles. The latter lost 2659 men, and the allies at least as many. The battle of D. was the last occasion in which an English sovereign appeared on the field. See Carlyle's *History of Friedrich II. of Prussia*.

Deuca'lion (the 'bright' or 'brilliant'), in Greek mythology, a king of Phthia, and son of Prometheus and Clymene. When Zeus, to punish the wickedness of men, had sent a flood over Hellas, D. with his wife Pyrrha entered an ark, previously prepared on the advice of his father, and they alone were saved. On the ninth day the ark rested on Mount Parnassus. There D. sacrificed to Zeus, who sent Hermes to grant any prayer he might offer. Having prayed for the restoration of the human race, he and his wife were ordered to cover their heads, and cast their mother's bones behind them as they went their way. Judging that the earth was their mother, they cast stones behind them, when those thrown by D. became men, and those by Pyrrha women. D. is the father of Hellen, from whom sprang the Hellenes or Greeks, and of Protogeneia ('the first-born'). Cox, in his *Manual of Mythology*, finds in the names evidence of the mythic perversion of solar phenomena.

De'us ex Mach'ina, a phrase used by the ancients in allusion to a practice not unfrequent in the classical theatre of bringing about the solution of a difficulty in the plot by the intervention of a god, who descended on the stage in a kind of machine. Horace (*De Arte Poeticâ*) obliquely censures the abuse of this unskilful artifice—

> 'Nec Deus intersit, nisi dignus vindice nodus
> Inciderit.'

The phrase has been borrowed by the moderns, who have given it, however, a wider application.

Deuteron'omy (Gr. 'the second law') is the fifth book of the Bible. According to Jewish and Christian tradition, it was, like the rest of the Pentateuch (q.v.), the composition of Moses. It is almost entirely made up of discourses of Moses to the people regarding the way in which Jehovah had guided them through the desert, and setting forth anew his commands; the only historical part, with the exception of iv. 41-43, being the last four chapters. Modern critics endeavour to prove that the aim of the author was not historical, but hortatory with reference to the circumstances of his own time—about the time of Hezekiah and Josiah, if not as late as the Babylonian exile—to suit which he brought prominently forward those laws which were then needed, altered some of the earlier ones, and gave new ones altogether; which treatment is shown particularly in the laws relating to the priests and Levites, and the offering of sacrifices in one place. See Bleek's *Einleitung in die Heil. Schrift* (Berl. 1870).

Deut'zia, a genus of plants of the natural order *Philadelphaceæ*, many of which are cultivated in our greenhouses. They are natives of India, China, and Japan. The leaves of *D. scabra* of Japan are covered with siliceous star-shaped hairs—favourite objects under the microscope—and are used by wood-polishers in Japan. Similar hairs are seen on *D. staminea*.

Deux Ponts. See ZWEIBRÜCKEN.

Dev'apraya'ga, a town in Gurwhal, Hindústan, 12 miles W. of Srinnuggur, in the fork of the Aluknunda and the Bhagiratti, henceforth named the Ganges, the part of which deemed most sacred by the Hindus being at D. Hence it is the resort of numerous pilgrims, but its fixed population consists of 1000 Brahmans. In the upper part of the town is a temple 60 feet high, built of large blocks of squared stone piled up without mortar. Three basins have been excavated in the solid rock below the level of the stream. D. is 2266 feet above the level of the sea.

Devel'opment of Doc'trine is related to, but not to be confounded with, the Roman Catholic doctrine of Tradition (q.v.), according to which there is a supplementary revelation over and above that contained in the Bible, and which has been handed down outside of the Scriptures. A certain theory of D. of D. is indeed held by some Roman Catholics, namely, that although the doctrines of Christianity are all in the Scriptures, they are there only in their rudiments, and that the Church, under the tuition of the Spirit, comes to understand all that these rudiments imply, and to expand them in their fulness. The orthodox Protestant doctrine is, that 'all the facts, truths, doctrines, and principles which enter into Christian theology are in the Bible, as fully and clearly at the beginning as they are now.' Still progress has been made in theological knowledge as well as in physical science. As the science of astronomy, for example, is always advancing, while the structure of the heavens remains ever the same, so the Bible, which contains the great truths of revelation, is always becoming better understood, and the representations of the early fathers regarding, for example, the doctrine of the Trinity, as compared with the clear, precise, and consistent statements in the creeds of the Church, are like the astronomy of Pythagoras compared with that of La Place. Another theory, initiated by Schleiermacher, and founded on the philosophy of Schelling and Hegel, is that humanity is a generic life which, assumed into union with the divine life of the Son of God, and thus raised to a higher power, is communicated from him by a natural process of development to the Church, and that Christian theology is not the systematic exhibition of what the Bible teaches, but the interpretation of this life. Without regard to any theory, the D. of D. seems to be the change which the definitions of doctrines, teaching certain essential truths, continually undergo partly at least under certain external causes, such as differences of climate, national character, personal feelings and passions, court intrigues, priestly imposition, the fanaticism of monks, and the internal principles of human reason. See Donaldson's *Critical History of Christian Literature and Doctrine from the Death of the Apostles to the Nicene Council* (Edinb. 1864).

Dev'enter, commonly **Dem'ter** (Lat. *Daventria*), an ancient town in the province of Overyssel, Holland, on the Yssel, 55 miles E.S.E. of Amsterdam, fortified by a wall and ditch. The principal buildings are the townhouse, courthouse, and prison. D. has numerous hospitals and several high-class educational institutions. The chief industries are iron-foundries and the manufacture of Turkey carpets and hosiery. D. exports butter, grain, beer, and a celebrated gingerbread known as 'D. cake' (*D. Koek*). D. was destroyed by the Saxons in 778, and again by the Norsemen in 883, and was made an imperial fortress by Lothar of Saxony in 1123. During the Middle Ages it was a famous Hanse town, and in the 16th c. ranked after Antwerp and Amsterdam as an emporium of trade, and is still flourishing, though neither so famous nor so conspicuous as formerly. Pop. 23,353.

Devia'tion of a Ship. Under the contract of affreightment, if a vessel be compelled by weather, by an enemy, or by accident, to deviate from the appointed line of voyage, no claim arises to the freighter against the owners; and it is now held that the master may detain the cargo, though formerly the rule was that he was bound to forward it in another ship. An unnecessary D., being an alteration of risk, discharges the underwriter. The *onus probandi* lies on the person alleging D.

Device', in heraldry, an emblematic design, borne upon armour or on banners. The term is derived from the *vestialla divisa*, or parti-coloured uniforms by which Italian retainers were distinguished in the 13th c. Devices were used to mark different warriors early in the Middle Ages. Henry II. bore the D. of the broom-plant, or *planta-genista*, an emblem of his name, Plantagenet. The devices of the Houses of York and Lancaster—the red and white roses—became famous in the civil war. In the 16th c. painted or carved devices were very common in noblemen's dwellings.

Dev'il (Gr. *diabolos*, 'traducer'), in Christian theology, is a personal evil spirit, the cause of all evil, and the active enemy of God and man. One of the first tasks of man's imagination, in his primitive state, is to account for the phenomena of nature. On the one hand there appears to be a beneficent power, who scatters welcome gifts upon men; on the other, a harsh and cruel power, that covers the sky with blackness, sweeps away his home with torrent or tempest, starves, freezes, or scorches him, poisons him with exhalations, casts him to the beast of prey: 'One a god of light smiling in the sunbeam, the other a god of darkness scowling in the thunder-cloud; the one ruling by good and gentle spirits, the other by fierce and evil spirits.' Here we have the origin of the dualism, or worship of two gods, which prevailed among the ancient Indians, Persians, Egyptians, and many other nations; for instead of the good deities alone being worshipped, as might be supposed, the terrible gods were more adored than they, from fear of their vengeance.

The monotheism of the Hebrews lifted them far above the perplexities of the dualistic idea. Belief in a D. nowhere appears in the earlier books of the Bible. In Genesis the serpent which tempted Eve is not represented as a great being hostile to God, though in later times that interpretation was accepted as the only adequate explanation of the phenomenon. After the captivity the D. was discovered under the disguise of the serpent (Wis. ii. 23, 24), the symbol of the Persian Ahriman. Neither is there any dualism implied in the ceremonial connected with Azazel (Lev. xvi. 8, 10, 'scapegoat'), for he is not a personal being, and the goat is not offered to him; he is merely a personification of abstract uncleanness; although the prototype of Azazel is the Egyptian Set. The first definite appearance of the doctrine afterwards so fully developed is in the Book of Job. According to the introduction of this book, among the 'sons of God' who surround Jehovah's throne there is a Satan (Heb. 'adversary'), whose part it is to speak against man, and bring misfortunes on mankind, but who seems as much a servant of God as the other angels. A slight development of the idea appears in the prophecies of Zechariah, where Satan, although still merely the accuser, is rebuked for his attack on Joshua, the high-priest, and on Jerusalem; so that he is already beginning to be opposed to Jehovah. It is at this point that the influence of the Persian dualism which took effect during the captivity appears. The Jews, of course, did not adopt the dualism of that religion. The grand idea that Jehovah shaped and directed all things was so strong in them that they did not recoil from the consequence that not only plagues and disasters, but even moral evil, must be in some deep, mysterious way the work of God; and on the part of some of the nobler-minded prophets there was a direct protest against the dualistic notions when they began to take effect (see Isa. xlv. 7). To others, however, Jehovah's moral purity seemed to suffer from this conception, and the conception of Satan gradually developed from that of an 'adversary' into that of the *tempter* of mankind. The change in the conception of the moral world is well seen in the account of the temptation of David to number Israel, as given in 2 Sam. xxiv. 1, where it is said to have been Jehovah who moved him to do it, and by the Chronicler (3rd c. B.C.), who makes it the work of Satan (1 Chron. xxi. 1). It would be very difficult to tell how far the Jewish conception of Satan was influenced by the Persian belief in Ahriman; but the likeness between the Hebrew and Persian evil powers gradually became so great that it was easy to confuse them—the distinction between them, however, being manifest, namely that Ahriman is physical evil which has also become moral evil, while Satan is moral evil becoming physical evil. This explains the unbounded influence which he had acquired in the physical world before the time of Christ (see DEMONIACS). The growth of this influence is clearly seen in the Apocryphal books, which all contain either Alexandrine or Persian elements. In the Book of Wisdom the evil spirit, there first called *diabolos*, the devil, is identified with the serpent of Genesis. He now resides in a subterranean hell, and heads an army of evil spirits, many of whom are undoubtedly Persian—*e.g.*, Asmodeus (Tobit), Pers. *Aehsma-dæva*. Others are mentioned in the Book of Enoch, which contains also the earliest form of the belief about the fall of the evil angels from heaven. The likeness to Ahriman begins distinctly in this, that the D. now adds hatred to God to his hatred of man, and although he does not make war directly on God, seeks to spoil his creation by waging war on man.

An extraordinary development of the doctrine finds expression in the New Testament. The D. has now taken his position as the author of all evil. The solution of the problem regarding the origin of evil is given in 1 John iii.: it comes from the D. His nature is the negation of all that is real and true in God, of light, of love, and of life. But being now cast out from heaven and all communion with it, he can no longer influence God against men; he therefore vents his rage directly on men themselves. He is especially the antagonist of Christ and of Christians; and necessarily so, since the mission of the Messiah (q.v.) was by a victorious struggle with Antichrist (q.v.)—the 'Prince of the demons,' the 'Ruler of the power of the air,' the 'Ruler of this world'—to establish the 'kingdom of heaven.'

In the early Christian centuries many influences combined to foster this notion of an antagonistic parallelism between the kingdom of light and the kingdom of darkness, and to establish more definitely the conception of a kingdom of the D. opposed to the kingdom of God; the persecuted Church representing the latter, the persecuting world the former. Hence expulsion from the Church was 'given over to Satan,' and every new convert to Christianity before being baptized, was exorcised, or had the D. driven out of him (see EXORCISM), and was required to abjure the D. and all his works. The notions about this opposition were most fully developed in the theory of redemption, which, as taught by Irenæus, was as follows:—Man having by the fall become the D.'s rightful property, it would have been unjust on the part of God to deprive him by violence of his own. Accordingly the D. was able to stipulate that, if he gave up his claims on man, Christ should be handed over to him. But in this transaction he was outwitted, for when he got Christ he found that he could not keep him. Having swallowed the 'bait' of his human nature, he was so tortured by the 'hook' of his divinity that he was glad to let him go.

During the following centuries, and on through the Middle Ages, the doctrine of the fall of Satan and the evil angels was fully developed. To account for the fall of man, the fall of the angels had to happen before that event. According to Augustine, they were created on the first day of Genesis i., when God said 'Let there be light,' and fell on the second, when He divided the waters under the firmament from the waters above the firmament. The details of their fall were filled in from texts of Scripture. Thus the fall of the archfiend was due to pride and envy. According to St. Bernard's exposition of Isaiah xiv. 12, 13, he was cast out of heaven because, although entitled as a seraph to stand above the throne of God (Isa. vi. 2), he presumed to *sit* in the presence of the Eternal. The other angels fell through lust (Gen. vi. 4). To the D. was now (before the 9th c.) given a body of an endless variety of form and feature, borrowed from the different pagan mythologies — fiery eyes, red protruding tongue, large horns, a long tail, the hoof of a horse (of the centaurs), or the cloven hoof of the satyrs, &c. He and his imps made a prey of men at large. Now too arose the notion that a compact could be made with the D., by which the soul could be exchanged for the object of one's greatest desire. This led, in the 13th c., to the execution of witches and sorcerers, the supposed servants and accomplices of the D. (See WITCHCRAFT.) It may here be noticed that the name Lucifer (Lat. 'light-bringer') was given to the D. from a mistaken interpretation of the apostrophe in Isaiah xiv. 12. 'How art thou fallen from heaven, O Lucifer, son of the morning.'

The vulgar conception of the D. in modern times has been materially affected by the writings of two men—Milton and Göthe. Milton by his *Paradise Lost*, familiarised his countrymen with the theological traditions of Italian literature and art, from which the whole scheme of his drama was borrowed; but it had the effect, in the mind even of those who could not look beneath the surface, of divesting the D. of his flesh and blood, horn and hoof nature, whilst in reality the poet idealised Satan altogether, and the hero of his drama was Evil in the abstract. The design of Göthe, in his *Faust*, was very similar. Mephistopheles was simply 'our own ignorant, besotted, dogmatising, superstitious, animal nature, cultivated and developed at the expense of the intellectual in us.' The poet's aim was to show that this is the real nature of the Evil Spirit to which was given so materialistic a form in the Middle Ages, that this is the real 'Ruler of the world' of apostolic times.

Recent writers on the D. speak of him as a *fallen majesty*, because even 'those who profess belief in his existence live absolutely as if they held no such belief'; and how great is the contrast between the belief of the present day and that of the Middle Ages may be seen by a study of witchcraft. Those who now refuse to believe in the existence of such a being hold, nevertheless, that there is embodied in the conception of a personal D. a great truth—that no action, in respect of morality, stands purely on its own merits, but involves a principle which extends through all time and all space; the principle, namely, that by any sinful action, or by resisting evil on any particular occasion, we take the side of, or we resist, evil in the abstract, or *all* evil, past, present, and to come. The belief in the existence of the D. may be said, at present, to be on its trial. There is, beyond all question, a profound and widespread *suspicion* of the unreality of a personal Agent in the mind of Christendom; but so many grave issues seem to depend on the acceptance or rejection of the doctrine, that men will probably remain undecided in their convictions till they clearly see what the surrender of the belief really implies. If anything be imperilled which sustains and strengthens the religious life, men will prefer to acknowledge a forbidding mystery rather than allow their sense of the dire nature of evil to be permanently weakened. See Roskoff's *Geschichte des Teufels* (Leipz. 1870), Buckle's *History of Civilisation*, and Kuenen's *Godsdienst van Israel* (Haarl. 1869; Eng. transl. 1875).

Devil's Bit. See SCABIOSA.

Devil Fish, belonging to the genus of Rays, is a fish possessed of a stunted head, on each side of which are winglike fins. Its tail has spines and is long and slender. Its mouth, which is over 2 feet wide, is under-jawed and furnished with teeth arranged in many rows. The pectorals extend beyond the head and look like unto horns. This fish occurs in the equatorial portions of the Atlantic Ocean, and the largest specimens have been seen near Jamaica. Some have been caught weighing as much as 5 tons and almost 18 feet long by 18 feet broad. The fish is hideous and strong, but of a timid nature and easily scared by man. See CEPHALOPTERA.

Devil Fish.

Devise' is an English law-term signifying properly a gift of real estate by a last will and testament; a form of conveyance, *mortis causa*, which the English law admits. The giver is called the *devisor*, and he to whom the estate is given is called the *devisee*. But the term is now applied to all legacies. The power of D. extends not only to property possessed by the testator at the time of making his will, but to all that he may acquire subsequently. See WILL.

Devi'zes, a town in the centre in Wiltshire, near the Avon and Kennet Canal, 22 miles N.N.W. of Salisbury. It has silk-throwing mills, and snuff and malt manufactures. Its corn-market is the largest in the W. of England. Until 1885 it returned one member to Parliament. D. took its rise from a castle built here in the reign of Henry I. by Roger Bishop of Salisbury. The name is a corruption of the Latin *Devisæ*, so called from being the point on the road from London to Bath where the Roman and Celtic districts *divided*. Pop. reg. sub-dist. 13,015; mun. bor. 6426; and parl. div. of county 48,297.

Devonian System (Ger. *Obere Grauwacke*), the name given by Sedgwick and Murchison to the rocks developed in the S. of England and the Rhine lands near Coblenz, which occupy a geological position above the Silurian and below the Carboniferous formations. The Old Red Sandstone (q.v.) of Wales, Scotland, and Russia is similarly situated; but in how far these two series, differing considerably from each other both as regards their lithological and fossil character, are strictly contemporaneous it is impossible to say, since in no place do they touch. There seems to have been a physical barrier stretching across England and the N. of Central Europe S.E. towards the Black Sea, on the S. side of which salt-water deposits of the D. type were formed, and on the N. large lagoons or inland sheets of water, giving rise to the Old Red Sandstone. The D. S. is divided into—(1) *The Lynton Beds*, or Lower D., a series of hard unfossiliferous sandstones resting on chlorite slates, which contain traces of animal life in the form of corals and gasteropods; (2) *The Ilfracombe Beds*, or Middle D., grey schists and limestone, the latter containing a very typical brachiopod, the *Stringocephalus Burtini*, besides numerous corals, crinoids, and gasteropods quite distinct from the Silurian and Carboniferous forms; (3) *The Barnstaple and Marwood Beds*, or Upper D., consisting of sandstones and shales, which abound in marine fossils, a number being identical with those of the Carboniferous system. In the district of the Rhine, Harz, and Thïolinger-Wald, these three subdivisions are also recognised. In N. America the rocks seem intermediate in character between the true D. and the Old Red Sandstone. Fossils corresponding to the types of both formations are obtained, and the upper strata show the same carboniferous character as in England. Land plants are numerous in the N.E., and coal seams, the oldest known in the world, occur here.

Dev'onport, a borough and naval arsenal in Devonshire, England, on the Hamoaze, the estuary of the Tamar, 2 miles W.N.W. of Plymouth, and 248 miles W.S.W. of London. It was named *Plymouth Dock* until 1824. The town stands on a height, and is defended on the N., E., and S. sides by a wall 12 feet high, and a fosse cut in the solid rock to a depth of from 12 to 20 feet, while the sea-entrance is protected by forts with heavy batteries. The houses are generally well-built, and the streets regular, with marble footpaths. Water is supplied from Dartmoor. The importance of D. springs from its dockyard and arsenal, which contain everything necessary for building and equipping ships of war. The docks cover an area of 100 acres. A basin and two of the docks were begun in the reign of William III., and two other docks in the reign of George III. The north basin, finished in 1868, is 900 feet long by 400 wide. The port-admiral and governor have official residences in D., and there are extensive barracks and military hospitals. Besides ropemaking, sailmaking, and anchor-making, there are breweries, soapworks, and a large trade in victualling ships. D., comprising the parish of Stoke Damerel and the township of East Stonehouse, returns two members to Parliament. Pop. parl. bor. 70,204; county bor. 54,803.

Devonshire (the Roman *Damnonia*, a Latinised form of the Celtic *Dyfnaint*, 'the deep valleys'), a county in the S.W. of England, bounded N. by the Bristol Channel, S. by the English Channel, W. by Cornwall, and E. by Dorset and Somerset. It has a rocky, precipitous coast-line of 160 miles, in the N. indented by Barnstaple or Bideford Bay, in the S. by Plymouth Sound, Salcombe Haven, Tor Bay, Exmouth, and Lyme Bay. The county is in great part hilly, and famous for its beautiful streams and valleys. The small *coombes* on its N. coast are not surpassed in picturesque daintiness by any coast scenery in Britain. The centre and S.W. is occupied by Dartmoor (q.v.), and in the E. are Exmoor and Blackdown, also tracts of elevated heath. The rivers flowing N. are the Taw and Torridge; those entering the English Channel are the Exe, Teign, Dart, Tamar, and Tavy. The Dart is specially notable for its wild beauty and its legendary renown. Along the S. coast the climate is extremely mild, in winter attracting many invalids. The famed vale of Exeter includes over 120,000 acres of the finest land in England. Of the 1,667,097 acres, which constitute the area of the county, 240,949 are under corn crops (oats, 122,539 acres); 131,311 under green crops (potatoes, 11,934); 205,137 under clover, sainfoin, and grasses in rotation; 629,369 under permanent pasture; 32 under flax; and 1432 under small-fruit cultivation. Nursery grounds occupy 318 acres, and 124,387 acres of mountain and heath land are used for grazing. Woods and plantations cover 84,098 acres. The chief exports are live stock, the famous cider, and dairy produce, especially butter and clotted cream. There are manufactures of druggets, serges, linen, carpets, leather, &c., and also valuable pilchard, mackerel, dory, and mullet fisheries. The formation of D. is for the most part Devonian, interposed with igneous rocks, but in the N.E. it is Carboniferous. The tin-mines are among the most celebrated in the world; the other minerals are copper, lead, iron, silver, gypsum, Bovey coal, marble, and porcelain clay. Exeter is the capital, and the other chief towns are Plymouth, Devonport, Tavistock, Tiverton, and Barnstaple. D. contains eight Parliamentary divisions, each of which returns one member :—Eastern, or Honiton, pop. 52,025; Mid, or Ashburton, 53,005; N.-Eastern, or Tiverton, 52,763; Northern, or S. Molton, 46,719; N.-Western, or Barnstaple, 61,331; Southern, or Totnes, 49,642; Torquay, 57,450; Western, or Tavistock, 50,616. D. was the seat of an early civilisation, through its intercourse with Phœnician or Carthaginian merchants. At Plymouth and elsewhere large collections of bronze weapons and ornaments have been found, showing these to have been gathering-places of pre-Roman traders. The Tamar is the old border river of the W. Saxons and Britons, and overhanging it is Hingston Down, the *Hengestesdun* of the Chronicle, where Ecgberht defeated a united British and Danish force in 835. The sloping bank of the river is dotted with barrows of unknown antiquity. Pop. anc. county 631,808; adm. county 455,353; and reg. county 636,225. See also articles, CATTLE, HORSE, PIG, SHEEP.

Devonshire, Dukes of. The House of D. takes its rise in the 12th c. in the Counts or Earls of Devon. In 1556 the earldom reverted to the Cavendish family (see CAVENDISH), the third of whom was created Duke of D. in 1694. Excepting the present Duke, the House of D. has never taken a very prominent part in English politics, but has been distinguished for its firm adherence to the Whig party. The most notable members of the family are **William Cavendish, First Duke of D.,** born 25th January, 1640, served in the navy, opposed James II. in Parliament, was a witness in favour of Lord Russell, became Earl of D. in 1684, and in 1694 Duke of D. He was one of the regency during William III.'s absence, and died 18th August, 1707.—**Georgiana Spencer, Duchess of D.,** youngest daughter of John, Earl Spencer. Born 9th July, 1757, she married William Cavendish, Duke of D., in 1774. Her beauty, wit, audacity, and accomplishments made her one of the most celebrated women of her day. The Duchess was an ardent Whig, and the firm friend of Fox. She wrote *Memorandums of the Face of the Country in Switzerland* (1799), and a poem, *The Passage of St. Gothard* (1803), not undistinguished by elegance and fancy. She died 30th March, 1806.—**William Spencer Cavendish, Sixth Duke of D.,** son of William Cavendish and Georgiana Spencer, was born 21st May, 1790. He was a strong advocate of Catholic emancipation, was Lord Chamberlain in the Grey Ministry, and supported Reform. He took great interest in art, as well as in politics. He died unmarried, 18th January, 1858, and was succeeded by his cousin, **William Cavendish, Seventh Duke of D.,** born 27th April, 1808. He was for some time Chancellor of the Universities of London and Cambridge. He died 21st December, 1891, and was succeeded by his son, **Spencer Compton Cavendish, Eighth Duke of D.,** born 23rd July, 1833. See article CAVENDISH.

Dew is the deposition of moisture from the air, which has been cooled below the minimum temperature at which it can retain in suspension the quantity of vapour present. This critical temperature is called the *dew-point;* and it is the temperature at which the deposition *begins* to take place if the air be subjected to a continual cooling process. During the day the heat of the sun evaporates the moisture of the earth's surface, and saturates the earth with vapour; but towards and at sunset this action is arrested, the surface radiating the heat it formerly absorbed, and cooling, if unchecked, below the dew-point, whereupon the D. is deposited. Such is the theory established by Dr. Wells, and generally accepted now. Clouds, by obstructing radiation, check this deposition; and winds, by constantly renewing the air in contact with a given surface of ground, have the same effect, since sufficient time is not permitted for the required cooling to take place. D. falls chiefly on calm, serene nights, and earliest upon the objects which radiate fastest. When the temperature is at or below 0° C., the D. takes the form of hoar-frost, the vapour passing at once into the solid state. The D. falling in England annually has been estimated by Dalton as equal to a bed of water 5 inches deep.

Dew'as, a town of the state of Dewas, under the Manpur agency, on an affluent of the Chambal, and capital of a petty state of the same name, taken under British protection, 18th December, 1818. It is governed by two chiefs, descended from two brothers of a Rajput family, who intermarried with Mahrattas, and destroyed the purity of their blood. These chiefs possess equal authority, and have each the right of adoption. A hill near the town is crowned by a temple, dedicated to the goddess Chamunda Devi, whose form, in gigantic proportions, is cut on the cliff. Numerous pilgrims visit the spot every year. Pop. of town 15,068. The area of state is 882 sq. miles, and the pop. is estimated at 152,073.

Dew'berry, a Rosaceous plant allied to the Bramble (q.v.), which belongs to the same genus, common in many parts of Europe and Asia. There are two species in N. America. Both produce an edible fruit, that of the American species being much superior. A kind of 'wine' is made from the juice of the British D. See RUBUS.

De Wett'e, Wilhelm Martin Leberecht, a famous German theologian, was born at Ulla, near Weimar, 14th January, 1780, studied at Jena, and was appointed Professor of Theology at Heidelberg in 1809. Called to Berlin in 1810, he was Professor of Theology there till 1819, when he lost his chair for meddling with politics, but was soon after appointed Professor of Theology at Basel, where he remained till his death, 16th June, 1849. D., following out the principles of Jacobi (q.v.), laboured, like Schleiermacher (q.v.), to introduce a more pious mode of contemplating the mysteries of Christianity, in opposition to the merely intellectual mode of Rationalism. Hence he was regarded by Rationalists as a mystic, although those who know only his free criticism of the sacred canon and mythological treatment of the Old Testament class him with the Rationalists themselves. In reality he advocated, though in a conditional and philosophical manner, old Lutheran orthodoxy.

De Witt, Jan, a great Dutch statesman, was born at Dort in 1625. His father, Jakob De Witt, was a strong opponent of William II., Prince of Orange, and the hatred descended to the son, who, after receiving a careful education, entered public life, and was sent by the States of Holland to Zeeland, to persuade that province against an Orange policy. De W. further showed ability of another sort by publishing a mathematical treatise titled *Elementa Linearum Curvarum*. At this time he was chosen Pensionary of Holland, and in this capacity he did his best to deprive the House of Orange of power, and even to abolish the office of Stadtholder. He so far succeeded that in 1654, at the end of the war with England, an article was secretly inserted in the treaty with Cromwell, in virtue of which the House of Orange was deprived of all state offices. Subsequently, however, the influence of De W. declined, particularly after Holland was invaded by the French (1672), and the Orange party carried the elevation of William III. to the office of commander of the Dutch forces. In the first campaign the troops were beaten, and the popular hatred against De W. rose so high that he and his brother Cornelius, who had been accused of conspiring against the Prince of Orange, were attacked and murdered by a mob, at the Hague, 20th August, 1672. The *Memoirs of De W.*, published in 1667, contain valuable information about the political history of the time.—**Cornelius De W.,** brother of Jan De W., was born at Dort, 23rd June, 1623. When young he served in the navy, and on the fall of the Orange party in 1650, was made burgomaster of Dort, and deputy for W. Friesland and Holland. He was an able coadjutor to Jan De W., and showed great political talents. He distinguished himself in a sea-fight under De Ruyter in 1672, but was shortly afterwards murdered along with his brother.

Dews'bury, a town in the W. Riding of Yorkshire, on the left bank of the Calder, 30 miles S.W. of York, and 186 miles N.N.W. of London by railway. It is noted for its manufactures of blankets, woollen cloths, carpets, shoddy, &c. In the vicinity are collieries and ironworks. The parl. bor. of D., which returns one member, consists of the bor. of D., and part of the bor. of Batley, parts of the townships of Soothill and Thornhill, and the district called Ravensthorpe. Pop. parl. bor. 72,986; mun. bor., reg. sub-dist., and civ. par. (each) 29,847.

Dextrine. See BRITISH GUM.

Dey' (perhaps from Turkish *dai*, 'an uncle by the mother's side'), the former title of the chief of Algiers, corresponding to the Bey of Tunis and Tripoli. The D. was first appointed by the Algerians about 1600. The office became independent of the Sultan about 1623, and was abolished at the French conquest of Algiers in 1830.

Deyster, Louis de, a Flemish painter, born at Bruges in 1656. He studied under Jean Maas, resided for six years in Rome, and also for some time in Venice, after which he returned to his native place. Of a deeply religious disposition, he rarely went into society, and somewhat of the gloom of his life is reflected in his works. Of these, the principal are 'The Death of the Virgin,' 'The Resurrection of Christ,' 'The Appearance of Christ to the Three Marys,' and the 'History of Judith,' in several parts. His manner is bold and large, evincing a strong Italian taste, while his colour is bright, warm, and pure. To give prominent effect to the work, on the chief parts of his subject he occasionally slurs and sacrifices the setting. In later life D. abandoned his art for music. He died at Bruges in 1711. His daughter, **Anne D.** (died 1746), won considerable reputation both in music and painting. She wrote a Life of her father. See Deschamps, *Vies des Peintres Flamands*, vol. iii.

Dhalac', or **Dahlac el Kebeer,** an island in the Red Sea, 9 miles from the coast of the Buré Peninsula, Massowah, Abyssinia, of very irregular form, and about 120 miles in circumference. It is of coral formation, and is mostly sandy, with a few grassy spots in the rainy season, affording pasture to asses, goats, sheep, and antelopes. Dubellu, the principal village, imports millet and dates from the opposite coast of Arabia, and exports pearls, sharks' fins, and turtles. D. having no springs, rain-water is preserved in tanks and cisterns. The surrounding islets form the D. Archipelago.

Dha'mi, one of the twenty-six Cis-Sutlej hill-states of India. Area, 27 sq. miles; pop. 3985 of whom 3940 are Hindus and 38 are Mohammedans. It has an elevation of 4000 feet above the level of the sea. In feudal subordination to the government of the Punjab, it pays £72 of its annual revenue as a tribute. Chief productions, grains and opium. Fateh Singh is its ruler and is a Rajput by caste.

Dhar, a town in the Bhopawar Agency, Central India, nearly 2000 feet above the level of the sea, is surrounded by a mud wall, while the fort is defended by walls 30 feet high. Pop. formerly estimated at 100,000, is now 18,430. The *state* of the same name, of which D. is the capital, and in which opium is largely cultivated, besides sugar-cane, cotton, tobacco, turmeric and linseed, has an area of 1775 sq. miles, and a pop. of 169,474.

Dhar'war, a town in the S. of the province of Bombay, capital of a district of the same name noted for its cotton growing. It has government schools for Mahrattas and Canarese. The fort is said to have been built in 1403 by an officer of Ram Rajah; in 1685 it was captured by the Mogul Emperor and in 1753 it fell to the Mahrattas. Hyder Ali took it in 1778, but in 1791 the Peshwa retook it by the help of the British, to whom it passed in 1818. Pop. (1891) 32,841.—The *district* of D. has an area of 4603 sq. miles, and a pop. of 1,051,314 of whom 903,739 are Hindus, 131,000 Mohammedans, 4222 Christians, 12,159 Jains, 135 Parsees, and 27 are Jews. Canarese is the prevalent language. The chief manufactures are silk and cotton goods; also cotton carpets. There are three annual fairs in the district, which attract a great number of pilgrims to the different shrines.

D'Herbelot, Barthélemy, a great French Orientalist, was born of good family at Paris, 4th December, 1625. After studying Eastern tongues, and travelling to Italy, he received from Louis XIV. a pension and Professorship of Syriac in the Collége de France in 1692. D. died at Paris, 8th December, 1695. His great work, *Bibliothèque Orientale, ou Dictionnaire Universel contenant tout ce qui fait connaître les Peuples de l'Orient* (Par. 1697), written originally in Arabic, is a treasury of learning relating to the literature, history, religion, &c., of the Arabs, Turks, and Persians, still unsurpassed in Oriental scholarship. D. also wrote *Anthologie Orientale* and *Dictionnaire Arabe-Persien-Turc*. Editions of the *Bibliothèque* were published at Paris in 1697, and at Maestricht in 1776. A supplement was added in 1781, containing the *History of Tartary* by Vixtelon, and a translation by Galland of remarkable Oriental sayings.

Dhole, or **Kohl'sun,** a species of wild dog inhabiting the western frontiers of British India. In size it averages an ordinary retriever, and exhibits a rich brown or bay colour, darkest on the feet, muzzle, and tail. In habits the D. is shy, although when hunting in packs it may evince courage. The ears are pointed and erect. The term D. is also applied to nearly allied varieties of dogs common in Ceylon and elsewhere, and often known by the name of Red Dogs. The genus *Chryseus* includes the latter varieties.

Dhol'ka, a town in the district of Ahmedabad, province of Bombay, British India, 22 miles S.W. of Ahmedabad, surrounded by a mud wall. Pop. 16,494, of whom 11,203 are Hindus, 5161 are Mohammedans, 124 are Jains, and 3 are Parsees. The inhabitants are mostly the descendants of soldiers of fortune who entered the district in 1297. Chief manufacture is female robes.

Dholpore', or **Dholpur,** a capital of a Jât state of the same name, Rajputana, 34 miles S.S.W. of Agra. A town on the same site existed in the 11th c. and surrendered to Babar in 1526. Then it was moved to the north to be clear of the floods arising from the Chambal. Two centuries later the present town was built by an ancestor of the reigning prince. Near D. is a lake of 41 acres of water, on the shores of which are 114 temples, where annual fairs are held. Pop. 9739.—The *state* is separated from Gwalior by the Chambal, and was increased by a grant of territory in 1805. Area, 1154 sq. miles; pop. 279,890, of whom 259,787 are Hindus, 17,423 are Mohammedans, 2649 are Jains, 25 are Sikhs, and 6 are Christians. In some parts where irrigation is possible the soil is very fertile; wheat, barley, rice, and cotton being produced in considerable quantity. The Maharaj Rana, the native prince, has a council of three to assist him in the government of the country, and his state is under the political superintendence of the British Agent.

Dhubbui', a semi-ruined town of India, in the protected state of Baroda, on a tributary of the Nerbudda, 7 miles S.E. of Baroda. It is surrounded by colonnaded walls, affording extensive views of the fine alluvial country, and has richly-sculptured temples, and an immense tank, approached by splendid flights of stairs. Monkeys swarm in the deserted buildings. Pop. 500.

Dhun'chee, or **Dhan'chi,** an annual plant of the natural order *Leguminosæ*, a native of India, where it is cultivated for the sake of its fibre, which, as it bears frequent wetting, is valuable for nets, &c., though, from its contracting too much when drying, it is unfitted for ropes, ships' cordage, and such uses. It is also found in the W. Indies and tropical Africa. It is prepared in much the same way as Sunn (q.v.).

Dhwalagi'ri, or **Dhaulagiri** (*Dewalagiri*, 'the White Mountain'), one of the loftiest peaks of the Himalayas, is situated in Nepal, and has a height of 26,826 feet.

Diabe'tes (Gr. *diabetes*, 'a flowing through,' from *dia*, 'through,' *bainein*, 'to go') is a disease which is accompanied by much thirst. Two kinds are described by medical writers, *D. Mellitus* and *D. Insipidus*. The former is a disease of which we know neither the origin nor pathology, and consequently its treatment is not satisfactory. It is characterised by increased discharge of fluid, containing sugar allied to Grape-Sugar (q.v.), and always of a high specific gravity. The patient complains of great thirst, hot dry skin, general debility, &c. He gradually becomes emaciated, with a sweet breath, a great tendency to disease of the lungs, and generally a voracious appetite. Sugar is found in the blood, and in most of the secretions and excretions of the body. *D. Mellitus* probably depends on disordered functions of the liver, possibly due to irritation of the nervous system. The treatment consists in abstaining from sugary and starchy food as far as possible, and living chiefly on animal food. Milk has been highly recommended. Of medicines, opium, iron, and quinine are the best. Turkish baths are sometimes beneficial, but in point of fact *D. Mellitus* is seldom if ever cured. *D. Insipidus* is a different disease; the chief symptoms are great thirst, and an enormously increased discharge of fluid, of a light specific gravity, but containing no sugar. Steel-drops may be taken with advantage.

Diab'lerets, a mountain in the Bernese Alps, has a height of 10,672 feet, and is chiefly notable on account of two enormous and destructive landslips (hence its significant name), which took place on its sides in 1714 and 1749 respectively. It is composed of limestone, and the huge masses were undermined by the percolation of glacier-water.

Dia'chylon, lead plaster, made by boiling together litharge (oxide of lead), olive oil, and water. D. mixed with resin and soap, and spread on cloth, forms the common or sticking plaster. The name was applied by the Greeks to an emollient plaster composed of the juices of herbs.

Di'adem (Gr. *diadēma*, from *dia*, 'across,' and *deō*, 'I bind'), originally the blue and white band, or fillet, worn by Asiatic monarchs round the *tiara*, fastened behind, the ends being allowed to fall loosely over the shoulders. Sometimes it was broad and adorned with costly jewels, as in the case of the Persian kings; sometimes narrow and plain, or plaited, as in that of Bacchus, who is generally represented in ancient sculptures with this ornament, and is mentioned by Pliny as its inventor. The diadems of the Egyptian divinities had the figure of a serpent upon them. Alexander the Great adopted the D. from the Persians, and Antony, during his amour with Cleopatra, assumed the Egyptian badge. Gradually it became the recognised emblem of sovereignty among the Western nations, and was assigned by sculptors to various divinities. None of the Roman emperors wore it till the time of Diocletian. By the addition of gold and gems it went on increasing in size till it became the modern Crown (q.v.).

Diæ'resis (Gr. *diairesis*, a 'dividing'), a term used in grammar to denote the resolution of a diphthong or of a contracted syllable into two syllables, as Lat. *aulæ*, *aulaï*, *silvæ*, *silüæ*. The term D. is also applied to the mark .. placed over one of the vowels to indicate that it is to be pronounced separately from the preceding or succeeding one, as the case may be.

Diagno'sis (Gr. from *dia*, 'thoroughly,' and *gignoskein*, 'to know') means, in medicine, that knowledge of a disease which the physician can obtain by careful examination of the patient. To make a perfect D. the family and the personal history of the patient must be considered, the condition and functions of the organs of the body, and the abnormal symptoms present carefully noted.

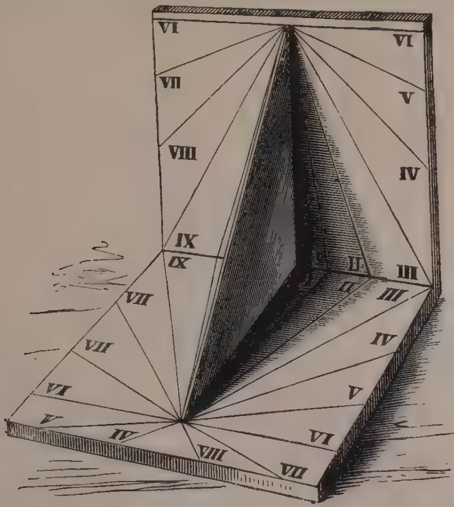
Diag'onal is a line joining any two non-adjacent angles of a rectilinear figure. A pentagon has 5 diagonals, an octagon 20, and a nonagon 27. The D. of a solid is a line joining any two non-adjacent solid angles: a cube has 4.

Diagonal Scale, a form of scale used for the accurate and convenient measurement of small subdivisions of any given unit of length. If we suppose, as an illustration, the unit to be one inch and the required subdivision to be into one-hundredth parts, it is easily seen that although it would be possible to divide a straight line, measuring an inch in length, into one hundred equal parts, and then to make measurements upon a scale so constructed, the smallness of the intervals would make both the operation difficult and the measurement inconvenient. By means of a D. S. this could be done easily and without having to set out any smaller dimension than $\frac{1}{10}$th of an inch. The process is as follows:—Draw eleven parallel lines at any convenient distance (say $\frac{1}{8}$th of an inch) apart, calling them O., I., II., III., ... X., beginning at the bottom. Crossing all these at right angles, draw two parallel lines exactly one inch apart, and divide this inch upon lines O. and X. into tenths. Let the line marking the left-hand end of the measured inch intersect O. and X. in 0, and number the tenths 1, 2, 3, &c., towards the right. Then draw lines joining 0 on O. with 1 on X., 1 on O. with 2 on X., and so on, and the D. S. is complete. The lines OX. and 01 intersect in the point o upon O., and are $\frac{1}{10}$th of an inch apart upon X.; at each intermediate line I., II., III., &c., they are therefore 1, 2, 3, &c., *tenths of one-tenth*, that is, hundredths, of an inch apart, and similarly with the lines 12, 23, &c. Thus any required dimensions in hundredths of an inch can be measured upon one or other of the intermediate lines; for example, forty-nine hundredths is the distance from the line OX. to the line 45 measured upon the parallel IX. and so on.

Diag'oras, a Greek poet and philosopher, son of Telecleides, was a native of Melos, one of the Cyclades. He is said to have been a disciple of Democritus of Abdera; and from his open avowal of disbelief in the popular theology he was branded as an atheist. Besides this, very little regarding his career is known for certain. He had, however, taken up his abode in Athens as early as 424 B.C., for Aristophanes, in his comedy of the *Clouds*, which was performed in that year, refers to him as a celebrity. From the epithet *Melian*, applied to Socrates in the passage, it has been conjectured that the latter was a pupil, or, at all events, an acquaintance of D. In 411 B.C. D., having got involved in a lawsuit about impiety, found it expedient to flee from the city. Though a price was set upon his head, he managed to reach Pallene, from which, after a time, he went to Corinth, where he died. While irreligion was the ostensible ground of accusation, the real cornerstone of his offending was doubtless of a political nature. All accounts represent D. as a man of exemplary conduct, stainless morals, and signal earnestness of purpose. Among his philosophical works was one entitled *Phrugioi Logoi*, in which he explained and defended his opinions. D. seems also to have had some reputation as an orator.

Di'al (Low Lat. *dialis*, from *dies*, 'a day, a space of time'), or **Sun-Dial**, an instrument of great antiquity for measuring time. Since the invention and introduction of clocks and watches, it has become of less and less use, till now it is regarded as a mere astronomical toy. Herodotus says the Chaldeans taught its use to the Greeks; and Anaximander gets the credit of having made a D. in 550 B.C. L. Papirius Cursor placed the first one seen at Rome on the temple of Quirinus, and divided the day into twenty-four hours (B.C. 293).

A D. usually consists of a plane surface, in the centre of which is fixed the *style*, whose shadow cast by the sun upon the plate indicates the time by its position. From the same centre are drawn the lines which represent the hours, and it is the laying down of these lines which constitutes the great difficulty attending the making of a D. That edge of the style whose shadow gives the time must point towards the pole of the heavens—or, more correctly, must be parallel to the axis of the earth. It is apparent, then, that at any given time the sun, the edge of the style, and the shadow will be in the same plane, which plane, passing through the centre of the earth, rotates uniformly with the sun, taking twenty-four hours to complete one revolution. The problem is then reduced to finding the lines of intersection on a given plane of twenty-four other planes, which all pass through the same line given in position, and which make with each other the same angle of 15°. These lines of intersection will not in general make the same angles with each other; a fact which may be easily shown by slicing an orange in a direction not at right angles to the axis, when it will be seen that though each lith is of the same size, the exposed surface of each on the newly-cut circle will not be so. It is not necessary that the D. be horizontal, or even plane, though in the latter case the laying down of the hour-lines is rendered much more difficult, and indeed is best done practically by comparison with a standard D. Next to the common horizontal D., the *vertical D.* is the one most frequently met with. It is usually fixed upon the wall of a church or house, and if possible faces one of the cardinal points. If it does not do so, it is termed a *declining vertical D.*, and the investigation of its hour-lines becomes much more complicated. The style is usually the straight edge of a thin plate, or a wire; but a slit or hole in a thin plate, allowing the light to pass through, will answer the purpose just as well. The time indicated by the D. is of course the true solar time, and agrees with the mean time, or that shown by a good clock only at four different times of the year, which occur at about the middle of April, the middle of June, the beginning of September, and the end of December. This disagreement with mean or civil time, and the necessity of applying a correction which varies from day to day, are decided objections to the employment of sun-dials as time-indicators. Further disadvantages arise from the impossibility of getting a clearly-defined edge to the shadow cast by the style, and consequently of obtaining even an approximately accurate estimate of time from a D. of convenient size; and also from atmospheric refraction, which has the effect of throwing the shadow a trifle towards noon at all times. Accordingly, a correction must be made, which varies with the sun's altitude, and which must be subtracted for all hours before noon, and added for all hours after noon. On the more elaborately constructed sun-dials tables of corrections for every day in the year were frequently inscribed. For an account of some curious dials, see Brewster's edition of Fergusson's *Lectures;* also Delambre's *Astronomie Ancienne*, and Montusla's *Histoire des Mathématiques*.



Dial.

Di'alect, in the narrowest sense a local variety of a language, has, since the development of philology and consequent recognition of the connections between various tongues, been applied to languages of kindred origin. Thus Greek, Latin, German are spoken of as Aryan dialects, having sprung from a common Aryan source. In the earlier and more restricted use of the word, the Greek language contained four distinct dialects, the *Doric*, *Æolic*, *Ionic*, and *Attic*. The Doric, marked by the broad sound of the *a*, was simple, rough, and unpolished. It prevailed in the Peloponnesus. The Æolic, resembling the Doric in roughness, was peculiar to Bœotia, the adjoining districts, and various Æolian colonies. The Ionic was soft, flowing, melodious, especially rich in combinations of vowels. It was confined to part of Asia Minor and the neighbouring islands. The Attic was at first closely similar to the Ionic, but through the spread of commerce and the influence of the Dorians and Æolians, became a distinct D., more succinct and nervous than the Ionic, more polished and euphonious than the Doric and Æolic. Through the political and literary greatness of Athens the Attic became the Greek D. in which writers of every state wrote. It was at first restricted to Athens and the neighbourhood, but after the Roman conquest was generally, though not universally, adopted throughout Greece. The process of gradual dialectic divergence from a common stock is strikingly shown in the rise of the Romance languages from the Latin. The Latin tongue, even in its palmiest era, embraced two dialects—the polished Latin of the literary and refined classes, and the *sermo plebeius* or *rusticus*. These differed widely in vocabulary and accent; the classic *verberare*, *equus*, and *pugna*, for example, being represented in the vulgar Latin by *battuere*, *caballus*, and *battualia*, while *stabulum*, *oraculum*, *duplicare*, *ponere*, &c., are contracted in the plebeian D. to *stab'lum*, *orac'lum*, *dupl'are*, *pon're*, &c. From this vulgar Latin, which must be distinguished from the *Low Latin*, a corrupt literary medium extinguished during the barbarian invasions, arose the *Romance* or *New Latin* dialects, comprising the French, Provençal, Spanish, and Portuguese, the Rhæto-Romanic of S. Switzerland and the Wallachian. Before the Gothic invasions began to influence the Latin speech, that language was tending to simplify its inflections, and after the barbarians settled in the empire, grammatical disorganisation immensely increased. The Gothic tribes, discarding the inflectional endings, 'seized,' says Littré, 'on the solid part of the word, the kernel which offered them resistance;' and thus, for example, the Latin *sollicitare*, *ministerium*, *æstimare*, become the French *soulcier*, *mestier*, and *esmer*. Before the end of the 8th c. the *Lingua Romana Rustica* was the common speech of the Gothic settlers round the Mediterranean, and gradually various dialects became defined, from what had, for a time, been a kind of linguistic debris. These different dialects did not arise from an original variety of speech among the Teutonic tribes, but from historic events subsequent to the general adoption of the *Lingua Rustica*. Thus the Spanish was modified by the Arabic of the Saracen conquest of Spain. Through time the Romance dialects diverged more widely, and each branched into various minor dialects, one of which, generally through some fortuitous circumstance, became at last the classic national speech. The same process is seen in the Teutonic tongues. The Alemannic, Frankish, and Suabian were the dominant German dialects until the High German was rendered the national speech by the influence of Luther's High German translation of the Bible. Similarly Tuscan was rendered the classic D. of Italy because used by Dante for his *Divina Commedia*. For the various dialects of English, see ENGLISH LANGUAGE. The use of the word D. is somewhat vague and perplexing. In one sense every language is a D. in regard to its kindred tongues and the speech whence it mainly sprang, while a local variety of a language, such as Scottish in relation to English, is likewise correctly spoken of as a D. After an indefinite amount of linguistic variation and development, a minor D. may become an independent tongue, as Portuguese, which was at first considered a corrupt D. of Spanish. Scottish is not a different language from English, nor is it in any sense a corrupt form of the latter. It was originally Northumbrian English, and its first peculiarities showed themselves when it was cut off from Southern influence by the union of the English Earldom of Lothian with the old Gaelic kingdom of Scotland and the Cymric principality of Strathclyde. It is now a mere ruin, but it still preserves in its splendid decay many old English forms which have long ceased to adorn the classic tongue of the South. See Gidel's *Littérature Française*, Whitney's *Language and the Study of Language*, Oliphant's *Standard English*, and Skeat's *Bibliographical List of the Works published or in MS. illustrative of various Dialects of English*.

Dialec'tic (from the Gr. *dialegomai*, 'I hold conversation with') means a conversation, controversy, dispute; and hence the D. art meant the art of discussing a subject by questioning another. Plato applied the term to the process of metaphysical speculation as well as of logical inference; and this use of it has been revived in recent times; for example, by Hegel. Aristotle limited the term to the logic of probabilities as distinguished from positive demonstration. The word is also employed in its universality as equivalent to logic, the science of the formal laws of thought, and, in a narrower sense, as the application of the laws of reason rather to the discussion or defence of any point than to the attainment of truth.

Di'allage, an hydrated, calcareous augite, varying in colour from pale green to grey and brown. *Bronzite*, so named from its colour, is a nearly allied mineral, being the hydrous representative of the magnesian augites. *D. rock* is a generally palish green or grey rock, granitic or porphyritic in appearance, and composed of labradorite and D.

Di'alogue, a conversation, is especially applied to dramatic conversations, and to writings in which two or more persons are represented discussing any topic. Among the ancients, who were fond of this form of literature, and used it for gay and serious themes, Plato, Cicero, and Lucian (*Dialogues of the Dead*) are memorable. In later times it was adopted in Italy by Petrarca, Machiavelli, Algarotti, Galileo, Gelli, &c.; in France, by Sarrasin, Malebranche, Fénélon, Fontenelle, Diderot, St. Mard, and Galiania; in Germany and the Low Countries, by Erasmus, Lessing, Mendelssohn, Engel, Jacobi, Herder, Schelling, Wieland; in England by Ascham, Spencer, Berkeley, Hurd, Addison, Lyttelton, and others. The chief English work in D.—outside the drama—is Landor's *Imaginary Conversations*, which are of almost peerless beauty of style. The distinctive feature of the light literature of the present day is the inordinate amount of space devoted to D. The *short story* has simply become the text of a play with the stage directions cut down to the minimum, and all the descriptive elegance, which adorns the writings of the less modern school, is conspicuous by its absence.

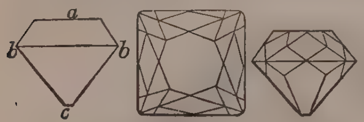
Diamagnet'ic, a term applied by Faraday to those bodies which appear to be repelled by either pole of a magnet. Bismuth and antimony had long been recognised as having such a property, but they were regarded as mere curiosities till Faraday in the course of his experiments showed that matter of almost every kind, solid, liquid, and gaseous, was capable of being repelled or attracted by a magnetic pole. Substances which, like iron and nickel, are attracted by a magnet, are called for distinction *paramagnetic*. If a rod of a paramagnetic solid, or an elongated cylinder of thin glass, containing a paramagnetic liquid, be suspended between the poles of a strong magnet, it will either arrange itself *axially*, or in the line joining the poles; and if a D. substance be similarly treated, it will arrange itself *equatorially*, or at right angles to the line joining the poles. A very ingenious method, invented by Plucker, of showing the magnetic nature of a liquid, is to pour a little into a watch glass which rests upon the poles. If the liquid be paramagnetic, its upper surface becomes simply concave; but if D., there are two concavities, one over the termination of each pole. A stream of gas, if directed through between the poles, will continue in its course intersecting the axial line if the gas be paramagnetic, but will be divided so as to pass on both sides of this line if it be D. Another method employed by Faraday to make the effect more apparent was to float a soap-bubble filled with the gas in the magnetic field. This test was found very delicate. These phenomena, at first sight so irreconcilable, are easily explicable upon Faraday's theory of action through a medium, especially when taken in connection with the experimentally established fact that a substance ordinarily D. acts as a paramagnetic body in a medium more D. than itself, and a paramagnetic body acting in a medium more paramagnetic than itself behaves as a D. substance. In other words, these D. bodies behave with respect to the magnetic attraction in the same way as a balloon ascending does to the gravitating attraction of the earth. Taking air as the medium, the more important paramagnetic bodies are: iron, nickel, cobalt, manganese, palladium, platinum, chromium, sealing-wax, plumbago, shell-lac, charcoal, oxygen, &c.; and the D.: bismuth, antimony, gold, copper, silver, zinc, tin, cadmium, mercury, sodium, rock crystal, alum, glass, phosphorus, sulphur, india-rubber, litharge, wood, starch, sugar, beef, apple, blood, water, alcohol, hydrogen, nitrogen, carbonic acid, coal-gas, &c.

Diamanti'no, the name of a river and of two towns in Brazil. The river, supposed to join the Paraguay, rises in the province of Matto Grosso. Eighty miles N.N.W. of Cuyaba it is joined by the Ouro, where the smaller of the two towns named D. stands. The name was given to it from the diamonds found in the neighbourhood. Pop. 4500. The larger town, formerly *Tejuco*, is in the province of Minas Geraes. It lies 5700 feet above the sea, is well built, and has a fine climate. Pop. 10,050.

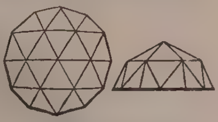
Diam'eter, in elementary geometry, a straight line passing through the centre of a figure. For central curves and surfaces of the second order, each D. bisects a system of parallel chords. This property has led to a wider definition of the term applicable to all curves, viz., a D. is the *polar line*, with respect to the curve, of an infinitely distant point. See POLES and POLARS.

Di'amond (Fr. *diamant*, a corruption of the Gr. *adamantinos*, 'unbreakable'), the hardest and most brilliant of all precious stones, and, excepting the ruby, the most precious. It is generally colourless or pale yellow, but is occasionally blue, green, or red. It reflects all the light which falls on it at an angle of incidence greater than 24° 13′, and its power of refraction is 2·487, that of common glass being 1·525. To these qualities are due its brilliancy and sparkle. Being the hardest of all known substances, it can only be cut and polished with its own dust. The D. is composed of pure carbon in a peculiar allotropic condition. Attempts to produce diamonds by artificial means have not proved altogether unsuccessful, but the process involves too much expense for the results to be commercially useful. D. is combustible in oxygen, the combustion producing pure carbonic acid, just as happens in the burning of common charcoal, and under high heat can be changed into a form of graphite or black-lead. Diamonds are at present obtained from three localities—India, Brazil, and Cape Colony. In India they are pretty widely distributed, occurring in the Deccan in the alluvium of rivers, in Bundelcand, and at Sumbulpore on the Mahanuddy. The D. is much scarcer in the East than formerly. In the 17th c. the famous D.-mines are said to have occupied 60,000 persons. A large proportion of the diamonds brought to the market at the present day are found in Matto Grasso, Brazil, where also the D.-yielding soil is widespread. The discovery of rich D. deposits in Griqualand West, S. Africa, was only made in 1867. From that time till the beginning of 1876 the washings had yielded diamonds to the value of £12,000,000, being at the rate of £2,000,000 yearly. In 1875 there were over 60,000 diggers in the fields, of whom 15,000 were Europeans. In 1889 diamonds to the value of £4,325,137 were exported from Cape Colony; in 1890 and 1891 the value of the export exceeded £4,000,000, but in 1892 there was a slight falling off, and in 1893 it was estimated at £3,821,443. The total value of diamonds exported (1867—1893) is estimated at £66,421,630. The stones found are mostly small and of inferior colour or water. One stone, however, the 'Star of South Africa,' found in 1869, weighed $83\frac{1}{2}$ carats, and was valued at £20,000, and another of 147 carats was unearthed in 1873, while a valuable blue one was found in 1876. The existence of diamonds in Australia has also been demonstrated, and they have been found in Borneo, Sumatra, and Java, and in the Ural Mountains.

The cutting and polishing of diamonds, upon the success of which the beauty of the stones depends, is chiefly performed by Jews in Amsterdam, and the industry demands great care and skill. In many cases the rough stones require to be split or cleaved into form before cutting is begun, and for the success of this delicate operation the workman must take advantage of the cleavage lines of the stone. Diamonds are chiefly cut into the form of single or double brilliants. In this form the stone consists of two principal parts—the bezil and the pavilion. The bezil extends from the table *a* to the girdle *b*, and the pavilion from the girdle to the cutlet *c*. The facets which touch the table are called star facets; those which touch the girdle either from above or below are skill facets. In the single-cut brilliant the table is square, and the whole stone presents thirty-eight facets. The other forms of the D. are the table-cut, a form only found in old stones, and the many-sided rose-cut, in which brilliancy is sacrificed to size.



Top and Side View of Double Brilliant.



Top and Side View of Rose Diamond.

The value of a D. depends on its brilliance, purity of colour, freedom from flaws or specks, and its shape and size. By a D. of the first or second 'water' is meant one comparatively free from clouding and imperfections. A peculiarity, such as a blue, green, or red hue, gives the stone an exceptional, and sometimes an exorbitant, value. Diamonds are subject to great fluctuations in value, and the discovery of the Cape deposits caused a considerable depreciation in price. Up to a weight of 5 carats (20 grains) the value is estimated by the weight, and Harry Emanuel has given a table of the value of perfect brilliants, from which we make the following extracts. It should be stated that the table in question refers to a period previous to the discovery of Cape diamonds. A brilliant weighing half a carat, £5 10s.; three-quarters, £9 10s.; one, £18; one and a half, £38; two, £65; two and a half, £88; three, £125; four, £220; five, £320. Above that weight the price of the stones increases rapidly, and the value becomes a question of individual bargaining.

A few diamonds of uncommon size are known to exist, some of which have a remarkable history. The Koh-i-noor ('mountain of light'), which is now among the British crown jewels, is a D. which has figured in Indian annals from a very remote period, and been the object of much cupidity and intrigue. When it came into the possession of the Queen, in 1850, it was an irregularly-shaped and rather lustreless mass, weighing 186 carats. By subsequent cutting its weight was reduced to $102\frac{1}{2}$ carats, but it was formed into a brilliant of unequalled purity and sparkle, and its value is now estimated at £1,000,000 sterling. The largest D. is asserted to be the Braganza, a Brazilian stone in the Portuguese crown collection. Its weight is stated at no less than 1880 carats, but the genuineness of the stone is doubted. Next in weight comes the Mattan D. of Borneo, an uncut stone weighing 367 carats. Of other well-known stones are the Orloff, in the Russian crown collection ($194\frac{1}{4}$ carats); the Regent, or Pitt, which belonged to the French crown jewels ($136\frac{3}{4}$ carats); the Emperor of Austria's brilliant ($139\frac{1}{2}$ carats); and the Brazilian Star of the South (125 carats). The King of Portugal also owns a Brazilian stone of $138\frac{1}{2}$ carats, and the Sultan of Turkey, the Shah of Persia, and some of the Indian native princes, are known to possess some valuable stones.

There are several ordinary methods of testing the genuineness of a so-called diamond. Being harder than any other substance, a diamond cannot be scratched or marked except by another diamond. Friction electrifies a true diamond, but heat does not, as is the case with the topaz, &c. If a small hole be made in a card and examined through the diamond, only one hole will be observed; should the substance be no diamond, two holes will be seen, in place of one. The setting of a real stone cannot be seen through it, whereas through a false one the setting is plainly visible.

Diamonds and diamond dust have been discovered in meteoric bodies. In 1886 three meteoric stones, which had fallen in S. Russia, were analysed and disclosed the existence of minute particles of diamond dust. Since then diamonds have been found in similar bodies both at Penza and Arizona.

Diamonds have an industrial value for the cutting of glass and the polishing of gems. The stone used in the D. rock-boring machines in use is the carbonado, boart or black D. of Brazil, of no lustre or value as a gem, but possessing the hardness of the precious D. See Dieulafait's *Diamonds and Precious Stones*, &c. (1874), and Emanuel's *Diamonds and Precious Stones*, &c. (1875); and Streeter's *Precious Stones and Gems* (1877).

Diamond Beetle, a genus of Coleoptera or Beetles, belonging to the *Tetramera*, and so named from its gorgeous hues and lustres. It is allied to the Weevils (q.v.), and is coloured of a golden green, with two black bands on the thorax. It is found in Brazil and other parts of S. America.

Diamond Harbour, on the left side of the Hoogly, the port of Calcutta, from which it is distant 38 miles S.S.W. by railway, and 41 by river. D. H. is very unhealthy, especially during and immediately after the periodical rains. The adjacent rice-fields yield heavy crops. Here are stationed harbour-master and customs officers, and the arrivals and departures of all shipping are telegraphed to Calcutta several times a day. There is no village, but an ancient graveyard exists, which may point to a former occupation of the locality by a resident population.

Diamond Necklace, a costly ornament which gave rise to one of the strangest episodes in French history. It was made for Madame du Barry by Bœhmer, the King's jeweller, was formed of 500 diamonds, and valued at about £80,000. On the death of Louis XV., it could find no purchaser, and the Cardinal de Rohan, a rich libertine, persuaded by a clever adventuress, De Lamotte, that the Queen viewed him with favour, procured it as a gift for Marie Antoinette. On 1st February, 1786, Rohan took the ornament to Versailles, and next day, Villette, an accomplice of De Lamotte, carried it off with the words *De par la reine.* Having thus duped Rohan, De Lamotte and her associates fled from Paris, and began to sell the diamonds, but were shortly flung into the Bastille along with Rohan. De Lamotte was branded and imprisoned for life, but the others were acquitted. The affair led to much scandal, and fastened an odium on the Queen among the Parisian populace, which clung to her to the last, and helped to sharpen the people's fury against her. See Carlyle's *D. N.* in his *Miscellaneous Essays.*

Dian'a, a Roman goddess, identified in the confusion of the mythologies with the Greek Artemis, the goddess of hunting, was the daughter of Jupiter and Latona, and twin-sister of Apollo. The place of her birth was Delos (q.v.). As the huntress-queen, she is represented as a full-grown maiden, of masculine figure, with bare limbs and buskined feet, armed with bow and quiver, and attended by hounds. As sister of the Sun-god, she is regarded as the Moon-goddess, and represented as wearing a crescent on her forehead. As a benignant goddess invoked by women in travail, she is called *Lucina*, *Ilithyia*, and *Genitalis;* in the cross-roads, she was worshipped as *Trivia*, and from her triple character as a celestial, terrestrial, and infernal deity, she received the name *Triformis.* She was the goddess of chastity. At Ephesus she had a splendid temple—one of the seven wonders of the world—in which she was represented as 'the many-breasted,' symbolising the fertility of the earth. At Aricia, according to Strabo, she was ministered to by a priest, one of whose qualifications always was that he had murdered his predecessor. At Sparta she was propitiated by human victims; but goats, kids, boars, and oxen were her usual offerings. The name D. is the feminine form of *Dianus* or *Janus*, and is akin to the Lat. *Juno*, the Gr. *Zeus*, and the Sansks. *Dyaus*, 'the sky.' The solar origin of the myth is apparent even in its later and poetised form.

Diana Monkey, a species of Catarrhine monkeys, found in Guinea, Congo, and other parts of Africa, and attaining a length of about 4½ feet. It is distinguished by a long white beard, and by a crescentic white line on the forehead. The fur is generally chestnut, the lower parts being bright orange. The hands are black. The D. is intelligent and of cleanly habits.

Dia'no, a small town in the province of Salerno, S. Italy, 45 miles S.E. of Salerno, near the river Calore. It has a strong castle, and several churches and convents.

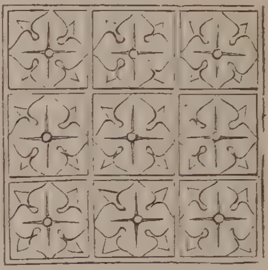
Dian'thus. See PINK.

Diapa'son, in music, is a word used in several senses. In ancient writings it was used for the octave; in France at present it means *pitch;* while in this country it sometimes signifies the whole range or compass of a voice or instrument. In the organ some of the principal stops are called *diapasons;* they are of 'eight-feet pitch,' the note corresponding to any key being of the same pitch as in the pianoforte.

Diapason Regulator, an instrument invented by Duhamel, and improved by Breguet, which is capable of measuring minute intervals of time. It consists essentially of a revolving, slowly advancing cylinder, on which a sinuous line is produced by a style fixed laterally to a prong of a diapason or tuning-fork. The time of vibration of the fork being known, the number of sinuosities, impressed while a certain occurrence lasts, gives, by a simple calculation, the time of duration. Breguet fixed the apparatus to clockwork, so as to regulate the motion of the cylinder, and lengthen the time during which the fork vibrates.

Diapede'sis (Gr. 'a leaping through'). Under certain abnormal conditions, both red and colourless corpuscles of the blood may leave the blood-vessels without rupture of their walls. This is D. The red corpuscles sometimes escape during venous congestion, when, in consequence of the high pressure, the plasma is first squeezed out, and afterwards the red corpuscles. The colourless corpuscles leave the vessels by virtue of their power of amœboid movement in Inflammation (q.v.). When the web or mesentery of a frog is seen under the microscope in a state of inflammation, the colourless corpuscles may be observed clinging to the walls of the vessels, and actually passing through these into the surrounding tissues. The conditions seem to be sufficient slowness of the blood stream, and a peculiar adhesiveness of the colourless corpuscles, the result of inflammation.

Di'aper (from '*d'Ipres*,' because manufactured at Ypres in Flanders; Fr. *diapre*, *diaspre*, 'marbled, or variegated'; Ital. *diaspro*, Lat. *diasprus*, 'an ornamental textile stuff'; Lat. and Gr. *iaspis*, 'jasper,' which was much used in ornamenting jewellery) is a variety of linen or other cloth, figured with a pattern, and produced by a process of twilling, in use chiefly for table-linen and towelling. D.-work in architecture, in mural painting, and decorative work generally, is the covering of a flat surface, which might otherwise have a monotonous and bald appearance, with a repeated floral or arabesque pattern. The **D.** is often used in heraldic painting to relieve and vary fields of black and white, but this arbitrary decoration does not form part of the heraldic bearing.

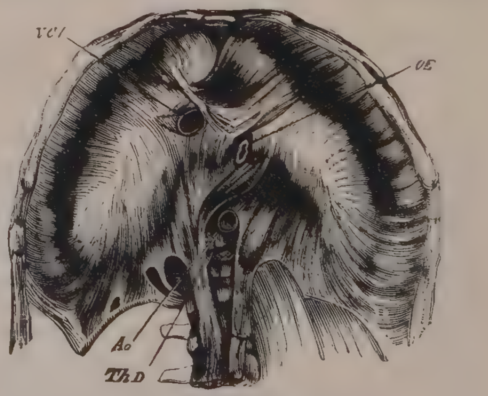


Diaper.

Diaphan'oscope (Gr. *diaphanos*, 'transparent,' and *skopeō*, 'I see'), a box, with or without a lens, for exhibiting transparent photographs or other pictures. It is frequently combined with a Stereoscope (q.v.).

Diaphoret'ics (Gr. *diaphoretika*, from *diaphorein*, 'to throw off') are medicines which promote insensible perspiration by opening the pores of the skin, or by stimulating the glands which secrete the sweat. Acetate of ammonia, antimonials, Dover's powder, and very specially the drug *Jaborandi* (q.v.), are examples; and hot baths, as the Turkish bath, may also be regarded as D. After using them, great caution is necessary for some time to prevent the patient catching cold.

Di'aphragm (Fr. *diaphragma*, 'a partition wall'; in Eng. *midriff*, Old Eng. *midrif*, 'the middle of the *hrif*, or bowels'). This is a partition between the abdominal and thoracic cavities, formed partly of membrane and partly of muscle. The muscular fibres arise from the bodies of several of the upper lumbar vertebræ, from two arches external to



Diaphragm viewed from the lower side.
V.C.I., Vena cava inferior; *Œ.*, Œsophagus; *Ao.*, Aorta; *Th.D.*, Thoracic duct.

these, from the cartilaginous end of the sternum, and from the cartilages of the six lower ribs. They all pass towards the centre, and unite with a strong tendinous membrane, of a trefoil shape, called the central tendon of the D. The D. is perforated by three large holes for the passage respectively of the aorta, the œsophagus, and the vena cava. During relaxation of the D., as after death, it presents an arched form, the convexity of which is directed towards the thorax. By contraction of the muscular fibres the D. centre descends, the convexity becomes less, and consequently the vertical diameter of the thorax is increased, as in inspiration. When the D. relaxes the centre ascends, as in expiration. The D. is present only in mammalia. See RESPIRATION-MECHANISM.

Diaphragm, a perforated plate, employed in optical instruments for cutting off all superfluous light, thus increasing the sharpness and brightness of the image.

Diarbek'r (anc. *Amida*, Arab. *Amid*, Turk, *Kara-Amid*), a fortified town, and the capital of a vilayet of the same name, Asiatic Turkey, lies on the Tigris, 195 miles N.E. of Aleppo. It is the seat of a Nestorian metropolitan, of a Jacobite patriarch, and of a Roman Catholic and an Armenian bishop, and has a great khan, occupied by the garrison, and many mosques, churches, baths, and bazaars. The climate is hot and unhealthy in summer, but cold in winter. The Tigris, which is here crossed by a stone bridge, is often frozen over. D. lies in the trading-way between Bagdad and Constantinople. Its manufactures, which have suffered from the introduction of European goods, are chiefly morocco leather, cotton and silk stuffs, copper utensils, and pipe-heads. It was formerly one of the most flourishing trading places in Turkey, but its pop. of 400,000 was decimated by the plague in 1756-57. Pop. 39,200, of whom 17,300 are Mohammedans and 12,200 Armenians. D. occupies the site of the ancient *Amida*, which became a Roman colony in 230 A.D., and the seat of a Christian bishop in 325. It was fortified by the Emperor Constantine. After being in the hands of various Turcoman dynasties and of the Persians, and being sacked by Timur (1394), it was finally annexed to Turkey by Selim I. in 1515.—The *vilayet* forms the E. portion of Kurdistan, and is watered by the Tigris and Euphrates. It is in part inhabited by nomads. Area, 18,074 sq. miles; pop. 471,462.

Diarrhœ'a (from Gr. *dia*, 'through,' and *rheō*, 'I flow'), a disease characterised by frequent *purging*. It is generally accompanied with pain, nausea, foul tongue, a bad odour in the breath, and flatulence. It has many causes, as indigestible food, unripe fruit, new vegetables, meat which has commenced to decay, too fat meat, &c., cold, damp, heat—the last called 'summer cholera'; or it may be due to drinking foul water or partaking of some purgative medicine. D. is also a frequent symptom of some other disease, specially Phthisis (q.v.), and typhoid fever and cholera. The treatment depends on the particular cause. When D. is due to some irritating substance in the bowels, a small dose of opening medicine is beneficial to the patient; when due to irritation of the bowels, opium is one of the quickest and most efficacious remedies. Of astringents, gallic acid, chalk, and lime-water are the best. D. is not generally a fatal disease, except in aged and very young persons, or in those affected with consumption and other wasting diseases. It is much more common in hot than in cold climates, in the former of which it often partakes of the dysenteric form.

Diarthro'sis, a term used in anatomy to denote a particular form of joint, such as that of the elbow. Here we have plates of cartilage covering the articular surfaces of the bones. The joint is lined in every part by a membrane, termed a *synovial* membrane, which secretes a fluid which lubricates the joint. The bones are held together by strong fibrous ligaments, constituting membranous capsules, bands, or cords; and they are likewise kept in apposition by the tension of surrounding muscles and by the pressure of the atmosphere. See JOINTS.

Di'ary (Lat. *diarium*, from *dies*, 'a day') at first meant the daily allowance of food to slaves, and afterwards a notebook of daily incidents, which is its present signification.

Diaschis'ma, the Greek name for a small interval which occurs between the true pitches in two keys of a note which, in the tempered scale, is made alike in both. See ENHARMONIC and TEMPERAMENT.

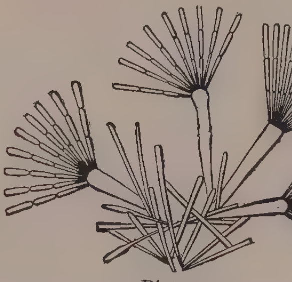
Di'astase is a nitrogenous substance developed during the germination of seeds, and is characterised by the remarkable property of causing starch to be converted first into dextrine, and later into grape-sugar. (See GLUCOSE.) In the process of malting grain is allowed to sprout, and the germination is then checked by heat. The malt thus prepared contains a store of D. more than sufficient to convert the starch contained along with it in the grain into sugar. On *mashing* or boiling the malt with unmalted grain, the starch in both is converted into grape-sugar, which dissolves in the water and forms the *sweet wort* of the brewer. The grape-sugar in the wort is subsequently converted into alcohol during the process of fermentation. The proportion of D. in malt is very minute, seldom exceeding 0·002 to 0·003 per cent.; but the smallness of the quantity is compensated by the extraordinary activity of the D., 1 part of the latter sufficing to convert 2000 parts of starch into grape-sugar. D. has never been prepared in a sufficiently pure state for analysis. In the impure condition it may be obtained by extracting malt with water, maintaining the solution for some time at a temperature of 70° C., filtering from the albuminous principles coagulated by this treatment, and finally precipitating by absolute alcohol. Prepared in this manner D. is a white powder.

Dias'tole is dilatation of the heart and arteries when the blood enters their cavities. It is the opposite to *systole*, when the heart and arteries contract to send forth the blood. See CIRCULATION OF THE BLOOD, HEART.

Diather'manous (Gr. *dia*, 'through,' *thermos*, 'heat'), a property possessed by certain substances, notably by rock-salt, of allowing radiant heat to pass through them in the same way as transparent bodies permit of the passage of light. See HEAT.

Diath'esis (from Gr. *dia*, 'through,' and *thesis*, 'a placing or arranging') is a term used by the older physicians to describe the constitution of an individual rendering the person peculiarly liable to certain diseases. It is transmitted from parent to child. We speak of the gouty D., the cancerous D., tuberculous D., &c.

Diatoma'ceæ, or **Di'atoms,** an order or sub-order of green-spored Algæ, yellow-brown in colour, and containing a large quantity of silex or flint in their fronds. Their mode of reproduction resembles that of the *Desmideæ* (q.v.). In their adult state they are mostly free-moving, but in their young state many of them are attached by a slender pedicle, which in some genera is repeatedly dichotomous. The separate joints, which often remain connected for a long time, are called *frustules*, and are in most cases adorned with beautiful sculpturing, so that even in a fossil condition the species can be easily distinguished. In many, if not in all, cases there are minute openings in the frustules, through which they derive their nourishment from the medium in which they live. They are found both in salt and fresh water, on damp rocks and walls, flower-pots, glass of hot-houses, and often in col-



Diatomaceæ.

lections of powdery-looking matter, at the bottom of standing pools. The Tripoli limestone beds, of great thickness, are almost built up of extinct species in a fossil condition, hence this rock is well adapted for polishing. In Sweden large quantities are found in a fossil state in the mountains, and under the name of *Berg Mehl* (mountain meal) are mixed with flour as food, though they can have no direct nutritive qualities. The order is found in every part of the world, and on the Polar Seas in such abundance as to give the green discoloration to those parts which the whalers note as the favourite haunts of the true whale. Dr. Hooker also found the Antarctic Ocean stained of a brown colour with them. They form the food of many mollusca; hence in the stomachs of fishes which have fed on these mollusca, and in the guano of birds which have lived on the fishes, numbers of unique forms are frequently found. An immense number of species has been described, and the list is always being increased by new discoveries. But it is doubtful if some of the so-called new species are not immature forms of others already known.

Diaton'ic ('by tones') a term used in music to describe the arrangement of the notes of the scale upon which all our music is based. The Greek 'D. genus' seems to have been based upon the scale of C major, and not to have included the same relative intervals in any other key, and the fact that a D. scale could be based upon any note of any pitch whatever had to fight its way into full recognition during the first ten centuries of our era. It should be remembered that while the D. scale—with such modifications as those which occur in what we call *minor* scales—is the only one which satisfies *our* ears, and the only one possessing certain mathematical properties, it is only one of a great number of possible scales. The Eastern nations, for instance, use sub-divisions of the scale which are as intolerable to our ears as European music is unpleasing to them.

Di'atribe (Gr. *dia* 'through,' *tribein* 'to rub'), a name applied originally to a prolonged discussion or critical analysis, now synonymous with a bitter invective or severe criticism.

Diaz, or **Dias, Bartolommeo,** was one of the distinguished Portuguese navigators of the second half of the 15th c., whose feats are sung in Camoens' *Lusiad*. In 1486 he led an expedition fitted out by João II. beyond the point on the Guinea coast which had been reached by Cam and D'Aveiro. With two vessels of only 50 tons burden D. pushed on to Algoa Bay, subsequently named by the British Port Elizabeth. Sailing along the Kafir coast, he entered in lat. 34° 30' the Great Fish River (called by the Dutch 'Grote Vis River'), but at the Island of Cruz was compelled by the entreaties of his sailors to turn back. He gave the name of Cabo Tormentoso ('Cape of Storms') to what was shortly afterwards known as the Cabo de Buena Esperanza ('Cape of Good Hope'). Returning to Lisbon in December, 1487, he accompanied Vasco di Gama on a portion of his famous voyage, for which D. had built the ships *St. Raphael* and *St. Gabriel*. He perished in a great storm which shattered the fleet of Cabral after the discovery of Brazil in 1500. See Lopez, *Historia da Conquista da India*.—**Miguel D.,** born in Aragon, was a friend and companion of Colombus. Leaving the colony of Isabella, he established himself near the mouth of the river Ozema, in Haiti, from which he introduced his countrymen to large gold-mines. When in 1500 Bobadilla superseded Columbus as governor, he was made governor of the islands, &c., of the New World, D. was Alcalde of Santo Domingo, and resisted the entrance of the new governor. After a period of disgrace he was made governor of Porto Rico. He died in 1514. See the Histories of Columbus by Lamartine and W. Irving, and Las Casas.

Dibble, a simple implement once used in fields, now only in gardens. It is of wood, and is 15 inches long with a cross-head for the handle; the shaft is round and tapering, of about two inches in diameter. Dibbling is too slow for farm practice, although found by experiments in thick sowing to yield better results than drilling. Experiments with oats in dibbling, drilling, and sowing broadcast show that of 360 grains placed in the ground there resulted of dibbled plants 270; of drilled plants, 257; of broadcast, 226. Yet drilling is much more advantageous up to a certain point than dibbling. Of 180 seeds, dibbling yielded 150 plants, and drilling 163.

Dibdin, Charles, the musician and song-writer, was born at Southampton, 15th March, 1745. His musical talent showed itself very early; an opera, *The Shepherd's Artifice*, of which he had written both the words and the music, being produced at Covent Garden Theatre in 1761. D. remained before the public as singer, actor, or theatrical manager until 1805, when he retired in somewhat straitened circumstances. Government, however, granted him a pension of £200 a year until his death, 25th April, 1814. D. is best known for his sea-songs, of which he wrote (both words and music) nearly 1200. Coming at a time when the English navy was actively employed, and naval affairs were in everybody's mouth, these spirited songs won unbounded popularity, which not a few of them still retain. A fine edition with drawings by Cruikshank was published in 1861. Besides his sea-songs D. wrote a *History of the English Stage* (Lond. 1795), and *Professional Life* (Lond. 1802). His two sons, **Charles** (died 1833), and **Thomas** (died 1841), were both theatrical writers of some mark.—**Thomas Frognall D.,** nephew of the writer of sea-songs, was born in 1776 at Calcutta. Having studied at Oxford, he joined the legal profession, but took orders in 1804; from which time till his death, 18th November, 1847, his life was devoted to bibliography. D.'s works show wide research and tireless industry, but are marred by lack of exact scholarship and critical discernment. The chief are *Typographical Antiquities of Great Britain* (1810-19), *Bibliographical Decameron* (1817), *Library Companion* (1824), and *Reminiscences of a Literary Life* (1836).

Dibranchia'ta (Gr. 'two-gilled'), the name applied to an order of Cuttlefish (q.v.) distinguished by the possession of two branchiæ or gills, and not more than eight or ten arms; by the arms being provided with suckers; by the presence of an ink-sac, and by the shell being internal, or, if external, not chambered. In this order are the paper nautilus or *Argonaut*, the *Octopi* or *Poulpes*, the Squids, *Spirula*, the extinct *Belemnites*, &c. The companion order, *Tetrabranchiata*, is represented by the pearly nautilus alone.

Dice (plur. of *die*) are small cubes made of ivory or bone, with black dots, ranging in number from one to six, on each of their sides, and much used in games of chance or hazard. When D. are fairly made, there is no way of shaking the D.-box so as to throw a given number, but professional gamblers sometimes 'load' their dice—*i.e.*, plug them with lead on a particular side — so that the highest number generally turns up. Any game played with dice, except backgammon, is held to be illegal by statute 13 Geo. II. c. 19.

Dicen'tra, a genus of Fumariaceous plants (the *Diclytra* or *Dielytra* of De Candolle). *D. Cucullaria* is the 'Dutchman's Breeches' of the United States; *D. Canadensis*, the squirrel corn; *D. farinosa*, a species from Virginia and N. Carolina, much cultivated in our gardens; but the best-known species is *D. spectabilis* of Northern China and Siberia, one of the most beautiful of the genus, introduced into Britain in 1846. It can be grown in the open air, but requires the protection of the house in most situations before it can attain to full perfection. It is one of the favourite plants of the Chinese.

Dichlamyd'eous (Gr. *dis*, 'twice,' and *chlamys*, 'a covering'), a botanical term expressive of a flower having both calyx and corolla. De Candolle divided Dicotyledonous (q.v.) plants into D. (including *Thalamifloræ*, *Calycifloræ*, and *Corollifloræ*) and *Monochlamydeæ*, which formed a subclass by itself.

Dichot'omous (Gr. *dichotomos*, 'cut into two equal parts'), a botanical term signifying having the divisions always in pairs, and equally applicable to branches, veins, the forking of ferns, and the fronds of algæ. The stem of the mistletoe and the branching of the Doom Palm (q.v.) are examples.

Dich'roism (from the Gr. *dis*, 'twofold,' and *chrōa*, 'colour'), a property possessed by certain crystals and minerals, which present different colours when viewed by transmitted light in different directions. Thus mica is nearly opaque in one direction, but transparent and of a different colour in another. Crystals of chloride of palladium are deep red when viewed along, and a bright green when viewed across, the axis.

Dick Bequest, The, is a fund established by James Dick, 'of Finsbury Square, London, to encourage active schoolmasters, and gradually to elevate the literary character of the parochial schoolmasters and schools in the counties of Aberdeen, Banff, and Moray.' Dick, born at Forres, 1743, on his death, in 1828, left the bulk of a large fortune for the above purpose. The bequest amounted finally to £118,787; the annual income remaining to be distributed, after deducting all expenses, is on an average about £4000. To ensure the literary proficiency of the schoolmasters, the trustees instituted an examination in literature and science; and no teacher could participate in the D. B. till he had passed this examination. Again, to ensure the efficiency of the teaching they attached a certain money value to instruction in the higher branches, and the manner in which these were taught was taken into account, as judged by a 'visitor' or inspector. A scheme relating to this bequest was made by the Commissioners appointed under the Educational Endowments (Scotland) Act of 1882, and was approved of by the Queen in Council on 1st May, 1890. The whole of the property is now vested in a governing body of thirteen elected persons. The endowment may now be applied only within the district, consisting of the counties of Aberdeen, Moray, and Banff, with the parishes of Abernethy and Duthil; every part of the burghs of Aberdeen, Elgin, Banff, and Forres being excluded. Besides providing for the continued payment to schoolmasters in the district who had been in receipt of an annual payment since Whitsunday, 1873, and for payments (£15-50) to teachers appointed to the district prior to 1st May, 1890, the scheme allows the governors to make annual grants to School Boards within the district for the purposes of higher instruction under certain conditions, and such grant may range from the fixed payment of £15 to £50 (£1-35 being additional, as capitation grant). Exceptional grants, £60-200, may also be made to School Boards for efficient instruction in Latin, Greek, and Mathematics under a University graduate; and special grants may be made for supplying appliances for scientific instruction. For additional information the reader is referred to the handbook of the scheme of the Dick Bequest Trust, as it is now named.

Dick'ens, Charles, an English novelist, was born at Sandport, near Portsea, Hampshire, 7th February, 1812. His father, John D., for some time a clerk in the Navy Pay Office, seems to have been an amiable, though unfortunate and improvident man; his family were sometimes in great straits while he was an inmate of Marshalsea Prison, and in consequence D. had at an early age to shift for himself. The first place he filled was a menial one in a blacking warehouse; from this he went as a clerk to an attorney's office in Chancery Lane, London, where he showed a taste for theatricals; finally, he qualified himself for the post of parliamentary reporter. The first situation he obtained as such was on the *True Sun;* he next proceeded to the *Morning Chronicle*, where his ability and industry won him the admiration and encouragement of the editor, the well-known John Black. In the evening editions of the *Chronicle* D. first showed his powers as a humourist by his essays entitled *Sketches by Boz* (1836). The same year he married Catherine Hogarth, daughter of a fellow-labourer on the *Chronicle*. The *Sketches by Boz* were succeeded by a work which at once raised D. to the front rank among English humourists. This was the *Pickwick Papers*, which has probably evoked more innocent laughter than any other book in the world before or since. Some of the characters, such as the two Wellers and Pickwick himself, are immortal. D. was now recognised as a great artist, and was warmly appreciated by the first critics of the age. His next work was a novel with a more ambitious plot (*Nicholas Nickleby*), which, besides, had a moral 'purpose,' namely, to paint the weaknesses and barbarities of the cheap-school system. It was not less successful, and D. continued to pour forth fiction after fiction, all of which were greedily devoured, and most of which exposed social sores and delineated individual peculiarities. The chief are *The Old Curiosity Shop*, *Barnaby Rudge*, *Oliver Twist*, *David Copperfield* (in the opinion of many his finest work), *Martin Chuzzlewit* (the fruit of a voyage across the Atlantic), *Dombey and Son*, *Bleak House*, *Hard Times*, *A Tale of Two Cities*, *Little Dorrit*, *Great Expectations*, and *Our Mutual Friend*. D.'s faculty of humour began to flag towards the end, and his pathos had always a tendency to become maudlin, yet many of his characters, such as Little Nell, Mrs. Gamp, Agnes, Micawber, Tom Pinch, Fagin, and Pecksniff, are unique in literature. Probably no novels have had such a healthy and genial moral influence as those of D. His boundless energy required and found other vents. He was a clever actor, and wrote an opera, *The Village Coquettes*, which was acted once in 1836; he travelled much, and there is no livelier account of travel than his *American Notes for General Circulation* (1842). As a writer of Christmas stories he is unrivalled, in proof of which one need only name his *Christmas Carol*, *Chimes*, *Cricket on the Hearth*, and *Dr. Marigold's Prescriptions;* and as a public reader of his own works, he obtained great and merited popularity. D. even attempted journalism; he took part in starting the *Daily News* in 1845, and was long editor of a popular weekly magazine, *Household Words*. D. died 9th June, 1870, leaving behind him an unfinished novel, *The Mystery of Edwin Drood*. His Life has been written by his most intimate personal friend, the late John Forster (Lond. 1872-74).

Dick'son, David, a notable Scottish divine, born in 1583, at Glasgow, was minister of Irvine from 1618 to 1641, when he was elected Professor of Divinity in his native town; helped to draw up the Confession of Faith, and was ejected from the Church for nonconformity in 1662, the year of his death. D.'s works comprise commentaries on Hebrews, Matthew, and the Psalms, *Therapeutica Sacra*, and a *Treatise on the Promises*.

Dickso'nia, a genus of Ferns, mostly arborescent. The silky hairs from the caudex of D. of Madeira and of D. of Java are used in Holland and Germany as a styptic, and for stuffing beds, cushions, &c. The hairs of the latter species are imported under the name of *Pakoe Kidang*. D. of Australia is now a common ornament of our greenhouses, while others are found in Juan Fernandez, Brazil, St. Helena, Colombia, and Java.

Dicotyle'dons, Dicotyledo'neæ, Dicotyle'dones, or **Dicotyle'donous Plants,** one of the two great subdivisions of flowering plants, distinguished by the plants having two seed lobes, netted veined leaves, the wood of the stem in concentric circles, and the parts of the flower generally four or five, or multiples of four or five. About 7000 genera and 70,000 species belong to this division, which is again subdivided into—(1) *Thalamifloræ* (q.v.); (2) *Calycifloræ;* (3) *Corollifloræ* (q.v.); (4) *Monochlamydeæ* (q.v.); and sometimes (5) *Gymnospermæ* (q.v.), or naked-seeded plants, all the other divisions having the seeds enclosed in seed-vessels, or *Angiospermous*. Hooker and Bentham add another group intermediate between *Thalamifloræ* and *Corollifloræ*, called *Discifloræ*. See COTYLEDON, ROOT AND STEM.

Dicot'yles. See PECCARY.

Dicra'nium, a genus of Mosses (q.v.), containing numerous species, some of which are very common on the ground, moist rocks, or more rarely on trunks of trees in Britain.

Dicta'tor, in republican Rome, an extraordinary magistrate, with absolute power, appointed, when the state was in great peril, for the execution of some unusual public act, such as the celebration of solemn games. A D. was chosen for six months by one of the consuls, in obedience to a senatorial decree, but was expected to resign on fulfilling the duty for which he was elected. The office was at first confined to patricians, but was afterwards thrown open to the plebs. Although an autocrat in military matters, a D. had to conform to law in civil acts, and when chosen for some special purpose, might be successfully opposed if he sought to control other affairs. It is said that a D. could not spend public money without permission of the senate, and it seems to have been illegal to wield dictatorial power beyond the limits of Italy. A D.'s insignia were four lictors who carried *secures* or axes in their fasces. The office was established, it is said, B.C. 501, fell for a time into disuse, was revived during the second Punic War, after which it became extinct, the prolonged dictatorships of Cæsar and Sulla being unconstitutional. On Cæsar's death the office was abolished.

Dic'tionary (Low Lat. *dictionarium*), a book in which words with their peculiar meanings are arranged in alphabetical order; or, in a wider sense, a book in which a subject, or a branch of a subject, is treated under heads alphabetically classified. A D. demands a certain definite, systematic arrangement of information, and is thus distinguished from a mere catalogue. A D. of the Greek language is generally spoken of as a *lexicon*, and a D. of geography as a *gazetteer*. The terms *glossary* and *vocabulary* are almost synonymous with a D. of a language. For dictionaries of facts, see ENCYCLOPÆDIA.

Dictionaries of Words.—The earliest of such dictionaries is the *Lexeis Homerikai* or *Homeric Lexicon* of the time of Augustus, but the first which has any pretensions to completeness is the Greek D. of Suidas, a Greek lexicographer of the 11th c. The Latin *Thesaurus* of Robert Estienne (1535), shows a marked advance in D.-making upon the work of Suidas, and the Greek *Thesaurus* of Henri Estienne (1572) has been the basis of succeeding Greek dictionaries. Other dictionaries deserving mention are the *Etymologicum Magnum*, a Greek lexicon of the 10th c., worthless in its etymologies, but a storehouse of interesting and quaint traditions; the *Phraseologia Generalis*—a Latin D.—by W. Robertson (1681); the *Etymologicon Linguæ Latinæ* of Vossius; the Latin D. of Forcellini (Padua 1771); the Latin D. of Freund. The best Greek and Latin dictionaries published in England are the Latin-English D. and English-Latin C. of W. Smith; the Latin-English D. of Riddle and White; the Greek-English Lexicon of Liddell and Scott. Notable polyglot dictionaries are Whiter's *Etymologicon Magnum* (1800-22); Minsheu's *D. of Eleven Languages* (Lond. 1617). Among the best dictionaries of foreign tongues are the *Dictionnaire de l'Académie Française;* the Italian *Vocabolario degli Academici della Crusca;* and the Spanish *Diccionaria de la Lengua Castellana compuesto por la Real Academia Española* (Madr. 1726). Among English dictionaries may be specified Elisha Cole's English D. (1677); Booth's *Analytical D. of the English Language;* Johnson's English D. (1755), a really great work, but very defective in etymology; Jamieson's *D. of the Scottish Language* (1808); Bouchier's and Wright's Dictionaries of archaic and provincial words; Crabb's *Technological D.* (1859); Webster's D.; and from the Clarendon Press the enormous *New D. of the English Language on Historical Principles*, edited by Dr. Murray; Cassell's *Encyclopædic Dictionary;* Collins' and Ogilvy's Dictionaries; Nuttall's *Standard Pronouncing Dictionary*, and Lloyd's *Encyclopædic Dictionary*, &c.

Dic'tum de Ken'ilworth, an edict of Henry III., given at Kenilworth Castle, commuting penalties incurred by certain rebel barons into five years' rent of their legally forfeited estates.

Dicty'ogens, one of Lindley's subclasses of Monocotyledons (q.v.), which, while agreeing with the general characteristics of the class, differ from it in having the wood of their rhizomes arranged in a concentric manner like that of Dicotyledons (q.v.), while the leaves have reticulated or netted veins. *Dioscoreaceæ*, *Smilaceæ*, *Trilliaceæ*, &c., are among the most important orders of D. It may, however, be noted that some *Araceæ* and *Liliaceæ*, not included among D., have also netted veined leaves.

Dic'tys Creten'sis, the alleged author of a Latin history of the Trojan war, which differs widely from Homer, chiefly in excluding all supernatural agency. It is asserted in the preface that the original was composed by D. of Cnossus, who accompanied Idomeneus to the Trojan war, that it was buried in the author's grave till exhumed by an earthquake in the time of Nero, that it was then brought to Rome by one Eupraxis and translated into Greek, from which Greek translation the Latin version was made by Q. Septimius Romanus. All that is actually known about it is, that a Greek work under the name of D. is frequently quoted by the Byzantine writers, which was probably written in Greek about the time of Nero, and afterwards translated into Latin. The chief literary value of the work consists in its being the principal channel through which the legendary lore of Greece flowed into the romances of the Middle Ages, passing thence into popular tales and ballads. D. is generally printed along with Dares (q.v.). The best edition is that by Diederich (Bonn, 1837).

Dicyn'odon, a genus of extinct reptiles, included by Owen in the fossil order *Anomodontia*. In D. the front portions of the jaws were toothless, and formed a beak-like structure, which probably was invested by a horny sheath. No teeth were developed in the lower jaw, but each half of the upper jaw bore a large tusk-like tooth, which (like the tusks of living elephants, or the front teeth of rodents) grew throughout life from a permanent pulp. This genus—of which *D. lacerticeps* is a familiar species—occurs only in rocks of Triassic age in S. Africa and India. These animals were fitted to move on land, and had well-developed limbs.

Didac'tic Po'etry (Gr. *didaskein*, 'to teach') is that species of poetry which has for its avowed object the instruction, as distinguished from the mere entertainment or gratification, of the reader. Many poems of the highest order, whether lyric, epic, or dramatic in form, are, of course, in a sense D., but the term is generally restricted to such as seek to inculcate information on some definite subject or range of subjects. When the theme is happily chosen, and the work executed in a masterly style, the advantages of verse over prose are undoubted, and the result has been that, in almost all languages, we find an abundance of D. P., embracing an almost endless variety of subjects. Among the Greeks the *Works and Days* of Hesiod; among the Romans the *De Rerum Natura* of Lucretius, the *Georgics* of Virgil, and the *Epistles* and *Satires* of Horace, are notable examples; while numerous D. poems, in English and other European tongues, have attained to the rank of classics. No small charm is imparted to such works by the skilful introduction of episodes and illustrations, such as the tale of *Aristæus and his Bees*, and the legend of *Orpheus and Eurydice* in the *Georgics*.

Didel'phys. See OPOSSUM.

Di'derot, Denis, a French encyclopædist, born at Langres in October, 1713, was the son of a respectable cutler, who had him partly educated for the Church at the Collége d'Harcourt. Declining to enter either the Church or the law, D. supported himself by teaching mathematics, Latin, and Greek. In 1744 he married Mlle. Annette Champion, whom he speedily deserted for the more witty, but less virtuous, Madame de Puisieux. To this period belong his *Pensées Philosophiques* (which was publicly burned) and his *Lettre sur les Aveugles*, which introduced him to Voltaire, who contested its atheistic conclusions, and to the prison of Vincennes, where he was visited by Rousseau (Confess. B. viii.). On his release he formed a lasting attachment for Mlle. Voland: his letters to her, from 1759 to 1774, give a graphic account of the 'family of atheists,' *i.e.*, D'Holbach, Galiani, Grimm, &c. D. now tried the drama, but his plays *Le Père de Famille* and *Le Fils Naturel* were pronounced to be stilted and pretentious failures. In 1758 D. and D'Alembert replanned the great *Encyclopédie*, which till then (7th vol.) had been chiefly a translation from Ephraim Chambers' *English Encyclopædia*. D. wrote the *Prospectus* and the *Système des Connaissances Humaines*, and took charge of the department of history of ancient philosophy. He steadily excluded all Jesuit and Jansenist contributors from the theological department; and after the withdrawal of D'Alembert, confronted alone the storm of opposition which the *Encyclopédie* excited from the court, the Church, the theatre, the Sorbonne, and the law. He had as friends only Madame de Pompadour, M. de Choiseul, and M. de Malesherbes; but he refused Voltaire's advice to fly to Russia, and continued for thirty years to work with the courage of his convictions. He wrote the articles on the mechanical arts; but in his editorship and his occasional compositions he displayed the most wonderful range of information and facility of composition. D. was frequently the dupe of his own good nature, so that he must have died in poverty had the Empress Catharine not pensioned him. Louis XV. declined to help D.'s candidature for the Academy, saying, 'He has too many enemies.' In 1773 he visited his benefactress at St. Petersburg. His chief later works are *Jacques le Fataliste*, *La Religieuse*, and *Essai sur les Règnes de Claude et de Néron*. He died 30th July, 1784, from a slight stroke of apoplexy. D. had frequently suffered from overeating. Before his death he had just eaten an apricot, and asked his wife, 'How the deuce can that hurt me?' In spite of the calumnies of La Harpe and the mistakes of Naigeon, D. appears to have been occasionally visited by religious feeling. See his article PROVIDENCE in the *Encyclopédie*. D. was one of the most industrious and enthusiastic writers of the 18th c., and disseminated his opinions with rare courage and unflagging toil. His works are pregnant, fresh, and vigorous, but he produced no literary masterpiece, his best work being probably his dialogue *Le Neveu de Rameau*, a brilliant realistic satire, which Göthe translated. His style is rambling, opaque, and declamatory, for which he has been called the most German of French authors. His richness of thought and expression were better seen in conversation than in writing:—Marmontel says that to know D. from his writings only, is not to know him at all. There is a complete edition of D.'s works in 15 vols. (Par. 1798), and another in 20 vols. (Par. 1875-77). See Morley's *Diderot* (Lond. 1875), Bersot's article on D. in his *Études sur le Dix-huitième Siècle*, Carlyle's *Miscellanies*, and Morley's *Diderot and the Encyclopædists* (1878).

Di′do, or **Elis′sa**, daughter of Agenor or Belus, King of Tyre, married her uncle Sichæus (by some called *Acerbas*), priest of Hercules. Sichæus having been murdered by Pygmalion, the son and successor of Belus, who desired to obtain his immense treasures, the disconsolate D., taking with her her husband's wealth, sailed with some Tyrians, touched at Cyprus, where she secured wives for her followers, and at last safely landed on the African coast. Here she purchased from King Jarbas (Hiarbas) as much land as could be enclosed by a bull's hide—no small extent of territory, inasmuch as she cut the hide into the narrowest thongs possible—and on the site built Byrsa (Bull's Hide). Strangers flocked to the new colony, which every day acquired greater commercial importance. D. then, with the consent of the Libyans, built Carthage, which rapidly grew in power and prosperity. Then King Jarbas, smitten with the charms of the Tyrian princess, asked her in marriage, and threatened her with war in the event of refusal. D. asked and obtained three months to consider the proposal; but before the expiry of the time she erected a funeral pile, and, sword in hand, offered herself a willing sacrifice to the manes of Sichæus. After her death she was worshipped as a divinity. Ancient writers are not agreed as to the date of the founding of Carthage, but it probably took place from forty to one hundred years before the building of Rome. The anachronism committed by Virgil in the *Episode of Æneas and D.*—one of the most charming creations of antiquity—has been frequently remarked by ancient and modern writers.

Dido, the name of a beautiful genus of *Lepidoptera*, or Butterflies, belonging to the family *Nymphalidæ* of that order, and found in Brazil and Guiana. The wings are blackish-brown above, with markings of pale green, whilst the under surface is chocolate-coloured, with green patches bordered with silvery white. The caterpillars are green, with red and white stripes. The wings in the D. (*Cethosia D.*) have a stretch of 4 or 5 inches.

Di′dot, the name of a famous French family of publishers, printers, and papermakers.—1. **François D.**, born at Paris in 1689, founded (*à l'enseigne de la Bible d'Or, Rue Pavée*) the celebrated firm in his native city, and issued, among other works, Abbé Prévost's *Voyages*, in 20 vols. He died 2nd November, 1757.—2. **François Ambroise D.**, son of François, was born in 1730, and carried typography to greater perfection than had been previously known in France. His editions include Longus (1778), Tasso (1784-86), and Bitaubé's translation of Homer (1787-88). He died 10th July, 1804.—3. **Pierre François D.** (born 1732, died 1795), was brother of the former, to whose success he greatly contributed by improvements in the manufacture of paper.—4. **Pierre D.**, eldest son of François Ambroise D., born 1760, is principally remembered for his splendid folio editions of Virgil (1798), Horace (1799), and Racine (1801-5), Denon's *Voyage dans la Basse et la Haute Egypte* (1802), and also for Boileau's *Œuvres* (5 vols. 1815), all characterised by faultless orthography and printing. He died 31st December, 1853.—5. His brother, **Firmin D.** (born 1764), is well known in connection with the process of stereotyping, which he applied extensively. By this means he vastly reduced the price of books, selling his *Virgil*, a gem of printing, for sevenpence. It enabled him also to issue an immense number of French, Italian, and English classics. He died 24th April, 1836.—6. **Henri D.** (born 1765, died 1852), son of Pierre François, had a strong mechanical taste, and acquired some reputation as an engraver. The 'microscopic' letters founded by him are miracles of clearness and delicacy.—7. **D. Saint Léger**, brother of the preceding, manager of the paper factory of Essonne, invented the machine for making the paper called *Sans Fin*. The business long carried on under the name of Firmin Didot Frères became Firmin Didot Frères, Fils, & Cie. From the enormous catalogue of their publications we may enumerate the *Bibliothèque Française*, *Collection des Classiques Français*, *Bibliothèque des Auteurs Grecs*, the edition of *Thesaurus Græcæ Linguæ*, and the *Nouvelle Biographie Générale*. See Werdet's *Études Bibliographiques sur la Famille des D.* (Par. 1864).

Didymi′um. This metal accompanies Lanthanum and Cerium (q.v.) in all their compounds found in nature, and derives its name from the circumstance (*didumos*, Gr. 'twins'). D. was discovered in 1841 by Mosander. Its symbol is Di, and its atomic weight 48. Neither D. nor its salts have any practical importance.

Die′, St., a town in the department of Vosges, France, on the Meurthe, 25 miles E.N.E. of Épinal. It is a bishop's see, and has a cathedral and fine church. There are manufactures of cotton, and a trade in corn, cattle, flax, leather, ironmongery, &c. In the neighbourhood are iron and copper mines, paper mills, and dyeworks. Pop. commune 18,136; arrond. 108,028.

Dieff′enbach, Johann Friedrich, a celebrated German surgeon, was born 1st February, 1792, at Königsberg, became Professor of Clinical Surgery at Berlin in 1832, and died 11th November, 1847. His chief works are *Chirurg. Erfahrungen* (1829-34), *Durchschneidung der Sehnen und Muskeln* (1841), and *Die Operative Chirurgie* (1844-49), the last unquestionably placing him among the first surgeons of the world.

Die′go, San, a town of California, at the southern extremity of the state. It has one of the best harbours on the Pacific coast, 6 miles long, with a depth of 6 or 7 fathoms close to the shore. The town is divided into the old, or Spanish, and the new, or American. There is a trade in hides, tallow, fish, and salt; and gold, copper, quicksilver, and coal are said to be found. Pop. (1880) 2637; (1890) 16,159.

Dielec′tric, the name given by Faraday to the medium which separates two conductors of electricity, and through which Induction (q.v.) acts. Faraday discovered that the charge induced upon a conductor, placed at a given distance from a charged conductor, varied with the D. employed, being dependent upon what he termed the specific inductive capacity of the D. He was thus led to the conception of the theory of action through a medium. Specific inductive capacity is the induction across any surface due to unit normal charge, and is therefore unity for air, since, in this case, the induction is equal to the charge. A complete discussion of the theory of the D. and of action through a medium will be found in Clerk Maxwell's *Electricity and Magnetism*.

Diep′enbeck, Abraham Van, a Dutch painter, born at Hertogenbosch (Bois-le-Duc) in 1607, became famous as the first painter on glass of his time, but, abandoning glass-painting, entered the school of Rubens at Antwerp, devoting himself to study under that master. After a tour in Italy, he returned to Antwerp, and re-entered the studio of Rubens in the capacity of assistant in 1641. His versatility was great, and, besides such pictures as his 'Crucifixion' (at Coblentz), his 'Elizabeth and Clelia' (Berlin), &c., he showed excellent taste and great facility in painting on tapestry and panelling, and in designing title-pages and other decorative work. His 'Temple of the Muses,' a series of fifty-nine designs from Ovid's *Metamorphosis*, and a work of great genius, was reproduced in copperplate by the best engravers of the time. His colouring and composition were excellent, his ingenuity exhaustless, but his work was always hurried, and wanting in finish. Many examples of his glass-paintings are preserved at Antwerp. In 1641 he was elected Director of the Academy at Antwerp, where he died in 1675. See Decamps, *Vies des Peintres Hollandais*.

Dieppe′ (Old Norse, *Duipa*, 'the deep water'), a seaport and watering-place of France, department of Seine-Inférieure, at the mouth of the Arques, here divided into two streams, 45 miles N. of Rouen by railway. It is a fortified town of the fourth rank, the seat of a tribunal of the first instance, and of a communal college; has a Gothic church, St. Jacquès, dating from the end of the 13th c., the beautiful church of St. Remi, a castle of the 15th c., hospitals, an exchange, and a theatre. There are elegant bathing *établissements*, and several public squares, numerous fountains, fine quays, and promenades. The harbour consists of large basins, and admits vessels of 1200 tons. There is a regular steam service with Newhaven, and great numbers of Englishmen pass through D. on their route for Rouen and Paris. The exports are cottons, silks, woollens, fruits, &c., and the imports iron, steel, coal, and timber. D. has manufactures of lace, articles of ivory and bone, as also ship-building yards, sugar-refineries, distilleries, and sawmills. Its leading industry is, perhaps, in herring and cod fisheries, and in the management of the enormous beds of oysters in the vicinity. To the W. of D. lies the suburb of Pollet, remarkable for the entire contrast its inhabitants present to those of Upper Normandy in speech, dress, and manners, on which account they have been taken for the descendants of the Saxons who settled here in the times of the Merwings. D. is first known historically in 1196, and subsequently became a flourishing French port. It rose to the height of its prosperity under François I. The ships which carried the first French colonists to Canada sailed hence. But the fortunes of D. sank with the revocation of the Edict of Nantes (1685), and the town was all but destroyed by the English and Dutch forces, 17th July, 1694. It was rebuilt by royal command on the Peace of Rijswijk, and again bombarded by the English, 14th September, 1803. The Germans, under Manteuffel, seized D., 9th December, 1870. Pop. commune 22,771; arrond. 108,390.

Die-Sinking, the art of producing a design, usually incised, on a block of steel, called a die, which forms a matrix for the reproduction of a number of identical dies, used in striking medals, &c. The art is best displayed in the making of medals and coins. A piece of fine-grained steel is fashioned into a rough dye-block, and is strengthened by a ring of iron to prevent its cracking. The rough die-block having been softened by annealing, and a smooth surface formed on it on the lathe, the die-sinker sketches and engraves in outline his design upon it. After delicate manipulation with differently shaped tools or gravers of many sizes, he produces a finished 'matrix.' While the die is being engraved, technically called 'roughed,' the die-sinker takes frequent casts, in clay or type-metal, to test the correctness and progress of the work. A number of duplicate dies are prepared, as injury might result to the original from continual use in the press. The first step in the multiplication of dies is to harden the matrix, by protecting the design with a charcoal paste, heating the steel to a bright cherry-red, and then exposing it to a falling stream of water. It is next cleaned, tempered by being raised to a certain temperature, and slowly cooled in oil or water, and 'lapped,' or polished. A piece of steel of the same quality as the die is now turned on the lathe to the form of a truncated cone, made quite smooth, and carefully annealed. The matrix being placed beneath a powerful press, the narrow end of the annealed piece of steel or 'punch' is placed upon it, and by a succession of light blows is sunk into the matrix till the design appears in perfect relief upon the punch. The blows require to be slight, as the punch is apt to crack, and softens after each blow. From the punch, which is strengthened with an iron collar and hardened, a series of impressions are obtained on soft steel, and from these, subsequently hardened, the medals or coins are struck by means of a press. All metals, except tin, have to be annealed after each blow in the press, to prevent cracking. Dies for stamping notepaper, &c., and for fine kinds of metal ornaments, are prepared by the die-sinker. For inferior stamped metal ornaments the dies are chiefly cast, and afterwards touched up with a graver.

Di′es Incep′tus pro Comple′to Habe′tur, a legal maxim, signifying that a day begun is a day ended. See COMPUTATION OF TIME.

Di′es I′ræ, the name given (from the opening words) to the great Latin hymn on the judgment-day—the crowning effort of mediæval piety in song. The modern world has nothing comparable to it in awe-stricken devotion and hallowed fear. The hymn has been ascribed to the General of the Minorite Order, Matthäus Aquasparta (died 1302), to Cardinal Frangipani (died 1294), to Malabranca, Bishop of Ostia (1274), to Bonaventura (q.v.), to St. Bernard (q.v.), and even to Gregory the Great (q.v.). But Luke Wadding, the learned historian of the Franciscan Order (*Annales Minor.*, Lugd. 1625), assigns the authorship to Thomas of Celano, a native of the Abruzzi, and pupil and friend of St. Francis of Assisi. Thomas died about the middle of the 13th c., and his name is first mentioned in connection with the poem about the end of the 14th c. There are three different texts of the D. I.—(1) that of the Roman Missal, which is the one best known; (2) the Mantuan; (3) that given to the Cathedral of Zürich (about 1475) by Felix Malleolus (Ger. *Hämmerlein*), Provost of Solothurn and Chorherrn. The relative value of these texts is still the subject of critical discussion. The hymn itself first became part of the liturgy of the Church in the latter half of the 14th c. It has been repeatedly translated into German, English, and other tongues. Lisco, in his monographs on the D. I. and the *Stabat Mater* (Berl. 1840-43), enumerates sixty versions of the former, of which August Wilhelm von Schlegel's is probably the best. Crashaw, Macaulay, and Lord Lindsay are among those who have tried to render it into English.

Di′esis, in music, a small interval occurring under the same circumstances as *Diaschisma* (q.v.).

Diest, a strongly fortified town in the province of Brabant, Belgium, 32 miles E.N.E. of Brussels, with manufactures of hosiery, beer, and gin. The Church of St. Sulpitius is the only building of note. Pop. 8531.

Die′terichs, Joachim Friedrich Christian, a great veterinary surgeon, was born at Stendal, Prussia, 1st March, 1792, entered the Veterinary College of Berlin as a bursar in 1813, and, after examination, was named, in 1817, superior veterinary surgeon. He was sent to France at the expense of the Government to study stud-keeping and horse-breeding, and pursued the same study further in Würtemberg, Bavaria, Austria, and Hungary. On his return he occupied a chair in the Veterinary College of Berlin till 1823, was appointed to a post in the General Military School of Berlin in 1830, and appointed Professor in Ordinary in 1841. His works, which have been translated into various languages, are widely used in Germany.

Dietet'ics is that department of science which treats of food. The question of the kind of food best suited for man may be treated either theoretically or practically. Theoretically, food may be considered as consisting of various alimentary or proximate principles, each of which has specific physiological properties; or, practically, food may be regarded as composed of these collectively, in such proportions and in such physical states as fit the food for the maintenance of life. It is the practical aspect of the question of food which forms the subject of D. As an example of a natural food, take milk. It contains the following alimentary principles:—Nitrogenous matter (casein chiefly, with small quantities of other albumenoid matter), fatty matter, or butter, a carbo-hydrate, in the form of sugar of milk (lactine), and inorganic matter, comprising salts and water. Here we find a combination of principles present, designed in the economy of nature for the purpose of sustaining life during an early period of mammalian existence. An egg is another example of a compound food or material containing all the principles necessary for the development and growth of the body of the chick. It has also been shown by experiment that food containing a combination of principles is required to nourish the body of an animal. Thus gelatine, albumen, fibrine, and fat, taken separately, nourish animals for a very limited period, and in an incomplete manner. A truly nutritious food must contain a mixture of these, along with saline materials and water. In addition, a certain amount of sapidity or flavour is required to make the food palatable.

The nature of the food required by a healthy man is also affected by the exigencies of the climate in which he lives, and by his habits of life. Exercise and exposure to cold increase the demand for food, while a state of inactivity and a warm climate have usually the opposite effect. Again, dwellers in the Arctic regions consume an enormous quantity of the most efficient kind of heat-producing material—oleaginous matter, or fat—while the inhabitants of the tropics live chiefly on vegetable products, containing principles, such as starch, belonging to the carbo-hydrate group of bodies. In a temperate clime, we find men living more on a mixed diet. The following table, by Moleschott, may be regarded as representing the necessary combination of alimentary principles for maintaining health, in a person of average height and weight, in a temperate climate, and with a moderate amount of either nervous or muscular work:—

Dry Food.	In oz. avoir.	In grains.
Albuminous matter	4·587	2,006
Fatty matter	2·964	1,296
Carbo-hydrates, such as starch, sugar, &c.	14·250	6,234
Salts	1·058	462
	22·859	9,998

Water from 50 to 80 ounces. The 23 ounces of water-free material correspond to about 42 ounces of ordinary food. For a healthy, average-sized man, doing a moderate amount of work, a sufficient diet of ordinary food would consist of about 8 oz. for breakfast, 6 oz. for luncheon, and 16 oz. for dinner—in all, 30 oz.

When we examine the dietaries of persons engaged in various ways, we find a correspondence between the work done and the food consumed, and here, as has been well said, there is a harmony between the dictates of experience and the suggestions of science. In order to ascertain the value of any dietary, the composition of the constituent articles requires to be known. The following table, compiled from Dr. Letheby's Cantor *Lectures on Food*, represents the percentage composition of several of the more common articles of diet:—

	Water.	Albumen.	Starch.	Sugar.	Fat.	Salts.
Bread	37	8·1	47·4	3·6	1·6	2·3
Biscuit	8	15·6	73·4		1·3	1·7
Wheat flour	15	10·8	66·3	4·2	2·0	1·7
Oatmeal	15	12·6	58·4	5·4	5·6	3·0
Rice	13	6·3	79·1	0·4	0·7	0·5
Peas	15	23·0	55·4	2·0	2·1	2·5
Potatoes	75	2·1	18·8	3·2	0·2	1·0
Arrowroot	18	...	82·0	...	...	...
Turnips	91	1·2	5·1	2·1	...	0·6
Cabbage	91	2·0	5·0	3·0	0·5	0·7
New milk	86	4·1	...	5·2	3·9	0·8
Cream	66	2·7	...	2·8	26·7	1·8
Cheese	36·8	33·5	...	...	24·3	5·4
Lean beef	72	19·3	...	...	3·6	5·1
Fat beef	51	14·8	...	...	29·8	4·4
Mutton	72	18·3	...	...	4·9	4·8
Veal	63	16·5	...	...	15·8	4·7
Fat pork	39	9·8	...	...	48·9	2·3
Tripe	68	13·2	...	...	16·4	2·4
Poultry	74	21·0	...	...	3·8	1·2
White fish	78	18·1	...	...	2·9	1·0
Salmon	77	16·1	...	...	5·5	1·4
Egg	74	14·0	...	...	10·5	1·5
Butter	15	...	...	...	83·0	2·0
Beer and porter	91	0·1	...	8·7	...	0·2

The following table shows the relation between the amount in ounces of dry food and the habits of life of the individual:—

	Nitrogenous matter.	Fat.	Carbo-hydrates.	Mineral matter.
	oz.	oz.	oz.	oz.
Bare subsistence—diet as in prisons, hospitals, &c.	2·33	0·84	11·69	...
Adult in full health, with moderate exercise	4·215	1·397	18·960	0·714
Active labourers, such as soldiers during war	5·41	2·41	17·92	0·68
Hard-working labourers, such as navvies	5·64	2·34	20·41	0·72

As regards the effect of animal and vegetable food on the system, the following statements may be made:—(1) Animal food increases the amount of fibrine in the blood, renders the blood richer in red corpuscles, and produces firmness of muscle with an absence of superfluous fat. (2) Vegetable food increases the deposition of fat, is less stimulating than animal food, and appeases hunger for only a short time; otherwise its nutritious value, if capable of being digested, is quite as great.

Diet of Infants.—The proper food for an infant is the milk of the mother. Failing this, the nearest approach to the best food is the milk of another woman. A wet-nurse should be free from constitutional taint, and in a healthy condition. Her milk should be sufficient in quantity and good in quality, and she should have borne a child about the same time as the mother of the infant given into her charge. But if no wet-nurse can be got, the next best substitute for the mother's milk is the milk of the cow. This milk, as seen in the following table, is the nearest approach to what is wanted, and it is easily procurable:—

	Milk of			
	Woman.	Cow.	Goat.	Ass.
Nitrogenous matter	3·35	4·55	4·50	1·70
Butter	3·34	3·70	4·10	1·40
Sugar and salts	3·77*	5·35	5·80	6·40
Water	89·54	86·40	85·60	90·50
	100·00	100·00	100·00	100·00

* Understated.

To render cow's milk suitable for the infant, it is usually diluted with water and sweetened with sugar. Farinaceous food, consisting of bread, biscuit-powder, flour, rusks, &c., are not really suitable for infant life, although much used. Liebig's food, derived from malt-flour, wheat-flour, cow's milk, bicarbonate of potash and water, is more suitable. As regards practical dietetics and the food for invalids suffering from various diseases, see Dr. Pavy's *Treatise on Food and Dietetics.*

Die'trich of Bern, one of the characters in the old German epic the *Niebelungen Lied* (q.v.), and a favourite hero in German legend and song. In the *Niebelungen Lied* he is one of Etzel's (Attila's) chief vassals, and revenges the death of Siegfried by bringing Gunther, the Burgundian king, and Hagen, Siegfried's murderer, captive to Queen Chriemhilt. D. is only of secondary importance in the *Niebelungen Lied,* but is the central figure in a great cycle of Gothic tales. In the *Heldenbuch,* or *Book of Heroes,* written by Wolfram von Eschenbach and Heinrich von Ofterdingen, D. is represented as seeking adventures in a fairyland in the Tyrol, and as riding to Chriemhilt's rose-garden, and forcing the almost invulnerable Siegfried to hide beneath Chriemhilt's veil. Other sagas tell how D. was head of a band of heroes, and was crowned Emperor of Rome. In the comparatively late tale of *D. and Sigenot,* D. is shut up in a tower, and, like Ragnor Lodbrog, is attacked by snakes, but escapes. The story of *D. and Ecke* greatly resembles the Volsunga saga, and, according to some, can be connected with the *Iliad.* It paints D. as the bravest of all warriors, and as beloved by the beautiful Queen Seburk, whose pleading for D.'s life, according to Cox (*Mythology of the Aryan Nations,* i. 305), symbolises the Dawn pleading for the life of the Sun. D. likewise appears in German legend as a ghostly midnight hunter, answering to King Hugh in France and Herne the Hunter in England. This heroic and mythical D., or Thiderick, is identified with the great Ostrogothic conqueror Theodoric of Verona (q.v.). See Ludlow's *Popular Epics of the Middle Ages.*

Di'ets of Compear'ance, in the law of Scotland, are the days on which a party to a civil or criminal process is cited to appear in court. In criminal cases, the indictment, or Criminal Letters (q.v.), must be called on the precise day for which the accused is cited.

Diez, Friedrich Christian, an illustrious Romance scholar, was born at Giessen, 15th March, 1794. After serving as a volunteer against Napoleon in 1813, and living as a private tutor at Utrecht, he went to Bonn in 1822, where he was appointed Professor of Modern Literature in 1830. He died 2nd June, 1876. By his two great works, *Grammatik der Romanischen Sprachen,* and *Etymologisches Wörterbuch der Roman Sprachen,* which have been translated into English and French, D. founded the philology of the Romance languages. Among his other works are *Die Poesie der Troubadours* (1826), and *Ueber die erste Portug. Kunst und Hofpoesie* (1863). A 'D. Memorial,' in the shape of scholarships for the studies to which his life was devoted, was established in 1878.

Diff'erences, in heraldry, devices to indicate feudal alliance and dependency, but not blood-relationship. Another view is that D. are used by the brothers and other descendants of a family after the death of their father, while marks of Cadency (q.v.) are employed during his lifetime. D. are effected in ways innumerable, by modifications of tincture and of all the charges—ordinaries, sub-ordinaries, and miscellaneous. Women cannot bear D.

Differences, Calculus of Finite, a branch of pure algebra, of the greatest importance in the discussion of series and questions of annuities, &c. The law which the successive terms of many series, at first sight very irregular, follow, is made quite evident by taking what are known as successive differences. The following numbers give an example of this :—

Series,	18		27		40		58		82		113		152
First differences,		9		13		18		24		31		39	
Second differences,			4		5		6		7		8		
Third differences,				1		1		1		1			

The law is evident in the row of second D., while the fourth obviously vanish. It is apparent, then, that given any term and the corresponding differences, the other terms can be calculated.

Differen'tial, in music, is a third note produced when any two tones are sounded simultaneously. Its pitch is that corresponding to the *difference between the number of vibrations* of the two primaries. The D. has an important effect on the consonance of certain intervals. See Consonance.

Differential Calcu'lus. See Calculus.

Differential Equa'tions are equations in which differential coëfficients of the variable quantities enter. They are divided into two classes, *ordinary* and *partial*—the former having only one independent variable, the latter more than one. D. E. are also distinguished by their *order* and *degree* —the order being that of the highest differential coëfficient present, and the degree corresponding to the highest power to which any differential coëfficient is raised.

Differential Thermometer. See Thermometer.

Diffrac'tion, or, according to Newton, *Inflexion,* is an optical phenomenon which takes place when a ray of light passes very close to an opaque body. It was first observed by Grimaldi, and much studied by Newton, who supposed it to be due to a kind of molecular force subsisting between the opaque body and the light corpuscles. Let a narrow beam of sunlight, entering a darkened room, fall upon a plate which is perforated by an exceedingly small hole or slit. If the light transmitted through this minute aperture be received upon a white wall or sheet, the small light-spot will be surrounded by several concentric rings of coloured light with intermediate rings of darkness. The experiment may be varied so as to present most startling and beautiful phenomena, all of which, however, can be explained upon the undulatory theory of light with a simplicity almost inconceivable. D. is, in fact, a case of Interference (q.v.). If a small opaque disk be interposed in a beam of sunlight, the shadow cast is found to have a small bright spot in the centre. This is another case of D.; and a general idea of the manner in which it is explained may be got from a consideration of the effect an obstacle has upon a wave travelling along the surface of a sheet of water. Where the crests of the two halves so formed meet, a larger wave will be produced, but where crest meets hollow, there will be no wave apparent; and darkness is the absence of that undulatory motion which constitutes light. The complete explanation requires the aid of higher mathematics, for which we refer to Fresnel's memoir before the Academy of Sciences *Sur la D. de la Lumière* (1826). A *D.-grating* is a transparent surface ruled with numerous lines, so close that they cannot be singly observed. By means of such an apparatus a series of most perfect spectra is obtained when a beam of sunlight, transmitted through it, is received upon a screen. These spectra are free from the objection which holds for prismatic spectra, that the violet portion is too much extended. Further, it is easily demonstrable, upon the principles of interference, that the distance of any portion of the spectrum from that point on the screen which is in the same line with the sunbeam and the centre of the grating, is proportional to the wave-length of the light at that part of the spectrum. This greatly increases the value of such gratings, which are, however, exceedingly scarce.

Diffu'sion, the gradual intermingling of two liquids or gases. If over a strong and coloured saline solution, such as sulphate of copper, or bichromate of potash, water be poured gently so as not to disturb the solution, the process of D. will become very apparent. For measuring the rate of D., however, this method is not sufficiently exact. Sir William Thomson employed a number of glass beads, whose specific gravities were different, but all intermediate between those of the two liquids. As D. goes on, the beads gradually separate, and indicate by their positions the specific gravity at any depth of the solution. Another method adopted by the same physicist was to measure the refractive indices of the various layers of the diffusing liquids. There are many pairs of liquids, such as water and oil, which do not mix, and therefore do not diffuse, and there are others in which the D. is only partial, the final result being the lighter liquid mixed with a small proportion of the heavier floating upon, and distinctly marked off from, the heavier liquid, mixed with a small proportion of the lighter. This is the case with ether and water.

Every gas is capable of D. into every other gas—a fact first remarked by Priestley. Graham, who investigated the phenomenon thoroughly, has shown that the rate, at which the D. of any substance goes on, is proportional to the rate of variation of the strength of that substance in the fluid as we pass along in the direction of the D.; exactly the law which holds for conduction of heat and electricity. He also deduced from his experiments that the rates of D. of two gases are inversely proportional to the square roots of their densities—the lightest diffusing most rapidly. If a porous solid be intercepted between the two gases, D. takes place, according to Graham, in the same way that it would have done if there had been no septum present; Bunsen, however, regards the phenomenon as dependent upon capillarity, and doubts the truth of Graham's law of densities. There is another class of cases, differing from the last in the fact that the diaphragm is not in the ordinary sense porous. Thus, if a soap-bubble be blown with carbonic acid gas, the gas is continually passing through—being absorbed on the interior surface, passed in a state of solution through the film, and given off at the exterior surface. Hydrogen and other gases behave similarly with respect to caoutchouc; but their rates of passage have no connection with those of ordinary D., being rather a chemical than a mechanical action.

Graham distinguished what he called *colloïd* and *crystalloïd* substances; the former being capable of uniting temporarily and loosely in various proportions with other substances, the latter always combining in definite proportions. Glue is a *colloïd* body, forming a jelly with various proportions of water; salts are *crystalloïd*. They are easily distinguished by the difficulty with which all colloïd bodies diffuse through a porous solid, crystalloïds diffusing with ease. If a colloïd substance be combined with some liquid or crystalloïd solution in different proportions throughout its mass, D. takes place through the colloïd body till the structure is homogeneous—an interesting analogy to the tendency which an unequally heated body has to come to a uniform temperature. It is on this theory that Graham explains the passage of hydrogen through iron and palladium at a high temperature, the metals acting, with respect to the gas, as colloïd substances. See Graham's *Memoirs* in the *Philosophical Transactions* prior to 1851, Graham's *Chemistry*, Bunsen's *Gasometry*, translated by Roscoe, and Clerk Maxwell's *Theory of Heat*.

Digamma, a letter once occupying the sixth place in the Greek alphabet, which gradually fell into entire disuse. It was called D., *i.e.*, double gamma, from its resemblance to two gammas placed one on the other, Ϝ Ϝ. The D. existed in the time of Homer, but is not found written in any extant copy. In pronunciation it answered to the English *v*. The manner of its disappearance may be illustrated by a comparison of the Greek *aiōn*, *oinos*, with the Latin *ævum*, *vinum*.

Dig′by, a seaport in the Dominion of Canada, province of Nova Scotia, on the Bay of Fundy. It has an active industry in the curing of pilchards, which are prized on account of their flavour, and are known as *Digbies* in the fish trade. There are also valuable herring and mackerel fisheries, and some shipbuilding and lumbering. Pop. town 1381; district 19,897, of whom 9302 are Roman Catholics and 6233 are Baptists.

Digby, Sir Kenelm, the son of Sir Everard D., one of the men who suffered for participation in the Gunpowder Plot, was born 11th July, 1603, at Gayhurst, in Buckinghamshire. He distinguished himself at Oxford, and after two years' travel on the Continent, was knighted by James I. Charles I. appointed him to numerous offices, and in 1628 he sailed with a squadron to the Levant, where he defeated the Venetians. He also fought against the Algerines. Originally a Protestant, D. became, in 1636, a Roman Catholic. When the civil war commenced he was imprisoned as a Royalist, but was released in 1643. For a long time he resided and studied in France, returning to London in 1661, and dying there, 11th June, 1665. D., who was a learned man, and an adherent of what is known as 'the corpuscular philosophy,' was the author of numerous works, including *A Treatise of the Nature of Bodies*, an interpretation of *The Twenty-second Stanza in the Second Book of Spenser's Faerie Queene*, and *Two Treatises on the Nature of Bodies and of Man's Soule*. His private memoirs were published in 1827.

Di′gest, the name given to the Pandects of the civil or Roman law, as containing *Legalia præcepta excellenter digesta*. See CODE.

Diges′ter, Papin's, a strong metallic vessel, tightly fitted with a lid, and provided with a safety valve. It is used for subjecting bodies to a higher temperature than could be obtained by merely boiling water in the usual way; for the steam, being unable to escape, increases the pressure upon the water, the boiling-point of which is consequently raised.

Diges′tion. This is a term given to the processes by which the food is changed into a condition suitable for being absorbed into the blood-vessels or by the lacteals. During the course of D. the food is changed physically and chemically; it passes through various organs, and it is acted on by various juices. In the mouth the food is divided and comminuted by the teeth. It is mixed, at the same time, with the various fluids which compose the saliva. Having been reduced to a pulpy mass, it is, by the action of the tongue, passed backwards into the pharynx, and by the successive contractions of the muscles of the pharynx it is propelled into the œsophagus. This tube leads from the pharynx into the stomach, which is a receptacle for the food, and the cavity in which the chief digestive processes occur. In the stomach the food is subjected to three actions:—(1) to a triturating movement, effected by the contractions of the muscular walls of the stomach, by which it is thoroughly mixed with the juice, secreted by glands in the lining membrane of that organ and called the *gastric juice*; (2) to the chemical action of the gastric juice; and (3) to the influence of a temperature of about 100° F. The food is thus further reduced into a pultaceous or gruel-like mass called *chyme*, and as it is partly liquified, portions successively pass into the small intestine (see STOMACH), while the larger masses are left behind in the stomach to be further acted upon. In the small intestine (see INTESTINE), which is about 15 to 20 feet in length, the chyme is mixed, as it is slowly propelled along the bowel, with—(1) the intestinal juice; (2) the bile; and (3) the pancreatic juice. By these juices certain of the constituents of the food are further acted upon, and the alimentary matters, thus liquified and prepared, are gradually absorbed by the blood-vessels of the intestinal mucous membrane and by the lacteals, and become *chyle*. The indigestible portion of the food is passed by the muscular action of the walls of the small intestine (see PERISTALTIC ACTION) into the large intestine, from which, with certain refuse or excrementitious substances, it is expelled by the act of defæcation.

The action of the various digestive fluids on the proximate constituents of food may here be briefly summarised, while reference is made, as to the structure of the various organs and as to the composition of the various fluids, to the following headings:—MOUTH, PHARYNX, DEGLUTITION, ŒSOPHAGUS, STOMACH, GASTRIC JUICE, INTESTINE, LIVER, SALIVA, and PANCREAS. Five digestive fluids act on the food:—

(1.) *Saliva*, which converts starch into sugar, and assists in Deglutition or Swallowing (q.v.).

(2.) *Gastric juice*, which acts on the albuminous matters, converting them into *Peptones* (q.v.), or soluble modifications of albumen.

(3.) *Bile*, which separates the refuse from the nutritious matter of the chyme, neutralises any excessive acidity of the chyme caused by the gastric juice, aids in the absorption of fat by covering the surface of the mucous membrane with an alkaline fluid, stimulates the peristaltic action of the bowels, and arrests putrefactive changes. See BILE, LIVER.

(4.) *Pancreatic juice*, which emulsionises fatty matter, splits up certain fats into glycerine and the corresponding fatty acid, converts starchy matter into sugar, and converts peptones into two substances called Leucine and Tyrosine (q.v.), which are then absorbed and taken to the liver.

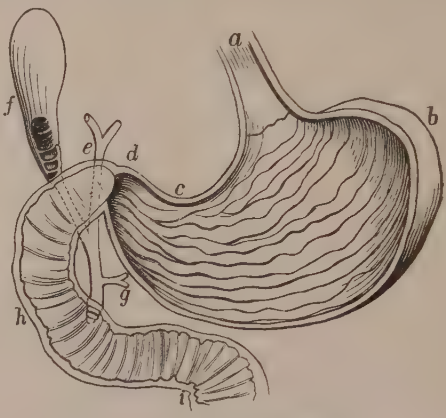
(5.) *Intestinal juice*, which, so far as is known, combines the actions of all the other juices, and acts on the albuminous, starchy, and fatty principles.

The conditions favourable for good D. in the stomach are—(1) a temperature of about 100° F.; (2) constant movement of the walls, which brings in succession every part of the food in contact with the mucous membrane and gastric juice; (3) the removal of such portions as have been fully digested, so that what remains undigested may be brought more completely into contact with the solvent fluid; and (4) a state of softness and minute division of the aliment.

According to the celebrated experiments of Dr. Beaumont upon St. Martin, a Canadian, who, on 6th June, 1822, met with a severe gunshot injury, the result of which was a permanent fistula or opening into the stomach, the rapidity of D. varies according as the food is more minutely divided, whereby the extent of surface with which the gastric fluid can come in contact with it is proportionately increased. Liquid substances are for the most part absorbed by the vessels of the stomach at once, and any solid matter suspended in the liquid, as in soup, are concentrated into a thicker material before the gastric juice acts upon them. A full meal, consisting of animal and vegetable substances, may be converted into chyme in about an hour, and the stomach may be left empty in two and a half. Rice and tripe, in St. Martin's case, were digested in about 1 hour; eggs, salmon, trout, venison, and apples, in 1½ hours; tapioca, barley, milk, liver, and white fish, in 2 hours; turkey, lamb, and pork, in 2½ hours; beef, mutton, and fowls, in 3½ hours; and veal in about 4 hours. The following circumstances no doubt also affect D.:—(1) the quantity of food taken—the stomach should be moderately filled, but not distended; (2) the time which has elapsed since the last meal, which should be always long enough for the food of one meal to have completely left the stomach before more is introduced; (3) the amount of exercise previous and subsequent to a meal, gentle exercise being favourable and over-exertion injurious to D.; (4) the state of mind, tranquillity of temper being usually essential to quick and due D.; (5) the bodily health; (6) the state of the weather; (7) the period of life, D. being more active in the young than in the old.

The quantity of digestive fluids secreted daily, according to the estimates of Bidder and Schmidt, which are probably (with the exception of the last two) at least 25 per cent. too high, is, in pounds avoirdupois:—Saliva, 3·5; bile, 3·5; gastric juice, 14·1; pancreatic juice, 0·44; intestinal, 0·44.

The survey of the digestive functions throughout the animal series leads us to contemplate very wide variations in the form and complexity of the assimilative apparatus. In the Protozoa (q.v.), or lowest animals, the bodies of which are composed of the simple albuminous substance known as Sarcode or Protoplasm (q.v.), food particles are taken into the interior of the body, and are there digested amid the protoplasmic substance. This substance, therefore, constituting of itself a living being, assumes the functions of a digestive system. Even in these lower animals, an essential difference from plants may be perceived in the process of D., in that they receive their nutritive matters within their bodies, and digest them internally, whilst in plants the process of nutrition goes on in the external surfaces and outer tissues of the organisms. Some of the protozoa (*e.g.*, *Gregarinæ*), and some more highly organised animals also (*e.g.*, tapeworms), live by simple imbibition—that is, by simply absorbing the fluids on which they subsist. And in such forms no distinct or specialised mouth, stomach, or other digestive apparatus exists. In none of the protozoa, except in the Infusorial (q.v.) animalcules, does a mouth exist; and in the latter no digestive system is specialised, food being digested by the protoplasm of which the body is composed. In the Cœlenterate animals (represented by the hydræ, zoophytes, corals, &c.), a stomach-sac may be wanting, as in all Hydrozoa, and food is digested simply within the general cavity of the body. But in the sea-anemones and other actinozoa a distinct stomach-sac is specialised, although this latter structure is open inferiorly, and communicates thus with the body-cavity. Tentacles are also now found, by means of which the food is drawn towards the mouth-opening, which is always developed. In Annuloida or echinozoal animals (such as sea-urchins, starfishes, sea-cucumbers, &c.), a perfect digestive system is usually to be found, although, as in the tapeworms, already noticed, a digestive apparatus may be wanting, possibly in consequence of their degraded condition as internal parasites. In Annulosa (such as worms) the digestive system is of tolerably perfect structure, and when we advance to the higher members of the latter sub-kingdom (such as insects, spiders, crustacea, &c.), we find not only a perfect digestive apparatus, but many supplementary organs in addition. In insects, a crop and gizzard, stomach, intestine, biliary or liver tubes are found, with a heart and blood-vessels for the circulation of the nutritive fluid. In higher crustacea, such as lobsters, &c., the digestive structures become still further specialised, the liver especially becoming better developed. In Mollusca (such as cuttlefishes, snails, oysters, &c.), salivary glands, teeth-like structures for the trituration of the food, and a large liver exist. In Vertebrata, and among fishes representing the lowest group of the class, the digestive system may include not only a mouth, teeth, stomach, and intestine, but also a liver, pancreas or sweetbread, and other structures. In Amphibia (q.v.) a spleen is also present, and in reptiles some further specialisation exists. In birds no teeth are developed; but a gullet, crop, gizzard, and proventriculus or true stomach, together with an intestine, intestinal cæca, liver, pancreas, spleen, and other glands are found.



The Stomach laid open behind.

a, the œsophagus; *b*, the cardiac dilatation; *c*, the lesser curvature; *d*, the pylorus; *e*, the biliary duct; *f*, the gall-bladder; *g*, the pancreatic duct, opening in common with the cystic duct opposite *h*; *h*, *i*, the duodenum.

It may be noted that vertebrates differ from all lower animals in possessing a distinctly developed lacteal or Absorbent System, that is, a special system of vessels, the function of which is to receive the products of D. from the digestive canal and transfer them to the blood system, where they mingle with the current of the circulation and thus repair the bodily waste. And as a rule of the most universal character throughout the entire animal series, it may also be remembered that the digestive system of an animal feeding upon plants or vegetable food is longer and of more complicated nature than that of an animal feeding upon flesh. The contrast between the digestive systems of a grain-eating and a flesh-eating bird in this respect is seen to be very marked; and the contrast is equally well observed in the difference between the digestive system of the larval frog or tadpole and that of the carnivorous adult frog.

In mammalia broad variations in the form and complexity of the digestive systems are noticeable. In some the system is comparatively simple, whilst in others—as in some marsupials, but most notably in the case of the ruminants (sheep, oxen, &c.), or those that 'chew the cud'—the stomach evinces a highly complex nature. The structure of the ruminant digestive system will be noted under the head of Ruminant (q.v.) and Rumination (q.v.). Variations exist in the mammalian digestive organs chiefly in the relative length of the intestinal canal, in the nature and number of the teeth, in the development of the tongue and other appendages, and in the glands connected with the system.

Dig'it (Lat. *digitus*, 'the finger'), in arithmetic, the name given to each of the symbols, 0, 1, 2, 3, &c., to 9; in astronomy, the twelfth part of the diameter of the sun or moon. In anatomy the name is applied to the fingers and toes of the *Vertebrata*.

Digital'ine is the active principle of the common foxglove. It is colourless, crystalline, and sparingly soluble in water; dissolves more readily in alcohol and ether, and is very bitter and poisonous. Considerable doubt exists as to its true chemical composition. It belongs, however, to the class of bodies called Glucosides (q.v.), for when boiled with dilute acids it takes up water and splits into Glucose (q.v.) and other products. D. is a valuable medicine.

Digita'lis, a genus of plants of the natural order *Scrophulariaceæ*. They are biennials or perennials, with erect stems and large showy flowers in long one-sided racemes. They are natives chiefly of Europe and the N. of Asia. D. is often cultivated in gardens, especially the yellow *D. grandiflora*. Only one species is native in Britain—*D. purpurea*, the common purple foxglove. It grows from 2 to 4 feet high, with beautiful flowers spotted inside. It occurs in dry hilly places, roadsides, and plantations. It abounds in Western and Central Europe, and extends as far as Scandinavia. The *leaves* of *D. purpurea* are used in medicine. They are collected from wild plants in Britain when about two-thirds of the flowers are expanded. They are used as powder, tincture, and infusion. In large doses D. is an irritant poison, and in small doses it depresses the heart's action. It is a valuable medicine in certain kinds of heart-disease, and very specially in dropsies depending on heart-disease; but being cumulative in its action, it should be administered with great caution. Its active principle is Digitaline (q.v.).

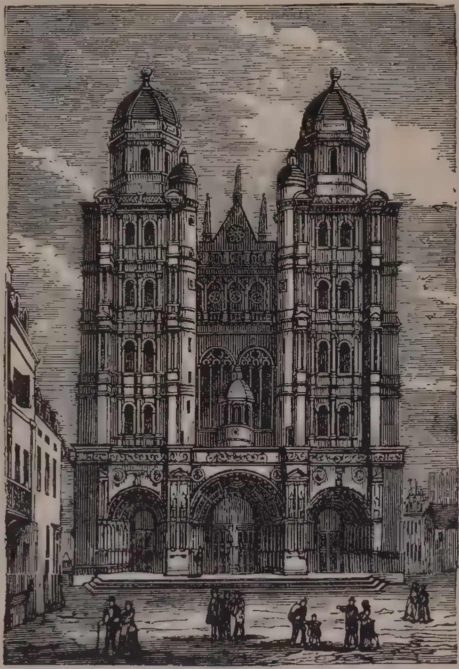
Digitalis.

Digitigra'da ('toe-walkers'), the name applied to that section of the mammalian order of *Carnivora* of which the included members walk on the tips of their toes, the heel being raised from off the ground. Examples of such forms are found in the *Felidæ* (tigers, lions, cats), *Canidæ* (dogs, wolves, &c.), &c. Some forms (*e.g.*, *Mustelidæ* or weasels) are termed *semi-plantigrada*, since they apply only part of the sole to the ground in walking; whilst the bears are wholly *Plantigrade*, and apply the entire sole of the foot to the ground.

Digne, the capital of the department Basses-Alpes, in a wild mountain gorge on the left bank of the Bléone, 45 miles N.E. of Nice. It is surrounded by walls flanked with towers, is the seat of a bishop (since 340), of a Communal college, and of a theological seminary, and has manufactures of woollens, colours, hosiery, &c., and an active trade in dried fruits, wine, honey, wax, and cutlery. In the vicinity is the beautiful Castle of Malijay, and the village *Les Mées* (pop. 1993), where a pleasant wine resembling champagne is made. D. is the Roman *Dinia* (probably from the Cymr. *din*, 'a fortified height'; cognate with the Gael. *dun*), and was the capital of the Bodiontici, but has no antiquities. Napoleon issued at D. his proclamation of 4th March, 1815. Pop. commune 7261; arrond. 43,208.

Di'hong, or **Dihang**, the name of a part of the Dzangbo or Machang Sanpo, chief tributary of the Brahmaputra. It forms the portion between Tibet and the confluence with the great river in Assam. Some 15 miles E. is the Dibong, the lower part of the Kempu, another branch of the Brahmaputra.

Di'jon, the capital of the department Côte d'Or, France, in the valley of the Suzon, where it is joined by the Ouche, 195 miles S.E. of Paris by railway. It lies near the base of the vine-clad Mont-Afrique, at the N.E. end of the Côte d'Or range, and has gardens, promenades, and tree-shaded ramparts, which make it one of the finest towns of France. The chief buildings are the Cathedral of St. Bénigne, rebuilt for the third time at the end of the 12th c., and having a graceful spire 300 feet high; the church of Notre Dame, pronounced by Viollet-le-Duc the finest Burgundian building of the 13th c.; that of St. Michael, in which the external details are Grecian and the interior pure Gothic; the town hall, formerly the palace of the Dukes of Burgundy, and containing in its magnificent saloons a rare collection of scientific and art subjects, and a valuable library of 50,000 volumes.



Cathedral of Dijon.

The seat of a celebrated academy and of various educational institutions, D. has also manufactures of woollen cloths, blankets, glue, mustard, beer, baskets, iron, saltpetre, &c., and a trade in grain, wine, oil, and wool to the value of seventy million francs yearly. During the Roman invasion a village on the slope of Mont-Afrique was occupied by Cæsar as a camp, and fortified, receiving the name of *Dibio*, or *Dibis-dunum* (Celt. 'the fort on the two waters'). It subsequently prospered, and in the Middle Ages became the capital of Burgundy. The Germans besieged D. on the 31st October, 1870, after which it capitulated, and was for a time the head-quarters of Werder. A struggle between Manteuffel and the armies of Bourbaki and Garibaldi took place in the vicinity, 21st to 23rd January, 1871. Pop. town 65,428; arrond. 163,966.

Dik'owa, or **Dikoa,** a town of the Sudan, in the kingdom of Bornu, 60 miles S. of Kuka, and 30 of Lake Tchad. It is the centre of a great cotton-field, and carries on extensive cotton manufactures. Pop. 12,050.

Dilapida'tion, in English law, when an incumbent allows the chancel, parsonage, or outhouses to decay, or pulls down any building, or destroys trees, belonging to his benefice, he is subject to an action for D. at the instance of his successor. But an incumbent is not bound to maintain painting, papering, or other ornament. Under the Ecclesiastical Dilapidations Acts of 1871 and 1872, surveyors of D. are appointed for each diocese, who are to inspect buildings and report to the bishop. If the incumbent refuse or neglect to repair in accordance with the report, the bishop may sequestrate the revenues of the benefice for the purpose. When the works are executed, the incumbent is protected from further liability for five years. The Act provides for fire insurance, &c. A successor can proceed against his predecessor, or, if dead, against his executors, or against an alienee, if the benefice had been passed to avoid the charge of dilapidations.

Dil'atory Defence', a term of Scotch law for a plea for avoiding the conclusions of an action without entering on its merits, such as the pursuer's want of title.

Dilemm'a is in logic an argument presenting two or more alternatives, each of which is fatal to the opposite argument. Any position which presents a choice of evils is spoken of as a D. The popular equivalent is a *fix*.

Dilettan'te (Ital. pl. *dilettanti*, Lat. *diligentes* or the post-classical *dilectores*), a term used in England, France, and Germany to denote an amateur, primarily of music, but afterwards of the kindred arts. The name first meant 'a lover of art'; it was then applied to one who dabbled in art; and has lastly become a depreciatory term conveying the notion of a shallow critic or trifling virtuoso.

Dilettanti Society, The, was founded in 1734 by a gentleman who had travelled in Italy. It met at the Thatched House Tavern in St. James's Street, at first merely for informal talk on the subject of art. In 1764, however, the society's funds having increased, its members, who were about sixty in number, sent out an expedition to Greece. The monuments of ancient times were examined, and the enterprise bore rich fruit in two volumes on the *Antiquities of Ionia*. A second expedition was despatched to Asia Minor in 1811, which resulted in two works, *The Unedited Antiquities of Attica* (1817) and *Antique Sculpture* (1835). This society, by its liberality and judiciousness, did much to elevate and correct the public taste.

Dil'igence, a term of Scotch law, used in three unconnected meanings:—1. In its ordinary sense, as indicating the care which the law requires every one to bestow on the subject of a contract. (See CRIME, CULPA, DOLE.) 2. It means the warrant of a court to enforce attendance of witnesses or production of writings. 3. The term is applied to the process of law by which persons, lands, or effects are attached in execution of Sentences and Decrees (q.v.), or in security of debt. In the second sense, the English general equivalent term is *Subpœna* (q.v.).

Diligence. In France a stage-coach is called *La D.* It has generally three divisions—the *coupé*, the *intérieur*, and the *rotonde* or *banquette*. In booking, a receipt should be taken. As with ourselves, the system of diligences has been almost superseded by that of railways. In Scotland, the word was, in former times, used to denote a stage-coach. Every one will remember the celebrated *Hawes Fly* or *Queensferry D.* of *The Antiquary*. In Spain, *La Diligentia*—the name one would suppose being satirically bestowed—still flourishes; but no one who dislikes dirt, vermin, and the smell of garlic should travel by D. in Spain. Owing to the 'poverty' of the horses, the ordinary Spanish D. is drawn by 7 horses or more, as many as 11 being sometimes harnessed together—an odd number is usually preferred. While one man holds the reins, another, armed with a long-thonged, short-handled whip, extends the team by dragging the three leaders as far as he can from the D. along the road in the direction to be taken. Then, at a signal from his companion, he brings his thong smartly down on the backs of the leaders, which start off at a gallop, followed by the remaining pairs. As each pair passes the whipper, they receive their fair share of 'persuasion,' and as the D. at length rolls by, the man leaps upon the box, and joins the driver in shouts of 'Anda! Anda!' The gallop gradually decreases to a trot, the trot to a walk, and eventually the team pulls up; whereupon the same programme is repeated again and again until the next posting-house or the final destination is reached.

Dilke, Charles Wentworth, a well-known English critic and journalist, was born 8th December, 1789, served in the Navy Pay-Office, took to literature, contributed to the *Westminster Review*, &c., became (1830) editor and proprietor of the *Athenæum*, and established the *Daily News* in 1846. He edited *Old English Plays* (Lond. 1814), wrote ably on Junius and other curious questions of literary history, and died at Alice Holt, Hampshire, 10th August, 1864. See *The Papers of a Critic, Selected from the Writings of the late C. W. D., with a Biographical Sketch by his Grandson* (Murray, 1875), containing original letters from Charles Lamb, Keats, Hood, Haydon, Lord Lytton, Dickens, Savage Landor, &c.—**Sir Charles Wentworth D.,** eldest son of the former, was born in London, 18th February, 1810, studied at Westminster School and Cambridge, and was one of the active originators of the Industrial Exhibition of 1851. A member of the Society of Arts from 1844, he received a baronetcy in 1862. He died at St. Petersburg, 10th May, 1869.—His son, **Sir Charles Wentworth D., The Right Hon.,** was born at Chelsea, 4th September, 1843, graduated at Cambridge in 1866, and travelled round the world, giving his experiences in *Greater Britain*. He was elected for Chelsea in 1868, and re-elected in 1880, when he became Under Sec. for Foreign Affairs (April, 1880, to December, 1882), and President of Local Government Board (December, 1882, to June, 1885); but being defeated at the Chelsea election in 1886, he withdrew for a time from public life. He was, however, returned to Parliament as member for the Forest of Dean Division of Gloucestershire on 15th July, 1892, and again at the general election in 1895. He is a Liberal Home Ruler.

Dill, a genus of Umbelliferous plants. The common D., a common plant of the Cape of Good Hope, Egypt, the Mediterranean countries, &c., is aromatic, and used as a flavouring material for pickles, sauces, &c., while the seeds, or rather fruits, are used as a remedy for flatulence, and to alleviate the painful effects of purgative medicines on infants, in the form of *D.-water*. Sowa D. of Bengal produces a fruit much used as an ingredient in curries. It is believed to be the 'anise seed' of the New Testament.

Dillenia'ceæ, a natural order of Dicotyledonous plants, allied to *Ranunculaceæ* (q.v.), natives principally of Australia, India, and equinoctial America. Above 230 species and 30 genera are known. Of these, *Dillenia*, *Candollea*, and *Tetracera* are examples. Most are astringent, and are used for applying to wounds, and, in Brazil, for tanning. The acid calyces of some species of *Dillenia* (*D. scabrella*, and *D. speciosa*), owing to their acid taste, form in India an ingredient in curries. The acid fruit of *D. speciosa* is eaten with sugar, and the juice mixed with water is in favour as a cooling drink in fevers. A decoction of the leaves *D. retusa* is employed in Ceylon for cleansing ulcers. The wood of some trees of the same genus (*D. pentagyna*, &c.) is also very hard and durable. Some species are also cultivated for the sake of their evergreen foliage and beautiful flowers.

Dill.

Dilman′, a town in the province of Azerbijan, Persia, 50 miles N.N.W. of Urumiyah, in the fertile plain of Selmas, and surrounded by gardens. The streets are clean, but the bazaars are ill supplied. Pop. 5280. Four miles distant from D. are the ruins of the old town of D.

Dilo′lo, Lake, in the interior of S. Africa, on the frontier between Lobale and Usamba, about 20 miles S.W. of Katema, is an expansion of the Liba, a branch of the Zambesi, and is 10 miles long, and has an extreme breadth of 4 miles. It was discovered by Livingstone in 1856. See his *Missionary Travels and Researches in South Africa.*

Dil′uents (from Lat. *diluo*, 'I wash away') are medicines which increase the watery portion of the blood, and render the secretions and excretions less acrid and viscid. The best diluent is water.

Dilu′vium (Lat. 'a washing away'), the name given in geology to such superficial accumulations of debris or matter as may have resulted from the wearing action of rivers, or been deposited on a land surface by the action of water. The muddy sediment left on land by the overflowing of a river is a *diluvial* deposit in this sense—the only one in which the term can be applied in modern geological science. Formerly the term *diluvial deposits* was given by the advocates of the 'diluvial' or 'flood' theory to collections of matter which they believed had been left by the flood of Noah—a flood credited by them with the power of having caused all recent events in the history of the world.

Dime′ (Fr. originally *disme*, from Lat. *decima*, 'tenth'), the tenth part of an American dollar; but, as in the case of the French *décime* (of which the name is merely a doublet), used but little in commercial life.

Dimen′sion (Lat. *dimensio*, 'a measuring'), in geometry, a line is of one D., a surface of two—length and breadth—and a solid of three. Thus also space is of three dimensions, three numbers being necessary and sufficient to fix the position of a point in space. The *dimensions* of an algebraic expression is obtained by taking the algebraic sum of the indices of the factors which enter.

Dimidia′tion (Lat. *dimidiatio*, 'a halving'), in heraldry, a mode of impalement in marshalling coats of arms, which was introduced as early as the beginning of the 14th c. It consists in cutting two shields by a vertical line through the fess-point, placing together the dexter half of the one and the sinister half of the other, and thus forming a new composition. But extraordinary effects were often produced by D., one of which is seen on the seal of the Cinque Ports—the sterns of the ships and the fore parts of the leopards showing unheard-of monsters. Impalement by complete coats of arms instead of halves has superseded D. in English heraldry.

Diminuen′do (in music). See DECRESCENDO.

Dimin′utives, words which convey the idea of diminution or of smallness compared with the meaning of the words whence they are derived. D. may be formed by adding a letter or letters, as *ie*, a diminutive termination now almost confined to Lowland Scotch, in *lassie, mousie, boatie;* or as *ock* in *hillock;* *kin* in *mannikin* and *lambkin* (comp. Ger. *chen*, as *mädchen*); *en* in *kitten;* *l* in *tiercel*, a small hawk, from *tierce.* The diminutive termination *ling*, as in *darling*, 'little dear,' was at first an Old English patronymic—thus in the Old English Bible Elisha's son is *Elising* (Latham)—and from signifying relationship, came to denote endearment, youth, or littleness. The ending *et*, as in *trumpet*, is of classical origin, and in the ending *let*, the *l* is German, and the *t* either English, as in *gimlet*, or French, as in *ringlet.* D. may also be formed by changing a vowel, *e.g.*, *top*, *tip.* D. frequently convey the idea of endearment, but also of contempt, as in *hireling*, *witling*, *lordling.* Adjectives as well as nouns can become D., as *whitish*, *greenish.* In Latin, D. end always in *lus*, *la*, or *lum*. They are common in all languages, the modern German and Tuscan being especially rich in them.

Dim′ity, a cotton fabric used principally for bed furniture, &c., said to owe its name from having been originally a manufacture of Damietta in Egypt.

Dimor′phism. Of late years, chiefly owing to the observations of Charles Darwin, it has been discovered that in several plants belonging to different orders two forms are found, the one form having long stamens and a short pistil, the other a long pistil and short stamens, and with different sized pollen-grains, but differing in no appreciable way. Such plants are called *Dimorphic.* The common primrose is an example. These two forms act towards each other almost exactly as if they were separate species, instead of merely forms of the same species, with no difference appreciable to the ordinary observer. In such a case, the pollen of the long-stamened form must be carried attached to the bodies of insects to fertilise the long-pistilled form, and that of the short-stamened form to fertilise the short-pistilled form; otherwise it acts like so much inert dust. The object of this and similar arrangements for cross fertilisation seems to be to prevent too close interbreeding. See also FERTILISATION and TRIMORPHISM.

Dimor′phous Bodies are those which crystallise in two distinct forms—that is to say, in forms belonging to different crystalline systems. (See CRYSTALLOGRAPHY.) Sulphur furnishes an excellent instance of dimorphism. Native sulphur (*i.e.*, sulphur occurring in the free state in nature) is found in octohedral crystals belonging to the rhombic system, and where crystals can be obtained artificially by allowing a solution of sulphur in bisulphate of carbon to evaporate spontaneously. But if sulphur be fused, and then allowed to cool slowly, it crystallises in quite a different shape. This second modification of sulphur is easily obtained by fusing a few pounds of sulphur in a dish, allowing the fused mass to cool until a crust forms on its surface, and then perforating the crust with two holes, through one of which the sulphur still remaining fluid is poured away, whilst the other serves to admit air. When all the fluid portions have been poured off, the dish is broken, and it will then be found that its surface is covered with a cake of solid sulphur from which transparent amber-coloured needles jut out. These needles are oblique prisms. Carbonate of lime is another D. body. It occurs in nature as two distinct minerals, viz., *arragonite* and *calc spar*, or *Iceland spar.* The crystals of arragonite are ortho-rhombic prisms; those of Iceland spar, rhombs.

Dinagepore′, or **Dinájpur,** a town of British India, province of Bengal, capital of the district of the same name, 261 miles N. of Calcutta. Pop. 12,204. It is a poor place, the houses being for the most part mere huts. The *district* of D. has an area of 4118 sq. miles. Pop. 1,555,835, of whom 740,442 are Hindus; 41 Brahmos; 802,597 Mohammedans; 103 Jains; 511 Christians; and 10,694 Animistic. Much area is occupied by *sola* woods, which produce only poor timber, and jungles, from which the people obtain beeswax and vegetable drugs and dyes. Big game abound as well as deer and hogs. Birds and fish are excellent sport, and most palatable food. Great quantities of cattle are raised. Chief crops are rice, maize, pulse, sugar-cane, tobacco, and jute. Neither drought nor flood ever visits the district. Scarcely any manufacture exists, as nearly all the people are agriculturists. Gunny cloths and wild grass fabric are made. Education has spread considerably, and there are now close on 500 elementary schools.

Din'an (from Cymr. *din*, 'a fortress'), a town in the department of Côtes-du-Nord, France, on the Rance, 14 miles S. of St. Malo, on the summit of a steep hill, upwards of 200 feet above the river, and surrounded by high old walls. The older streets are narrow and filthy, and many of the houses are built of wood. The most noteworthy edifice is the cathedral of St. Sauveur, an ornate Gothic edifice with a fine spire. D. has manufactures of linen, cotton, and woollen goods, nails, beetroot-sugar, &c., and some tanneries, salt-refineries, and barge-building yards. It has a good coasting and inland trade. In the neighbourhood are favourite chalybeate springs. Pop. town 10,444; arrond. 121,232.

Dinant' (Cymr. 'the fort on the stream'), a town in the province of Namur, Belgium, on the Maas, 14 miles S. of Namur. The principal buildings are the citadel, occupying the summit of a lofty pyramidal limestone rock, the Church of Notre Dame, and the Hôtel de Ville, formerly the palace of the Princes of Liége. There are manufactures of hats, woollen stuffs, stained paper, cutlery, &c., besides tanneries, breweries, soap-works, salt-refineries, and mills for sawing marble. D. is famous for its gingerbread. The town, which dates from the 6th c., was strongly fortified as early as the 12th c. Pop. commune 7048; arrond. 90,005.

Dinapore', or **Dinapur** (*Dánápur*), a town and military station in British India, headquarters of district of Patna, on the right bank of the Ganges, about 12 miles N.W. of Patna. Pop. of D. 44,419. In the mutiny of 1857 three native regiments here rose against their officers, and in spite of the presence of a European force, were allowed to withdraw from the cantonment with comparative impunity. A detachment, however, was sent from D. to help in the defence of the neighbouring Arrah, and failed disastrously, in spite of the bravery of our men. Two Europeans received the Victoria Cross for their acts of heroism before the enemy.

Dinar'ic Alps, the easterly range of the Central European system, extending along the Adriatic coast. It forms a southern continuation of the Julian Alps, and separates Bosnia and Herzegovina from the Austrian coast lands. It is some 230 miles long from Fiume to the river Narenta, and has few heights of more than 7000 feet.

Dindigal' (*Dindúkal*, 'rock of Dindu,' a demon), a town in British India, province of Madras, district of Madura, 247 miles S.W. of the city of Madras. It is neatly built, and the bazaar, which is well supplied, is lined with trees on both sides. The fort, on a rocky elevation, 280 feet high, is supplied with water from a well on the rock of enormous depth. Principal products of the district around are hides, tobacco, coffee, and cardamoms. Silks and muslins are made here, and formerly a famous blanket, called 'Carumba,' from the wool used. Hyder Ali used D. as a fortress to oppose the advance of the British, who took it, lost it, and acquired it finally by treaty in 1792. Pop. 20,203—14,589 Hindus, 2251 Mohammedans, and 3363 Christians.

Ding'elstedt, Franz von, a German poet and novelist, born 30th June, 1814, at Halsdorf, near Marburg, studied at Marburg, and was for some time teacher in the Gymnasium at Fulda. In 1843 he was appointed librarian and reader to the King of Würtemberg, in 1850 manager of the Court Theatre at Munich, in 1857 general superintendent of the same at Weimar, in 1867 director of the Court Opera at Vienna, and in 1871 of the City Theatre there. Delicacy of sentiment, pictorial beauty, and epigrammatic terseness of reflection are D.'s most conspicuous merits. He died 15th May, 1881.

Din'gle (Gael. *Daingean-ui-Chuis*, 'the fort of O'Cush,' the ancient family of proprietors before the English), the most westerly town in Ireland, a seaport and favourite sea-bathing place, county of Kerry, on the N. side of the bay of the same name, 39 miles W.N.W. of Killarney. The harbour admits vessels of 300 tons. Some of the older houses are built in the Spanish style, which gives the town a pleasantly antique appearance. D. exports corn and butter to Liverpool, and imports iron, coal, salt and earthenware. Pop. town 930; parish 1601.

Din'go, in natural history, a species of dog indigenous to Australia. In appearance and disposition it much resembles the wolf. Its average height is a little less than 2 feet, and its average length 2½ feet. Its general colour is a reddish-brown. The tail is bushy, like that of a fox, though in a less degree. The D. is a ferocious animal, and works havoc among the flocks of the colonists, delighting in killing as many sheep as it can. It does not bark or growl, like other dogs, but erects its hair-like bristles when angry. It is capable of domestication, but being less trustworthy than the shepherd's dog, it is generally treated as a foe, and exterminated as fast as possible.

Ding'wall (Scand. 'hill of justice'; Gael. *Inverpeffer*, 'at the mouth of the Peffer'), a royal burgh and the capital of Ross-shire, Scotland, lies at the head of the Cromarty Firth, 18 miles S.W. of its mouth in the Moray Firth, and 17 N.W. of Inverness by railway. It has an antique appearance, is approachable to vessels of 9 feet draught, and has some export trade in wool and cattle. D. is portion of the Wick parliamentary district, and along with Tain, Dornoch, Wick, Kirkwall, and Cromarty, it returns one member to Parliament. The chief objects of historical interest are the traces of an old castle of the Ross family, and a conical hill supporting a vitrified fort, probably the 'hill of justice' from which D. originally took name. In the vicinity the village of Strathpeffer, nestling in a sheltered and picturesque valley, attracts large numbers of invalids to its chalybeate and sulphurous springs. Pop. town 2300; parl. burgh 2290.

Din'ka, a pastoral people of Central Africa, in the Upper Nile district, to the S. of the confluence of the Bahr-el-Ghazal and the White Nile, and occupying an area of from 60,000 to 70,000 sq. miles. They are one of the most extensive and unique of African races, peculiar alike for their cleanliness, their civilised tastes and pursuits, and their ferocity in war. Very dark in colour, they are taller than Englishmen, and have thick lips, contorted features, and shallow foreheads. Their hair is cut short, and is adorned with ostrich feathers, in imitation of the heron. No covering is worn except by the women, who are scrupulously clad, and who wear heavy iron rings on their wrists and ankles. Both sexes break off the lower incisors, a practice that renders their language inarticulate. The dwellings of the D. are conical, well-built huts, and are scattered in clusters over the cultivated plains. Nearly the whole of their vast territory is a steppe of dark alluvial clay, unbroken by a single hill, mass of rock, or large tract of forest. Of the cultivated plants the chief are sorghum, penicillaria, beans, earth-nuts (*archis*), earth-peas, sesame, yams, and Virginian tobacco. The domestic animals are the ox (of the zebu race), the sheep, goat, and dog. A village of a few huts has seldom less than 2000, and sometimes as many as 10,000 cattle. An estimate of the total number of cattle gives three for each inhabitant. The ox, which is never killed, is the object of exclusive, almost religious care. Whatever of religion the D. has, centres in an institution called the Cogyoor, which embraces a society of necromancers and jugglers. There is much tribal disturbance. Since about 1855 the various efforts of the Khartum slave dealers to subdue the Dinkas have completely failed, and it is even at some risk that parties venture through their territory to reach Bongo, Niam-Niam, Mittu, &c. All the early captives taken to Egypt were converted into soldiers. See Dr. Schweinfurth's *Heart of Africa*.

Dink′elsbühl, one of the oldest towns in the circle of Middle Franconia, kingdom of Bavaria, on the Wernitz, 20 miles S.W. of Ansbach, has large manufactures of hosiery, paperhangings, &c. It is defended by walls and towers, and has a large Catholic church and a handsome Protestant one. Fortified under Heinrich I., and created a free city of the empire in 1351, D. was greatly reduced during the Thirty Years' War, and has since suffered much from religious dissensions. Pop. town 4496; district 24,868.

Din′mont, the name given in Scotland to a wether or gelded hogg after its first fleece has been cut.

Dinor′nis (from the Gr. *deinos*, 'terrible,' and *ornis*, 'a bird'), in natural history, the name of a genus of extinct wingless birds of great size, whose remains are abundantly found in New Zealand. The D. was first brought under the notice of the scientific world by a paper read by Professor Owen in 1839 on the fragment of a shaft of a femur, 6 inches long. From this fragment Professor Owen deduced the former existence in New Zealand of a large bird combining some of the leading characteristics of the ostrich and the dodo, and subsequent discoveries have proved the general accuracy of his deductions. The D. is generally known in New Zealand, alike to the Maoris and the colonists, under the name of the Moa. Scientific examination of the bones discovered in different parts of the colony has resulted in the establishment of several distinct species. The largest of these, *D. giganteus*, must have been from 10 to 11 feet high; while the *D. didyformis* attained a height of 4 feet only. The leg-bones of the D. are of an exceedingly massive description, and the toes of *D. elephantopes* rival in this respect those of the elephant, whence its name. Deposits of D. bones have been found in many parts of New Zealand, but especially in the provinces of Otago and Canterbury. The most remarkable discoveries of this nature have been made in the Dunstan district of Otago and the Glenmark district of Canterbury. In caves in the former locality there has been found a neck with the skin and some of the feathers attached, as well as a thigh-bone with a large piece of the flesh adhering to it. In the same neighbourhood were also found, 50 feet below the surface, some D. feathers in an excellent state of preservation. They were of a chestnut-brown for the basal two-thirds, shading off into black, with white tips. A vexed controversy has arisen among naturalists as to the probable date of the extinction of the D. On the one hand it is claimed that the freshness and situation of the remains prove that the D. has not been extinct for more than a century; and on the other, that it was exterminated by a race of *autochthones*, prior to the arrival in New Zealand, 500 years ago, of the Maoris, who have no legends regarding it. That the D. was hunted and eaten by a savage race is proved by the discovery of bones and egg-shells, some of them charred, in old native cooking places, along with stone implements. Being a slow, ungainly bird, unable to fly, its means of escaping pursuit were small. The remains of a large species of D. have been found in the Leichhardt Downs, Queensland, 86 feet below the surface. Further particulars regarding the D. remains discovered in New Zealand will be found in the *Transactions of the New Zealand Institute*, vols. iv. and v.

Dinornis.

Dinosau′ria, or **Deinosauria** (Gr. 'terrible lizards'), an order of extinct Reptiles, distinguished by the variable nature of the skin-scales, by possessing teeth, by the development of two pairs of limbs adapted for walking, and by the absence of clavicles or 'collar-bones.' The pelvis approaches very nearly in its character to that of Cursorial or Running Birds. The order is represented by such forms as *Megalosaurus*, *Compsognathus* (q.v.), and *Iguanodon* (q.v.), the remains of which occur in Oolitic and Cretaceous strata.

Dinother′ium, or **Deinotherium** (Gr. 'terrible beast'), an extinct genus of *Proboscidea* or elephant-like mammalia, the fossil remains of which occur in Miocene formations of Europe and of India. *D. giganteum* is a familiar species. In the D., molar and præmolar teeth are developed, the upper jaw possessing no incisor or canine teeth. The lower jaw possessed two large tusks formed by the lower incisor teeth, these tusks being bent *downwards* and backwards, instead of upwards as in living elephants. These animals must have attained a very large size, and probably used their tusks for grubbing up the roots of the aquatic plants upon which they fed.

Dinotherium.

Di′ocesan Courts. See CONSISTORY and COMMISSARY.

Di′ocese (Fr. from Gr. *dioikēsis*, 'administration') is the territory of a bishop's ecclesiastical jurisdiction. England is divided ecclesiastically into two provinces—Canterbury and York—each of which is subdivided into dioceses; each D. is subdivided into archdeaconries, and each archdeaconry into parishes. Formerly there were in Scotland the Archbishop of St. Andrews, entitled *The Primate of All Scotland*, and the Archbishop of Glasgow, entitled *The Primate of Scotland*. Under them were twelve bishops, who each had a D. Scotland is now ecclesiastically divided into presbyteries. See PRESBYTERY. The largest diocese in connection with the Church of England, and, probably, the largest in the world, is that over which the Right Rev. W. H. Stirling presides. It consists of the Falkland Islands and all S. America, except British Guiana, and therefore covers 7,115,511 sq. miles. The diocese of Mackenzie River covers 600,000 sq. miles, but the number of persons connected with the Church of England does not exceed 1000, while that of N. China is said to extend over 498,433 sq. miles, and that of Saskatchewan and Calgary reaches 300,000 sq. miles.

Diocletia′nus, Vale′rius, was born near Salona, in

Dalmatia, A.D. 245. He was of humble origin, but having entered the army, he served with distinction, and rose to high command under Probus, Aurelian, and Carus. In 284, after the murder of Numerianus, the troops assembled at Chalcedon and unanimously invested D. with the supreme power. His first act was to slay with his own hands Aper, captain of the guard, who was believed by the soldiers to be guilty of the late Emperor's death. The death of Carinus, the surviving colleague of Numerianus, in the hour of victory, and by the hands of his own officers, left D. undisputed master of the situation, and he used his victory with singular moderation. His reign is remarkable for the changes effected by him on the form and constitution of the sovereignty, and by the substitution of the dress, manners, and court style of Persia for those of Rome, revolutions which were intended to provide for the defence of the empire and for the security of the Emperor. In 286 D. assumed as colleague Maximianus Herculius; and, since the dangers that threatened the Roman dominions were increasing alike in Europe, Asia, and Africa, a further partition of authority was made. In 292 the two Augusti, D. and Maximianus, assumed as subordinate colleagues, under the title of Cæsars, Constantius Chlorus and Galerius. The empire was divided among the four potentates, and their efforts to re-establish it were crowned with success. Maximianus routed the Mauritanians, Constantius secured Britain, D. subdued Egypt, and Galerius triumphed in the East. These splendid victories were celebrated at Rome in the twentieth year of the reign of D. by a magnificent triumph, which was memorable as being the last ever witnessed in that city. In 305 D., now exhausted by anxiety and toil, abdicated the throne, and after eight years' retirement near Salona, died in 313. In 303 D. stained his name by authorising the last and fiercest of the ten great persecutions inflicted on the Christians by the Roman Emperors. See Mason's *Persecution of D.*

Dioda'ti, Giovanni, a Calvinistic theologian, was born probably at Lucca, 6th June, 1576. While D. was still a child, his family emigrated to Geneva on account of their Protestant opinions. Such was his precocity, that at the age of twenty-one he was appointed a Professor of Hebrew. Distinguished as a staunch reformer and an eloquent preacher, he became, in 1608, a pastor of the Reformed Church, and in 1609 a Professor of Theology. He played an important part in drawing up the articles of the Synod of Dort, where he represented the Genevan Church. He died at Geneva in 1649. D., who was the author of several theological works, translated the Bible into Italian (1607) and into French (1614).—His nephew, **Charles D.** (died 1638), was a schoolfellow and beloved friend of John Milton, who lamented his untimely death in one of his most exquisite poems, the *Epitaphium Damonis*. See Masson's *Milton* (vol. i.).

Di'odon, a genus of *Teleostean* (q.v.) fishes, belonging to the group *Plectognathi* (q.v.), and including forms popularly known as Globe-Fishes, Sea-Porcupines, and the like. They belong to the division of *Gymnodont* ('naked-toothed') fishes, a name applied to them from the projecting nature of the jaws, which appear in the front of the mouth, covered with shining ivory. The name D. itself ('double-toothed') is, in fact, derived from the apparently tooth-like form of the jaws. The nearly-allied genus *Tetraodon* (q.v.) has the jaws divided, so as to present the appearance of four teeth. Of the diodons, the *D. pilosus*, or hairy urchin-fish, and the *D. hystrix*, are familiar species. These fishes possess the power of inflating their bodies with air to a considerable extent; and their appearance when distended, together with the formidable array of spines with which their skin is provided, is very curious and imposing. This power of inflation serves apparently as a means of defence. The *D. hystrix* may attain the length of 12 or 14 inches, and with neighbouring species occurs chiefly in warm seas.

Diodo'rus Siculus, born at Agrium, in Sicily, was a contemporary of Cæsar and Augustus. He was the author of a universal history from the earliest times down to Julius Cæsar's Gallic wars, and in the preparation of this work he spent thirty years. It consisted of forty books, of which fifteen alone are extant, viz., books i.-v. and xi.-xx. It was called by the author the *Bibliotheca*, or *Library*, and was written in a lucid style; but its confusion and contradictions are so great as to deprive it of nearly all historical value. The best modern edition is that of Dindorf (Leipz. 1828-31).

Diœ'cious (lit. 'two habitations') is a term used in botany to express the fact of a plant having the flowers containing the stamens on one individual of the species, while those with the pistil are on another. Willows are common examples, hemp and the date-palm are less familiar. *Diœciously-hermaphrodite* plants are those in which the flowers are Hermaphrodite (q.v.), but yet in none of which both the stamens and pistils are perfect. In one flower the stamens may be perfect and the pistils imperfect, and *vice versâ*.

Diog'enes the Cynic, born at Sinope, in Pontus, B.C. 412, went early in life to Athens, where he became one of the few pupils of Antisthenes, the founder of the sect of the Cynics. The youth of D. had been spent in dissolute indulgence, but his character now changed, and he became emphatically an austere man, wearing coarse clothes, living on plain food, sleeping on the bare ground, and, finally, if the common story be true (although probably it is not), residing in a tub. At Athens D. was noted for his free and pungent raillery, and for his indiscriminate ridicule of all engaged in the pursuit of literature, art, or science. A ship in which he was sailing to Ægina was taken by pirates, and D. was carried to Crete, where he was sold to Xeniades of Corinth, whose 'ruler' he speedily became, and with whom he resided till his death, at the age of ninety, B.C. 323. In a well-known interview with Alexander the Great, which commenced by the king's announcing, 'I am Alexander the Great,' D. replied, 'And I am Diogenes the Cynic.' To the king's further inquiry whether he could serve him in any way, D. answered, 'Yes; you can stand out of the sunshine.' Alexander is reported to have said: 'If I were not Alexander, I should wish to be Diogenes.' The philosophy of D. inculcated the abnegation, so far as practicable, of all sensual gratifications.

Diogenes Laer'tius, a philosopher of Laërte in Cilicia, whence his surname, wrote a *History of the Greek Philosophers* in ten books. The work is valuable for the information, anecdotes, and quotations which it contains, but is utterly destitute of plan, precision, and critical ability. The period of D. is uncertain, being by some assigned to the 2nd, by others to the 3rd C. A.D. The first complete edition of the *Lives* is that of Basel (1533); the best modern edition is that by Hübner (Leipz. 1828-31).

Di'omede Islands, three in number (Fairway, Crusenstern, and Ratamanow), are situated in Behring's Strait, between East Cape and Cape Prince of Wales, and form, as it were, the fragmentary links of a chain which had once connected the continents of America and Asia. They are uninhabited and of small size.

Diome'des, in Greek legend, the son of Tydeus and Deïpyle, and successor of Adrastus in the kingdom of Argos, was one of the *Epigoni* who took Thebes. In the Trojan war he distinguished himself beyond all the Greeks except Achilles. He went to Troy with eighty ships, and under the protection of Athene exhibited matchless prowess, vanquishing in single combat Hector and Æneas, and wounding even Venus and Mars. With Ulysses he took the Palladium from Troy, slew Rhesus, and bore away his steeds. At the funeral games of Patroclus he won the chariot race, and overcame the Telemonian Ajax with the spear. On the conclusion of the war he returned to Argos, only to learn that his wife Ægialeia had been unfaithful in his absence. In wrath and disgust he went to Ætolia, but again setting out for Argos, was driven by a storm to Daunia in Italy. He there married Euippe, daughter of Daunus, assisted the Trojans against Turnus, and founded a number of cities. He died at an advanced age—some say by the hand of

Daunus—and was buried in one of the islands off Cape Garganus.

Dionæ'a. In the Southern States of America, and more particularly about Wilmington, in S. Carolina, is found the most remarkable *D. muscipula*—familiarly known as Venus' fly-trap. Every leaf bears at its summit an appendage which is probably the true blade, while what seems the leaf is only an expanded winged petiole. A mid rib divides this appendage into two equal parts, on the upper surface of which are three or four hairs, and along their margins are also rows of long closely-set hairs and bristles. On an insect alighting on the blade so as to touch the hairs, the two sides close so as to crush the insect to death, while at the same time a fluid is exuded. The researches of Darwin and others leave little doubt that this fluid acts as a digester, and that the substance of the fly or other animal matter is absorbed into the substance of the plant, and in some way assists in its nutrition. Not less remarkable is the fact discovered by Burdon-Sanderson, that this closing of the leaf of D. is accompanied with electrical phenomena, analogous in their nature with those which occur when nervous or muscular actions are induced in animals. See Darwin on *Carnivorous Plants;* Tate, *Proc. of Nat. Hist. Sect. of Midland Institute;* Thos. Balfour, *Trans. Bot. Soc. Edin.*

Di'on Cass'ius Cocceia'nus, a celebrated Greek writer and historian, was born at Nicæa, in Bithynia, A.D. 155. After his father's death (A.D. 180) he repaired to Rome, and under a succession of emperors attained the highest official positions. His greatest work is a *History of Rome* from the time of Æneas to that of Alexander Severus, in eighty books, of which only eighteen (36th-54th) with fragments of others are extant. Of some of the books there are abridgments by Xiphilinus and others. D. spent ten years in collecting materials for this work, and twelve more in its composition. In critical acumen, grasp, and vigour, he is far behind Thucydides, whom he took as his model; but his history is exhaustive, honest, and notwithstanding a rhetorical tinge and peculiarities of style and language, eminently valuable. Besides his history, D. wrote a book on *Dreams and Prodigies*, now lost. He died at his native Nicæa. The date of his decease is not known. The best edition of his works is that of Sturz (Leipz. 1824-43).

Di'on Chrysos'tomus ('the Golden-Mouthed'), also called *Cocceianus*, a surname derived from the Emperor Cocceius Nerva, whose favour and friendship he enjoyed, was born at Prusa, in Bithynia, about the middle of the 1st c. A.D. He improved an excellent education by foreign travel. Though confining himself to no particular sect or school, he had a preference for the Stoic and Platonic systems. Being looked on with suspicion at home, he went to Rome, from which, on account of Domitian's hatred, he was compelled to flee. After visiting Thrace, Mysia, Scythia, &c., he returned on the murder of Domitian, A.D. 96, and was honourably received by Nerva, of whose claims to the purple he was an enthusiastic advocate. Trajan, Nerva's successor, esteemed him so highly that he allowed him to ride with him in his golden chariot. D. died at Rome, A.D. 117. As a man he was beloved and esteemed, and as an orator universally admired. Of his works, eighty complete orations, and fragments of fifteen, on a vast variety of subjects, remain to attest his eminence as a rhetorician and as a writer of pure Attic Greek. His chaste style and brilliant oratorical powers won the golden opinion of Niebuhr. The critical edition of his works by Reiske (Leipz. 1784) is still considered the best.

Dionys'ius the Areop'agite was a member of the Areopagus at Athens, who, according to Acts xvii., was converted by the Apostle Paul, which is all that is said of him in the New Testament. The historian Eusebius relates that Dionysius, Bishop of Corinth, wrote an epistle to the Athenians, in which he mentions D. the A., St. Paul's convert, as the first Bishop of Athens. He is chiefly famous on account of certain writings, probably belonging to the end of the 5th c., which were forged under his name, and first appeared in the Monothelite controversy, about 523. The object of the writer, who has been called the father of mysticism in the Christian Church, was to show that the real doctrines of Christianity were identical with those of his own philosophy—Neo-Platonism; the substance of his system being that the universe is an efflux of the life of God. The writings, the titles of which are *The Celestial Hierarchy, The Terrestrial Hierarchy, Mystical Theology*, and *Twelve Epistles*, had an unbounded influence in the Greek Church from the first; and when translated into Latin by Scotus Erigena, helped greatly to develop the tendency to Pantheistic mysticism which afterwards prevailed in the Western Church. See Neander's *Kirchengeschichte*, and Hodge's *Systematic Theology*.

Dionysius the Elder, tyrant of Syracuse, was born in 431 or 430 B.C. He commenced life as a clerk in a public office, but early took part in the political affairs of Syracuse. In 406 he secured the deposition of the commanders who had failed in the conduct of the Carthaginian War, and was himself one of those appointed in their stead. He next succeeded in obtaining by intrigue the removal of his colleagues, and became general autocrator in 405. D. confirmed his power by ingratiating himself both with the troops and with the populace, subdued partly by firmness and partly by good fortune several revolts against his authority, and successfully attacked the Chalcidian cities of Sicily. In 397, after extensive preparations, he declared war against Carthage. In the first campaign he encountered no opposition, and took Motya, an important stronghold, but in the following year Himilco, with a great armament, totally defeated the Syracusan fleet, and compelled D. to shut himself up within the walls of Syracuse. A pestilence, however, broke out among the Carthaginians, and D. was thus enabled to attack them suddenly and successfully. The Carthaginians renewed the war in 393 and 392, but on both occasions were defeated by D., and peace was then concluded. Through his allies, the Locrians, D. obtained extensive influence throughout the S. of Italy, and during the remaining twenty years of his tyranny he embraced every opportunity of maintaining and increasing his power. He died in 367. Strange as it may seem in the case of so vigorous and unscrupulous a tyrant, D. devoted himself assiduously to poetry, and one of his dramas carried off the first prize at Athens. He also courted the society of men distinguished in literature and philosophy.

Dionysius the Younger, tyrant of Syracuse, was the son of the preceding, by Doris of Locri, and at the age of thirty succeeded his father, B.C. 367. D. had never been permitted to take part in public affairs, and being encouraged in vicious excesses by Philistus the historian, became unpopular with the Syracusans, whom he further alienated by the banishment of Dion. On the return of Dion, the Syracusans revolted against D., who repaired to Locri, which he ruled with the utmost cruelty for several years. He recovered Syracuse by treachery ten years after his expulsion, but was compelled to yield to Timoleon in 343. He spent the remainder of his life at Corinth in degradation and destitution.

Dionysius of Halicarnassus flourished in the 1st c. B.C., his death having occurred soon after 7 B.C. He went to Italy (B.C. 29), and spent twenty-two years at Rome in studying the Latin language and literature. His rhetorical and critical treatises—such as his *Ars Rhetorica* and his criticisms on the Greek orators—are of great value. His chief work is his *Archæologia*, or Roman history, in twenty books, of which only the first nine have reached us complete. This work contained the history of Rome from the earliest times to the year B.C. 264, and discussed fully all that relates to the Roman constitution, religion, history, and antiquities.

Dionysius Thrax, or the Thracian, was a celebrated Greek grammarian, who taught at Rome about 80 B.C. He is remembered for the merit of his grammatical works, and for his explanations and criticism of Homer. His grammatical treatise was used in schools for many centuries.

Dionysius, surnamed **Periege'tes,** from his being the author of a *periēgēsis* (Gr. 'geographical description of the earth') in Greek hexameters, was a native of Africa, and lived probably in the latter part of the 3rd or beginning of the 4th c. His work, which is still extant, is written tersely, and was translated into Latin by Rufus Festus Avienus, and also by the grammarian Priscian. There still exist a commentary upon it by Eustathius, and a Greek paraphrase and Scholia. The *editio princeps* appeared at Ferrara in 1512, with a Latin translation. It was also printed at Venice by A. Manutius in 1513, but the best edition is that of G. Bernhardy (Leipz. 1828).

Diony'sos. See BACCHUS.

Diophan'tine Anal'ysis, a branch of algebra which treats of the solution of undeterminate questions, such as: to find three commensurable numbers whose squares are in arithmetical progression. The name is derived from Diophantus (q.v.), who solved a great many questions of this kind.

Diophan'tus, a Greek algebraist, who flourished at Alexandria probably about the 4th or 5th c. of the Christian era. Montucla, after Abulpharagius, places him at A.D. 365; but the date is of little consequence except with reference to the question whether he obtained his algebra from the Hindus, or is to be regarded as the sole inventor of his methods. From an epitaph in Greek verse, discovered by Bachet, we gather that he married when thirty-three years old, that his son, born five years after the marriage, died at the age of forty-two, four years before himself, and that D. therefore lived eighty-four years. The information is given in the form of an algebraic problem. Of the thirteen books of his *Arithmetica*, only six are extant. There is also one other book, *De Multangulis Numeris.* The first printed edition was in Latin, by Xylander (Basel, 1575); Bachet de Meziriac published the original Greek, with Latin version and valuable notes (Paris 1621); but the best is by Fermat (Toulouse, 1670). Miss Abigail Baruch Lousada left a complete English translation, which has unfortunately never been published.

Diop'sis, or **Stalk-Eyed Fly,** a genus of Diptera (q.v.) or Flies, belonging to the family *Muscidæ*, and distinguished by the elongation of the sides of the head to form stalks for the eyes. *Diopsis thoracicus* is a familiar species of this group, the representatives of which mostly occur in warm climates.

Dioscorea'ceæ, the Yam order, a natural order of Monocotyledonous plants, belonging to Lindley's sub-class *Dictyogenæ*, chiefly tropical plants. *Tamus communis*, the Black Bryony (q.v.), is the only British representative. There are about 160 species and seven genera. *Tamus*, *Testudinaria*, and *Dioscorea* are examples. The Yams (q.v.) are among the most important plants of the order. The Elephant's Food (q.v.) is another.

Dioscor'ides, the author of thirty-nine epigrams in the Greek Anthology, is thought to have lived in Egypt in the time of Ptolemy Euergetes. His epigrams, chiefly on the ancient poets, were included in Meleager's *Garland*.

Dioscorides, the name of several physicians and medical writers of antiquity.—1. **D. Pedacius** or **Pedanius** of Anazarba, in Cilicia, flourished in the 1st or 2nd c. He wrote a treatise on *Materia Medica*, a work of immense research, and for many ages a standard authority, also a treatise on *Poisons* and another on *Venomous Animals*. Some minor works have been ascribed to him, but on insufficient grounds. His *De Materiâ Medicâ* has been translated into Italian, French, German, and Spanish, and an Arabian version of it in MS. is to be found in several European libraries. The first Greek edition was published by Aldus Manutius (Ven. 1499). The best edition is still that of Saracenus (Frankf. 1598).—2. **D. Phacas,** so called from the moles or freckles on his face, lived in the 2nd or 1st c. B.C. His medical works, of which several are mentioned by ancient writers, have perished.—3. A grammarian and probably a physician at Rome in the time of Hadrian, who devoted his attention to medical literature, and edited an edition of the works of Hippocrates.

Dip and Strike are terms used in geology. The 'dip' is the downward inclination of beds with reference to the horizontal plane, and requires for its determination two numbers—viz., the inclination of the beds to the horizontal, and the point of the compass towards which they slope. The 'strike' is the line drawn at right angles to the dip, corresponding to the outcrop when the surface is level.

Diphthe'ria (from Gr. *diphthera*, any leathery material), the name given to a contagious and epidemic disease of great severity, affecting chiefly the throat and neighbouring parts. It is essentially a blood disease, characterised by the formation of a false membrane on the back part of the mouth and throat. D. generally commences with headache, sickness, often diarrhœa and chilliness, and is soon followed by great prostration and the formation of dirty whitish patches on the back of the mouth, at first small, but soon coalescing so as to form a membrane whose appearance has been compared to that of 'damp, dirty, washed leather.' When this membrane begins to peel off there is a most offensive odour in the breath, and frequently the patient is unable to swallow. D. is a very fatal disease, and generally in a short time. The treatment consists in supporting the patient's strength, giving iron tonics internally, and applying Condy's fluid, or other disinfectant to the throat. Recovery is often followed by paralysis of some of the muscles. The patient should be kept warm in bed, and the air in the room should be hot and moist.

Diph'thong (Gr. *di*, 'twice,' and *phthongos*, 'a sound') is the blending of two vowel sounds into one syllable, *e.g.*, *ou* in 'house,' *ai* in 'aisle,' and *oi* in 'oil.' The distinction sometimes made between a D. to the eye and a D. to the ear is incorrect. There can be no D. which is not a D. to the ear.

Diph'yes, a beautiful genus of oceanic *Hydrozoa* (q.v.), or Zoophytes, belonging to the order *Calycophoridæ*, and consisting of a delicate thread-like *cænosarc* or connecting medium, bearing the various polypites, or individual animals of which this compound organism is composed. At its proximal end the cœnosarc expands to form two mitre-shaped *Nectocalyces*, or 'swimming-bells,' by means of which the organism is supported in the water. Each of the polypites is protected by a glassy 'bract,' or hydrophyllium. *D. appendiculata* is a familiar species of this genus of *Calycophoridæ*, and occurs in the Mediterranean and warm seas.

Diplacan'thus, a genus of extinct Ganoid fishes, of which *D. gracilis* is a familiar example. This genus belongs to the family *Acanthodidæ*, the members of which possessed small scales, and a spine implanted in the flesh in front of each fin. No operculum was developed. D. had two dorsal fins, and is confined solely to Devonian rocks. The tail was heterocircal.

Dip'loe, the cellular bony structure between the two plates or tables forming the flat bones of the skull. These cells are filled with a reddish pulpy substance, similar, when examined microscopically, to the marrow of bones.

Diplogloss'us, a genus of *Lacertilia*, or Lizards, found in Cuba. The colour of the best-known species (*D. sagræ*) is grey with bronze tints, whilst a black streak marks each side. The D. is an active little creature, and inhabits dry localities.

Diplograp'sus, a genus of *Graptolites* (q.v.), an extinct group of Hydrozoa (q.v.) or Zoophytes. This genus, of which *D. pristis* is a familiar species, ranges in Britain and N. America from the Upper Cambrian strata to the upper strata of the Lower Silurian rocks; but in Bohemia, D. occurs in Upper Silurian rocks also.

Diplo'ma (Gr. *diploō*, 'I double or fold') is the writing given by universities and other learned bodies in proof of the person named in it having been granted a degree or license for professional practice.

Diplom'acy is the art of managing international affairs by means of ambassadors and other officers accredited by one state to another. (See AMBASSADOR.) A diplomatist requires to be a man of great tact and good temper, ready in all social ceremonial to conform to the manners and customs of the people among whom he is resident. Infinite tact is required in matters involving questions of precedence. Precedence is conceded to crowned heads, and a head crowned is held to maintain its dignity under all reverses. In making a treaty, the usual practice is to make as many copies as there are parties to it. Each state gets a copy with precedence to its own name. In other matters the precedence of the various powers of Europe and of the United States of America, from time to time, is by what is called the *Alternat*, which is determined by lot. Maritime international ceremonial is arranged by compact. Salaries, allowances, and pensions in the Diplomatic service are paid under the authority of statute 32 and 33 Vict. c. 43. See SALUTE.

Diplomat'ics is the art of reading ancient writings, combined with scientific knowledge of their circumstances. The term has been superseded by the more descriptive one of Palæography (q.v.).

Diplop'terus, a genus of fossil Ganoid (q.v.) fishes, included in the group *Crossopterygidæ*. This form, which has representatives in the Devonian and Carboniferous rocks, had two dorsal fins, rhomboidal and smooth scales, and lobate fins. Like all *Crossopterygidæ* ('fringe-finned'), the species of D. had the paired fins each in the form of a central lobe covered with scales, and having the fin-rays attached to its sides.

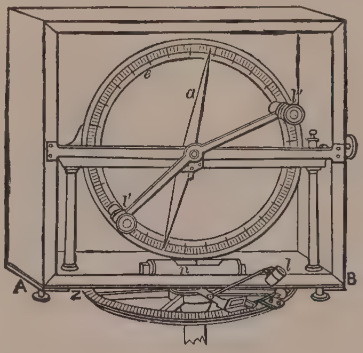
Dip'noi, an important order of the class of fishes represented by the *Lepidosirens* (q.v.), or Mud-Fishes of Africa and S. America, and by the *Ceratodus* or *Barramunda* (q.v.) of Australia rivers. Probably Günther's idea that the D. should be viewed as a subdivision of the Ganoid fishes is correct and trustworthy. As a distinct order, the D. are recognised by possessing fish-like bodies; the skull has distinct cranial bones and a lower jaw, but the spine is represented by a *Notochord* (q.v.), and no bony spinal elements exist. Small *cycloid* scales cover the body. The pectoral and ventral fins (in *Lepidosiren*) are filamentous in character, and in *Ceratodus* consist each of a central rod with lateral branches. The tail-fin is median and vertical. The heart is three-chambered. The breathing is conducted by gills and also by rudimentary lungs, formed by the modified 'Air-Bladder' (q.v.). The nostrils open posteriorly into the throat. In respect of the last three characters, these fishes differ from all others. *Lepidosiren* is said to have external gills like amphibians in its young state.

Dipp'el's Animal Oil. This is a colourless transparent liquid, obtained by repeatedly rectifying the liquid products arising from the destructive distillation of animal matter (bone, horn, &c.). It was first prepared by Dippel, an apothecary living in the 17th c., and was employed by him as a medicine. It is colourless, mobile, and highly refractive, and has a pleasant smell and taste like cinnamon. Exposed to the air, it gradually becomes brown. D.'s A. O. consists of a mixture of a great number of substances, part of which are bases containing nitrogen, part compounds of carbon and hydrogen. It is now prepared as a byproduct in the manufacture of Bone Black (q.v.). It is occasionally employed in medicine as an antispasmodic.

Dipper—Water Ousel.

Dipp'er, or **Water Ousel,** a species of Insessorial birds, belonging to the Dentirostral section of the order and to the Thrush family. The genus to which it belongs is distinguished by the bill being of moderate size, but curved slightly upwards. The opening of the nostrils is of semilunar shape. The wings are rounded, and have their third and fourth quills largest. The tail is short and even. The tarsi are large, the outer toe being longer than the inner one. The D. frequents rapid streams and rivers, and exhibits quick, jerking movements. Its average length is about 7 inches, and its colour brown on the upper parts, a rusty red below, with the throat and breast white. The food consists of insects, crustaceans, and the eggs of fishes. The D. is remarkable as differing so completely in habits from all the other members of its family. It dives with great ease, and can remain below water for some time, keeping itself underneath by the action of its wings. The nest is formed of moss, and has a dome-like shape. The eggs number five, and are coloured white. The D. may produce two or even three broods in a year.

Dipp'ing-Needle is a magnet suspended so as to have as free motion as possible round its centre of inertia in a vertical plane. It is found that such a needle, if not on the magnetic equator, *dips*, or points downwards; and if the plane in which it moves coincide in direction with the magnetic meridian, the needle gives the direction in which the terrestrial magnetic force acts. The magnet is as delicately suspended as possible, and is provided with a vertical graduated circle (marked *e* in the figure) for measuring the amount of the dip, and an azimuth circle (Z) for fixing the vertical circle in the true direction, which is found by means of a declination needle. (See DECLINATION OF THE MAGNETIC NEEDLE.) Since the magnetic axis rarely coincides exactly with the geometrical axis of the magnet, the needle must be reversed—the side which at first faced E. now facing W.—and the mean of the two readings taken as the true reading. Care must be taken not to have any iron or steel adjustments about the instrument, else the results would be rendered valueless. *l*, *l'*, *l'*, are microscopes for reading the angles; and *n* is a spirit-level for securing the horizontality of Z and the perpendicularity of *e*. From observations with such an instrument, Sir J. C. Ross, in 1831, fixed the magnetic pole in Boothia Felix, N. America, near lat. 70° N. and long. 96° W., where he found the dip to be 89° 59′—nearly perpendicular.

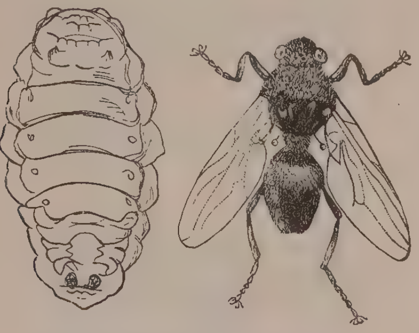


Dipping-Needle.

Dip'sas (from Gr. *dipsa*, 'thirst'), a genus of Colubrine snakes, of which the *D.* or *Eudipsas cynodon* of Asia and the Philippine Islands is an example. The neck and tail are very slender, the head being broad and of triangular shape. The colour is grey, variegated with brown. The ancients believed that this snake was constantly seeking water, hence its name.

Dipsoma'nia (from Gr. *dipsa*, 'thirst,' and *mania*, 'madness'), the name given to an intense craving for intoxicating liquors. So strong is this craving for alcoholic drink in some persons that they will sacrifice everything to obtain it. Of late years, much difference of opinion has been expressed in regard to the question whether D. is insanity or not, some physicians maintaining that it is a kind of madness, others that it is only a kind of wickedness. D. ought to be distinguished from true insanity; but though few physicians would commit dipsomaniacs to a lunatic asylum, most believe that they should be put under restraint, because of their being altogether incapable of taking care of themselves, and also on account of the misery they bring upon their families. D. most frequently occurs among members of families in which there is a hereditary tendency to insanity, and the tendency to the disease is fostered by the habitual use of alcoholic liquors from early periods of life, in many cases even from infancy. See DRUNKENNESS.

Dip'tera (Gr. 'two-winged'), an order of Insects represented by the familiar Flies (q.v.) and other two-winged forms. The D. are included in the Holometabolic group of the insect class, or in that section the members of which undergo a *complete* Metamorphosis (q.v.), and show the three characteristic stages of an active caterpillar or *larva*, a quiescent *pupa* or chrysalis, and a perfect winged and sexual *imago*. The front pair of wings are alone represented in these insects, the place of the absent hinder wings being supplied by a pair of filamentous organs, termed *halteres* or *poisers*, presumed to be serviceable to the insects in balancing them in their flight. The prothorax, or first segment of the chest, is always small, and, along with the other two thoracic segments, is generally fused into a single mass. The head is large, and the eyes are prominent. The mouth is for the most part of suctorial kind (see INSECTS), and the stomach is frequently of compound nature. The legs are usually long, and end in soft spongy bodies, by means of which these insects are enabled to obtain a firm foothold on smooth and perpendicular surfaces. In addition to the compound eyes borne by the head, several *ocelli* or simple eyes may also exist; and the antennæ or feelers are situated on the part of the head between the eyes. The wings may be wanting altogether in some D., and the skin of the larva for the most part forms a pupa case for the Chrysalis. In some flies (such as in *Pupipara*), the young larvæ reside within the body of the mother, and there become pupæ; and in *Cecidomyia* or the Hessian-fly, each larva produces within itself another larva, which latter feeds on the primitive larva and becomes the future fly. See also articles relating to the various kinds of flies, such as CRANE-FLY, HESSIAN-FLY, &c.



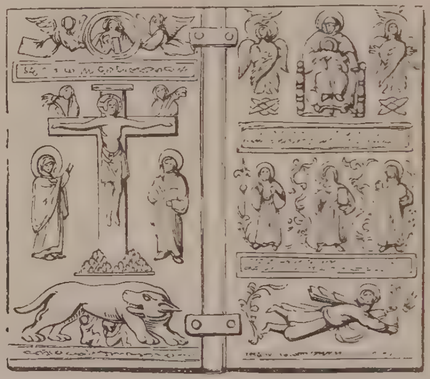
Larva and Imago of the Bot Fly of the Ox.

Diptera'ceæ, or **Dipterocarpa'ceæ,** the Sumatra Camphor order, a natural order of Dicotyledonous trees with resinous juice, natives of the forests of tropical India, with the exception of the genus *Lophira*, which is found in tropical Africa, though by some this genus is made the type of a separate order (*Lophiraceæ*). There are about fifty species and seven genera in the order, all of which owe their peculiarities to the presence of the resinous juice. Wood-oil or Gurgun balsam is yielded by the trunks of *D. lævis* or *turbinatus* of the W. Indies. The oil is used in India for painting, and is employed for much the same purposes as Copaiva (q.v.). *Dryobalanops aromatica* yields Sumatra camphor (see CAMPHOR). *Hopea odorata* of Burma yields a styptic resin. *Shorea* (*Vateria*) *robusta* is the Sal (q.v.) of India, and yields Dhoona pitch. *Vateria indica* yields the oleo-resin known as white Dammar or piny resin, used in India for making candles and as a varnish. Piny tallow or vegetable butter of Canara—a concrete oil—is obtained from the fruit of this plant, and has lately been imported into this country as a local application in rheumatism, &c. (Bentley). See ANIME, COPAL, DAMMAR, and VARNISH-TREE.

Dip'terus, a genus of extinct Ganoid (q.v.) fishes, confined exclusively in their distribution to the Devonian and Old Red Sandstone rocks. Two dorsal fins existed, and the body was covered with smooth overlapping scales. The head had a kind of helmet-covering, and the teeth were conical in form.

Dip'teryx, a genus of Leguminous plants. The seeds of the D. of Guiana, owing to the presence of Coumarine (q.v.), are very pleasantly scented, and under the name of *Tonquin*, *Tonka*, or Itonka beans, are used for perfuming snuff, &c. The nuts of the Eboe D. of the Mosquito Coast are also fragrant, and yield a fatty oil much used for anointing the hair of the natives. The timber is heavy and yellow coloured.

Dip'tych (Gr. *dis*, 'turce,' *ptussein*, 'to fold,' or 'twice-folded'), in classical and post-classical times the name given to two writing tablets fastened together at the back by means of wires, which served for hinges. They were made for the most part of wood, the inner sides of which were covered over with wax, which was written on with the stilus. There was a raised margin round each to prevent the wax of the one tablet rubbing against that of the other. Diptychs were employed especially for public registers. They were small enough to be held in the hand, rarely exceeding eight inches by four. Instead of wood, ivory and metal were sometimes used, and these were often richly carved or chased.



Diptych.

Dip'us. See JERBOA.

Di'rect and Ret'rograde, two astronomical terms, applied to the motion of a planet, according as it appears to move in the zodiac from W. to E. or from E. to W. When it is moving neither way it is said to be *stationary*.

Direc'tion-Co'sines are the cosines of the angles which a given line makes with three rectangular axes given in position. Take any point (x, y, z) upon the line through the origin, whose D.-C. are l, m, n; then if r be the distance of this point from the origin, we have at once $x = lr$, $y = mr$, $z = nr$. Squaring and adding, we obtain $(l^2 + m^2 + n^2) r^2 = x^2 + y^2 + z^2 = r^2$, or $l^2 + m^2 + n^2 = 1$. Again, if there be another line, whose D.-C. are $l'\ m'\ n'$, the angle which it makes with the first is that angle whose cosine $= ll' + mm' + nn'$. These two fundamental formulæ are of great and growing importance in physical investigations.

Direc'tor. In commercial concerns it is usual to have a body of men—commonly about ten or twelve—whose business is to meet at short fixed intervals to consult together about the affairs of the concern, and to advise and assist the manager. The members of this body are called the *Ordinary* Directors. There is commonly another body called the

Extraordinary Directors. These have no business functions, and are chosen as a rule from their social position being supposed to add to the reputation of the joint-stock undertaking. Ordinary Directors being paid officers, it may be held that they are bound to make themselves thoroughly conversant with the affairs of the undertaking; on the other hand, the remuneration is commonly insufficient to make it reasonable to suppose that they can afford time for this, when the concern is extensive and complicated. As trustees they are debarred from making any personal profit from the corporation to which they belong. On the whole, the view of the commercial community seems to be that a D. is entitled to rely on the statements of the manager, unless these be such as ought to excite the suspicion of a man of ordinary business intelligence. But where this is the case, he is not entitled to shut his eyes. He is bound to have the matter of suspicion probed to the root, and, if necessary, to consult the shareholders. Clearly the position must, in certain circumstances, be one of great danger and difficulty. As if disposing of all objection to the plenary responsibility of a D., the general truth is sometimes stated, that there can be no excuse for the neglect of a voluntarily accepted trust. But the question is as to the exact nature of the trust. A D. is not a manager. His function is to advise, not in ordinary circumstances to investigate.

Law Regarding Directors.—The powers of a D. are determined by the special act, if his company has been incorporated by statute, and by certain sections (90-100) in the Companies Clauses Act of 1845; but his powers depend upon section 14 and table A of the Act of 1862, if his company has been incorporated under that statute. A director must vacate his office by the acceptance of any other office of profit in the company, by being concerned in any contract with it, or by bankruptcy; that at the first ordinary meeting after incorporation all the directors must retire from office, and that at the first ordinary meeting in each subsequent year one-third, or the number nearest one-third, must retire; those retiring who have been longest in office. They are reeligible. Directors may delegate their powers to committees. Minutes of business transacted at directors' meetings are to be carefully made, and signed by the chairman. Dividends are only to be paid from profit, and if a dividend is declared when the company is known by the directors to be insolvent, or when payment of the dividend will make it insolvent, they shall be jointly and severally (see JOINT AND SEVERAL) liable for the debts then existing of the company, or which shall be contracted while they remain, respectively, in office. A D. who issues a prospectus calling for subscriptions to his company, becomes liable (under statute 53 and 54 Vict. c. 64) to compensate subscribers for loss, should the prospectus contain an untrue statement, should the loss have arisen therefrom, and should the D. have had no reasonable ground to believe the truth of the statement. Each of his fellow directors in that case becomes also liable to contribute to the damages awarded to the plaintiff subscriber.

By 24 and 25 Vict. c. 96, directors, members, or officers of any body corporate or public company fraudulently appropriating property, or keeping fraudulent accounts, or wilfully destroying or vitiating books, or other writings, or publishing any false statement with intent to deceive, are guilty of a misdemeanour, punishable with penal servitude or imprisonment, according to degree of guilt. See JOINT-STOCK COMPANIES.

Direc′tory was the executive power in the new constitution of the *Thermidoriens* introduced in 1795. It was a council of five persons, who had the conduct of peace and war, the execution of the laws, and the general administration without legislative functions. The D. along with the formation of the Double Council (viz., the Ancients and the Five Hundred) distinguish this Constitution of year 3 from the Girondist Constitution of 1791, the Democratic monarchy of 1792, and the Jacobin Constitution of 1793. The 'decrees of the two-thirds,' by which the Old Convention insisted on modifying the proposal of the eleven Girondist commissioners, led to the 'Day of the Sections' (4th October, 1795), in which Bonaparte destroyed the National Guards in the Rue St. Honoré. Barras and Carnot (who replaced Sieyès) were the most prominent Directors, all of whom were elected by the two Councils. The D. soon became unpopular in spite of Bonaparte's brilliant campaigns. They crushed the Babœuf Conspiracy (1797), and Pichegru and the Royalist party on the 18th Fructidor; but their policy of *bascule*, or seesaw between the Moderates and the Manéze Club in home affairs, their cruel Law of Hostages, and their misunderstandings with Bonaparte, who was the idol of the army, paved the way for the negotiations of Sieyès, which resulted in the Revolution of 18th Brumaire and the Consulate.

Directory for Public Worship of God, one of the works of the Westminster Assembly, drawn up in 1644. George Gillespie, the Scottish commissioner, had a chief hand in framing it. The order of worship prescribed begins with an invocation; a chapter from each Testament is read; and the Lord's Prayer and other set forms are used. Baptism, marriage, and rebuke are to be public; and burial, without ceremony. The General Assembly of the Church of Scotland adopted the D., 3rd February, and the Scottish Parliament ratified it, 6th February, 1645. The D., however, was not recognised at the Revolution Settlement, nor at the Union. The book was the expression of a fond illusion that uniformity of worship could be established, so as to secure the happy unity of the kirks of the three kingdoms. See *A Directory for the Public Worship of God* (Edinb. 1645); Principal Lee's *Hist. of Church of Scotland* (Edinb. 1860); Dr. R. Lee's *Reform of the Church of Scotland* (Edinb. 1864); and *Minutes of Westminster Assembly* (Edinb. 1874).

Direc′trix, in geometry, is a straight or curved line on which depends the description of a curve or surface. A point, whose distances from a given point and straight line bear a constant ratio to each other, describes one of the Conic Sections (q.v.). This straight line is the D. of the curve in question. If a surface be generated by the motion of a line which always rests on other fixed lines, these latter are sometimes called *directrices*, but more frequently *directors*; the moving line is called a *generator*.

Dirk, a Scottish dagger or poniard formerly carried by Highland chieftains; also the name for the short sword worn as a side-arm by midshipmen in the British royal navy.

Dirk Hartog Island is one of several islands forming a breakwater for the extensive inlet of Shark Bay, on the W. coast of Australia. D. H. I. is high, and about 40 miles long by 10 broad. It lies in S. lat. 25° 28′-26° 6′, and E. long. 113°.

Dir′schau (Pol. *Szczevo*), a town of Prussia, on the Vistula, and on the Eastern Railway, 21 miles S.S.E. of Danzig. It has iron and machine works, large mills, a cattle-market, and an active timber trade. The Vistula is here crossed by an immense iron bridge, 2844 feet long and 37 feet high, erected 1850-60.

Dirt-Beds, a name given by geologists to certain deposits embraced by the Portland or Upper Oolite rocks, and more especially in connection with the Purbeck beds of these formations. The name 'D.-B.' is applied to these formations by quarrymen, and denotes old soils in which vegetable matter is thickly interspersed. These beds are in all likelihood old land surfaces formed between strata of marine origin by the intermittent elevation of the latter. Fossil cycads (*Mantellia*) form their chief vegetable remains.

Disabil′ity, in English law, is legal incapacity. It may be absolute, as by Outlawry (q.v.), excommunication, and (formerly) attainder; or it may be partial, as from minority (see AGE) or Coverture (q.v.), or drunkenness, or lunacy. See also CAPACITY, LEGAL.

Disban′ding, in military language, is the breaking up of a battalion or regiment. It generally occurs when peace is proclaimed after war, the officers being placed on half-pay, and the men discharged. But it was resorted to in India to punish the mutiny of the native troops—the first instance being the D. of the 19th regiment of native infantry at Barrackpur on the 1st of March, 1857.

Disbar′ is to degrade a barrister-at-law, or expel him from the bar. The power to D. in England belongs to the Benchers (q.v.) of the four Inns of Court. No barrister who has been disbarred can plead before the courts of law. The person so affected may appeal to the judges.

Disc, or **Disk,** a somewhat vague term in systematic botany, generally applied to any organ 'intervening between the stamens and the ovary,' and may be in the form of a ring or scales. Frequently it consists of metamorphosed stamens forming an inner whorl. Sometimes it is glandular and secretes a honey-like fluid: in this case the older botanists called it the *nectary*.

Disc and **Discob′olus.** See QUOITS.

Discharge′. A verbal obligation may be dissolved by a verbal D., but a written obligation requires a written D.; the rule of law being that the same solemnities required to constitute an obligation are required to extinguish it. A similar expression is used of a prisoner when he is permitted to go free; or of a sheriff when the person under attachment is legally liberated; or of a jury when the court so directs, or when one of their number dies, or when they have returned their verdict or sentence has been pronounced by the court; or of a rule *nisi*, when the order of the court is against its being made absolute.

Dischar′ging, in the navy, is relieving the ship of the commission under which it is placed in active service, the officers on full pay and the crew on the wages list. The fact that officers and crew can only serve on board ship puts them on a different footing from the officers and men in a regiment. Soldiers are on permanent pay during peace and war, sailors only while the ship is in commission. D. leaves the men off the wages list, and the officers mostly on half pay.

Dis′cina, a typical genus of Brachiopodous mollusca, represented by living forms, and also by fossil species, which begin in the Silurian period. The family *Discinidæ* is recognised by the shells being attached to fixed objects by a fleshy stalk or peduncle, which passes through the ventral valve. The characteristic arms of the *Brachiopoda* (q.v.) are fleshy in *Discinidæ*, and the valves or halves of the shell are not articulated by any distinct hinge. The shell in D. is circular, its upper valve being limpet-shaped, the lower valve being flat or convex. *D. circe*, and *D. pelopæa* are well-known fossil species from Silurian rocks.

Dis′cipline, The First Book of, or **Policie,** an important landmark in the reformation of the Scottish Church. After the overthrow of Popery and the adoption of the ancient Confession, in 1560, a commission, dated 29th April of that year, was given to John Knox and five others to draw up a B. of D. According to this B. of D., the minister was to be admitted with consent of the people and the approval of the ministers; ordination by imposition of hands was disapproved of; readers were to be provided for destitute places; the country was to be divided into ten districts with superintendents for planting churches, appointing ministers, and visiting vacant places; elders and deacons were to be elected annually; every church was to have a schoolmaster; and the ancient patrimony of the Church was to be devoted to the threefold support of the ministry, education, and the poor. This book was dated 20th May, 1560; and on 27th January, 1561, it was subscribed in secret council by twenty-six noblemen and gentlemen, but it was never ratified by Parliament. It failed to become law because those who held the patrimony of the Church did not regard Knox's 'devout imagination' with favour. See *The First and Second Booke of D.* (Edinb. 1621); M'Crie's *Life of Knox* (Edinb. 1812); *Knox's Hist. Ref.* (Laing's ed., Edinb. 1848); and Cunningham's *Church Hist. Scotland* (Edinb. 1859).—**The Second B. of D.** was the result of an effort to make the Church of Scotland more strictly Presbyterian. The great reformer, Andrew Melville, and some others, were appointed, 24th April, 1576, by the General Assembly, a committee to perfect the regulations of the Church. As the fruit of their labours they presented the Second B. of D., which was sanctioned by the General Assembly, 24th April, 1578. This book set up a more elaborate form of Presbyterianism, and made a more complete distinction between civil and ecclesiastical jurisdiction. Patronage was abolished, also the titles of abbots, and the superiority of bishops; ministers were to be elected by judgment of eldership and consent of the people; ordination was to be by laying on of hands; and the various Church courts were appointed. The Second B. of D. was registered among the Acts of the Church by the Assembly, April, 1581; but it never was ratified by Parliament, and never became a binding law of the Church. See M'Crie's *Life of Melville* (Edinb. 1824), and Bryce's *Ten Years of the Church of Scotland* (Edinb. 1850).

Disclaim′er, in English law, a plea of denial or of renunciation. A D. may be made by a trustee, an executor, a devisee, and in respect of a patent.

Disclama′tion, in Scotch law, signified the disavowal by a vassal of some one who was, or claimed to be, his Superior (q.v.). The penalty of D. on frivolous grounds was forfeiture of the Fee (q.v.). But any reasonable excuse exempted the vassal from the penalty. D. is now obsolete.

Discob′oli, a term formerly applied by Cuvier to certain genera of fishes, exemplified by the Lump-Suckers (q.v.), &c., with sucking-disks formed by the united ventral fins on the lower surface of their bodies. The term is not now used, lump-suckers being included in the *Gobiidæ* or Gobies (q.v.).

Discoph′ora (Gr. 'disk-bearers'), a name given in modern zoology to a subclass of Hydrozoa (q.v.), represented by the true *Medusidæ* (q.v.), or sea-blubbers and jelly-fishes. These organisms may be defined as possessing a free, oceanic body (*hydrosoma*), consisting of a single *nectocalyx*, or swimming bell, from the roof of which a single zoöid or *polypite* hangs. A system of canals run through the swimming-bell. Many forms, at one time regarded as *Medusæ*, are now known to be merely the free-swimming reproductive bodies of zoophytes.

Dis′cord, in music, an interval producing Dissonance (q.v.). Strictly speaking, an interval is said to be *dissonant* if the notes of which it consists have any musical relation to each other, and *discordant* if they have none.

Dis′count is the deduction made from a debt paid before it is due. To discount a Bill of Exchange (q.v.), or a draft, means to exchange it under deduction of a percentage on account of its not having reached maturity. When this is done, it is the custom of money-dealers to subtract the interest accruing during the time between the date of their purchase and the date at which the bill or draft falls due. This causes the real charge to be greater than the nominal one, the interest being received by the lender before it is due. Thus, if you discount a bill of £100 due three months hence at 5 per cent., you will receive £100 less $\frac{1}{4}$ of £5—that is, £98 15s.; but if you then lend your £98 15s. for three months at 5 per cent., it is plain that the interest accruing during the period cannot be so much as the interest on £100 which has been deducted. In a true calculation of D., therefore, the question to be answered is—What sum will, at the given rate of interest, at the end of the given period, amount to the value of the deferred payment? The rule for ascertaining this is—Find the amount of £1 in the given time, and by that divide the given sum, and the quotient is the answer. Thus, What is the value of £100 to be received three months hence, interest at 5 per cent.? The interest of £1 for a year will be 1s., and for three months 3d. = £0·0125. The amount of £1, therefore, for the period is £1·0125; and the value of £100 three months hence is $= \frac{100}{1\cdot0125}$ = £98·765 = £98 15 $3\frac{1}{2}$

The interest on which for three months at 5 per cent. is . . . . . . 1 4 $8\frac{1}{2}$

£100 0 0

To find the amount of a given sum improved at compound interest at any rate, and for any number of years, the rule is —Multiply the amount of £1 for a year so often into itself as there are years proposed and the last product multiplied by the principal gives the answer. Thus—What will £10 amount to in three years at 5 per cent. compound interest? —1·05 × 1·05 × 1·05 = 1·157625 × 10 £11·57625 = £11 11s. 5d.

By D. is also understood the depreciation of any share or stock below the original value. Thus, when a bank share on which £100 has been paid will only bring £90 in the market, it is said to be at a D. of 10 per cent. The converse position is called being at a *premium*.

The rate of D. for bills of exchange in the United Kingdom, in ordinary times, ranges from 3 to 5 per cent. on bills of three or four months' currency. When it goes above 5 per cent. the fact indicates commercial disturbance. In recent times the rate has more than once risen as high as 10 per cent. The provincial banks, in their D. rates, follow the lead of the Bank of England. See INTEREST.

Discre'tion. According to English law, if an agent or trustee is instructed to act according to his D., he must act according to law and reason. The law of Scotland recognises the same rule.

Dis'cus proligerus, a small heap of granular cells found within a graafian vesicle, and on which the ovum rests.

Discus'sion is a technical term of Scotch law, signifying a demand for payment against a principal debtor, and by denouncing the debtor and registering the execution of an unexpired charge, by poinding his moveable estate, or by arrestment and furthcoming, and by adjudicating his heritage (see Erskine's *Principles, &c.*, by Rankine)—or against heirs. Formerly cautioners (see CAUTION), unless bound jointly and severally (see JOINT AND SEVERAL) with the principal debtor, could insist on the creditor enforcing his demand against the principal debtor in the first place, or to *discuss* him, as it was called. By the Mercantile Law Amendment Act, cautioners can now only have this right by stipulation.

Discussion of Heirs.—All heirs who have incurred a representation of their ancestor are liable for his debts; but they may insist on being sued in a certain order. Where a special heir is burdened with a debt, the creditor must *discuss* that heir before he can insist against the heir-at-law. But where the debtor does not charge any special heir with payment of a general obligation, the D. must be in legal order. See REPRESENTATION, TITLE, PASSIVE.

Disdi'aclasts, minute doubly-refracting molecules, which, according to Brücke, form part of the ultimate structure of muscle. See MUSCLE.

Disease' (lit. the opposite of *ease*), a medical term for that condition of the system in which there is a deviation from health. D. may or may not be accompanied with pain, but there is always a departure from the normal standard of health. D. may be local or general, structural or functional, curable or incurable, the latter always ending in death. The classification of D. is called Nosology (q.v.), and the changes in structure caused by it form the subject of Pathology (q.v.).

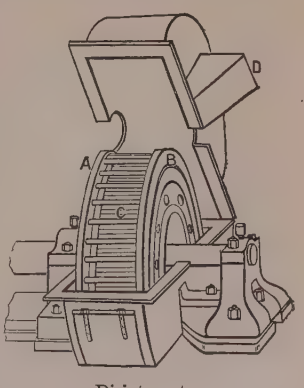
Disease, Acts Respecting. The Public Health Act of 1875, by which all the previous acts were consolidated or amended, now provides [except in London, which is dealt with in the Public Health (London) Act of 1891] for the division of England into urban sanitary and rural sanitary districts, over each of which are appointed by the acts various bodies of authority. Sewage, scavenging, water supply, infectious diseases, and hospitals, offensive trades, markets and slaughter houses, &c., are placed under the supervision and control of these bodies. The Contagious Diseases (Animals) Acts have been numerous and diversified. The chief statutes relating to the prevention of the spread of disease by killing the affected animals and by restricting the transfer of others suspected or companions of the diseased ones, and relating to other matters in connection with the (cattle, &c.) trade, &c., are the Acts of 1878, 1884, 1886, and 1890, to which the reader is referred for further information.

Diseases of Plants may be referred to four cases—(1) Parasitic fungi or other plants attacking the tubers; (2) Insects causing galls, fissures, wounds, &c.; (3) Poisonous gases in the air or soil, or any poisonous material so placed as to affect nutrition; (4) Atmospheric or other causes, 'so affecting the plants as to alter the conditions of nutrition by giving a redundancy or deficiency of air, light, moisture, warmth.' The principal D. are noticed in this work under their own names.

Dishon'our, a term of mercantile law, denoting the refusal of the drawee in a bill of exchange, promissory note, or cheque to accept or pay it. If a bill be presented and acceptance refused, or a qualified acceptance only offered, prompt notice must be given to all the parties to whom the holder intends to apply for payment. In case of a foreign bill, notice should be sent by first post or earliest opportunity. Generally, in both foreign and inland bills, notice is given next day to the immediate endorser, who is allowed a day to give notice to those who are liable to him. Delay in giving notice frees the drawer and endorsers from liability. No particular form of notice is required, but it is well to send a copy of the bill. A person having taken a cheque in payment of a debt cannot sue for the debt until the cheque has been dishonoured; but a creditor is not bound to accept a cheque. If the holder of a cheque accept payment in bank-notes, and the bank fail, the holder has no recourse against the drawer of the cheque. See BILL OF EXCHANGE, CHEQUE.

Disinfec'tants are substances which by a chemical action destroy contagious matters or effluvia from decaying animal and vegetable substances. Chlorine (q.v.) is one of the best and most powerful D. It decomposes the compounds of hydrogen, and thereby substitutes a harmless for a hurtful compound. Bleaching-powder depends for its action as a disinfectant on the chlorine it contains, as well as chlorate of soda. By adding an acid to these substances free chlorine is given off more freely. Charcoal, permanganate of potash, or Condy's fluid, chloride of zinc, or Burnett's disinfecting fluid, steel drops, sulphur dioxide, hydrate of chlorine, and carbolic acid, are all useful; but dry heat, when it can be applied, is probably the most efficient of all D.

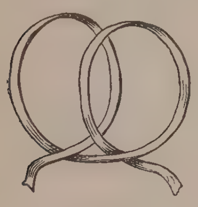
Disin'tegrator, a machine for pulverising, or disintegrating, various soft or hard materials. The patent D. of Thomas Carr, held in much favour for breaking up ores, rock, asphalt, artificial manures, peat, fireclays, oilcake, also for mixing moist sugars, the ingredients of mortar, &c., is here figured. It consists of a pair of circular metal disks, A and B, fixed to two separate shafts on one side of the machine, the shaft of the right-hand disk working through the tubular shaft of the left-hand one without touching it; an arrangement which leaves the hopper, D, by which the machine is fed with materials, unobstructed with driving-belts. The inside faces of the disks are studded with four concentric rings, or cages, of very strong projecting bars, or beaters, C; the rings of beaters in one disk occupy the opposite alternate interstices of the other, and the disks are driven in opposite directions at a high speed, varying from 350 to 500 revolutions per minute. The material to be ground being introduced through the hopper, is beaten, in its passage through the machine, with great violence by the beaters of the successive cages revolving in opposite directions, so that disintegration is thoroughly effected before the particles reach the end of their zigzag course to the cir-



Disintegrator.

cumference of the disks. A mineral D., 4½ feet in diameter, can pulverise from 5 to 15 tons of material per hour, according to the hardness of the material and the degree of fineness required. The disintegrating flourmill of the same inventor has a similar construction, and its efficiency may be judged from the fact that one, seven feet in diameter, produces as much flour, of a superior quality, as thirty pairs of millstones, and at a less cost.

Disloca'tion (Lat. 'a displacing') occurs when two bones which form a joint are displaced, and put 'out of joint.' It is often the result of violence, but sometimes of disease; and occasionally it is congenital, as in club-foot. Some joints, from their construction, especially the ball and socket joints, as the shoulders and big joints, are the most common seats of D. After these it occurs most frequently in the elbow. It is rare in children and in old age; in the latter, fracture is common. D. is liable to recur in the same joint. Surgeons divide it into partial and complete. In the latter, an external wound communicates with the joints. The symptoms are distortion of the limb, much pain, and often swelling in the neighbourhood of the joint. There is generally immobility of the limb, and always inability to use the joint. In all cases of D. there is more or less laceration of the parts around the joint. The treatment consists in returning the bones into their proper position, and maintaining them until the lacerated tissues are healed. This is effected by the surgeon in different ways, according to the joint implicated. When it is necessary to apply traction, the surgeon often does this by means of a hank of worsted applied in such a way that the traction does not cause the worsted to tighten round the limb. For this purpose the method adopted is what is termed the 'clove-hitch.' Occasionally it is necessary to use pulleys. In all cases it is good to give chloroform both to prevent pain and to relax the muscles.



Clove-hitch.

Dislocation, or **Fault,** in geology, the name given to the phenomena seen in rocks, where a crack or fissure has been formed in a series of strata, and where a displacement of the rock on either side has materially altered the original 'lie' or position of the strata. Faults vary much in nature and extent, and their effects are modified by the character of the rocks in which they occur. The dislocated strata may remain on each side of the fissure comparatively undisturbed, or may be, on the other hand, greatly bent and disturbed along the plane of the fault. Dislocations may be longitudinal ('strike faults'), or several faults may apparently proceed from one point or centre. The study of faults is of immense importance to the miner, since their occurrence in beds of coal may seriously interfere with the continuity of the seams, and cause much trouble and expense in determining the exact effects of the D. and the altered relations of the strata. The terms 'hitch,' 'slip,' 'slide,' 'heave,' and 'throw,' are applied by miners to faults.

Dis'mal Swamp, a large morass on the boundary of Virginia and N. Carolina, 30 by 10 miles, having an area of 300 sq. miles. It was formerly covered with immense trees and dense brushwood, but is now partially cleared and drained. It contains Lake Drummond, is crossed by the D. S. Canal, 23 miles long and 6½ feet deep, and is skirted by two railways on the Virginia side. There is another and smaller swamp in N. Carolina between Pamlico and Albemarle Sounds. Hither runaway slaves fled and hid themselves.

Dis'mas, St., in mediæval legend, is the name of the penitent thief.

Disorderly House. See NUISANCE.

Dis'part, in gunnery, is half the difference between the diameters of the breech and muzzle, and is of great importance to the gunner in taking aim.

Dispensa'tion is a license granted by the Pope to do some act otherwise illegal. The limits of the power having been the subject of controversy among many learned theologians, we shall not endeavour to define them. The Church, according to its own view, is empowered by God to release from vows, and to authorise marriages within degrees of relationship prohibited by the canon law. In former times, at least, it was a simple matter to apply the power to a wide department of civil affairs, by declaring that they bore upon affairs ecclesiastical. It is now, of course, only in Roman Catholic countries that D. is of any effect. In England it was abolished by Henry VIII., the power of the Pope in a very restricted form being then conferred on the Archbishop of Canterbury.

Disper'sion, of a pencil of light-rays, is the angular separation of the extreme rays of the spectrum after emergence from the prism, or, more correctly, is the difference of the indices of Refraction (q.v.) of these extreme rays. Experiment shows that the dispersive powers of different materials for light are not proportional to their refractive indices, a fact which renders possible an achromatic arrangement of lenses. See OPTICS.

Displayed', in heraldry, is a term applied to any bird of prey with its wings expanded.

Disposi'tion, in art, is the arrangement of the parts of a picture so that the form and colour of each part shall have its due effect. It differs from *composition*, in which the arrangement or design has for its aim and purpose the production of a general effect, to which all the parts contribute.

Disposition, in Scotch law, is a deed of alienation by which either heritable or moveable property is conveyed. The person to whom it is granted is called the *disponee.*

Disposition of Heritage.—The disponer or maker of the deed 'sells and dispones,' or, where the deed is gratuitous, 'gives, grants, and dispones,' the subject of the deed to the receiver, who is called the disponee.

Disposition of Moveables is a deed by which the disponer conveys his moveable estate, wholly or partially, to the disponee. This deed can only be made effectual by delivery of the subjects conveyed.

Disposition and Settlement is a deed by which a person provides for the general disposal of his property, heritable and moveable, after his death. See DESTINATION, WILL.

Disposition in Security.—This corresponds to mortgage in England, and will be explained under *Heritable Security.*

Disrae'li, Benjamin, Earl of Beaconsfield, K.G., a distinguished statesman and man of letters of the 19th c., was born in Islington, 21st December, 1804. The eldest of Isaac D'Israeli's three sons, he was privately educated at home, at Winchester, and at Walthamstow, was baptized in 1817 (the year of his father's final severance from the Portuguese Synagogue), and at an early age entered an attorney's office. The work, however, proving irksome, he abandoned it; and after extended travel, in the course of which he made the acquaintance of Lockhart, the son-in-law of Sir Walter Scott, and then editor of the *Quarterly Review*, he settled down to literary work. In 1826 he made his first successful hit in public with the brilliant and romantic novel of *Vivian Grey*, which was followed by *The Wondrous Tale of Alroy*, *The Young Duke*, *Contarini Fleming*, *Henrietta Temple*, all of which obtained for their author notoriety rather than fame. At the same time D. prepared the way for his entrance into political life by publishing *Ixion*, *A Vindication of the British Constitution*, and a poem, *The Revolutionary Epic*, which nobody is supposed to have ever read. Again D. travelled, this time in the East, and on returning plunged into the political strife that attended the great Reform agitation. He became, in 1832, a candidate for the burgh of Wycombe, and as he was recommended by Hume and O'Connell, it has been inferred that he began his active political career as a Radical, though he himself invariably affirmed that his political conduct was from first to last consistent. In 1835, when he contested Taunton, unquestionably as a Tory, and under the auspices of Lord Lyndhurst and Sir Robert Peel, he was beaten, and came into collision with O'Connell and his son, the latter of whom he challenged to fight a duel. At last, in 1837, at the age of thirty-three, he was elected a member for Maidstone. In making his maiden speech in the House of Commons, he was so disconcerted by the laughter which greeted his peculiar rhetoric and exaggerated gestures, that he sat down, saying, however, before he did so, 'I will sit down now, but the time will come when you will hear me.' D. then carefully studied both elocution and the temper of the House of Commons, and the result was soon seen in a marvellous parliamentary success. In 1841 he exchanged the constituency of Maidstone for that of Shrewsbury. Mainly by new novels, combining fiction and politics, the chief of which were *Sybil* and *Coningsby*, he became known as the chief of the 'Young England party.' His fortune as a partisan was made when, on Sir Robert Peel becoming a convert to free-trade doctrines, he attacked that great statesman with fiercely eloquent and persistent invective. Identifying himself with the Protectionists, D., who had exchanged Shrewsbury for Buckinghamshire, became, in 1848, on the death of Lord George Bentinck, their acknowledged chief. In 1852, after publishing a biography of Lord George Bentinck, he became Chancellor of the Exchequer in the cabinet of Lord Derby. Since then the history of D. may be said to be that of the Conservative party. In the three administrations of Lord Derby he held the post of Chancellor of the Exchequer, passing in the last, with the unwelcome assistance of the Liberal opposition, the Reform Act of 1867. (It may here be stated that the Reform Acts of 1832 and 1867 applied only to England and Wales, Scotland and Ireland being dealt with by other Acts; but the Representation of the People Act of 1884 provided for the whole of the United Kingdom.) When his chief resigned the Premiership in February, 1868, D. succeeded to it. In the end of the same year, however, he resigned, the general election of the time returning a majority against him on the Irish Church question. In February, 1874, another general election gave his party a great majority, and D. was again called to the post of First Lord of the Treasury; in 1876 he was raised to the Upper House as Earl of Beaconsfield and Viscount Hughenden. The Berlin Treaty (1878), the crown of his 'imperialistic' policy, was followed by the Afghan and the Zulu wars; and an appeal to the country in the spring of 1880 resulted in the unlooked-for triumph of the Liberals. The leisure of ten years earlier had yielded *Lothair*, and this now yielded *Endymion*. The name of the setting sun-god! and *Endymion's* author passed away in London, 19th April, 1881. He was buried at Hughenden, Bucks, by the side of the wife whom, as widow of Mr. Wyndham Lewis, his Maidstone colleague, he had married in 1839. She was, in 1868, raised to the peerage under the title of Viscountess Beaconsfield, and died 15th December, 1872, at the age of eighty-three, leaving no issue. No contemporary, scarce any bygone, politician was the subject of such various and conflicting criticism as D. His sincerity and sagacity were repeatedly challenged; his powers of leading often seemed misdirected, his serious eloquence excited no enthusiasm or admiration, yet his tact, audacity, ironical pleasantry, subtle humour, and unfailing courage, won him a personal popularity which his great rival could never secure, and which no modern statesman, except Lord Palmerston, has enjoyed in equal measure. It was always equally impossible both to friends and foes to discover whether, as writer or politician, he was in earnest or in jest, and very probably there were only three persons in the world who were ever permitted to become acquainted with the 'real man,' his true motives and opinions. These three persons were his secretary (Lord Rowton), his wife, and his Queen. See Lives of D., by Mill, Clarigny, Ewald, O'Connor, Hitchman, and Kebbel.

D'Israeli, Isaac, one of the best English literary anecdotists, was born at Enfield, May, 1766. His father, Benjamin D., was the descendant of a Hebrew family that had been driven from Spain to Venice by the persecutions of the Inquisition, and settled in business in England in 1747, where he made a fortune. D. was educated at Amsterdam and Leyden, and devoted himself from an early age to literature. He at first attempted satirical poetry, but found his vocation in literary and historical studies. The first volume of his *Curiosities of Literature* appeared in 1791. It is a classic in its way. It was followed by *A Dissertation on Anecdotes* (1793), *Essay on the Manners and Genius of the Literary Character* (1795), *Calamities* and *Quarrels of Authors* (1812-14), *Inquiry into the Literary and Political Character of King James I.* (1816), *Commentaries on the Life and Reign of Charles I.* (1828-31), *Eliot, Hampden, and Pym* (1832), and *Amenities of Literature* (1841). D. has a quaint, felicitous, but artificial style, on which his brilliant son's was distinctly modelled. But the elder never displayed the golden graces of the younger. D. died at Bradenham House, Bucks, 19th January, 1848. A collected edition of his works, with a Life, was published in 1858 by his son.

Diss, a market-town of Norfolk, in the vale of the Waveney, 18 miles S.S.W. of Norwich, has brush manufactories, breweries, and malting establishments. St. Mary's Church, a fine Gothic building (restored 1877), has a square tower, containing a peal of bells. Skelton, the poet-laureate in the reigns of Henry VII. and Henry VIII., was rector of D. Pop. reg. sub-dist. 7288; civ. par. and ecc. par. (each) 3763.

Dissec'tion, the method followed in anatomical schools of displaying the structure of the body in the dissecting-room, so as to enable each student to obtain as much information as possible without interference with neighbouring dissectors. The body is usually divided into ten parts, five on each side of the body, which are left in connection with one another until the D. is far enough advanced to admit of their being separated. See Quain's *Anatomy*, vol. ii. p. 1047.

Dissection Wounds are poisoned wounds received during dissection, or in making a post-mortem examination of a dead body. The virus or poison may be that of the disease from which the person died, or simply the virus of putrefaction. The former is the more dangerous. A body is more apt to produce serious results immediately after death than at a later stage. D. W. are generally caused by a puncture, and the more freely they bleed the less is the danger to the person wounded, because the blood flowing from the wound has a tendency to wash out the poison. When D. W. do not bleed freely, the wound should be enlarged with a clean knife, and in all cases washed, sucked, and afterwards cauterised with nitrate of silver, or by actual cautery. Frequently D. W. cause great constitutional disturbance. Sometimes they are followed by abscesses in the armpit, and gangrene of the diseased limb, necessitating amputation, and even causing death. In the robust, however, they seldom prove dangerous.

Dissen'ters, the name applied in Great Britain to those religious communions which, differing in either doctrine or discipline, or both, from the Episcopal and Presbyterian Churches established by law in England and Scotland, do not participate in the public support of these churches. During the 16th c. in England, Catholics and Puritans were persecuted with extreme rigour. The first instance of actual punishment inflicted on Protestant D. was in June, 1567, when a company of 100 were seized at worship in Plummer's Hall, and several sent to prison. The idea of toleration, which France had proclaimed in the Edict of Nantes (1598), was unknown. Whitgift controlled the policy of the Church towards D., and in the earlier part of the 17th c. Archbishop Laud, by the aid of the High Commission (which the royal prerogative had armed with illegal powers to fine, imprison, pillory, and mutilate), had almost succeeded in stamping out all visible signs of Nonconformity. Under Cromwell the Puritans were as intolerant and meddling as Laud; they prohibited the use of the Book of Common Prayer; they defaced churches and burnt pictures. On the Restoration it was made a crime to attend a dissenting place of worship, the penalty being transportation on a third offence, and death on return; and a further test was imposed on such divines as had been deprived of their benefices for Nonconformity, *i.e.*, for not accepting the English Book of Common Prayer. (The Act of Uniformity is 13 and 14 Car. II. c. 4, amended by 34 and 35 Vict. c. 37.) This persecution increased under James II. In 1687, however, James thought of banding all Nonconformists against the Established Church, and granted a partial measure of toleration for Scotland, Catholics and Quakers getting the right of public worship, Presbyterians only that of private worship. This was followed by the unconstitutional Declaration of Indulgence, which repealed not only the penal laws against Catholics and Puritans, but even the tests for civil and military office. The 'Five Mile Act' and the 'Conventicle Act' had previously been modified in operation by a similar declaration of Charles, which was immediately cancelled as illegal. The D. now separated into the Court party, led by Lobb (Independent), Care, Alsop, and Rosewell (Presbyterians), and Penn (Quaker), and the Church party, to which Baxter, Howe, and Bunyan belonged. The latter were in a great majority; and in spite of the efforts of the Board of Regulators of Corporations (who dismissed Tory and appointed Puritan magistrates and officers by hundreds), the D. supported the cause of the constitution, and even sympathised with the Bishops in the Tower. From what is called the Revolution Settlement—a toleration without equality of civil rights—the Unitarians were excepted, and the celebration of the Catholic mass continued to be for long prohibited. In 1779 the ministers of dissenting congregations and schoolmasters were relieved from the necessity of subscribing the Doctrinal Articles of the Church (19 Geo. III. c. 44). As in the case of Dr. Calamy, however, this subscription had frequently been dispensed with, and the Occasional Conformity Act of 1711 freed non-subscribers from the penalties. After the French Revolution a tide of liberal legislation set in. In 1813 an Act repealed the excepting clause of the Toleration Act against Unitarians, and also the Act of William which made it blasphemy to deny the divinity of Christ. The same statute led to the passing of the Act 57 Geo. III. c. 70 for Ireland, which extended complete toleration even to Unitarians. The Irish Relief Act did not pass till 1819, and required no declaration of belief in the Trinity. The Test and Corporation Acts followed in 1828, and the universities have since been thrown open to D. No measure, with regard to their legal position, has excited greater interest than the Dissenters' Chapels Act, 7 and 8 Vict. c. 45 [9 and 10 Vict. c. 59 protected the dissenters from molestation; 13 and 14 Vict. c. 28 and 15 and 16 Vict. c. 49 enabled them easily to acquire the title to land bought for religious or educational purposes; and 18 and 19 Vict. c. 81 dealt with the certificate and register of dissenters' places of worship], which was carried through by Lord Lyndhurst, Sir Robert Peel, Sir W. Follett, and Gladstone. The question was whether chapels, burial-grounds, schools, and ministers' houses, in the possession of Unitarian congregations, should be forfeited, because, at the time of the original endowment, the congregations held different opinions in theology. The Court of Chancery, in the case of Lady Hewley's trust, &c., had decided that new trustees must be appointed, and an Act then became necessary to secure other trusts in a similar position. In the proceedings it appeared that when in 1719 the 'Bill for strengthening the Protestant interest' (5 Geo. I. c. 4) was brought forward to repeal the restrictive portions of the Schism Act (12 Anne, c. 7), and the 'Occasional Conformity Act,' an attempt was made, and failed, to add to the Oath of Abjuration a declaration of belief in the ever-blessed Trinity, and that in the celebrated Salters' Hall Controversy (1719) a general meeting of all the English D. declined to say that the doctrine of the Trinity should be a term of communion. The three great bodies of English D.—the Presbyterians, Baptists, and Independents—have a joint organisation called the 'Three Denominations,' with the right of addressing the sovereign in presence. This right has been exercised. D. from the National Established Church in Scotland can hardly be said to have existed prior to Erskine's secession of 1733; as the Cameronians, or Hill Men, the descendants of the Remonstrants of the Sanquhar Declaration, were rather the growth of the wars of the persecution, and their principles put them out of relation with all other classes. In 1747 the Associate Synod split into the Burghers, and Anti-Burghers, and those again into the New Light Burghers, the New Light Anti-Burghers, the Old Light Burghers, and the Old Light Anti-Burghers. At the present time the bulk of these secessions from the Established Church are reunited in the United Presbyterian Church. The Episcopal Church was tolerated under the Act 5 Geo. I. c. 28, only qualified persons being allowed to hold divine service. They had themselves a fierce dispute between the College party under Lockhart and the Usagers under Gadderer. The Church was so much identified with the Rebellion of 1745, that statutes were passed narrowing the definition of a congregation (so as to encroach on private worship), and requiring letters of orders from English or Irish bishops in every case. There was, of course, a good deal of secret Catholicism, the principal stations of Jesuitism being Munches, Edinburgh, Aberdeen, Braemar, and Strathglass. In 1773 there were only seven Jesuit missionaries in Scotland. In the N. of Ireland the Presbyterian D. lived in harmony till the beginning of the 19th c., when the Trinitarian and Unitarian parties, under Drs. Cook and Montgomery respectively, separated, each retaining its share of the *Regium Donum* down to the Irish Church Act of 1869. In 1854 some excitement was created by Lord John Russell's Ecclesiastical Titles Act, prohibiting the use of British geographical names in the titles of the Catholic clergy. The Act was never put in force. The right of Dissenters to burial, with an appropriate service, in the parish churchyard, was not conceded till 1880. See Herbert Skeat's *History of Free Churches*.

Dissenters, Laws Regarding. See ACT OF TOLERATION.

Dissolu'tion of Marriage. See DIVORCE, DIVORCE AND MATRIMONIAL COURT.

Dissol'ving Views are produced by employing two magic lanterns, so arranged that their respective images may be super-imposed on the screen, and that, as the one is made to fade away gradually, the other increases in brilliancy, thus producing the appearance of the one dissolving almost imperceptibly into the other.

Diss'onance, in music, a disagreeable roughness produced when certain notes are sounded together. See CONSONANCE.

Dis'taff (Old Eng. *distaef*, 'the bunch or tuft of flax on the staff'), an implement formerly used for holding flax, wool, or other fibres in the process of spinning yarn from them. It is mentioned in the Proverbs of Solomon, 'She layeth her hands to the spindle, and her hands hold the distaff;' and frequent allusion is made to it by Homer and other classical writers.

Distaff.

Distem'per (Fr. *détrempe*, from Lat. *de*, and *temperare*, 'to temper'), a method of painting and illuminating in use almost throughout the Middle Ages, with pigments ground up with size, weak glue, gum water, or other vehicle instead of oil. It is still used for scene-painting, the decoration of staircases, &c., and within recent years in house-decoration, in which the chief mass or field of colour is often laid on in D., relieved by a border in stencilling, or partly stencilled, partly hand-painted. The brilliancy of some of the older pictures in D. was obtained by using a varnish of wax dissolved in an etherous oil. One drawback of painting in D. is that it is difficult, owing to the rapidity with which the vehicle dries, to blend or graduate the tints. Yet in D. the painters of the early Cologne school developed a beautiful and glowing style of colour. The improved method of painting in oils invented by Van Eyck, about the middle of the 15th c., superseded D. for strictly pictorial arts, and since 1500 easel pictures have been painted almost exclusively in oils.

Distemper, a disease affecting young dogs, very much as infantile fevers affect children. It appears to be an inflammatory affection, often very acute in its earlier stages, and inducing in some dogs symptoms not unlike those of madness. The symptoms of D. are loss of spirits and appetite, dislike for exertion, dull eyes, and coldness of the body and limbs. Discharges appear from the nose and eyes, and vomiting may occur. In some dogs the nervous symptoms are greatly exaggerated, and exhibited in convulsive spasms; whilst as the disease progresses, the inflammatory action appears to extend down the respiratory passages, and to affect the bronchial tubes and lungs. The disease usually attacks dogs from the third to the sixth month of their age; but it also shows itself much later. D. appears to be contagious from one young dog to another, and to affect different kinds of dogs very variously. It tends to run a definite course, and the dog rarely or never suffers from a second attack. The treatment consists in giving from two to three grains of calomel daily, as a purgative, in milk; James's powders may also be given with advantage instead of the calomel. The food should be light but sufficient, and the eyes and head generally should often be bathed with lukewarm water, the animal being guarded from subsequent cold. Indeed, he must be carefully tended from first to last, and be warmly housed, else the disease may leave permanent effects in the form of suppurating ears or other painful affections.

Distilla'tion (Fr. from Lat. *de*, and *stillatio*, 'a dropping'), is one of the oldest chemical processes, and was much in vogue with the alchemists.

The object of D. is to separate volatile from fixed substances, or volatile substances from one another. The principle of the process is simple. When heat is applied to a mixture of fixed and volatile substances, ebullition eventually takes place, and the volatile substances are gradually converted into vapour. If this vapour be caught and cooled, it will return to the liquid condition, whereas the fixed substances remain in the vessel in which the mixture was originally heated. Thus if sea-water be heated till it boils, steam is given off, and the steam if cooled yields pure water, whereas the saline ingredients present in the sea-water, being fixed substances, remain unvolatilised. Most ships intended for long voyages are fitted with the proper apparatus for distilling sea-water; and thus, if there be sufficient fuel, fresh water may be obtained at any moment. In the case of the separation of volatile substances from one another, advantage is taken of the fact that the most volatile body is the first to become vapour, so that if the first portion of vapour be cooled, the resulting liquid contains the greater part of the most volatile substance, whereas the liquid obtained by cooling the last portions of vapour contains most of the least volatile substance. This process of *fractional D.* will be explained more fully further on.

The apparatus in which D. is performed is called a *still*, and assumes various forms; but it consists essentially of two parts—a vessel in which the liquid to be distilled is heated (*body of the still*), and one in which the vapour is cooled (*condenser*). The simplest form of the still is that in which the body of the still is a glass retort, and the condenser a flask immersed in cold water. The vapour arising from the liquid boiling in the retort passes into the flask, and there condenses to a liquid. But such an apparatus is inconvenient for distilling large quantities, because the water used in cooling soon grows warm (from the great amount of heat given out during the transformation of a vapour into a liquid), and must therefore be frequently changed, which disarranges the whole apparatus. To obviate this, use is made of a *worm-condenser* (Fig. 1), a coil of pipe immersed in a vessel through which a current of cold water is flowing. The cold water arrives by a tube attached to the bottom of the vessel, and escapes by a tube placed near the top. Another convenient form of condenser was invented by Liebig (Fig. 2). It consists of a narrow tube passing through a broad one, and fitted into the latter by means of corks. The broad tube is provided with two smaller branches, one at each end. Through the lower branch cold water is made to enter, and after traversing the whole length of the tube, flows out through the upper branch. Thus the narrow tube (into which the vapour from the boiling liquid enters) is kept cold by a stream of water flowing over its external surface.

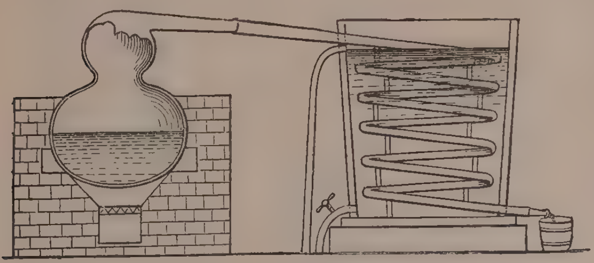


Fig. 1.—Worm-Condenser.

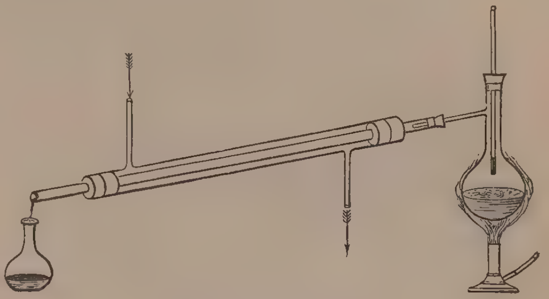

Fig. 2.—Liebig's Condenser.

Fractional Distillation.—It was stated above that when a mixture of substances of different degrees of volatility is heated, the most volatile is the first to assume the state of vapour; so that, on distilling a mixture of volatile bodies, the most volatile passes over first, leaving the less volatile to follow. But complete separation by means of a single D. can only be effected when the temperatures at which the different bodies boil are widely removed from one another, and only then if the different liquids are not chemically allied. The first portions of the distilled liquid or *distillate* always contain the largest proportion of the most volatile body, and the latter portions least. On subjecting the first distillate or *fraction* to a redistillation, and collecting the first portions that pass over separately, they will be found to contain a still larger proportion of the most volatile substance, and on repeating the process for a greater or less number of times according to circumstances, the most volatile body can, in most cases, be completely isolated. In the same manner, by repeatedly rejecting the first portions of the distillate, and collecting the last, and by repetition of the process, the least volatile body may be obtained in a pure condition. In conducting a fractional distillation, a thermometer is immersed in the vapour of the boiling liquid, and throughout the process the temperature is carefully observed. As soon as ebullition commences the temperature is noted, and the distillation allowed to proceed till the thermometer marks a certain rise in the temperature of the vapour. The vessel into which the distilled liquid is flowing is now changed, and the distillation continued during a fresh interval of temperature. The vessel is again changed, and so on till the whole of the liquid, or as much as may be required, is distilled. The first fraction (*i.e.*, the liquid which comes over during the first period of the D.) is again distilled, collecting as before in separate vessels; and this process is repeated until the boiling-point of the first fraction remains constant—constancy in the temperature of a boiling liquid being a criterion of its purity. If it be desired to separate the liquid boiling at a higher temperature, the last fractions are similarly treated, except that the more volatile portions are set aside, the less volatile alone being redistilled.

Alcohol is rectified by fractional D. Pure alcohol boils at 78° C., water at 100° C. A mixture of the two will commence boiling at a temperature below 100° C., and the nearer to 78° C. the more alcohol it contains. In rectifying alcohol, the mixture of alcohol and water is distilled till the temperature of the vapour reaches 100° C. During this rise the whole of the alcohol passes over, and the residue in the retort is pure water. In tolerably dilute solutions all the alcohol has passed over when a third of the mixture has been distilled. The alcohol thus rectified still contains a considerable proportion of water. On submitting it to a second D., and collecting, as before, only those portions which boil below 100° C., it may be further purified. And on repeating the process finally, collecting only that portion boiling within 10° C. of 78° C., a very strong alcohol may be obtained, containing only 13 per cent. of water. Owing, however, to the great attraction of alcohol for water, it can never be completely freed from the latter by rectification alone.

The process of D. is of much practical importance. All kinds of spirits are prepared by its means from dilute solutions of alcohol. Coal-tar is separated into benzine (from which the aniline colours are manufactured), into oils for lubricating machinery, into heavier oils for preserving wood, and into a variety of other products. In the manufacture of perfumes from flowers, the latter are distilled with water, and the steam carries along with it their essential oil, which condenses along with the steam, and may be readily separated from the water.

Destructive Distillation.—There are many substances which, though not volatile in themselves, are nevertheless resolved by heat either partially or wholly into volatile products. If such substances be heated in a still, the volatile products, as fast as they are formed, pass into the condenser, and there assume the liquid condition. This is the process of destructive D. Wood is a substance which cannot be volatilised intact, but when heated suffers complete decomposition, and yields various volatile products, together with charcoal, which is a fixed substance. The destructive D. of wood is carried out on the large scale on account of the valuable substances contained in *wood-tar* (the volatile products arising from the operation), as well as on account of the charcoal. From wood-tar most if not all the acetic acid of commerce is prepared. It also contains wood-spirit or naphtha, creosote, paraffine, various hydrocarbons, &c. The process of gas-making is another instance of destructive D. Coal is heated in iron or fireclay retorts; here it suffers decomposition, and is resolved into various volatile substances, and into coke (a compact form of charcoal). The coke, being a fixed substance, remains in the retort, whereas the volatile bodies pass off as vapour, and are made to traverse a considerable length of wide iron tube, cooled externally by the air. In this tube various liquid and solid bodies condense, forming a black viscid liquid called *coal-tar;* whereas the permanently gaseous products (gas) pass on unaffected, and after traversing various purifying apparatuses, at length enter the gasometer or store-chamber. The products of the destructive D. of substances are generally numerous and of a highly complex character, but this is not always the case. Thus if oxalic acid be distilled, it is resolved into carbonic acid, carbonic oxide, and water.

Distilled′ Water. Spring-water contains various impurities, among which are salts of ammonia, lime, and magnesium. When it is distilled, these impurities remain behind, and pure water passes over. It is well to reject the first portions of the D. W., as they are apt to contain a little ammonia, and the last, as they may contain traces of hydrochloric acid. Where D. W. cannot be procured, rain-water may be substituted, for it is water distilled by the sun's heat. It is insipid, without odour, and is used for making many officinal preparations in medicine.

Distilled Waters are prepared by distilling water along with the parts of plants containing volatile oils, as lavender-water, peppermint-water, &c.

Distress′, in English law, signifies the seizing of the personal effects and chattels of a debtor, and holding them as security for the debt, or selling them in payment of it; or of a wrong-doer as a pledge that a duty be performed by him or an injury redressed. D. is now chiefly enforced by landlords against tenants for non-payment of rent. Executors may distrain on behalf of the testator before or after Probate (q.v.). A husband may distrain during his wife's life for arrears of rent of her land or houses accruing before or during marriage. All chattels found on the premises, whether the property of a tenant or a stranger, may be distrained (except things in the custody of the law; wild animals; fixtures; goods under bailment in course of debtor's trade; a lodger's property; an ambassador's property; gas-meters; railway cars and trucks, not belonging to debtor; woollen, cotton, and silk loom goods; beasts of plough, sheep, tools of trade beyond £5 in value, and agisted stock (all conditionally, if there be enough of other property to satisfy debt); hired machinery; wearing apparel, bedding, tools, &c., of trade, of £5 in value; breeding stock; and articles *in use*). Nothing can be distrained which cannot be returned in as good a state as when taken. D. must be in proportion to the sum distrained for. See EJECTMENT and SALE. For Scotch law, see HYPOTHEC, SEQUESTRATION FOR RENT.

Distribu′tions, Statute of. The division of the personal property of those who die intestate and without settlement in England is regulated by the 22 and 23 Car. II., called by this name. After payment of debts and funeral expenses, if the deceased leave a widow and children, one-third goes to the widow, and the other two-thirds in equal portions to the children; or, if any of the children be dead, to their issue in equal portions. If there be no children nor lineal descendants of children, one-half goes to the widow, and the residue to the nearest of kin of the deceased in equal degree, or their representatives; but by statute 53 and 54 Vict. c. 29, the widow is entitled to receive at least £500, and if the estate be not of that value, she obtains the whole. If there be children but no widow, then the whole is divided among the children or their representatives. If a child has been portioned, the portion will be held as part of his share. An *heir-at-law* is entitled to his full share of the personal estate. If there is neither wife nor children living, nor representatives of deceased children, the whole property goes to the father of the deceased. If he has no father living, the whole goes to the mother, brethren, and sisters of the deceased in equal portions. If there are neither brothers nor sisters, the whole goes to the mother. If the mother be dead, the whole goes to the brothers and sisters and their children, failing all these, the whole goes to the grandfather or grandmother. After these, uncles, aunts, and nieces share equally. Failing all the above-mentioned relatives, the whole goes to the nearest of kin; and failing kin, to the Crown.

Dis′tricts, Mil′itary, certain divisions into which the country is marked off for purposes of efficiency in recruiting and organising the army. Prior to the passing of Cardwell's Act, in 1872, for localising the forces, England was divided into four districts, Scotland was one, and Ireland had five. Now there are in England ten general districts, or District Commands as they are called, each of which has headquarters as follows:—The north-western, with Chester as its headquarters; the eastern, with Colchester; the north-eastern, York; the western, Devonport; the southern, Portsmouth; the Thames, Chatham; the south-eastern, Dover; the home, Horse Guards, London; the Woolwich; the Aldershot. Scotland is one general district, with headquarters at Edinburgh. Jersey is a military district; Guernsey and Alderney another. In Ireland, there are the Belfast, the Dublin, the Cork, and the Curragh districts.

Ditch, in agriculture, a deep trench excavated along the sides of a field to serve as a main channel for the drain-water. In modern farming, ditches are frequently converted by the use of drain-tiling into covered sluices.

Ditch, in fortification, is the excavation in front of a parapet or rampart, and one of the chief defence-works. The earth taken from it supplies a parapet in field fortification, and the greater body of the material for a rampart in permanent works. It is kept dry, unless when actual danger is apprehended from without. The inner slope of the D. is the scarp; the outer, the counterscarp.

Dithyram′bus, a name of Bacchus, the origin of which is unknown, was a species of poetry invented by Arion, and cultivated by the Doric lyric writers, and afterwards at Athens. It was first used in honour of Bacchus, but afterwards also of other gods. It was elevated, but often bombastic in style, was accompanied by flutes, and gradually lost its regular choral or antistrophic character.

Dit′marsh, or **Dithmarch′en** (*i.e.*, the Deutsch or German marsh-lands), a fertile coast district in the W. of Holstein, between the estuaries of the Elbe and the Eider. It has a flat coast, indented by a great bay, and its chief towns are Meldorf, Brunsbüttel, and Heide. In the time of Karl the Great, D. was ruled by Abbio, or Albion, the companion in arms of Wittekind, and became a province or *Gau* (*Thiatmaresgaho*) of the Frankish empire in 804. It formed part of the Markgrafdom of Stade, and later (1474) of the Duchy of Holstein, which had been granted in feoffment to Christian I. of Denmark in 1460. In 1500 D. revolted, and after a vigorous struggle under Wolf Isebrand, threw off the Danish yoke, and remained an independent state till Frederik II. again subdued it in 1559. The famous *Dithmarsisches Landbuch*, or legal Code of D., was drawn up by forty-eight judges in 1321, printed in 1497, revised in 1567, and imposed anew in 1711.

Ditt′any (*Dictamnus*), a small genus of Rutaceous plants, natives of Southern Europe, Asia Minor, &c. The Fraxinella D. and the White D. (common or bastard D.) have been long cultivated in gardens for the fragrance of their leaves and their handsome flowers. The inflorescence and the outer parts of the flowers themselves are covered with glands secreting a resinous or oily volatile matter, which ignites with a flash in hot weather when the flowers are fading, if a light is applied to it. The white, thick bitter root was at one time much used in medicine as a tonic, aromatic, stimulant, diuretic, antispasmodic, and otherwise. The D. of Crete is *Origanum Dictamnus*, a plant of another order. (See MARJORAM.) The name is also applied to *Cunila maranaia*.

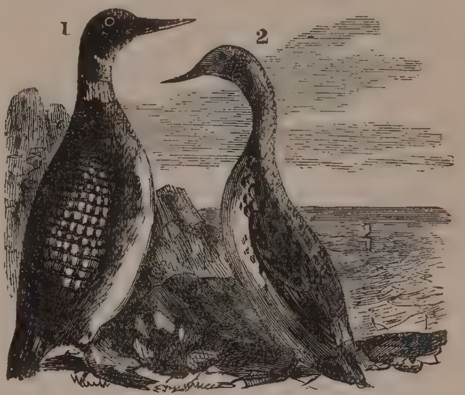
Dittelas′ma, a genus of *Sapindaceæ*. The berries of *D. Rarak* of the Malay Peninsula and S. China have marked saponaceous properties, 'making a lather even with salt water; used as a lotion, they are useful in skin-diseases, and when eaten produce giddiness.'

Diu′ (Sansk. *Dvipa*, 'an island'), a Portuguese island in the S. of the peninsula of Guzerat, Hindustan, at a short distance from the coast, has an area of two sq. miles, and a pop. of 13,016. It was famous in early times on account of the splendid temples of Mahadeva, destroyed by Mahmud of Ghizni in 1024. Seized by the Portuguese in 1515, it soon after became one of the most flourishing places of trade in India. The fortified town of D. lies at the E. end of the island, and is the seat of the Portuguese governor, who is subordinate to the Governor-general of Goa. Nothing of startling importance has happened here since 1670, when the place was sacked by Arabs. The harbour is small but safe. The coco-nut tree flourishes here, but agriculture is much neglected. The inhabitants chiefly support themselves by fishing. Besides D. town, there are three large villages—Nagwa, Bachawara, and Monakbara.

Diuret′ics are medicines which stimulate the kidneys. They are mostly given in dropsies. D. diminish the watery portion of the blood, and hence cause absorption of fluid from serous cavities and from the meshes of areolar tissues. Examples are the salts of potash, broom, foxglove, and juniper.

Divan′, a word of very various signification. In Persian, *diwân* means 'a book of many leaves,' 'an account-book,' 'a collection of books,' 'a senate or council.' In European languages it signifies a register, a muster-roll, a collection of poems, any administrative Turkish court, but especially a privy council or cabinet of the Sultan of Turkey. It also is applied to the room in which such a council sits—and hence to any room for the reception of distinguished guests—and to the low seats or cushions for their accommodation; for which reason the name D. is applied to a sort of sofa by the Western nations of Europe. The Turkish D. or State Chancellorship includes the greater number of the officials known under the name of *qualemié* or secretaries, and consists of five grades of officials, of which the highest grade corresponds with that of a general of division.

Di′ver, or **Loon,** a genus of Natatores (q.v.), or Swimming birds, belonging to the family Colymbidæ, and distinguished by the long, compressed bill with curved tip, by the short tail, the short tarsi, the three front toes being webbed, and the first and second quills being the longest in the wings. Of these birds, the Great Northern D. is the best known. It attains a length of $2\frac{1}{2}$ or 3 feet, and is green, black, and purple above, with a white breast and abdomen. The neck and upper breast are banded with two black collars, and the black of the back is variegated with short white streaks. This bird is common on the N. coasts of Britain. The eggs number two, and are dark-brown; the nest is little more than a bare patch on the ground. The black-throated D. and the red-throated D. are two other British species. The former is marked boldly with black and white on the back; the latter is of smaller size, and has a reddish throat. The red-throated D. is sometimes known as the Sprat loon; and the Great Northern D. as the loon and ember goose.



1, The Great Northern Diver; 2, The Red-throated Diver.

Diver′gent. See CONVERGENT.

Div′idend, in bankruptcy, is the share which a creditor ranked on the estate has in any fund falling to be divided. When a creditor has not been ranked in time to share in any declared D., if he prove his debt in time to share in a subsequent one, he is entitled to the arrear (called an *equalising D.*) out of any money for the time being in the hands of the trustee; but he is not entitled to disturb the distribution of any dividend, declared before his debt was proved, by reason that he has not participated therein. The term is also applied to the periodical (usually half-yearly) interest or profit arising from the public funds or from joint-stock undertakings.

Divi-Divi, the pods of *Cæsalpinia coriaria*, a great leguminous tree, a native of S. America. It is very rich in tannin, and is extensively imported for the use of tanners and dyers. D. is a strong astringent substance.

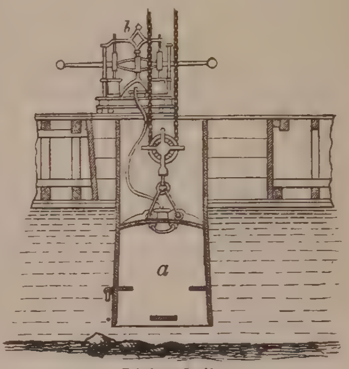
Divina′tion (Lat. *divinatio*), the presension or discovery of things future or hidden, by rites, omens, or other supernatural agency. The Latin term was used in a more restricted sense than the Greek (*mantikē*), which latter signifies the ascertaining of the will of heaven by any means whatever, whether through the mouth of the inspired seer or by the skill of the diviner. In all ages, and under all religious systems, the desire to penetrate the unrevealed and to know the future has prevailed in a greater or less degree. This yearning is rooted deeply in the human heart, and doubtless had its rise in the almost universal belief that gods and men had, at one time, met face to face. The belief that the gods care for man gave birth to another—that they sent indications of their will; hence it became the aim of mankind to interpret these manifestations. The Chaldeans had recourse to astrology, and tried to read the future by the aid of the stars. The Greeks, and after them the Romans—through Apollo, god of prophecy, and his inspired priesthood; through sacred books; by dreams and lots; by the flight, feeding, and chattering of birds; by the entrails of beasts; by placing straws on red-hot iron; by appearances in the heavens, such as comets, meteors, lightning, eclipses; and in countless other ways—strove to know the will of heaven. In the Middle Ages the same beliefs prevailed, and the already extensive catalogue of objects big with fate was increased. Even yet, D. flourishes in phases varying from the fortune-telling of the gipsy to that strange delusion spiritualism. The seeds of D. have become so rooted in our everyday life and conversation that they almost escape our notice, but reference to a few of them will suffice to prove not only their universality, but also their abiding influence. Such are the evil-eye, the sight of magpies, the number thirteen at table, the first-foot, the fact of stumbling, meeting a hare (the witch's steed), the fixing of the wedding-day, grouts in the tea-cup, the burning of nuts at Hallowe'en, spilling of salt, &c. Both in ancient and modern times omens have been drawn from sneezing, and nurses still exclaim when a child sneezes, 'Bless the child,' 'God bless it,' just as the ancient Greek cried *Zeu sōson!* 'Zeus save thee!' Many of the above-named modes of taking omens or reading the future were comparatively harmless, as they concerned the deluded inquirer only; but matters were much more serious when the diviner sought to ascertain the guilt or innocence of persons accused. Recourse was then had to an *ordeal*, and the individual was condemned or acquitted according as he stood the test imposed. The principal modes of D., which will be found under their proper heads, were Axinomancy, Belomancy, Bibliomancy, Botanomancy, Capnomancy, Cheiromancy, Coscinomancy, Crystallomancy, Geomancy, Hydromancy, Lithomancy, Oneiromancy, Pyromancy, Rabdomancy, Teraphim.

Divine Right. In former times the monarch was by a party regarded as the representative of the deity, and consequently as having no moral responsibility. Much learning has been shown in seeking to maintain or refute this view. That the king rules *jure divino* forms the groundwork of the learned and very abusive *Defensio Regia pro Carolo I.* of the learned Claudius Salmasius. He had for his opponent in the controversy the hardly less learned John Milton. The two great scholars abuse each other freely in classical Latin—*asinus* (ass), *pecus* (beast), and such-like terms being freely dealt with between them. See the *Convocation Book* of 1603; Archbishop Leslie's *Power of the Prince;* Sherlock's *Case of Resistance to Supreme Powers* (1684); Mackenzie's *Jus Regium* (1683); for the modern High Church view, Dr. Pusey's *Sermon on the 5th of November* (1837), and also Allen's *Royal Prerogative* (1849).

Divine Service, a tenure by which the tenant was bound to perform some special D. S. for the lord of the manor—as to sing so many masses. The tenure is obsolete.

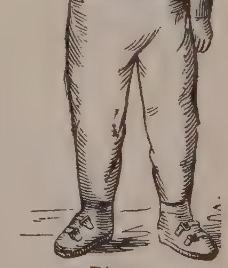
Div'ing. See Diving-Dress, Pearl and Sponge Diving.

Diving-Bell, a vessel open at one end only, and of various shapes, which can be lowered into water with the open end downwards, and replenished with fresh air, so that men within it can breathe freely and work beneath the water. The earliest reliable account of anything resembling the modern D.-B. is a quotation by Gaspar Schott, a Jesuit priest, in 1664, from a book by John Taisnier. The passage describes how the latter, in 1538, saw two Greeks descend into the water in a large inverted 'kettle' suspended by ropes. After this time the D.-B. often engaged the attention of ingenious mechanicians, but it was Dr. Halley, F.R.S., who, in 1720, proposed the changes which first rendered it really useful. The great difficulty in the way of its use was the want of adequate means of replenishing the air in it, so as to make it possible for men to remain in it for any considerable length of time. Dr. Halley's principal invention was an arrangement by which barrels of air could be lowered to the men in the bell, and their contents allowed to pass into it, while the foul air could at the same time be discharged. In spite of the practicability of this plan, Halley's D.-B. does not seem to have been introduced into engineering operations. Smeaton (q.v.) was the first to employ the D.-B. for this purpose, and to him seems also to be due the first use of a force-pump to supply the bell with air. The first engineering work of any magnitude in which the D.-B. was employed was Ramsgate harbour (1788), for which Smeaton was the engineer. Since that time it has come into general use among engineers, and has been constantly employed in the preparation of submerged foundations, the laying of masonry under water, &c.



Diving-Bell.

The illustration shows the form of D.-B. commonly used, which differs very little from that of Smeaton. It is made of cast-iron, and is suspended by tackle from a boat or scaffolding. The upper part of it contains small panes of thick glass, which are sufficient in bright weather to give light to the men inside. The pipe from the air-pumps is connected with the top of the bell, and is fitted to a valve opening inwards. As the bell is gradually lowered, air is pumped into it to prevent the water rising to an inconvenient height as the air already in it becomes compressed. By continually adding air, the water is kept out of the bell. As soon as the bell has reached the required position, the workmen signal to stop lowering. Signals for various purposes can be given, according to a preconcerted code. Air-pumps are constantly at work while the bell is under water, the used-up air continually escaping under its lower edge, and coming to the surface in bubbles. The pressure of the air in the bell depends upon the depth to which it is immersed. It seldom exceeds double the atmospheric pressure, which corresponds to a depth of between 30 and 40 feet. Breathing in such a dense atmosphere causes considerable discomfort to those unaccustomed to it, but no permanent ill effects to the workmen. The greatest depth under water at which work has been done is about 120 feet. This was reached in the foundation of the East River bridge, New York, for making which an air-tight caisson (similar in principle to a D.-B.) was employed. The pressure here was more than four times as great as that of the atmosphere, and the men could remain in the caisson only about twenty minutes at a time. See Caisson.



Diver.

Diving-Dress, a watertight dress, including a helmet, so arranged that its wearer can move freely under water. Some kind of dress which answers this purpose more or less imperfectly has been long known, but only within the last few years has it been brought into a really practicable form. The dress is of india-rubber cloth, and the helmet of metal, the latter having plates of glass opposite the eyes, and a nozzle for the attachment of the air-pipe. The diver has lead weights on his chest and back, and descends into the water by a rope ladder from a boat or wharf. He can give signals by means of a cord, and can remain submerged for five or six hours. The employment of divers in a dress instead of a diving-bell is now very common. Not only would it often be very inconvenient to fit up the necessary apparatus for the heavy bell, but often also the work can be done more satisfactorily by divers than by workmen who cannot get beyond a very confined space.

Divin'ing Rod, a forked branch, usually of hazel, formerly believed to have the power of indicating a treasure, mineral vein, a spring of water, &c., by bending towards the thing sought. In modern practice the diviner is placed in contact with a metallic or other magnetic substance. The art is still practised in Italy and the S. of France, under the names of *metalloscopy* or *hydroscopy*, according as the object sought is a metallic vein or a spring of water. Men of science have professed their belief in the D. R., though some of these are not clear as to the cause of its influence. Bayle's *Dictionary*, in the notes to the article 'Abaris,' contains some interesting facts bearing on the subject. See also De Quincey on *Sortilege*.

Divir'igi, a town in the vilayet of Sivas, Asia Minor, on the Tshalta, a tributary of the W. branch of the Euphrates, 23 miles W. of Egin. It is situated in a hilly region, is elevated about 1000 feet above the sea, and has some trade in fruits. Pop. 7800. D. was the ancient *Tephrene*.

Divisibil'ity, the property which all matter possesses of being separated into parts. To what extent the process may be carried on is a matter of speculation, the general belief being at the present time, however, that matter is ultimately composed of indivisible particles called atoms. (See ATOM.) There are some very striking examples in physics of this general property. Goldleaf has been obtained of a transparent thinness; and a film of the same metal can be formed not exceeding the ten-millionth of an inch. A single grain of blue vitriol tints five gallons of water. A musk grain that has perfumed a room for years shows no diminution in its weight. The animal kingdom gives many examples of extreme attenuation of matter.

Divi'sion, a fundamental rule of arithmetic, which gives the method of finding the number of times one figure contains another. The number to be divided is the *dividend*, that which divides is the *divisor*, and the result of the operation is the *quotient*. When the dividend contains the divisor an exact number of times, the former is said to be *divisible* by the latter. The distinctive symbol of D. is $\div$; thus $a \div b$ means the operation of dividing a by b. The same thing is far more frequently expressed, especially in algebra, by the fractional form, namely, $\frac{a}{b}$. The usual methods of D. are to be found in any treatise on arithmetic or algebra.

Division, Military, a section of an army, commanded by a general, usually consisting of two, and sometimes of three, brigades (see BRIGADE), and embracing infantry, cavalry, and artillery. The number of divisions in an army varies according to the number of men in the field or the scale of a war.

Division, Naval, was a secondary section of a fleet, forming a third part of a squadron, of which there were usually three in the most complete English fleets. The term is now practically abolished since the adoption of iron-clad and heavily-armed steamers.

Division of Labour is of two kinds: 1st, simple co-operation, which may be illustrated by the case of two greyhounds running together and killing more hares than four greyhounds running separately; or by the case of sawing timber, rowing a large boat, &c.; 2nd, complex co-operation, where 'one body of men having combined their labour to raise more food than they require, another body of men are induced to combine their labour for the purpose of producing more clothes than they require,' to be exchanged against the surplus food (Wakefield's Notes to Adam Smith). Such is the geometrical definition of political economy, but in reality the growth of D. of L. is much more natural, more complex, and less conscious, and is modified at every stage by the positive institutions of society, such as slavery, castes, craft guilds, trades' unions, &c. The production of a coat nowadays requires the following trades:—Sheep-breeder, sheep-feeder, wool-dresser, wool-spinner, weaver, dyer, and tailor, without counting the carriers, wholesale merchants, factors, &c., who act as middlemen between different classes of manufacturers. All these persons require to be provided with food, lodging, fuel, and clothing; hence, within limits, it may be said that the existence of one important branch of industry requires the existence of all others. Hence, not only does D. of L. increase the *quantity* of production, it renders *possible* a great many *kinds* of production. It has been said that no country has a productive agriculture unless it has a large town population or an export trade to supply. The increase of skill, the saving of time, and the saving of material sufficiently explain how D. of L. increases the quantity of production. Say mentions that there are 70 operations in cardmaking; Baggage that there are 102 in watchmaking; and yet the products of these numerous operations are sold very cheaply. Many great mechanical improvements have also been suggested by the attention of individual workmen being concentrated on single processes. The D. of L. is at all times necessarily limited by the market for the article, and by the nature of the employment. Whether production can be carried on most efficiently on a large scale is, therefore, a question depending not merely on theoretical advantages of D. of L., but also on such circumstances as the extent of population, the means of communication, the realised wealth of the community, &c.

Divorce'. Previous to the Matrimonial Causes Act of 1857, a marriage could only be dissolved in England 'after tedious and costly repetitions of the same inquiry before separate and distinct tribunals, the last of which was the House of Lords.' At that time, an apparent marriage might be declared null on the ground of Degree of Kindred (q.v.), or Bigamy (q.v.), and on some other grounds; but the effect of the legal declaration was to establish the fact that marriage had never existed. D. of course presumes the existence of marriage. Under the Act referred to, a husband may obtain D. on the ground of his wife's adultery. A wife may D. her husband on the ground of adultery and cruelty or two years' desertion, or on the ground of incestuous or bigamous adultery by itself, or on the ground of certain gross offences. Condonation (q.v.) or Collusion (q.v.) bars D. Desertion, however long, is not sufficient ground for D. unless accompanied with adultery. (See DESERTION OF SPOUSE, JUDICIAL SEPARATION.) After D. husband or wife may marry again, even with the co-respondent. The Judicature Acts have dealt with the practice and procedure of the Divorce Court established in 1857, and transferred its jurisdiction to the Probate, Divorce, and Admiralty Division of the High Court of Justice.

By the law of Scotland, D. may be had on the ground of adultery, or of wilful desertion for four continuous years. But neither of these grounds dissolves the marriage *ipso jure*. The offender forfeits all pecuniary benefit which might otherwise accrue to him or her from the marriage. Condonation or collusion also bars D. in Scotland. Recrimination does not; but as common guilt may affect the pecuniary interests of parties, it may be alleged in a counter-action. The guilty party, as well as the innocent, may contract a second marriage after D., but by special statute two guilty parties, declared so in the decree of D., are prohibited from intermarrying. After mutual decrees of D. each party takes his or her property as nearly as possible in the same condition as it was before the marriage, but when D. is obtained by one spouse, the decree binds the property of the guilty party for the entire benefit of the other, just as if the guilty party had died at that date.

Dix'on's Entrance, off the Pacific coast of N. America, is the strait between Prince of Wales and Queen Charlotte Islands, and an inlet receiving the Simpson River. It is about 100 miles long from W. to E., and partly separates British Columbia from Alaska.

Dixon, William Hepworth, an English author, descended from an old Puritan family, was born at Newton Heath, in the West Riding of Yorkshire, 30th June, 1821. After being for a short time in a Manchester mercantile house he took to literature, and settled in London in 1846, where he was called to the bar in 1854. He first attracted attention by his *John Howard and the Prison World of Europe* (1849), and two series of essays *On the Literature of the Lower Orders* and *On London Prisons*, originally published in the *Daily News*. D. now devoted himself almost entirely to historical and biographical works, publishing a biography of William Penn (1851), which obtained notoriety from its answer to the charges made against the great Quaker by Macaulay, a *Life of Robert Blake* (1852), *The Personal History of Lord Bacon* (1860), *Her Majesty's Tower* (1871), the *History of Two Queens* (1873-74), and *Royal Windsor* (1878-79); besides *New America* (1867), *Spiritual Wives* (1868), *Free Russia* (1870), *The Switzers* (1872), *White Conquest* (1875), and two novels, *Diana, Lady Lyle* (1877), and *Ruby Gray* (1878). Editor of the *Athenæum* from 1853 to 1869, and a Middlesex magistrate from 1869, D. died in London, 27th December, 1879. His style is picturesque, epigrammatic, and racy, and it is evident that he never used a word derived from the Latin when Saxon English happened to be as expressive. D. was made K.R.C. of Germany.

A warm-hearted man, of a genial and lively temperament, yet possessed of a somewhat bitter sharpness in retort, he made many friends and boasted of having a few enemies.

Dizful', the chief trading town of Khuzistan, Persia, on a river of the same name, at a foot of a range of hills, 36 miles N.W. of Shustar. It has an inferior bazaar, but it furnishes good supplies of victuals, and has a fine climate. To the N.W. of D. the river is crossed by an old stone bridge of twenty arches. Pop. 23,600.

Diz'ier, St., a flourishing town in the department Haute-Marne, France, on the river Marne, 30 miles S.E. by N. of Châlons-sur-Marne by railway. It has a theological school, a chamber of commerce, a fine townhall, and the ruins of an old castle. Its main industries are iron-smelting, cotton-spinning, and barge-building, and it has also an active trade in cabinet woods, grain, millstones, &c. Population 13,372. In the Middle Ages D. was called *St. Desiderii*, from being the last resting-place of Bishop Desiderius of Langres. It was long an important fortress, and in 1544 resisted for six weeks the army of Charles V. of Spain, its capitulation only being brought about eventually by the governor's treachery. On 25th January, 1814, the Russian general, Prince Tscherbatov, fought the French at D., and drove them back on Vitry, but two days later Milhaud recovered the town from Prince Lanskoi. The Prussians on the 30th January displaced Lagrange's division, and held D. till the 26th March following, when the French under Marshal Oudinot stormed and recovered it once more.

Djez'zar ('the Butcher'), the surname of an adventurer named Achmed, born in Bosnia about 1735, came into the hands of a slave-dealer in Constantinople, was bought at Cairo by Ali Bey, and earned his surname and the affectionate regard of his master by the facility with which he got rid of all persons obnoxious at court. In 1775 he was appointed Pacha of Acre. He exercised a commercial monopoly here, and extorted arbitrary impositions from a community of French merchants who had settled at Acre. Eventually he expelled the French consul and merchants, and sacked the consulate. This insult to the French flag was one of the considerations which determined Napoleon's expedition into Syria. On the 20th March, 1799, Napoleon opened the siege of Acre, but so obstinate was D.'s defence, that after attempting for two months to reduce the town, the French were obliged to retire. D., though a monster of cruelty, was possessed of great military and administrative capacity. He died in 1804.

Dmitrov' ('the town of St. Demetrius'), a town in the government of Moscow, Russia, on the Jakhrama, 40 miles N. of Moscow, with silk and woollen manufactures, tanneries, and a trade in linen, wax, and tallow. Pop. 10,026.

Dnie'per (Gr. *Borysthenes Banapris*, Turk. *Ohu*, Tartar, *Exi*), after the Volga and Danube the largest river of Europe, rises among forest marshes in the government of Smolensk. Its general direction is S., but in its lower course it sweeps first to the S.E. and then to the S.W. and W., and after a course of more than 1000 miles falls into the Black Sea below Kherson, its embouchure (*Liman*) forming a gulf on the W. side of which lies Odessa. In its mouth there is an archipelago of forty islands, on several of which there are forts. It is navigable nearly its whole length, the impediments produced by the numerous sandbanks and rapids in its lower course below Ekaterinoslav having been partly removed by blasting, and partly overcome by hydraulic works constructed at the expense of the state. Annually it is frozen for from 80 to 97 days. Its affluents from the E. are the Soj and the Desna, from the W. the Pripet and the Beresina. The D. traverses some of the finest governments of the empire—and Moghilev, Minsk, Kiev, Poltava, Ekaterinoslav, and Taurida—and conveys their products to the Black Sea. There is also some trade with the Baltic by canal communication between the D. and the Beresina and Dwina. At the mouth of the D. are valuable fisheries of sturgeon, herring, carp, &c.

Dnie'ster (anc. *Tyras*, *Taras*, *Danasterrus*, Turk. *Tur*), a river of Europe, rises on the N. of the Carpathians in Austrian Galicia, but is mostly in Russia. It enters the Black Sea 30 miles S. of Odessa, after receiving thirty-seven affluents, and after a course of upwards of 500 miles. The navigation, which is almost wholly downwards, is chiefly occupied with the transport of wood, grain, salt, &c. Mud flats and sandbanks obstruct the mouth of the river.

Do'ab (Sansk. 'two rivers'; comp. Lat. *duæ aquæ*) is the name given to the long, narrow strip of country in India, N.W. Provinces, lying between the Jumna and the Ganges, and stretching from Allahabad to the Himalayas. It includes the British districts of Meerut, Agra, Bulandshahr, Aligrarh, Muzaffarnagar, Saharanpur, Etah, Mainpuri; part of Muttra and Ettawah; and Cawnpur, Fatehpur, and Farukhabad, with part of Allahabad. The population is very dense, and mainly engaged in agriculture. The soil is fertile and productive. Easy communication is carried on both by land and water, and the region is connected with all the principal railroads in the peninsula. But the name is also applied generally in Northern India to any similar region. The Punjab, for instance, is subdivided into a number of Doabs.

Dobell', Sydney, an English poet, was born 5th April, 1824, at Cranbrook, in Kent. His youth was painfully precocious. Married in 1844 to one of the sweetest and truest women in England, he first came before the public in 1850 with the *Roman*, an impassioned dramatic poem, warmly espousing the cause of Italian freedom. After travelling in Switzerland he resided in Edinburgh until 1857, when he removed to Cheltenham and the Isle of Wight. He published *Balder*, a fervid, gloomy, and pathetic poem in 1854; *Sonnets on the War*, written along with Alexander Smith, in 1855; and *England in Time of War*, a collection of exquisitely musical, touching lyrics, in 1856. In 1865 he produced a pamphlet on *Parliamentary Reform*, in which, like Hare and Mill, he advocated a 'graduated suffrage.' Bad health hindered his literary activity during his later years. His *England's Day* (1871) is a defiant lyric against Grant, Bismarck, and Gortschakoff. D. died 14th November, 1874. In analytic subtlety he at times rivals Browning; his melody of verse is almost equal to Shelley's. His notes and memoranda were published as *Thoughts on Art, Philosophy, and Religion* in 1876, with a prefatory note by Nichol. See also Nichol, *Poetical Works of D.*, and *The Life and Letters of S. D. Edited by E. J.*

Dö'beln, a town of Saxony, on an island formed by the Mulde and Mühlgraben, 36 miles S.E. of Leipzig by the Mulde and Chemnitz Railway. It has manufactures of linens, woollens, brassware, &c., also bleachfields and worsted mills, a trade in butter, and important cattle and horse fairs. Pop. 12,087.

Dobrow'ski, Joseph, a Bohemian philologist, born at Gyermet, Hungary, 17th August, 1753, studied at Deutschbrot, where he acquired the Bohemian language, that of his childhood having been German. He afterwards studied at Klattau and Prague. In 1774, on the dissolution of the Order of Jesuits, to which he had attached himself, he withdrew to Prague, where he published his first work, *Fragmentum Pragense Evangelii S. Marci, vulgo autographi* (1778). From 1780 to 1787 he edited at Prague a journal of Bohemian and Moravian literature. From 1792 to 1795 he visited Denmark, Sweden, Russia, Italy, Germany, and Switzerland in search of MSS. illustrative of Bohemian history. After his return he exhibited symptoms of mental derangement, which, in 1801, necessitated his removal to an asylum. Recovering his reason in 1803, he lived sometimes at Prague, and sometimes in the country. He died at Brunn, 6th January, 1829. D.'s principal work is *Scriptores Rerum Bohemicarum* (Prag. 1783-84), in which he had Pelzel for a collaborateur.

Dobrud'scha, or **Dobru'ja,** the ancient Scythia Minor, since 1878 part of Roumania, is bounded, N. and W. by the Danube, E. by the Black Sea, and S. by a line drawn from Mangalia to near Silistria. It was the scene of numerous important operations during the Turko-Russian wars of 1854 and 1877.

Doce'tæ, heretics in the early Christian Church who held that the body of Jesus Christ was nothing but a phantom or appearance (Gr. *dokēsis*, hence the name), or that, if substantial, it was of a celestial substance. The heresy, which is supposed to be referred to in several passages of the New Testament, and the foundation of which is ascribed to Simon Magus, to Cassian, and to Tatian, was founded on the dualistic notion of the essentially evil nature of matter, so that the divine nature could not be supposed to unite itself with a material body and thereby expose itself to the pollution from which it was the object of Christ to free mankind, combined with the other favourite Oriental notion that a higher spirit has the faculty of presenting itself to the eye in various sensible but unsubstantial forms. See Neander's *Kirchengeschichte* and Blunt's *Dictionary of Sects*, &c.

Dock, an excavated enclosure, usually provided with gates, formed in connection with a river or harbour for the reception of ships. Docks are of two kinds, *wet* and *dry*. A wet D. is a basin in which the water is maintained at a uniform level by shutting the gates before the ebb of the tide, for facilitating the loading or unloading of vessels lying at the quays or jetties. A dry D. or *graving D.*, for repairing the exteriors of ships, is a long and narrow excavated basin with curved ends, lined with masonry, and left dry by the ebbing of the tide, or rendered so by pumping. A ship is floated in at high water, and is steadied in a vertical position by means of 'shores' and wedges. At low water the entrance is closed, and the remaining water pumped out. When the repairs are completed, the water is again admitted, and the vessel floated out. The walls of a dry D. slope inwards towards the bottom, and all round steps or 'altars' are constructed to allow of ready access to all parts, and also to serve as supports for the shores which hold the vessel upright. An inverted arch of masonry is usually constructed as a foundation for D. walls, which are thickest at their base, and are puddled with clay behind the granite or concrete facing, so as to be perfectly watertight. Cast iron has been used for the walls at the entrance to the Victoria (London) Docks, the iron plates being backed with concrete and coped with granite. As a protection from abrasion, fenders of timber are often secured to the faces of D. walls.

Gates or *caissons* are fitted at the entrance to docks, to shut out or keep in the tide. Small gates are formed of wood, large ones of wrought iron. The gates of the South Docks at the Isle of Dogs, in the Thames, are of the latter material, and are cellular, having two skins separated by horizontal and vertical ribs. Gates are usually in two parts, and the inner and outer upright posts, called the heel and mitre-posts, are generally of green-heart timber. Each leaf swings on pivots, working in sockets of gun-metal or chilled cast-iron, and is supported at the mitre-post on a roller which runs on a curved iron pathway. The sides of the gates are curved outwards, so as to resist better the pressure of the water. Caissons, shiplike in form, with stem and stern projections to fit into grooves in the masonry, are found convenient for closing D. entrances. They are built of wrought iron, and are divided into compartments, with apertures for the admission of water. To close a D. entrance, the caisson is floated into its proper position, and water being admitted to some of the compartments, it sinks down into the stone recesses; by pumping the water out, the caisson is readily removed. A shutting sill of timber is embedded in the masonry at the bottom of a D. entrance, and against it the base of the gates or keel of the caisson presses closely, preventing the passage of water.

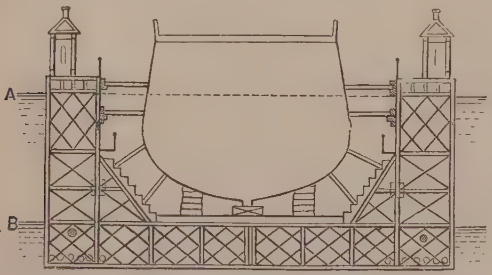
In recent docks, gates are opened and shut by hydraulic machinery, a power which is now used for emptying graving docks, and working the swing-bridges, capstans, cranes, and other D. conveniences. To further the performance of business, every facility is provided in docks. There are all kinds of hoisting apparatus and mooring-posts; and rails are laid along the quays having connection with the great railway systems; extensive warehouses and cellarage for the storage of goods, jetties to accommodate vessels of considerable draught, &c.

Sluicing is frequently resorted to to clean wet docks of the mud that is constantly being deposited. The docks being allowed to run dry, the mud is thrown into deep channels, and carried away by the scouring water that has meanwhile been admitted into them from sluices.

The docks of Great Britain surpass in extent those of any other country. The most remarkable examples are to be found on the Thames and the Mersey. The docks on the East of London, having an area of over 1100 acres, comprise the Surrey Commercial, East India, West India, St. Katharine's, London, Victoria, Millwall, and Tilbury Docks (the latter cost £3,000,000; opened 1886). The total area of the Liverpool and Birkenhead docks and basins, irrespective of graving docks, amounts to 440 acres, with a wall quay-face 28 miles long. The graving docks number eighteen, having an aggregate length of floor of upwards of two miles; the Herculaneum graving docks are the largest, the floor of each being 750 feet long. There are also important docks of both kinds at Bristol, Hull, Cardiff, Swansea, Pembroke, Southampton (where a new dock was opened in 1895 to accommodate the vastly increasing traffic), Sunderland, Shields, Leith, Dundee, Great Grimsby, &c.

Other Arrangements for affording Access to Ships' Exteriors.—In past times *beaching* and *careening* were resorted to. In the former operation the vessel was run on to the beach, so that it was left high and dry by the ebb of the tide; in the latter, it was heaved over first on one side and afterwards on the other, so that the keel was raised out of the water by means of power applied to the masts, which were properly strengthened for the great strain. In some situations a *slip* or inclined plane, with vertical wheels and hydraulic machinery for dragging a vessel out of the water is adopted. (See SLIP.) In America vessels are raised out of the water by means of a *screw D.*, or timber frame raised or lowered by means of screws and other machinery.

Floating Docks.—In localities where the construction of graving docks would be enormously expensive, a most convenient substitute is found in a floating D., which has the advantages of being independent of the tide. In the United States timber structures of this nature have been in use for many years. In Great Britain iron has been employed in their construction. The Spanish port of Ferrol, on the Atlantic, possesses a floating D., made after the designs of G. B. Rennie, wholly constructed of plate, angle, and T-iron riveted together. It resembles an oblong rectangular box without top or ends, and measures 350 feet long, 105 broad, and 37½ high from the floor of the D. The base or pontoon and side walls are hollow, and divided into watertight compartments, strengthened by open lattice girders and diagonal bracing, which give the structure great rigidity. The upper chambers in the side walls are airtight, and keep the D. from sinking too low when water is admitted by sluices and distributed by pipes through the lower chambers. When the D. is sufficiently submerged, the sluices are closed, and the vessel to be docked is drawn in between the side walls. The water in the chambers being then pumped out, the D. rises gradually, lifting the vessel, which is steadied with the usual appliances, completely out of the water, as shown in the following figure. The displacement of water by the base equals 13,000 tons, and deducting the weight of the D. itself, 5000 tons, a sustaining or lifting power of 8000 tons remains. An iron floating D. of different construction was launched at North Woolwich in 1868, and towed in the following year to Bermuda, where it has successfully docked first-class men-of-war. It is U-shaped in section; the double sides and bottom, 20 feet apart, are divided into compartments, and a caisson is fitted at each end. To dock a vessel, some of the compartments are filled with water to sink the D. sufficiently, and then water is admitted into the inside by valves in the caissons, till the sea outside and inside has the same level. The caissons are next taken out, and the ship led in over the central line of blocks. The D. is afterwards raised about 10 feet by partly emptying the chambers, the caissons are placed in position, and the water remaining inside the D. is run into the side balance-chambers, leaving the vessel dry. To undock the vessel, the side chambers are filled up, and water let into the inside of the D. by the openings in the caissons, which are then removed and the ship led out. Pontoons capable of supporting small vessels may be used in connection with this D. The Bermuda floating D. affords facility for the examination of its own base, by filling the upper chambers of one side with water.



Transverse Section of Rennie's Floating Dock.

A, Level of water preparing to receive first-class ship.
B, Level of water with first-class ship docked.

Hydraulic Lift Dock.—This is another ingenious contrivance for the dry-docking of vessels. One of them was supplied to the Victoria Docks, London. On two parallel sides of a channel 300 feet long and 60 feet broad, sixteen upright cast-iron columns, in a row, are sunk into the ground. At the base of each column there is an hydraulic press, and the top of each piston or ram carries a cross-head, from the ends of which two iron girders are suspended by iron bars. These girders extend across the excavation to the cross-head of the corresponding column on the opposite side. There are thus thirty-two girders forming a kind of platform capable of being raised or lowered. On this platform rests a wrought-iron pontoon, open at the top, having sufficient buoyancy to support a vessel. To apply the apparatus, the girders and pontoon, weighted with water, are sunk to the bottom of the lift, and the vessel to be raised is drawn in directly over the centre of the pontoon. The rams are then slowly raised by hydraulic power, the vessel being at the same time secured by wedges and blocks. When out of the water, the pontoon is emptied by valves which are afterwards closed. The girders being again lowered, the pontoon, with the vessel upon it, remains afloat, and may be towed to a convenient spot. As many vessels as there are pontoons can be docked in a similar manner.

Dock, a sub-genus of *Rumex* (see SORREL), containing those plants which are not acid, and the flowers of which are almost invariably hermaphrodite. Most of them are troublesome weeds, though they may grow in watery places. The roots of the great water-D. are administered as an antiscorbutic, and were looked upon by the Druids with superstition. The roots of other species are also astringent, and can be employed medicinally in rheumatism as styptics, as astringent gargles, or as a dentifrice. Monk's rhubarb has been employed in place of true rhubarb, but is not so powerful. The roots of D. have also been employed in dyeing. In all, there are eleven British species of D.

Dock'et, in English law, is a record in the courts containing an entry of judgment. *Striking a D.* was when a creditor gave a bond to the Lord Chancellor to prove his debtor to be a bankrupt. See DOQUET.

Dock'ing Horses. When young work-horses are sent to grass, they are docked, *i.e.*, six joints of their tails are amputated, the object being to keep the naturally long tails from being incommoded in the trams of a cart. The cutting is accomplished by aid of a machine similar in form to a pair of nutcrackers. It is a cruel custom and is now held to be illegal.

Dock Warrant. When goods are consigned in a Bonded Warehouse (q.v.), a certificate is granted called a D. W. When a transfer is made, the warrant is endorsed with an order to deliver to the purchaser. An entry in the warehouse books completes the transference. When a D. W. is lost, a new one will only be granted on security of indemnification to the company should loss arise in consequence.

Dock'yard, a naval arsenal for the construction, repairs, and equipment of ships. A D. usually embraces building slips, repairing docks and basins, workshops, and all the machinery and tools necessary for the manufacture of anchors, cables, and other adjuncts of a ship and storehouses. The royal dockyards in Great Britain are at Portsmouth, Devonport (Plymouth), Chatham, Sheerness, and Pembroke. Woolwich and Deptford dockyards were closed in 1869. Early in this century the English dockyards were in a very backward condition; now they are unequalled for completeness.

Dockyard and Naval Stations.—Statutes 46 Geo. III. c. 153; 10 Vict. c. 27; 16 and 17 Vict. c. 107; 24 and 25 Vict. cc. 45, 47, 80; 25 and 26 Vict. cc. 16, 69; 26 and 27 Vict. cc. 30, 31; and 28 and 29 Vict. c. 100—provide for the security of the ports, wharves, embankments, harbours, piers, and navigable rivers of the United Kingdom. They regulate the mooring and placing of private ships, restrict the keeping of gunpowder on board ship, &c.

Doc'tor (from Lat. *doceo*, 'I teach'), a title at first bestowed on one who could teach a special art or science, but now applied to one who has taken the highest degree in law, divinity, physic, or music. The title was probably first sanctioned at Bologna University about the middle of the 12th c., where Inerius or Werner, Professor of Roman law, is said to have induced the Emperor Lothar II. to introduce the dignity. The title then passed into the faculty of divinity—Peter Lombard, Bishop of Paris, being made D. of divinity by the Paris University in the middle of the 12th c. The first D. of medicine was Gulielmo Gordenio, of Asti College, elected *D. artium ex medicinâ* in 1329. The title was not introduced into the English universities until the reign of John or of Henry III. See DEGREE.

Doctors' Commons was the college in London founded by Dr. Harvey, the Dean of Arches, in 1568, for the professors of the civil law. In it were situated, prior to the transfer of the ecclesiastical jurisdiction and the opening of the Probate and Divorce Courts, the residences of the judges of the spiritual and admiralty courts. It was also the abode of the doctors of the civil law practising in London, who for diet and lodging commoned together; hence the name of D. C. To the college belonged a certain number of advocates and proctors. The Courts of Arches (chief ecclesiastical court of the province of Canterbury) and Faculties, and the Vicar-General's office for granting marriage licenses, were in the renowned D. C. The statute 20 and 21 Vict. c. 77, dealt with this college, and under its provisions the property of the college was sold, the charter was surrendered, and the collegiate body was dissolved.

Doc'trinaire means, in the first place, a secular priest or clerk of the Christian doctrine. In this sense it has been displaced in the French language by *religionnaire*. Under the Bourbon Restoration it was applied to a set of political men, who professed to deduce their ideas, half liberal half conservative, from a coherent body of political theory. This fraction of the Chamber existed in 1816, when the name was first applied to Royer-Collard by the *Nain Jaune Réfugié*, a French newspaper published at Brussels. Cousin and Broglie were also leading Doctrinaires. But their representative man was Guizot, who in 1822, by an *Essay on the Origin and Development of the English Constitution*, revived that excessive admiration of *de facto* legitimacy which Montesquieu and De Lolme had already evinced for the English Constitution. He endeavoured to construct a political eclecticism on the ruins of Boulainvilliers the feudalist, Dubos the monarchist, De Mably the democrat, and Demaistre the theocrat. Practically the Doctrinaires were for extension of the *Charte* of Louis XVIII., and, therefore, opposed the absolutism of Charles X. Under Louis Philippe, however, most of them, then beyond middle age, were unable to move with the times; and it has been said that the Doctrinairism of Guizot, when in power, was sufficient to excuse the Revolution of 1848. Hence D. is sometimes used to denote an unpractical pedant—in vulgar language, a political prig. In England the term was applied to Bentham and other writers in the *Westminster Review*.

Dodd, Charles, the assumed name of Hugh Tootel, an English Roman Catholic historian, who was born near Preston, 1672, studied at Douay and at St. Gregory's, Paris, entered the priesthood, and settled (1697) as a preacher in Lancashire. He wrote a *Church History of England from* 1500 to 1688, which contains much curious and valuable information drawn from original papers, letters, &c. This work was published in Brussels (1737-39-42), and a new and corrected edition was begun by the late A. Tierney, but only five vols. appeared (1839-43). D. wrote many other works. He died 27th February, 1743.

Dodd, William, LL.D., a popular divine, was born at Bourne, in Lincolnshire, June, 1729, graduated as B.A. at Clare Hall, Cambridge, and then went to London, where he soon gained a wide reputation for effective preaching. After holding a prebend in the collegiate church of Brecknock, he was, through the influence of his former pupil, Lord Chesterfield, made a chaplain to the King, but lost the office for trying to acquire the living of St. George's, Hanover Square, by bribery. In return for the many favours he had received from his generous pupil and patron, he forged a bond for £2000 in the name of that nobleman, for which act he was condemned at the Old Bailey, 24th February, 1777, and executed on the 27th June following. D. was meanly ambitious, and nourished habits of luxurious wastefulness. Of his many works, the chief are a *Commentary on the Bible*, *The Beauties of Shakespeare*, *Reflections on Death*, and *Sermons on the Miracles and Parables*. See D.'s *Memoirs*, prefixed to his *Thoughts in Prison*.

Dodd′ed Cat′tle are animals without horns. The name is also given to cattle which, naturally having horns, have had them cut off to prevent them goring their neighbours in the field or fold—a method which should also be adopted in the foreign live cattle traffic. The details, as given by persons who have witnessed the horrors of the ocean passage, are hideous and revolting, and would lead us to believe that in no previous age has so much cruelty been inflicted upon this portion of the brute creation as in ours. Cock-fights and bull-baiting may be considered harmless amusements when compared to the ordinary every-day transit of cattle, some of which are suffocated, trampled, or gored to death by their neighbours. The public are ever ready to rush to the rescue of the victim of man's cruelty, and to punish the culprit when the former is a horse, dog, cat, or even donkey, but the tragedies on board of the ocean cattle steamer do not seem to appeal to anybody's sense of humanity. The veneer of the so-called civilisation of the 19th c. must indeed be extremely thin when a traffic so conducted is allowed to continue without check or remonstrance.

Dodd′er, a genus of annual leafless plants, of the natural order *Cuscutaceæ* (q.v.), which originally take root in the ground, but afterwards become parasitic, and sever their connection with the soil. There are two British species, *C. Europæa*, which chiefly attaches itself to thistles, oats, &c., and *C. Epithymum*, a smaller plant, which grows on thyme, &c. In addition, there are now naturalised in the English flora two other species or varieties, probably originally introduced with foreign seed, viz., *C. Epilinum* (the flax D.), and *C. Trifolii* (the clover D.). They are all very troublesome to cultivated crops, and the only remedy is to sift out the seed of the D. which has got mixed with that of the cultivated crop.

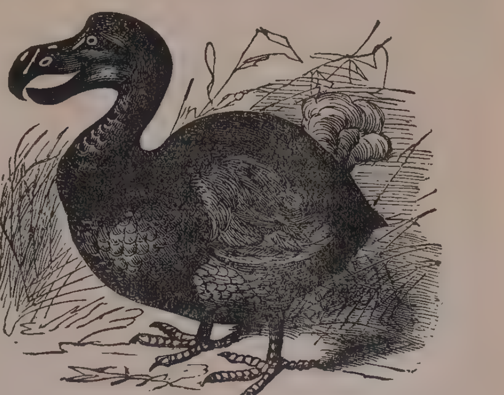
Dodd′ridge, Philip, a Nonconformist preacher and theologian, born at London, 26th June, 1702. He was educated at Kibworth, Leicestershire, of which place he became a minister in 1722, and whence in 1725 he removed to Market Harborough, where he opened a school. About 1730 he settled as a dissenting minister in Northampton. Bad health induced him to visit Lisbon, where he died, 26th October, 1751. His chief prose works are *Four Sermons on the Education of Children* (1732); *The Absurdity and Iniquity of Persecution for Conscience' Sake* (1736); *The Family Expositor* (1738); *Rise and Progress of Religion in the Soul* (1744); *Course of Lectures* (1763). D. is, however, best known by his hymns, which glow with impassioned devotion, and justly rank among the finest products of the evangelical muse.

Dodec′agon (from Gr. *dōdeka*, 'twelve'), an equilateral and equiangular plane figure of twelve sides. If a be the length of the side, the area is approximately 11·196 a^2.

Dodecahed′ron (from Gr. *dōdeka*, 'twelve,' and *hedra*, a 'seat' or 'basis'), one of the five regular solids, being bounded by twelve equal pentagons and thirty equal edges, and having twenty equal solid angles. If a be the length of each edge, the superficial area is approximately 20·6457 a^2, and the solid contents 7·66312 a^3.

Död′erlein, Ludwig, an eminent German philologist, was born at Jena, 19th December, 1791, studied at Munich under Thiersch, at Heidelberg under Creuzer and Voss, and at Berlin, where he graduated, under Wolf, Böckh, and Buttermann. In 1815 he was appointed Professor of Philology at Berlin, removed to Erlangen in 1819, where in 1827 he became Director of the Philological Seminary. He died 9th November, 1863. D. edited the works of Tacitus and the *Epistles* and *Satires* of Horace.

Do′do, a singular wingless bird, which has become extinct, through human interference, within the last 300 years. It inhabited the island of Mauritius. Most naturalists relegate it to the Rasorial birds, as possessing its nearest living ally in the *Didunculus strigirostris*, or tooth-billed pigeon of the Navigator Islands. It was a clumsy bird, larger than a swan,



The Dodo.

and weighing about 40 or 50 lbs. The Dutch navigators named it *dod-aer*, of which word the English D. is a corruption. Various writers describe the D., but it appears certain that the bird, being unable to fly, offered an easy prey to the sailors who visited Mauritius. A specimen was deposited in the Ashmolean Museum at Oxford, but unfortunately was allowed to go to waste, the head and feet being alone preserved. A good representation is contained in the British Museum. The legs were short and stout, the feet had each four toes; the tail was also short, and, like the rudimentary wings, carried a tuft of plumes. The bill was large, and prominently curved and hooked; the plumage a greyish brown, that of the females being paler. The D. was said to lay but one large egg. It is curious to note that the wingless Solitaire (q.v.) or Pezohaps disappeared, like the D., from the adjacent island of Rodriguez.

Dodo'na, a town in Epirus, was the seat of the oracle of Zeus, which was the most ancient in Greece. Homer attests its antiquity, and describes the Selli or Helli, who were the interpreters of Zeus. The god was believed to dwell in the stem of an oak, and the priests interpreted his will, as instructed by the branches of the tree. In later times, the oracles were interpreted by three old women. D. waned in influence with the growing importance of Delphi, and though it long continued to be consulted, and to enjoy wide celebrity, its advice was chiefly sought by the neighbouring tribes. In 219 B.C. the temple was destroyed by Dorimachus, general of the Ætolians. The site of D. has not yet been clearly established.

Dods'ley, Robert, an English author and publisher, was born at Mansfield, Nottingham, in 1703. The son of a poor schoolmaster, he was forced by bad health to serve as a footman, and in 1732 published *The Muse in Livery, or the Footman's Miscellany*, a volume of poems, which was followed by *Kitty, a Pastoral*, and *The Devil is a Dunce*. In 1775 his drama, *The Toyshop*, was, through Pope's influence, acted at Drury Lane, with such success that D. was enabled to open a bookseller's shop. He became a prosperous publisher, and wrote various plays, of which the most popular were *The King and the Miller of Mansfield* (1737), *Sir John Cockle at Court*, *The Blind Beggar of Bethnal Green*, and above all *Cleone*, which met with boundless applause. He published several of the works of Johnson and Pope, and started various periodicals, such as *The Public Register*, *The Museum*, *The Annual Register*. D. died at Durham, 25th September, 1764. He is best known now for his *Select Collection of Old Plays* (1780).

Dog, a genus and the type of a family (*Canidæ*) of Carnivorous mammalia. The family includes not only the dogs, but their near allies the foxes, wolves, and jackals. As a family, these animals are distinguished by their pointed muzzles, smooth tongues, and by possessing claws incapable of being retracted, as in the *Felidæ* or cats. The front feet each possess five toes, and the hinder feet four digits. They are Digitigrade (q.v.), in that they walk, like lions, &c., on the tips of their toes. The molar teeth in this family number either twelve in the upper jaw and fourteen in the lower jaw, or fourteen in either jaw. Two or three of the molars on each side are provided with tubercles or blunt processes. In the genus *Canis* itself—to which the wolf and jackal also belong—the incisor teeth number six, the canines two, the præmolars eight, and the molars four in each jaw. The pupil of the eye is round. The tail is of moderate size, and is covered with short hair. The subject of the relations of the many varieties or kinds of dogs assumes the same difficult aspect in treatment as that of determining the exact nature of the breeds of other animals, such as the ox and sheep, which have been extensively cultivated and reared by man; and the question becomes still more difficult when we attempt to determine the relationship of the so-called *wild* breeds of dogs to their more domesticated neighbours. Some naturalists incline to the belief that in the present day the D. is only known to us as a domesticated animal; and these authorities regard the wild races as having sprung from domesticated breeds. Others again maintain the distinct and primitive nature of certain wild dogs—such as the hunting D. of S. Africa, and the Dhole of British India—and believe that these or similar forms may represent the progenitors of the many existing breeds of dogs. Darwin inclines to the belief that the breeds of the domestic D. 'are descended from several wild species,' and he says, 'it cannot be doubted that there has been an immense amount of inherited variation; for who will believe,' he continues, 'that animals closely resembling the Indian greyhound, the bloodhound, the bulldog, pug-dog, or Blenheim spaniel, &c.—so unlike all wild *canidæ*—ever existed in a state of nature?' Another equally important subject is the question of the fertility or sterility of the progeny of the wolf and D. when interbred. We know with certainty that all our existing breeds of dogs can interbreed; and also that the D. will interbreed with the wolf and the jackal, although the exact extent of the fertility of the wolf and D. breed has not been determined. Probably the fertility is not affected by time, and in this view the common parentage or descent of the D., wolf, and jackal might be assumed by evolutionists. Le Roy instances a D. whose great-grandfather was a wolf, and which showed its wild origin particularly 'by not coming in a straight line to his master when called' (Darwin). The entire subject of the origin of the breeds or races of dogs becomes further complicated when we reflect that naturalists are by no means clear among themselves as to the characters which are to be deemed purely *specific* in their nature, and those which, on the contrary, are only of *varietal* value. Until, therefore, decisive information be obtained as to what characters constitute a true *species*, and what are those of a mere *variety*, the exact relationships of the dogs must remain a matter of conjecture and dispute.

The characters of dogs naturally vary with the particular breed or race to which they belong, and information on this head may be sought for in the separate articles devoted to the various kinds of dogs. The period of gestation in the D. is the same as that of the wolf—63 days—and this fact, together with the close similarity in the skeleton, has by some naturalists been cited as evidence in support of their similarity of origin and close relationship. An argument against this identity is derived from the observation that dogs when left to themselves, and when existing as nearly as possible in a state of natural freedom, do not tend to become savage or exhibit wolfish characters. From the most ancient times the D. has been the companion, and, without exaggeration, one may say the 'friend,' of man. The ancient records, both sacred and secular, attest the close companionship of the human and canine races, and in ancient Egypt the D. assumed a high place in the phases of animal-worship. The average life of the D. varies according to its race, but in general is about twelve years. The intelligence of these animals also depends much upon the breed and training. The shepherd's D., Scotch terrier, and Newfoundland D., probably possess, of all the breeds, the greatest natural intelligence. See also SPECIES.

Laws Regarding Dogs.—To allow any *mischievous* dog to go loose or unmuzzled is an indictable offence; and if the dog injure any one, he will have ground for a claim of damage against the owner, but not unless the owner has had notice of the dog having bitten someone before—in fact, the dog is entitled to the first bite. By 28 and 29 Vict. c. 60, the owner of a dog is liable in damage for any injury done by it to cattle or sheep; and in England it is not necessary for the party claiming damage to prove that the owner previously knew of the dog's mischievous propensity. In Scotland this knowledge must be proved, it having been so decided by the House of Lords, reversing the judgment of the Court of Session, in the case of Fleming *v.* Orr, 3rd April, 1853 (1 Macqueen). (See DAMAGES.) By 24 and 25 Vict. c. 96, any person convicted of stealing a dog before two or more justices may be imprisoned for six months with hard labour, or forfeit £20 more than the value of the dog. A second offence is a misdemeanour, punishable by fine or by eighteen months' imprisonment, with or without hard labour. To receive money for restoring a stolen dog, or corruptly under the pretence of restoring one, is punishable with eighteen months' imprisonment with hard labour. The duty on a dog is 7s. 6d.; dogs under six months old and those used for blind persons, sheep, and cattle are exempt; this duty is regulated by 42 and 43 Vict. c. 21, and two previous statutes which it amends. No dog can be used as a draught animal (2 and 3 Vict. c. 47), and under the Dogs Act of 1871, the Contagious Diseases Act (Animals) of 1886, and the Metropolitan Street Act of 1867, stray masterless dogs may be destroyed, and dogs not under proper control may be restrained wandering or approaching the public.

Dog'bane, a genus of plants belonging to the natural order *Apocynaceæ* (q.v.). The fly-trap of N. America is cultivated in this country. 'The five scales in the throat of the corolla of this plant secrete a sweet liquid, which attracts flies and other insects to settle on them; the scales are endowed with a peculiar irritability, the cause of which has not been accurately determined, but which causes them to bend inwards towards the centre of the flower when touched, and to retain the unlucky flies as prisoners. Numbers of dead flies may be seen in the several flowers of this plant. The movement of the scales probably serves to scatter the pollen on the stigma' (Masters). The bark of the root is emetic, diaphoretic, and tonic, but in large doses more or less poisonous and acrid. From the fibrous bark of the Canadian or Indian hemp the Indians prepare the twine of their fishing-nets, linen, &c. Its roots have the same medicinal properties as the preceding species. The milky juice of all the genus when dry exhibits the properties of India-rubber.

Dog'days. See CANICULAR DAYS.

Doge (Lat. *dux*, Eng. *duke*), the title of the principal executive magistrate in the Venetian and Genoese republics. The Venetian dogate goes back to 697, when Anafesto Paoluccio was elected. At that period the doges were actual sovereigns, but their supremacy soon began to arouse popular jealousy. The D. Orso was killed in 737, and for some years an annual magistracy ruled the republic. But the life-dogate recommenced in 742, and from that year till 1172, forty doges held the power, upon which limitations were imposed in 1032. Of these, only half were allowed to die a natural death. In 1172 the constitution underwent a change. The Great Council of 480 obtained the right to choose the D. Sebastiano Ziani was the first ruler under the new order, and in his dogate began the ceremony of the wedding of the Adriatic. (See BUCENTAUR.) Six members of the Great Council were delegated to advise the D., and the sixty *Pregadi*, or Venetian senate, performed a similar function. Thus the power of the D. was greatly circumscribed, but he still remained Captain-General of the Forces. After 1310 the appointment of the Council of Ten reduced the D. to a political nonentity, his office to a mere state show, with a few unimportant privileges, and several heavy drawbacks. The last D. of Venice, Lodovico Manin, was elected in 1788, the dogate lapsing with the fall of the republic in 1797. See VENICE.

The republic of Genoa was also governed by doges, of whom the first was Simon Boccanegra, elected in 1339. The Genoese dogate was held at first for life, like the Venetian, but under the new constitution of 1528 (see DORIA) was restricted to two years. The power of the D. was solely executive, legislative functions being discharged by councils. In 1804 the republic and the dogate ceased to exist. See GENOA, and Hallam's *Middle Ages*, chap. iii.

Dog'fish, a name applied generally to certain genera of fishes, closely allied to the sharks, and included with the latter forms in the order *Elasmobranchii* (q.v.). The D. belongs to the group *Plagiostomi* (q.v.), in which the mouth is transverse, and on the under surface of the head. The gills exist in the form of pouches or sacs, and open externally on the sides of the neck by distinct apertures. The pectoral fins exist on the breast, the ventral fins being abdominal in position. The dogfishes constitute the family *Squalidæ*, which includes numerous genera. Thus the genus *Scyllium* embraces the little D., the rock D. and other forms. The genus *Pristidurus* is exemplified by the black-mouthed D. The tope or miller's dog is the *Galeus canis* of the naturalist, the smooth hound or D. being the *Mustelus vulgaris*. Another common species is the picked D. These fishes are all common in British waters, and are bold and voracious in habits. See articles on the separate species of Dogfishes.

Dogfish.

Dog-Fox, a term applied to the male fox, and also to certain genera of dog-like animals belonging to the family *Canidæ* (see DOG), and represented by the *Corsac* (q.v.) and other species included in the genus *Cynalopex*.

Dogg'er, a kind of sea-going fishing-boat used by the Dutch.

Dogger-Bank, a great sandbank in the N. Sea, extending from 36 miles E. of Flamborough Head to 60 miles off Jutland. In some places it is 60 miles broad, and 9 fathoms in the shallowest part near England. It has valuable cod-fisheries. The Dutch and English fleets fought a drawn battle here in 1781.

Dog-Grass. See COUCH-GRASS.

Dog'ma (Gr. 'a decree') means primarily a decree, edict, or statute, as in Luke ii. 1, Acts xvi. 4, &c. In theology it means properly a positive statement of doctrine derived from divine revelation and enunciated by the Church; or, in a looser sense, the peculiar doctrine of a particular section of the Church, in which sense it is synonymous with an article of a creed. In the early Church, D. was sometimes used in the sense of the Christian religion or the faith of Christ, as the expositors generally supposed St. Paul used it in Eph. ii. 15; and it has a similar meaning yet; so that D. is Christian doctrine generally, as distinguished from *a* D. or doctrine.

The history of D., or of the gradual development of the doctrines of the Christian Church, formerly treated only in connection with ecclesiastical history or dogmatic theology, has, on account of its extent and importance, been recently advanced into a special part of Church history. In this position it forms the transition from Church history to dogmatic theology, its basis being biblical theology, while dogmatic theology continually supplies it with materials. Dogmatic theology proper is the rationale of the whole D. of the Catholic Church at a particular time, and the subject of the history of D. is the D. as it presents itself in the various stages of its development. (See DEVELOPMENT OF DOCTRINE.) Comparative dogmatic theology (Ger. *sumbolik*) has for its object a survey of the distinguishing principles of the different sections of the Church as embodied in their confessions of faith: and stands in the same relation to the history of D. as the Church statistics of any particular period stand to ecclesiastical history. The first attempt at compiling a system of dogmatic theology was made by Origen (q.v.). Augustine also wrote a work on Christian doctrine. But the founder of systematic theology was John Damascenus (q.v.), and the structure was completed in the Scholastic period, from the 8th to the 16th c. Since the Reformation, the Roman Catholic Church, regarding Protestants in the same light as the early Church regarded heretics, has found it necessary to exhibit her doctrine definitely in new confessions of faith. Protestants have also set forth their distinguishing principles in confessions which had reference to the Church of Rome, to the controversies within the Protestant Church itself (*e.g.*, between Lutherans and Calvinists), and to the tenets of heterodox sects (*e.g.*, Baptists, &c.).

Dogs, Isle of (*Poplar Marshes*), a projection or peninsula of the northern bank of the Thames, 3½ miles E.S.E. of St. Paul's, is insulated by the canal of the West India Docks. There is an old legend of doubtful authenticity to the effect that a king of England kept his dogs here; hence the name. It has an area of about a mile square, and though in the midst of a district of great activity, its appearance is squalid and uninviting.

Dogshores, pieces of wood so placed as to prevent motion in a ship about to be launched when all other supports are taken away. See LAUNCHING.

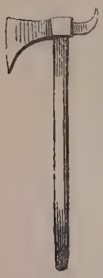
Dogs'tail Grass, a very numerous genus of grasses, natives of Europe and Asia. The crested D. G. is the only one of the two species found in Britain of any value as a pasture grass. From its shining yellow seeds it is sometimes known as the *goldseed*.

Doi'ley, or **Doi'ly** (perhaps from Dutch *dwaal*, 'a towel'), a napkin or small towel, sometimes coloured and embroidered, on which glasses were laid when the table was spread for dessert. D. is still used between finger-glasses and plates, and on dressing-tables.

Doit (Dut. *duit, duyt;* Ger. *deut*, from Venet, *daota*, a piece of eight soldi, *da oto soldi;* compare Fr. *dhuit, de huit*, of eight), an old Dutch copper coin, of which eight went to the *stiver* or halfpenny. It was also a division of the English grain Troy. It is used by the Old English writers to mean a coin of most trifling value, or a matter of no consideration. See Shakespeare's *Coriolanus*, act i. sc. 5.

Dokk'um, a town in the province of Friesland, Holland, on the Ee, 11½ miles N.E. of Leeuwarden, with a haven accessible to the largest sea-going ships. It has shipbuilding yards, breweries, distilleries, potteries, and wool-carding establishments, and a trade in wool, cattle, butter, and cheese. St. Boniface (q.v.) was slain here in 755. Pop. 4025.

Dolab'ra, in Latin, a hatchet or splitter (from *dolare*, 'to split,' allied to the Old Eng. *daelan* and the Ger. *theilen*, 'to divide'). In Latin it means a military, an agricultural, and a butcher's implement. Specimens are represented on the columns of Trajan and Antoninus.



Dolabra.

Dol'ce (Ital. from the Lat. *dulce*), sweet or sweetly, used as an expression mark in music.

Dol'ci, Carlo, or **Carlino,** a famous Florentine painter, was born in 1616. He came of a family of artists, his father, grandfather, and uncle being all painters of repute in Florence. His life was passed in the pursuit of his art, and he produced many fine works. He died at Florence, 17th January, 1686. D.'s style is marked by extreme delicacy and purity of colouring, and by elaborate finish. His range of subject was limited to madonnas, saints, holy families, and kindred themes. The most noted are his 'St. Cecilia,' 'St. Anthony,' 'Conception of the Virgin,' and 'Christ Blessing the Bread and Wine.' See Baldinucci's *Life of C. D.*

Dole, in English law, is a boundary mark, consisting of a post of wood or iron, or of a heap of earth; also a portion or lot in a distribution of money, &c.

Dole, in Scotch law, is defined as the evil intention essential to guilt. Simple negligence does not constitute a crime, but gross carelessness, however, is in certain cases criminal, without evil intention. This the law construes into D. See CULPA.

Dôle, a town in the department of Jura, France, in the beautiful Val d'Amour, on the Doubs, and on the Rhône and Rhine Canal, 28 miles S.E. of Dijon by railway. It has a tribunal of the first instance, a Jesuits' college, a public library of 40,000 volumes and 617 MSS., an art gallery, a museum of antiquities, &c., and is the centre of large iron industries and of an active trade in corn, timber, and marble. Its chief buildings are the large cathedral of Notre Dame, dating from the 16th c., the Hôtel-Dieu, of the 17th c., the Palais de Justice, formerly a Franciscan convent, and the ruins of a Roman bridge. Near D. are a mineral spring and marble and millstone quarries. The town existed before the invasion of the Romans, from whom it received the name *Dola Sequanorum*. It stood on the Roman road from the Rhine to Lyon, and has still many remains of this period, as the ruins of two aqueducts, an amphitheatre, and a temple. Later it became capital of Franche-Comté, the seat of the parliament, and of a university (1423-81), and was strongly fortified, but was taken by Charles of Amboise for Louis XI. in 1479. In 1636 it was attacked in vain by the Prince de Condé, and in 1668 eagerly espoused the cause of Louis XIV., who now made himself master of Franche-Comté, and who razed the fortifications of D. in 1674. The Austrians under Bubna here forced the passage of the Doubs, 6th January, 1814. D. was the headquarters of Garibaldi during the war of 1870. Pop. commune 14,253; arrond. 69,278.

Dol'erite, a term given by geologists to a group of igneous rocks of a dark green or grey colour, and composed of felspar (triclinic) with magnetic iron and olivine. The typical D. is a 'crystalline-granular mixture of labradorite and augite with magnetic iron.' It often contains small quantities of the carbonates of iron and lime.

Doles, at funerals (from *to deal*, 'giving money or bread in charity'; hence *to dole*, 'giving grudgingly'). This is a custom of the Early and Middle Ages, probably founded upon the Catholic doctrine of prayers for the dead. D. were given to procure rest for the departed spirit; and the usage at one time prevailed throughout Great Britain of giving something to all classes of the community at a funeral. A slight resemblance to this Christian custom may be traced in the funerals of Mohammedan princes, when a crowd of the poor follows to gather the small coins thrown to them on such occasions.

Dolgell'y ('dale of hazels'), the county town of Merioneth, N. Wales, on the Wnion, 3 miles above its estuary, and 46 W. of Shrewsbury. It is prettily situated near the base of Cader Idris, and its industries are chiefly woollen (Welsh tweed) and flannel weaving, tanning, bleaching, &c. The Wnion is here crossed by a stone bridge of seven arches. In 1404 Owen Glendwr held a parliament at C., and there allied himself with Charles VI. of France. Pop., in summer much increased by visitors, reg. dist. 14,492; civ. par. 3785.

Dolichoceph'alic, a term first introduced by Retzius to denote human skulls which are much elongated from before backwards, as distinguished from those termed *brachycephalic*, which have nearly as great breadth as they have length. See SKULL.

Dol'ichos, a genus of Leguminous plants including several shrubby annual and perennial herbaceous species cultivated for their flowers, seeds, or young pods, which are boiled for the table. About sixty or seventy rather dubious 'species' have been described, from the tropical and temperate regions of Asia, Africa, and America. Among the best-known species is the D. of the W. Indies and tropical S. America. In France it is much cultivated for the succulent young green pods, which are boiled for table. The tuberous root as well as the pulse of the D. of Martinique are eaten. The horse-gram of the E. Indies is single-flower D. The tubers of *Pachyrhizus*, an allied genus, are also used for food.

Do'lis, or **Sa'ta,** a town of Hungary, in the county of Komorn, about 40 miles W.N.W. of Buda-Pesth, consists of the Lake Town (Tóváros) on a small lake, and the Upper Town. The Esterhazy castle and gardens, and an old castle now in ruins, said to have been for some time a residence of Mathias Corvinus, are interesting. There are warm baths. Pop. 7029, engaged in the manufacture of woollen goods and faïence marble.

Doll, a toy in imitation of the human figure, made of all varieties of material, from the article of shreds to the elaborately dressed miniature of French fashions, costing from

2000 to 3000 francs. In the neighbourhood of Sonneberg in Thuringia not less than 32,000 individuals find employment in the manufacture of toys, and of dolls alone there are exported from that locality annually 24,000,000. The materials used in D.-making are *papier-mâché*, vulcanised india-rubber, &c. As a proof of the magnitude of the D. trade there exists a fellow-trade which is devoted entirely to the manufacture of dolls' eyes.

Doll'ar, a form of the Ger. *thaler* (Low Ger. *dahler*; Dutch, *daler*), from *thal*, 'a valley,' because first coined in Bohemia about the close of the 15th c. From the German empire the coin passed into Spain and the Low Countries, and thence to the New World. The D. is best known as the United States unit of money. The United States silver D., probably adopted from the Spanish, weighs 412½ grains of standard silver, one-tenth alloy. The cent, answering to the English halfpenny, is the hundredth part, the nominal value of the D. being 4s. 2d., but New York exchange on London is about $4·87 for £1. During the war, paper money was made legal tender. The D., or 1-peso, is also used in Mexico, and is imported in great quantity into China, the Straits Settlements, and the adjacent countries, where the exchange value has, within the last four years, varied from 3s. 11¾d. to 2s. 2d. on London.

Mexican Dollar (Silver).

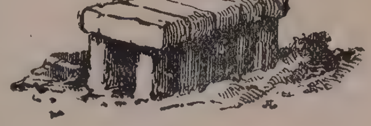
Dollar (*dol* or *dal*, 'a vale,' and *ar*, *aird*, 'a height,' 'the vale among the hills'), a village in Clackmannanshire, on the right bank of the Devon, at the foot of the Ochils, 10 miles E.N.E. of Stirling, is chiefly noted for a flourishing academy, founded and endowed by Captain John M'Nab, a native of the parish, in 1818, at a cost of £80,000. Classics, modern languages, English, and the arts, are taught by a principal and assistant teachers. The noble ruins of Castle Campbell, an ancient seat of the Argyll family, lie a mile N. of D. On the banks of the Devon there are numerous bleachworks. Pop. 1807, as against 2014 in 1881.

Doll'art, The, a gulf of the N. Sea, at the mouth of the Ems, between the provinces of Groningen and E. Friesland, about 10 miles long by 7 broad. It was formed by irruptions of the sea in 1277 and 1530. Much of it has been reclaimed.

Döll'inger, John Joseph Ignatius, born at Bamberg, 28th February, 1779, was at first a Catholic curate in Franconia, then Professor of Ecclesiastical History at Aschaffenberg (Church Training School), and latterly at the University of Munich, a chair which he subsequently resigned to Möhler, taking himself that of dogmatic theology. In 1826 his *Die Lehre von der Eucharistie in den ersten drei Jahrhunderten*, and in 1838 his *Lehrbuch der Kirchengeschichte* (which superseded a standard work by Hortig), gave promise of his later independence. As editor of the *Historisch-politische Blätter*, he wrote on semi-political subjects, as the mixed-marriage question, debated between the Archbishop of Cologne and the Prussian Government, Tractarianism, &c. In 1845 he entered the Bavarian Parliament as an Ultramontane, but lost his chair there and in the university through the influence of Lola Montez. In the National Parliament of Frankfurt he elaborated the definition of the relations of Church and State, which amounted almost to complete separation. In 1853 he protested against the proposed coronation of Napoleon III. by Pope Pius; and also produced his famous *Hippolytus und Kallistus*, a work on the Roman Church in the 3rd c., written against the views of Baur, Bunsen, Lenormant, &c., in the controversy raised by Miller's *Philosophumena* (Eng. transl. 1877). In 1857 appeared his *Heidenthum und Judenthum* (translated into English by Darnell in 1862), an attempt to appreciate the social forces which favoured or retarded the spread of Christianity. His work, *Kirche und Kirchen* (1861), in which he definitely argues against the temporal power of the Pope, has also been translated into English by M'Cabe. In spite of his formal excommunication on 18th April, 1871, for having resisted the doctrines of the Encyclical of 1864 and the Definition of 1870, D. received many honours, *e.g.*, in 1871, the degree of D.C.L. from Oxford, the rectorship of his own university, the Order of Merit from the Bavarian king, the Presidency (on Liebig's death) of the Royal Academy of Science at Munich, and in 1874 the Order of the Red Eagle from the Emperor of Germany. In September, 1874, he presided at the Bonn Alt-Catholik Conference, where he declared that the Eucharist was not a perpetual renewal of the propitiation of Christ, and that he was not bound by the Tridentine Decrees. Among D.'s other works may be mentioned *Mohammed's Religion* (1838), and *Die Reformation, ihre innere Entwickelung und ihre Wirkungen* (1846-48), and a work on prophecy, translated into English by Plummer (1873). The bill for transferring ecclesiastical property to a committee of the ratepayers and communicants in each parish of the empire greatly strengthened the Old Catholic party, of whom D. was the head until his death in 1890, but he was too old to undertake the task of reconciling the ideas of Catholic and Teutonic unity.

Doll'ond, John, F.R.S., was born in Spitalfields, London, 10th June, 1706. He began business as a silk-weaver, occupying his leisure hours with the study of mathematics, anatomy, theology, and physical science, till 1752, when he set up with his son Peter as an optician. In 1753 he communicated to the Royal Society his improvement on the telescope, and soon after he entered into a controversy with Euler, who denied the conclusiveness of Newton's experiments on the possibility of obtaining refraction without colour. This led him to repeat Newton's experiments, and to solve the problem which Newton had deemed insoluble—viz., an *achromatic combination of lenses*. For this great discovery D. received the Copley medal from the Royal Society. He died 30th November, 1761. See Kelly's *Life of D.*

Dol'men (Cym. 'stone table'), the name, chiefly used in France, of an interesting class of prehistoric monuments, similar to those known as Cromlechs (q.v.) in this country. They are found in great numbers in Bretagne, but are also to be met with along the shores of the Baltic, in Friesland, the Netherlands, in the British Islands, in Spain and Portugal (where they are called *antas*), and even in Algeria and other parts of N. Africa. The principal dolmens in France are the famous Pierre Couverte near Saumur, the Table de César, not far from Lakmariaker, in Bretagne, the Pierre du Mesnik at Morvilliers, the Pierre de Gargantua in Eure-et-Loire, and the vast stone catacomb on the small island of Gavrinis, in Morbihan. The Pierre Couverte is a rude structure, covering an area of 65 feet by 17. Its walls consist of ten unhewn blocks, about six feet high, and it is roofed over with four immense slabs. The D. was long looked upon as a sort of altar, and identified with Druidical sacrifices, but antiquaries are now agreed in regarding it as a place of sepulture.



Dolmen.

Dol'omite, or **Bitter Spar,** a mineral composed of the carbonates of lime and magnesia, and represented by large masses of magnesian or dolomitic limestones, which occur in the *Oolitic* formations. All dolomitic rocks contain a proportion of carbonate of iron, which sometimes exceeds that of the magnesian carbonate. In such cases they are named *Ankerite*. D. is usually brown or yellow, is very friable, and appears to result from the gradual metamorphosis of common limestone, the carbonate of magnesia taking the place of the original carbonate of lime. From its susceptibility to the action of the weather, it does not make a good building-stone,—a fact well shown by the weathered and wasted appearance of the Houses of Parliament.

Dol'phin, a genus of *Cetacean* mammalia, forming the type of the family *Delphinidæ*, which also includes the Narwhals (q.v.) and Porpoises (q.v.). The dolphins are distinguished from the whales by their smaller size of body, by possessing numerous teeth of conical shape in both jaws, and by the nostrils being united and placed far back on the upper aspect of the head. This single nostril, or *blowhole*, as it is termed, is crescentic in shape, and placed transversely. The head forms about one-seventh of the entire length of the body. The dolphins are recognised by the elongated snout, and by the head being separated from the snout by a depression. A somewhat hook-shaped dorsal fin exists in the centre of the back. The common D. possesses about 190 teeth. Its average length is about seven feet, but specimens measuring ten feet are not unknown. The back is black in colour, the sides greyish white, and the abdomen silvery. The eyes are small, and the aperture of the ears very minute. The female D. produces but one young at a birth. These animals tend their young with great care and fidelity. The D. is found in the European seas, and also in the Atlantic. It is a lively, playful animal, often accompanying ships in shoals, and for long distances. The bottle-nosed D. is a second species, which, however, possesses fewer teeth than its better-known neighbour. The French name the D. *Bec d'Oie* (goose-beak) and *Oie de Mer* (sea-goose), from its prominent beak.

Bottle-nosed Dolphin.

Dolphin, Black, a name given to the *Aphis fabæ*, a species of *Aphis* (q.v.) or plant-louse, found often in immense numbers on the bean. It derives its name from its black colour. These aphides cause great devastation in crops and gardens, and gardeners remove the top of the plants, for the reason that these pests first appear in that situation.

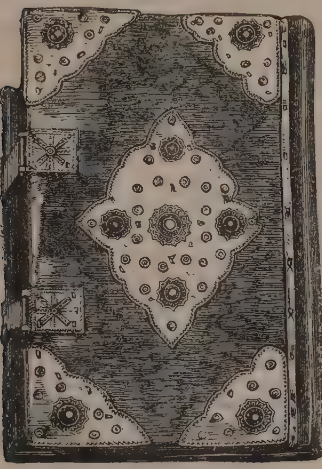
Dom-Boc, or **Doom-Book** ('book of dooms or sentences'), the code which Ælfred the Great compiled from the code of Ine of Wessex, the earliest extant collection of West Saxon law, and the code of Offa of Mercia. Ælfred was satisfied with expunging, modifying, and arranging preceding enactments, and added few original laws. Corporal punishment was assigned for many offences formerly punished by a fine or *blood-wite*, severe penalties were imposed on perjury and sacrilege, labour on Sundays and holy days was strictly forbidden, and the right of private revenge was restricted. Throughout there is visible a tendency to aggrandise the kingly power, alien to the early spirit of Teutonic government. The Ten Commandments and part of the Mosaic law were prefixed to Ælfred's code, of which Dr. Pauli says, 'So strong an infusion of biblical principles is scarcely to be met with in any other collection of laws belonging to the Middle Ages. Nowhere do we find the idea of combining the old Teutonic with the Judaic Christian law into a uniform whole carried into such perfect practical application.' See Pauli's *Life of Alfred*, sect. v., and Thorpe's *Ancient Laws of England*, fol. i.

Dombrow'ski, Jan Henryk, a famous Polish general, born at Pierzowice, Cracow, 29th August, 1755. He joined a regiment of Uhlans in 1770, became aide-de-camp in the Saxon service, and distinguished himself in the campaign of the Poles against the Russians in 1792. In the Polish struggle of 1794 he defeated the Prussians at Labiszyn and Bydgoszcz, and after Kosciusco's defeat at Maciéiowice, nobly declined a high post in the Prussian army. In 1796 he was empowered by the French Directory to raise the *Polish Legion*—a body of Poles who fought under the French flag with the ultimate hope of freeing their country. These Poles signalised themselves at the battles of the Trebia, Novi, and others; but the Polish interests being ignored at the Peace of Luneville (1801) and of Amiens (1802), D. quitted the French service for that of the short-lived Italian Republic, and afterwards of the kingdom of Naples. When the French entered Poland in 1806 he rejoined Napoleon, and called on all Poles to win back their freedom. His countrymen responded eagerly, and until the Peace of Vienna (1809) were ably and bravely led by D., who also covered the French retreat at the Beresina in 1812, and, on Poniatowski's death, became commander-in-chief of the Poles. After 1815 he retired to his estate in Posen, which had been given him as a national reward. Here he busied himself with arranging his memoirs until his death on 26th June, 1818. See Chodzko's *Histoire des Légions Polonaises en Italie* (Paris 1829).

Dome (Lat. *domus*, Low Lat. *doma*, Ital. *duomo*, Fr. *dôme*, Span. *dombo*), in architecture, the spherical or concave ceiling of a building. Early in the Middle Ages D. was applied to a church ('God's house,' *Domus Dei*), and from such structures being often surmounted by a cupola, the word acquired its present meaning. Of modern domes the most celebrated is probably that of St. Peter's in Rome. The external diameter is 195½ feet, being 2 feet more than that of the Pantheon; the diameter of the interior is 139 feet, being 3 feet less than that of the Pantheon. The traveller will hardly see any greater architectural wonder than St. Peter's from the Campagna. The D. of the Pantheon (*La Rotonda*) is the most magnificent ancient D. in existence. It is supported by a rotunda 143 feet in diameter, exclusive of the walls, which are said to be 20 feet thick. Of St. Paul's in London the D. is the most magnificent feature. While the general effect is powerful and grand, the outline is varied and graceful. Unquestionably an invention of the Romans, it was at Constantinople that the D. was first employed in ecclesiastical buildings.

Domenichi'no, properly **Domeni'co Zampie'ri,** one of the first painters of the Bolognese school, born in Bologna, 1581, studied first under Calvaert, and afterwards entered the school of the Caracci. His first important work was the decoration of the Nolfi Chapel at Fano. After studying in Lombardy, he went in 1604 to Rome, where he painted, among other great works, a Madonna of marvellous beauty for Cardinal Aquechi. His magnificent 'Communion of St. Jerome' (1614), now one of the chief treasures of the Vatican, his 'Martyrdom of St. Agnes,' in the Museum of Bologna, and 'Diana Hunting' (Borghese Gallery), are among the greatest of his pictures. He studied architecture, and on the accession of Gregory XV. (1621), was appointed architect of the Vatican. The Aldobrandini Palace at Frascati was built after his drawings. In design and in truth of expression, D. ranks the first of his school, while his colour is at once brilliant and delicate. He was persecuted by the jealousy of contemporaries, and his death, 15th April, 1641, at Naples, is supposed to have been caused by poison.

Domes'day Book, the name of the great statistical survey of England, drawn up by order of William the Conqueror during the years 1081-86. The name is the 12th c. form of the Old English *domesdaeg*, the 'day' on which a local court gave its 'dooms' or decisions; the D. B. thus meant the book compiled from inquiries made on local court days, and, perhaps, from the prevalent fears of the conquered English, had an additional reference to the 'day of judgment.' Its technical name was *Liber de Wintonid*, as it was at one time preserved in the treasury at Winchester. Camden calls it the 'tax-book of kinge William.' The object of the survey was to show the king to whom and in what proportions the country was allotted, to guard small landholders against the encroachments of the great proprietors, and, in general, to facilitate administrative, legislative, and fiscal measures. 'Domesday,' says Freeman, 'is the first known statistical document of modern Europe; it was the first survey of the kind which had been made since the days of the elder Roman Empire.' It was compiled by commissioners from information rendered on oath by the chief laymen and churchmen of each district. The survey gives the name of each estate, the name of its owner in the reign of Eadward and in the reign of William—for the reign of Harold is studiously ignored—its extent and the number and size of its woods, pastures, ponds, &c., the number of freemen and villeins upon it, its total value in William's and in Eadward's time, and the wealth of every freeman. It is of great historical value as a minute and thoroughly faithful picture of England before and immediately after the Norman conquest. It is not a mere colourless inventory, but is rich in details, which throw light on the manner of the confiscation of English estates, on the division of the country into shires, &c., on the different condition of various districts, and likewise on the character of William. It is marked by an air of consistent impartiality in its statements of the rival claims of Englishmen and Normans, King William himself being in one place included among those wrongfully holding the lands of others. The lawfulness of William's succession to Eadward, and of the transfer of lands from Englishmen to Normans, is throughout assumed, and the nature of the great confiscation is carefully veiled under legal euphemisms. 'Domesday teaches us better than any other witness of these times can teach us, that the England of the 11th c. and the England of the 19th are one and the same thing. Never was there a dry legal record so full of human interest of every kind as the great survey of England' *(Freeman)*. The taxes were raised according to the divisions of the country given in the D. B. until 1552, when a new survey, called popularly the *New D. B.*, was made. See *General Introduction to D. B.*, by Sir Henry Ellis (1833), Stubbs' *Select Charters*, and especially Freeman's *Norman Conquest* (vol. v. 1876).



Domesday Book.

Domes'tic An'imals are those which man, for various purposes, as for food or as beasts of burden, has trained and bred in near proximity to himself. This subject has already been partly noted under the head of Acclimatisation of Animals (q.v.). It will be found that, as civilisation advances, man's inroads upon both the animal and plant worlds grow more and more extensive; and his demands for articles of food, dress, and luxury, year by year open up new sources of supply, by the enlistment into his catalogue of resources of hitherto unknown kind; while he may also take advantage of natural qualities and phenomena, by interbreeding animals, and by thus forming those combinations of their features which present the qualities or substances most in demand. (See Breed and Species.) The circumstances that favour the domestication of animals are those that present to animals the qualities and conditions to which they have been accustomed in their natural state, although in many cases they may *adapt* themselves more or less completely to other environments and unwonted surroundings. We should perhaps distinguish between *acclimatisation* and *cultivation* of animals on the one hand, and their complete *domestication* on the other. The silk-moth, cochineal insect, ox, and horse, &c., may, strictly speaking, be described as 'cultivated' by man, whilst in the same sense we may talk of the dog and cat as 'domesticated.' But apart from strict etymological reasons, the term 'domesticated' is used to include all animals of use to man, to the breeding of which he gives his attention. It is not necessary to specify the various and diverse animals which are of use to man, or to indicate the many different sources which are being at the present time opened up for fresh experiments in the cultivation of commercial zoology. Pisciculture (q.v.), for example, is beginning to give important results even in its early stages of cultivation, and other departments of biology cannot fail in the future to afford as gratifying evidence of the rich stores that await our attention.

Domestic Ar'chitecture. The first consideration in building a house ought to be to make it healthful, the second should be to make it convenient, and the third to make it pleasing to the eye. These ends being in no way antagonistic, it ought to be possible to attain them all. Efficient drainage, with the means for efficient ventilation, are the chief requisites for a healthful house. Of course, the means existing, it must be seen that they are properly exercised. The inattention of some persons to airing their rooms, by opening their windows, is most blamable, and the evil effects of it ought to be pointed out forcibly, and due ventilation insisted on by those in a position to do so. Sleeping in kitchens, or in little rooms or alcoves off kitchens, should be avoided; hence in D. A., where means are sufficient, it should be made impossible to do so. In the houses of the middle and professional classes, servants' sleeping-rooms should be above-ground—at all events, quite apart from the kitchen. As regards convenience, arrangement of staircases, cupboards, closets, &c., the two latter are the important points. Scotch houses have generally more than English houses; but it is to be feared that this sometimes leads to the abuse of their being kept in dusty confusion. An airy, well-ventilated larder is a point of great consequence. It also should be well apart from the hot kitchen. In our country, to keep out the cold must, of course, always be a main object of D. A.; in Southern climes it is to keep out the heat. With us the problem of the day is from a minimum consumption of fuel to extract a maximum of heat.

Domestic Man'agement. A considerable and, perhaps, increasing number of people are forced to lament over the insoluble nature of the problem how to make one banknote do the work of two. Seeing that this is impossible, the only plan, with a narrow income, to make 'ends meet,' is to lessen the work to be done by self-denial and thrift, and out of expenditure so regulated to extract as much rational pleasure as possible. To attain thrift, careful account-keeping is a necessity. With all housekeepers who do not attend to this it is a subject of constant wonder where money goes to. You have exceeded your income one year; keeping careful accounts for the next will not bring back that which is gone, but by so doing you will discover where the leak is, or where the many leaks are. On one side enter all sums received; on the other side there should be various columns of £ *s. d.*, headed according to the various branches of your expenditure; thus, *rent and taxes, coal and gas, butcher, baker, education, furniture,* &c. Each item of expenditure should be entered under its appropriate head, and the book periodically balanced. If this system be carefully carried out, the mystery cannot fail to be solved. It will probably be found to consist largely in a wholly incredible consumption of various articles. In regulating expenditure, the first consideration should be given to matters affecting health. When income allows, let every one have an airy, cleanly, and cheerful home. (See DOMESTIC ARCHITECTURE.) Let there be fitting decoration. In and about the cottages of the poorer classes there is no decoration so pretty as flowers, and they cost almost nothing. Perfect cleanliness, it is to be feared, requires a certain income; yet much may be done by means of two inexpensive articles—a tub and water.

The art of cookery should be carefully studied by all women of the lower and middle classes, and even by those of the higher. It would be well that they should acquire a certain amount of gastronomical acumen; because there is often a very unhappy discrepancy in this respect between a man and his wife. Women are often unable themselves to see the difference between a good article of food and a bad one, and they think their husbands unreasonable, who see a very great difference. Then, by means of science, a good dinner may be had for less cost than a bad one, unscientifically prepared. Besides, good cookery is essential to health. So also, especially in our climate, a woman ought to have an economical and hygienic knowledge of clothing. Many young children die annually from being insufficiently clothed; purposely, sometimes, under the mistaken notion of 'hardening' them. With regard to the furniture of a house—we speak here rather of the houses of the middle classes—harmony is especially to be studied. Showy articles should be avoided. In themselves they are probably not highly tasteful, and in combination with other articles, perhaps somewhat faded, the effect is unhappy. A drawing-room ought to *look* what it ought to *be*, a room for use, and not for show. It ought not to look as if it was only used on special occasions. We should study to produce a tasteful, cheerful effect in selecting and arranging the furniture. Let signs of rational, pleasant occupation be habitually seen in it, books—books for reading, that is, not for show—music, and needlework of a rational kind.

With respect to the difficult question of *servants*, it would be well if women of the middle, or even somewhat higher classes, would learn to do much for themselves which, from false notions of dignity, they depend on servants doing. But, as the relationship will probably always be necessary in some measure, the responsibility of improving the terms of it must obviously rest with the mistresses, for the plain reason that they have, as a rule, received a better education and culture.

Dom'icile, in law, is the place of residence of any one, the home or fixed and chief establishment to which, whenever he happens to be absent, he intends to return. The D. of a minor is that of the father, unless the child be illegitimate, when, having no father in the eye of the law, the D. is that of the mother. A married woman has the D. of her husband, which she retains on his death till she acquires another. The place where a man lives is presumed to be his D.; but the presumption may be overcome by proof of an intention of going back to a former residence. Mere temporary absence from home does not change D. But in many cases, after legal residence has been determined, there arise questions of the utmost nicety in the application of international law.

There are three sorts of D., although only one can be said to be the D. of a person at one and the same time. Birth confers a D. upon a person, so also do the law and the choice of the person. A wanderer may, therefore, still retain his D. by birth, which, however, he may cast off, when he fixes his home permanently elsewhere, or when, by law, his D. has become changed. See FOREIGN LAW, APPLICATION OF.

Dom'inant, in music, the note a fifth above the key-tone. In connection with the chord of the D. and of the 'D. seventh,' see CADENCE and CHORD.

Dom'inant Ten'ement, in Scotch law, is the name of a tenement in favour of which a servitude exists. The tenement, over which the servitude is, is called the *servient tenement.*

Domin'go, Santo, the capital of the republic of Santo Domingo, or República Dominicana (q.v.), lies at the mouth of the Ozama, in a deep bay on the S. side of the island. It is quadrilateral in shape, and is surrounded by ramparts. Its principal buildings are a cathedral (1540), large barracks, an arsenal, a palace, and several convents and churches. Only small vessels can enter the harbour, and there is, therefore, but little trade. Pop. 14,150. D. was founded by Bartolommeo Columbus in 1494, and may be regarded as the first European settlement in the Western World. It was sacked by Francis Drake about 1586. The name of the city has superseded Hispaniola as applying to the whole island, which is also generally known as Haiti (q.v.), the eastern part forming the republic of S. D., while the republic of Haiti holds the western. D. is, besides, the name of several small rivers, settlements, and villages of S. America.

Dom'inic, De Guzman, St. (in Span. **Domingo de Guzman**), was born in 1170 at Calahorra, Old Castille. According to some, he belonged to the old family of Guzman, which had made alliances with royalty, but this statement is somewhat dubious. He was early distinguished as a learned theologian and a fervent missionary. After studying from his fourteenth to his twenty-third year at Valentia University, he became canon, and in 1198 archdeacon of Osma, in Castille. Being unsuccessful as a preacher, in his efforts to convert the Albigenses, he gained permission from Innocent III. to call in military force against the heretics of Southern France, whom he persecuted with relentless fanaticism. (See ALBIGENSES.) His admirers, however, declare that he strove to mitigate the horrors of the war which he had mainly provoked. This crusade gave rise to the Inquisition (q.v.), of which D. is the reputed founder, but which, in his time, was not definitely organised. He established the order of the Dominicans (q.v.), and is said to have invented the rosary. D. died at Bologna in 1221, having won the title of 'burner and slayer of heretics.' Many grotesque miracles were ascribed to him, and he was said to have converted 100,000 souls. He was canonised in 1234. D. was a man of sincere but implacable and misapplied religious zeal, and though he seems to have been visited by occasional gleams of tenderness, his fiery, persistent intolerance stands in marked contrast to the angelic mildness of St. Francis. He is mentioned in Dante's *Paradiso* (c. xii.) as a fellow-labourer with the Saviour. See Theodoric du Pay's *Vita S. Dominici*, Lacordaire's *Vie de Saint D.*, and Principal Tulloch's *St. D. and St. Francis.*

Domini'ca, or **Dominique,** the largest British island in the Lesser Antilles, W. Indies, lies between Guadeloupe and Martinique, and has an area of 291 sq. miles, and a pop. of 26,841, of whom 335 are white, 6806 are coloured, and 19,700 are black. It is traversed by rugged mountains, of volcanic origin, which rise in one peak to a height of 5314 feet. There are many streams, and in various parts hot and sulphurous springs. The climate is moist and unhealthy, the soil singularly fertile; nevertheless only 8651 acres are under cultivation. In the valleys, besides coffee, sugar, and cacao, are grown indigo, cotton, bananas, batates, and fruits. The hillsides are clad with forests of rosewood and other valuable timber, and the arable parts are very fertile. Sugar, molasses, rum, coffee, cacao, and copper ore are exported. The great majority of the inhabitants are liberated slaves; a number of the whites are descendants of the old Spanish settlers. Roseau or Charlotteville (pop. 5186), on the S. coast, is the capital; and the only other considerable place is the haven of Portsmouth. D. was discovered by Columbus on the 3rd November, 1493 (a Sunday, hence its name, 'The Lord's Day'), but remained unoccupied till 1759, when its possession was assumed by the English. It was captured by the French, under Bouillé, 7th September, 1778, but was restored to England in 1783. In 1802 England surrendered it to France, eventually to receive it again on the peace of 1814. Between D. and the islet, Île des Saintes, Rodney gained his famous victory over the French fleet, under Grasse, 12th April, 1782.

Domin'ical Letter, or **Sunday Letter,** one of the seven letters A, B, C, D, E, F, G, used to mark the days of the year, A marking the 1st of January, B the 2nd, and so on; A marking the 8th, 15th, 22nd, &c., and all days which have the same letters falling on the same day of the week. Consequently all the Sundays of the year are marked by the same letter, which is hence called the D. L. (from *Dies Dominica*, 'the Lord's Day,' or Sunday). The 1st of January, 1895, falling on Tuesday, Sunday is the 6th, and the D. L. for the year is F. Common years consisting of fifty-two weeks and one day, the D. L. for the next year is one earlier; but leap-years having two days more than fifty-two weeks, and the 29th of February having no letter attached to it, have necessarily two Dominical letters, the first for January and February, and the second, which is the letter immediately preceding, for the Sundays of the rest of the year.

Dominica'na, República, or **Republic of Santo Domingo, The,** forms the eastern part of the island of Haiti (q.v.). It was early colonised by Spain; but in 1795 it became French, as the west part of the island had already been. In 1814 France relinquished its authority in favour of Spain. The colony threw off the yoke of Spain in 1822, and united with the negro republic of Western Haiti, but again asserted its independence in 1843. In 1861 it once more placed itself under the government of Spain. A revolt, however, broke out in 1863, the Spanish troops were expelled, and on 14th November, 1865, a republican constitution was proclaimed which was further amended in 1879, 1880, 1881, and 1887. By the terms of the constitution, as it now stands, the executive is in the hands of a President, chosen by universal suffrage every four years, and the legislative power belongs to a National Congress, consisting of 22 deputies who are elected every two years by the voters who are entitled to the suffrage. Each province sends two deputies, and each district is similarly represented. The R. D. has an area of 18,045 sq. miles, and an estimated pop. of 610,000. Its chief productions are sugar, hides, mahogany wood, logwood, honey, coffee, cocoa, cattle, and tobacco; the last-named is on the decline, but sugar plantations and factories are rapidly increasing in commercial importance. The railway system is developing and already nearly 100 miles are open to traffic between La Vega, Samana, and Santiago. The clearances at the ports represent over 100,000 tons per annum. The Roman Catholic religion is that of the State, but others are allowed in the republic conditionally. There are over 300 elementary schools; instruction is free and attendance compulsory. The capital is Santo Domingo (q.v.), and the chief port is Puerto Plata with a pop. of 15,000.

Domin'icans, a religious order organised by St. Dominic (q.v.), who established the order of Dominican Nuns in 1206, and of Dominican monks at Toulouse in 1215, the last foundation being confirmed by Honorius III. in 1223. A third section, the military order of Christ, composed at first of nobles and knights, and intended to war against heretics, was known, after Dominic's death, as the Tertiarians, and included members of both sexes. The D. were also known as Predicants—Chaucer's 'frères prechours'—or preaching friars, in England as Black Friars, and in France as Jacobins, from their convent in the Rue St. Jacques, Paris. They rapidly grew in power and numbers, and were distinguished by their bitter hatred of heretics. (See ALBIGENSES.) They preached in the streets, administering the communion from portable altars, and wandered as missionaries into Asia. The Popes, of whom they were staunch allies, granted them many privileges, freed them from episcopal authority, and in 1272 recognised them as a mendicant order. They received the entire control of the Inquisition in Spain, Portugal, and Italy; and ceasing to be mendicants in 1425, held wealthier benefices than any other order possessed. Along with their rivals the Franciscans, with whom they had fierce controversies (see SCHOOLMEN), they were all-powerful in the Church, and very influential in politics, until the rise of the Jesuits (q.v.). The D. were opposed at times by the regular clergy, and by the University of Paris. Guillaume St. Amour, Doctor of the Sorbonne, wrote a treatise against them, which was answered by the great Dominican Thomas Aquinas (q.v.), and condemned by Pope Alexander IV. They devoted themselves to polemic theology and to foreign missionary work. To their order belonged Albertus Magnus (q.v.) and Las Casas (q.v.). They were at first governed by the rule of St. Augustine, with some additional regulations, and wore a robe, a black cloak, and a black pointed cap. In the 18th c. the D. possessed 1000 monasteries.

Dom'inis, Marcus Antonius de, a theologian and mathematician, born in 1566, at Arba, an island on the coast of Dalmatia, educated by the Jesuits at Loretto, and afterwards taught philosophy and mathematics at Padua and other Italian towns. He was successively Bishop of Segni and Archbishop of Spalatro, but having offended the Inquisition by some writings tinctured with Protestantism, he passed over into England in 1616, where James I. appointed him Dean of Windsor. In 1617 he published the first volume of his *De Republicâ Ecclesiasticâ*, in which he disputed the supremacy of the Pope. He afterwards returned to the Church of Rome, but his orthodoxy was always suspected, and Urban VIII. imprisoned him in the Castle of St. Angelo, where he died in September, 1624. The Inquisition caused his body to be disinterred and burned with his writings. In his *De Radiis Visus et Lucis in Vitris Perspectivis et Iride* (Ven. 1611, 4to), he first satisfactorily explained the phenomenon of the rainbow. His other works, in Italian, were translated, some of them into French and some into Latin.

Domin'ium, a Roman law-term denoting ownership.

Dominium Directum and *Dominium Utile*.—The former term in feudal law denotes the right vested in the Superior (q.v.) of a heritable (real) subject. The latter term denotes the right of use and profit vested in the vassal.

Dom'ino (Lat. *dominus*, 'lord'), originally a hood worn by the canons of a cathedral, later came to mean a woman's mourning veil, and eventually a loose silk cloak with a hood, worn by persons of either sex at a Masquerade (q.v.).

Dom'inos, a game usually played with twenty-eight oblong pieces of ivory or bone, which, with the exception of the blanks, are marked with dots ranging in number up to double six. There are various forms of the game, which is one of some antiquity.

Dom'inus Li'tis, a term of Scotch law, denoting the person having the real interest in a lawsuit, though nominally neither pursuer or defender, also the advocate, who continues a suit on behalf of the executor of his deceased client.

Domitia'nus, T. Flavius, son of Vespasian, and younger brother of Titus, was born at Rome, A.D. 52. After his father had been established as emperor, D. took part in the administration of Italy, but his career was marred by gross licentiousness and savage cruelty. He was jealous of the fame both of his father and of his brother, and the early death of the latter has been attributed to him. D. succeeded Titus, A.D. 81, and in the opening years of his reign displayed much energy and liberality. The external affairs of Rome under D. were of little moment, being confined to an expedition against the Chatti, A.D. 84, in which D. was successful, and an attack on Decebalus, king of the Dacians, who defeated the Romans, A.D. 87. In A.D. 84, D. withdrew Agricola from his great career in Britain, and from mean jealousy condemned him to private life. During the latter part of his reign he gave free vent to his wild and cruel passions. He sought the favour of the soldiers by increased pay, and of the common people by lavish gifts and public shows; while he shed with appalling frequency and freedom the noblest blood of Rome, and obtained a fresh supply of treasure by confiscating the property of the wealthiest citizens. He was assassinated by conspirators belonging to his own household, and with the knowledge, if not indeed at the instigation, of his wife Domitia, A.D. 96.

Do′mo d' Oss′ola, a town in the province of Novara, N. Italy, on the Tosa or Toccia, here crossed by a long bridge. It lies in the beautiful Val d' Oscella, at the S.E. base of the Simplon, and is the chief key to the South Alpine tours. The Simplon can be scaled hence in seven hours. Pop. 3628.

Don, an Italian and Spanish contraction of the Lat. *dominus*, 'lord' or 'master.' The Portuguese form is *dom*, the Old Eng. *dan* or *daun*. In Spain and Portugal the word is applied as a title to all persons of noble birth, including kings and princes, but it is also bestowed in courtesy on those who are not grandees. The Latin form was originally assumed by the popes, and descended from them to all ecclesiastics and scholars. Hence the 'dons' of English colleges, and the 'dans' of old English poetry—*Dan* Chaucer, *Dan* Lydgate, &c. Tennyson has restored the word to modern English in his *Dream of Fair Women*.

Don (anc. *Tanais*, connected with the Celtic *afon*, 'water' or 'river'), a river of Russia, issuing from Lake Ivan Ozera, government of Tula, and after a S.E. and then a S.W. course, falling into the Sea of Azov by three mouths, its entire length being about 900 miles. The navigation, on account of the shallowness of the channel from sandbanks, is conducted principally by flat-bottomed boats. The traffic on the lower waters is important, owing to the fisheries of the D., and the conveyance of produce to the S.

Don, a river in Aberdeenshire, rising in an elevated marshy district between the counties of Aberdeen and Banff, and falling, after a course of 78 miles, into the sea a mile N.E. of Old Aberdeen. Its principal tributary is the Ury, from the N.W. It has valuable salmon-fisheries. The 'Brig of Balgownie,' the youthful dread of Lord Byron, from an old prophecy which threatened its fall with a wife's one son, crosses the D. about a mile from the sea.

Don, or **Dun,** a river in the West Riding of Yorkshire, rises near the borders of Cheshire, and after a course of 55 miles falls into the Aire, which soon after joins the Ouse. By means of canals and cuttings it is navigable to Sheffield, a distance of about 40 miles.

Donaghadee′, a seaport of Ireland, county Down, on the Irish Channel, opposite the Copeland Islands, and 18 miles E. of Belfast by railway. It has considerable flax-mills, some industry in embroidering muslin for the Glasgow market, and an export trade in cattle, grain, timber, and potatoes. The harbour is commodious, and there are productive line and trawling fisheries. A conical mound, 140 feet high, to the N. of the town, commands a splendid view of the Irish and Scottish coasts. Pop. of town 1886; of parish 5050.

Don′aldson, Rev. John William, D.D., a distinguished philologer, was born in London in 1811, and educated at London University, and Trinity College, Cambridge, where he was second in the Classical Tripos and won a Fellowship. His first work was *The Theatre of the Greeks*, which was followed (1838) by the *New Cratylus; or, Contributions towards a more Accurate Knowledge of the Greek Language*, an important work, which reached a fourth edition in 1868. His *Varronianus*, a critical and historical introduction to the ethnography of ancient Italy, and to the philological study of the Latin language, appeared in 1844, at which time he held the head-mastership of the grammar-school of Bury St. Edmunds. He subsequently resigned this post, and returned to Cambridge, where he passed the remainder of his life in strenuous literary labours and tuition. Among his other works may be mentioned *Jashar*, an endeavour to identify in the Pentateuch fragments of the lost Book of Jashar; a Greek and a Latin Grammar; and an essay on *Classical Scholarship*. In 1856 D. was appointed classical examiner in the University of London. He died 10th February, 1861.—**James D.,** a Scottish schoolmaster and scholar, was born in Aberdeen in 1831. He studied at the universities of Aberdeen and of Berlin. In 1856 he was appointed a classical master in the High School of Edinburgh, of which he became rector in 1866. D. published several classical text-books, but is best known by his valuable *Critical History of Christian Literature and Doctrine, from the Death of the Apostles to the Nicene Council*, in three vols., the first of which has been reissued under the title of *The Apostolical Fathers*, and by his edition (in conjunction with Professor Roberts of St. Andrews) of a translation of the entire *Ante-Nicene Fathers* (Edinb. 1866-72). D. took an active part in the agitation that preceded the passing of the Scotch Education Act (1872); and in 1874 published *Lectures on the History of Education in Prussia and England, and on Kindred Topics*.—**James D.,** an Edinburgh printer, bequeathed in 1830 £215,000 to build and endow a hospital for the maintenance and education of poor children. A magnificent building, in the Tudor style, was erected at the west end of Edinburgh, from a design by W. H. Playfair, and was opened in 1851 for 300 children, who were to be clothed, kept, and educated; the boys for trade, and the girls for domestic service.

Donatell′o (properly **Donato di Betto Bardi),** one of the greatest of Italian sculptors, born at Florence, 1383, was taken early under the protection of a liberal Florentine named Martelli, and received lessons in sculpture from Lorenzo Bicci. His first work was an 'Annunciation,' still preserved at Florence, and of which the draperies in basso-relievo are treated in the spirit of the antique. This work won for the sculptor applause, commissions, and the friendship of Lorenzo and Cosmo de' Medici, for whose family he afterwards executed a noble monument. A great work, nicknamed by the Florentines *Lo Zuccone* (the Baldhead), is the finest of his six statues decorating the exterior of the campanile of Florence Cathedral. His marble statue of St. Mark (St. Michael's Church, Florence) drew from Michael Angelo the exclamation, 'Why do you not speak to me?' and the great bronze group, 'Judith and Holofernes,' is pronounced by Vasari a work of 'great excellence and mastery.' D. died 13th December, 1466.

Dona′tion. A D. in expectation of death, or *mortis causâ*, implies the reversion of the property to the donor should he recover. To be a valid gift, in a question with an heir or executor, the donor must have died before recovery from the particular illness, and he must have actually or symbolically delivered to the donee the thing meant to be given. Accordingly, a receipt for stock will not give the stock, because stock does not pass by receipt, but by transfer. But right to a bank note will pass by delivery of the note. A D. is often revocable, but no deed is presumed in law to be a D. if it admit of another construction, and when there is doubt, the law holds a transaction to have been for Consideration (q.v.). Donations between husband and wife are revocable; but if the donor die without revoking, his or her representative cannot revoke. A reasonable post-nuptial contract is not revocable.

Don′atists, a sect of the early Christian Church, founded by Donatus, who, being defeated in his candidature for the bishopric of Numidia in 311, and refusing to admit that the *traditors*, or such of the clergy as had yielded up the Scriptures to the magistrates during times of persecution, were eligible for ecclesiastical offices, withdrew with numerous followers from the Catholic community. The D. soon became powerful in Africa, and in 330 possessed 172 bishops. They asserted that the *traditors* had broken the line of apostolical succession, that the integrity of the Church depended not on the succession of bishops, but on the holiness of each of its members. They professed to hold a doctrine of perfect purity, and carefully rebaptized each convert they made from the Catholic Church. In 348, when efforts were made to suppress them, they ravaged N. Africa as bands of fanatical marauders, under the name *Circumcelliones*, and were frequently seized with a frenzied desire for martyrdom. The D. were extinguished when the Saracens invaded Africa.

Dona′tus, Ælius, a grammarian and rhetorician at Rome in the middle of the 4th c., and tutor of St. Jerome. His treatises, embracing a pretty comprehensive system of Latin grammar, were for many centuries the standard work on the subject, and formed the basis of most of the elementary books of the kind. In such repute were they during the Middle

Ages, that the word *Donat* or *Donet* came to signify lesson or rudimentary treatise. D. was also the author of an interesting and valuable commentary on five of Terence's plays. The work entitled *Scholia in Æneida*, which bears the name of D., is generally considered to be by *Tiberius Claudius D.*, a grammarian of later date and inferior calibre, who wrote a worthless and slipshod *Life of Virgil*.

Don'auwörth, a town of Bavaria, 25 miles N.N.W. of Augsburg, at the confluence of the Wernitz and Danube. It has manufactures of linen and leather, and a trade in cattle, flax, linen, and wool. D. is memorable as the place where the Protestant League originated in 1607, whose formation was the immediate cause of the Thirty Years' War. Pop. 3725.

Do'nax, a genus of mollusca belonging to the class *Lamellibranchiata*, and to the section *Siphonida* of that class. This genus belongs to the family *Tellinidæ*. The shell is wedge-shaped, with the point rounded. Fossil species of D. occur in the Eocene rocks.

Don Beni'to, a town in the province of Badajoz, Spain, lies on the left bank of the Guadiana, 60 miles W. of Badajoz by railway. It has some woollen manufactures, and an active trade in oil and wine. Pop. 16,287.

Don'caster (Roman *Danum*, Old Eng. *Don Ceastre*), a market-town in the West Riding of Yorkshire, on the right bank of the Don, 37 miles S.W. of York, and 156 miles N.N.W. of London by rail. It has some manufactures of cotton and woolspinning, glovemaking, and hosiery, besides manufactures of iron, brass, and agricultural machines. D. races are among the most famous in the kingdom. The St. Leger, run in September, brings out some of the finest horses in the kingdom. The race is called after Colonel St. Leger, who founded the stakes in 1776. Pop. parl. div. of county 73,032; mun. bor., reg. sub-dist., and civ. par. (each) 25,933.

Don Coss'acks. See COSSACKS.

Don'da-ndu'gu (Kisuaheli, from *donda*, 'ulcer,' and *nduga*, 'brother' = brother-ulcer), a peculiar form of ulceration, confined to the lower extremities, endemic in Zanzibar and Eastern Africa. This formidable disease is common in inter-tropical Africa, more especially after the rainy seasons, and it probably depends on the development of larvæ from eggs deposited by some species of insect. The ulcer is always situated on those parts exposed while the natives are travelling, with bare feet and legs, through mud and water, and most generally on the shin-bones, the gastrocnemius muscle or its insertion, the instep, and the toes. On the first appearance of the disease there is not, generally, very severe pain; the skin is smooth and glazed, and the sub-lying tissues have a boggy feeling, and not fluctuating as in abscess; in the centre there is a small spot, like an abraded pimple, exuding a little serous matter. An incision made at this stage reveals an extensive, deep-seated slough; but if left to itself the glazed skin soon separates as a slough. Tendons are laid bare, and the bone is denuded of periosteum; joints are opened, and the toes or foot may be separated from the limb. The disease is generally fatal, and those who recover are generally permanently lamed. Death results from purulent absorption, from extreme exhaustion, and occasionally from hæmorrhage. This disease seems to be allied to the ulcer Yemenensis, common in Arabia. The late Dr. Livingstone was confined to his hut at Bambarré, in Central Africa, for eighty days with this disease. The antiseptic is the only mode of treatment of any avail. The disease was first described by Dr. Christie (*Cholera Epidemics in E. Africa*, Macmillan, 1876).

Don'dra Head, the southern extremity of the island of Ceylon, and the site of the ancient Sinhalese capital, of which many remains still exist.

Don'egal (Celt. *Dun-na-n Gall*, 'the fortress of the foreigners,' *i.e.*, of the Danes), a market-town and seaport at the mouth of the Eske, D. Bay, D. county, 29 miles N.E. of Sligo. Near the town are the ruins of a castle once belonging to the Earls of Tyrconnel. D. exports grain and butter. The chronicle of the town is contained in the *Annals of the Four Masters*, written at D. Pop. 1323.

Donegal, a maritime county in the N.W. of Ireland, province of Ulster, 85 miles long, with an average breadth of 41 miles. D. is the most mountainous county in Ireland. Erigal in the N.W. attains an elevation of 2462 feet. The coastline of 395 miles is indented by various bays and loughs, of which Lough Swilly is 25 miles long. Many islands fringe the coast, of which the chief are the N. Aran Islands. The streams are numerous but small, the principal being the Foyle and the Swilly. Of the lakes the most noteworthy is Lough Derg (q.v.). Granite, metamorphic rocks, graywacke, trap, and carboniferous limestone compose the subsoil. The climate is moist. Much of the soil is poor, but the S.E. is fertile. The principal crops are oats, potatoes, and flax; there are manufactures of linen and worsted stockings; and fisheries of herring, cod, sole, and mackerel. Of the land area of D. (1,190,268 acres) 90,941 acres are under corn crops, beans, and pease (oats 88,557); 64,221 under green crops (potatoes 41,608); 10,363 under flax; 19,999 (for hay) under clover, sainfoin, and grasses in rotation; 42,439 (for hay) under permanent pasture and grass not broken up; and 1879 under fallow or uncropped arable land. Woods and plantations cover 5629 acres, while 131,528 represent the area under turf bog. Marsh and barren mountain occupy 342,780 acres. For live stock see separate articles CATTLE, HORSE, PIG, and SHEEP. The trade of D. is principally carried on through Londonderry. Among the minerals are marble, lead and copper ores, manganese, and pipeclay. Pop. 185,635; of these 142,893 are R. Catholics and 21,884 Protestant Episcopalians. D. is divided into four parl. divisions, each of which returns one member: E. D. 45,417; N. D. 46,248; S. D. 46,624; W. D. 47,346.

Dongarpur', or **Dungarpur,** the capital of a native state of the same name in Central India, which is under the superintendence of the Agent to the Governor-General for the states of Rajputana. It lies 139 miles S.W. of Nimach. It is fortified, and has a pop. of some 6431. A hill 700 feet high dominates the town; at its base is a small lake, and on one side are the Prince's palace and grounds. The Rajput state of D., which is an offshoot of that of Odepur, has long been governed with tact and intelligence. It is in part a wild hill-country, inhabited by feudatory tribes. Area 1447 sq. miles. Its revenue amounts to £20,931. The Maharawal received the right of adoption in 1862. Pop. of state, the wild tribes of the Bheels not being included, 98,448. Fruit and vegetables abound. Geologically speaking, the state of D. consists of trap; the rocks being composed of gneiss, mica, quartz, calcareous sandstone, clay slate. An excellent granite is quarried in the hills. The Mahi and Som are the rivers, small and stony. Wheat, Indian corn, rice, cotton, opium, ginger, and sugar-cane are the chief products. The climate is healthy, but the people suffer much from the guinea-worm. The name of the present ruler is Maharawal Udai Sing. Nothing is known of D. until the founding of the Mogul Empire in India, and to this and to the Mahrattas afterwards the state was tributary, until the British supremacy in those parts freed the inhabitants. Since then they have lived peaceably, with the exception of the Bheels, who have sometimes rebelled. The army consists of 400 horse and 1000 foot.

Don'gola (New), Kask Dongola, or **El Ordeh,** the capital of a province of the same name, Nubia, on the left bank of the Nile. Before the revolt of the Mahdi it was the seat of an Egyptian pacha, and a flourishing place of trade, with a fort, well-stocked bazaar, and a pop. of 7012. It was founded by the Mamlukes, on the loss of Old D., 75 miles S.S.E., on the opposite bank of the Nile. Near New D. is the charming islet of Argo, on which have been found many Egyptian and Nubian antiquities.

Do'nis, Statute de, is the statute of 13 Edward I. c. I. It is sometimes called the statute of 'great men,' as chiefly concerning the upper class and their interests. It created the power of entailing, by enacting 'that the will of the giver, according to the form in the deed of gift manifestly expressed, shall be henceforth observed.' See ENTAIL.

Donizett'i, Gaëtano, an Italian musician, born at Bergamo, in North Italy, 25th September, 1798, studied at Bologna, and for some time served in the Austrian army. He devoted himself at first to church-music (for writing which he was singularly unfitted), but afterwards to the opera. He operas are over sixty in number, among the best-known being *L'Elisir d'Amore*, *La Fille du Regiment*, *Lucia di Lammermoor*, and *Lucrezia Borgia*. D.'s music is more trivial, and his talent less than that of Rossini, of whom in many respects he was a follower. The flowing melody of his music has caught the popular ear, but the greater portion of it hardly deserves serious attention. D. died at his birthplace, 8th April, 1848.

Don'jon (from the Low Lat. *dominio*, 'a lordship,' contracted *domnio*, *domgio*, *dongeo*), or **Dun'geon,** originally the principal building of a district, or the strong tower of a fortress. The form *donjon* is now applied, in fortification, to a large tower or redoubt, to which a garrison may retreat in case of need; *dungeon*, to an underground prison, such as used to be a portion of the strong tower of a fortress.

Donjon.

Don Ju'an, an imaginary personage, whose story symbolises the same idea as the old German legend of the Tannhauser—the idea of a soul in which regard for the spiritual has been burned out by ungovernable desire. According to the popular version of the legend, D. J. is a young nobleman of Seville, whose rare intellect and courage enable him for a time to pursue with impunity a career of eclectic profligacy. Having slain the father of one of his victims, in impious bravado he challenges the Supreme Power to animate the murdered man's statue, which he mockingly invites to a feast. The statue arrives as he requested, and carries the blasphemous libertine down to hell. This legend has been frequently embodied in literature. It was acted, as a *spiritual* play entitled *Atheista Fulminato*, in the Spanish churches and monasteries, but was first cast into regular dramatic form in *El Burlador de Sevilla*, by Gabriel Tellez, an imitator and contemporary of Calderon. In this play D. J. appears as the sombre but impressive incarnation of godless, sensual sin. Translated into Italian by Cicognini, the drama passed from Italy to Paris, and gave rise to Molière's *Festin de Pierre*, where D. J. is represented as an unscrupulous, plausible scoffer and voluptuary, but fallen from the grandeur of the Spanish poet's creation. The legend has served also as a groundwork for Shadwell's *Libertine*, for Mérimée's *Les Ames du Purgatoire*, and for the plot of Mozart's *Don Giovanni*. Byron's D. J. has only the name in common with the legendary character; he is merely a youth who, being detected in an intrigue, leaves Spain to pursue a course of adventures in Greece, Turkey, Russia, and England.

Donk'ey Engine, a small auxiliary engine used on board ship for filling up the boilers and doing other work when the main engines are not in motion.

Donn, Robert, or **Robert Mackay,** born in the county of Sutherland in 1714, died 1778, probably the only one of the Gaelic bards who has received more attention and praise than his productions deserve. His poems were published in 1829, with a highly laudatory preface, and his clansmen raised a monument to him with inscriptions in Latin, Greek, Gaelic, and English. He is frequently spoken of as a poet of the highest order; but in truth, while one or two of his songs possess considerable merit, the great majority are commonplace, often interlarded with English words, and frequently disfigured by such coarseness as ought to have prevented their having ever been published.

Donne, John, an English poet and divine, was born in 1573. He was educated at Oxford and Cambridge, and studied law at Lincoln's Inn. Becoming master, at the death of his father, a London merchant, of property worth £3000, he went abroad, and accompanied the expeditions of Essex to Cadiz and the Azores in 1596-97. Returning to England, he became secretary to Lord Chancellor Ellesmere, whose niece he secretly married. For this he was imprisoned, and on being liberated had to recover his wife by a lawsuit. He remained a poor dependent on his friends, until James VI., pleased with his book *The Pseudo-Martyr*, induced him to take orders, and made him his chaplain. He became famous as a preacher and a poet, was made Dean of St. Paul's in 1623, and, after receiving further preferment, died 31st March, 1631. His poems, consisting of elegies, satires, epistles, and erotics, display a strange union of pathos and affectation, delicacy and coarseness. They abound in fantastic and jarring conceits; their verse is often harsh, and their thought crude; but amid their tangled intricacies runs an undercurrent of melody, and verses of the purest poetry occur. His *Sermons* (1640) are full of deep thought and far-fetched illustrations. Ben Jonson called D. 'the first poet in the world in some things.' See Isaac Walton's *Life of Dr. J. D.*, prefixed to the first edition of his *Sermons*.

Doo, George Thomas, an eminent engraver, born in Surrey, 6th January, 1800, well known for his prints after leading English artists and the old masters, such as Wilkie's 'Knox preaching before the Lords of the Covenant,' Etty's 'Combat,' Correggio's 'Ecce Homo,' and Raffaelle's 'Infant Christ.' D. was appointed Historical Engraver in Ordinary to the Queen in 1842, and R.A. in 1856, and was Chairman of the London International Exhibition of 1862. His engraving of Piombo's 'Raising of Lazarus' was the result of eight years' labour. Died 13th November, 1886.

Doom, or **Doum Palm,** a palm of Upper Egypt, Central Africa, Nubia, Abyssinia, and Arabia, remarkable for its repeated forkings in a dichotomous manner. It will grow in the sandiest soil, and in some of the most desert parts it is the prevailing or sole tree. The fruit tastes somewhat like gingerbread, hence it is sometimes called the *gingerbread tree*. From the fibres of its leaf-stalks ropes are made. An infusion of the fruit is gently aperient, and accounted salutary in fevers. The hard albumen of the seed is turned into beads and other little ornaments. The hard, tough wood is useful for making various domestic articles. There are a few other species of the genus, which extends as far S. as Natal.

Doom'ster. See DEEMSTER.

Doon (Celt. 'the dark water'), rendered by the muse of Burns the most classic of Scottish streams, rises in Loch Enoch, in the S.E. of Ayrshire, and flows through Loch D. Emerging from the loch, it rushes through the magnificent wooded ravine of Glen Ness, and after a course of 30 miles, falls into Ayr Bay, about 2 miles S. of the town of Ayr. Not far from its mouth are the cottage in which the poet was born, the monument erected to his memory, Allowa Kirk, the Auld Brigg, and all the magic associations of 'Tam o' Shanter.'

Doorn'boom (Dutch, 'thorn-tree'), the name given by the Dutch Boers, and now generally adopted in S. Africa, for *Acacia horrida*, the most common tree in the wastes of the Cape of Good Hope, &c. Its hard, tough timber is used for house carpentry. See ACACIA.

Doors, Doorways, have in all civilised ages formed an important detail of architectural composition, and in the successive well-defined styles of the art, they are invariably designed in harmony with the features of the special style, and their form and decoration supply data for determining the order and character of the building, of which they make part, and the period of its construction. In the ancient Egyptian tombs, and in all primitive stone structures, the character of the architecture has been borrowed from a wooden original, and the doorways, as might be expected, seem reproductions in stone of the entrances of wooden cabins. The lintels are generally rounded, and the walls are, *in idea*, mere square posts, grooved and jointed together. The famous 'Pelasgic' tomb at Mycenæ is of the shape of a regular equilateral pointed arch, a form which their mode of building—with horizontal layers of stone projecting the one above the other, and with one small stone covering the apex of the vault—naturally and necessarily suggested. Familiarised with the curved line of the pointed arch, they made use of it in their doorways, which were often curved pointed arches. In some, however, the sides of the triangular opening were straight for the whole height; but though this form of entrance was very stable, it must have been exceedingly difficult to fit with a door or to close by any known contrivance. The difficulty was obviated at a later period by inserting a lintel half way up the opening. Below this lintel the jambs were nearly perpendicular, while above it they sloped so as to form a pediment, which was sometimes filled with sculpture. In the architecture of the ancients the doorways were usually rectangular; though sometimes the jambs had a slight inward slope. In later Roman architecture they were sometimes arched; and when rectangular, an architrave or suit of mouldings ran round them, and around the top; these mouldings were often heavier and more numerous than round the sides, and were supported at each end by a truss or bracket. The doors of the ancients were made of wood, metal, and, rarely, of marble, and were swung upon pivots working in sockets. In the doorway of the Old English church of Monkwearmouth in Durham, the arch is round and rests upon pillars, 'evidently copied,' says Fergusson, 'from turned posts in wood.' The Norman doorways were heavily enriched with ornaments, and show surprising variety of design. The arch was commonly semicircular, but was also segmental or horseshoe in form. The mouldings round the arch were sometimes so numerous that their breadth nearly equalled that of the doorway itself. Shafts, sometimes circular, sometimes octagonal, and occasionally ornamented with zigzags or spiral mouldings, and with capitals enriched with figures and foliage, were used in the jambs. The original Norman doors present little ornamentation with the exception of the iron of the hinges, which often extended more than half across the door, in fanciful scroll-work. The west door of Lichfield (1275), in the Decorated Style (q.v.), is an example of the architecture of the period in its highest perfection. The chapter-house door at Rochester is excessively rich in ornament, and is satisfactory in design; but there is little freehand carving in its decoration, the greater number of the forms being produced by instruments. In this great work the tendency towards the more mechanical arrangement of the Perpendicular Style (q.v.) is already observable. In the doorways of this style the outer mouldings over the arch were usually formed into a square—the spandrels being filled with tracery, foliage, or sculpture; and the doors were usually panelled, and enriched with tracery. Of modern ornamental buildings, the doors and doorways are most commonly designed in the Early English or Decorated spirit.

Doq'uet, or **Dock'et,** an old English word denoting a summary of a voluminous writing. Attestations or declarations annexed to written instruments are called doquets. The notarial D. is a curious example of ancient style.

Do'ra d'Istria, the pseudonym of Helena Ghika, Princess Koltzoff-Massalsky, a Wallachian authoress, born of a noble family at Bucharest, 22nd January, 1829. Her early studies and travels made her an accomplished linguist, and at the age of fifteen she undertook to translate the *Iliad* into German. She composed several dramas when very young; became famous for her beauty and acquirements; and in 1849 married Prince Koltzoff-Massalsky, whom she accompanied to the Russian court. After further travels she published *La Vie Monastique dans l' Église Orientale* (Paris, 1855), under the pseudonym D. d'I., in allusion to the Ister or Danube. Among her other works are *La Suisse Allemande* (Geneva, 1856) and *Les Femmes en Orient* (Zurich, 1860). Her works are pervaded by ardent love of freedom and Christianity. She produced numerous articles in French, Italian, and German journals, attempted painting with success, and was chosen a member of learned societies which had never before admitted a woman.

Dorak', a town of Persia, province of Khuzistan, on the left bank of the Jarahi, about 44 miles from the Persian Gulf. It stands in a marshy plain, its houses are mostly of reeds, and it is partly circled by a thick mud wall. It is the chief seat of the Chāb Arabs. The climate is unhealthy, and fever is prevalent. D. has a trade in rice, wool, and Arab cloaks, for the manufacture of which it is famous. Pop. 9020.

Dor'cas Soci'ety. Charitable societies of ladies are sometimes so called, from the verse Acts ix. 39—'And all the widows stood by him weeping, and showing the coats and garments which Dorcas made while she was with them.' The object of the D. S. is the clothing of the poor and the employment of poor needlewomen.

Dor'chester (Old Eng. *Dorce-ceaster*), the county town of Dorsetshire, situated on the Frome, 140 miles S.W. of London by rail. D. is a pleasant town, consisting mainly of three streets, the chief buildings being the shire-hall, guildhall, St. Peter's Church, the exchange, and the gaol. D. has considerable trade in agricultural produce, and brewing is carried on, the ale of D. being famous. The town, which was nearly ruined by a fire in 1613, was the scene of several battles in the civil war. Near it are the remains of a Roman camp and amphitheatre. Roman urns, coins, &c., have been found in the neighbourhood. Pop. mun. bor. 7946; and reg. sub-dist. 9133.

Dordogne', a south-western department of France, formed out of the province of Périgord. The surface is hilly, with level uplands, narrow, fertile, well-watered valleys, and several moors and marshes. The N. is mostly woody or barren; the S. rich in corn and vines. D. is remarkable for its numerous streams and ponds. It is named from the river D., which rises in Mont Dor, and of which the chief tributaries are the Ceon, Isle, and Haute-Vezère. The climate is generally mild, though the winter in the uplands is severe. The chief products are vines, chestnuts, maize, rye, and buckwheat. There are mines of coal, iron, lead, copper, and quarries of granite and sandstone. The leading industries are mining and the manufacture of woollens, charcoal, paper, brandy, cutlery, &c., but there is also a large trade in iron, wine, leather, ham, and the truffles of Périgueux. D. is crossed by the Paris-Agen Railway, and by the *Canal-de-la-Cité* and *Canal-de-l'Isle*. The largest towns are Périgueux, the capital, Bergerac, Ribérac, and Sarlat. Area, 3546 sq. miles; pop. 478,471.

Doré, Paul Gustave, a French painter and designer of great fertility and fancy, was born at Strasbourg in January, 1832, was taken to Paris in 1845, studied at the Lycée Charlemagne, and after 1848 was engaged, along with Bertall (q.v.), to contribute sketches to the *Journal pour Rire*. From this date sketches, cartoons, and pictures came teeming from his hand in the most marvellous profusion. To attempt to enumerate more than his principal works would be undesirable. He first exhibited in the Salon in 1848, and his sketches of the Battle of Alma (1855) and Battle of Inkerman (1857) attracted considerable attention. In 1860, and subsequently, he exhibited a series of impressive cartoons illustrative of the *Divina Commedia*. Later he contributed a vast number of drawings to the *Journal pour Tous* and to many other periodicals, and also illustrated the works of Rabelais (1854); the *Wandering Jew* (1856); the *Contes Drôlatiques* of Balzac (1856); the *Contes de Perrault* (1861); Montaigne's *Essais* (1857); Taine's *Voyage aux Pyrénées* (1859), &c. The works, however, by which he has earned a European fame are illustrations of Dante's *Inferno* (1861); *Don Quixote* (fol. 1863); the Bible (1865-66); Fontaine's *Fables* (1867); Dante's *Purgatorio* and *Paradiso* (1868); Tennyson's *Idylls* (1866-68); Milton's Works (1866); a collection of drawings entitled *London* (1870); and Coleridge's *Ancient Mariner* (1875). D. was specially happy in rendering weird, unearthly subjects, to the effects of which his gloomy *technique*, consisting of engraved white lines on a black ground, greatly contributed. His grim humour found vent in occasionally grotesque exaggerations of life and nature. The main objection to his art, apart from the defects of execution, is general dulness of tone, and the consequent want of atmosphere, point, and brightness. D. died at Paris, 23rd January, 1883.

Do'ria (originally **D'Oria,** the children of Oria, wife of

Arduin of Narbonne, in the first half of the 12th c.), the name of an ancient patrician family of Genoa, which has furnished a long succession of historic names.—**Antonio D.**, elected consul in 1154, greatly advanced the trade and commerce of his native city. In the struggle between the Guelfs and Ghibellines, the Dorias, with few exceptions, took the side of the latter, and were in consequence highly favoured by the Hohenstauffens. They were also conspicuous in the conflicts of the Genoese families for political supremacy, and succeeded in obtaining for a time almost unlimited power. Their rule was the golden time of Genoa. During the 14th, 15th, and 16th centuries, their renown as commanders of the Genoese fleet was sustained by a series of brilliant victories over the fleets of the Pisan and Venetian republics. The most notable member of the family was **Andrea D.**, born at Oneglia, 30th November, 1468. He served in the papal guard, and under various Italian potentates; and, as captain-general of Genoese galleys, warred on the Moorish pirates. D. sided with François I. against the Emperor Karl V., and commanded the French fleet with signal success. Finding, however, that his native city was oppressed, he went over to the Emperor, and in 1528 drove the French out of Genoa. Karl offered to make him sovereign, but he patriotically refused, and was called 'Father and liberator of his country.' He formed a government, with a council (*signoria*) and a doge, who held office for two years. In 1535 he aided in the taking of Tunis, and in 1541 commanded the naval force in the Emperor's unfortunate expedition to Africa. Fieschi's conspiracy troubled his closing years, but this he crushed, and lived in great state at Genoa till his death, 25th November, 1560. See Lorenzo Capelloni's *Vita del Principe D.* (Venice, 1569); Carlo Sigonio's *De Vita et Gestis Andreæ Doriæ* (Geneva, 1586). The family still survives, and is represented by Alfonso Maria D.-Pamphilj-Landi, prince of Torriglia, Melfi, and Valmontone, duke of Avigliano, who was born at Rome, 25th September, 1851. His mother was a daughter of the Earl of Shrewsbury. He married, 24th June, 1882, Lady Emily Pelham Clinton of the Newcastle family.

Do'rians. The inhabitants of Doris, a small mountainous district of Greece, lying between mounts Œta and Parnassus, and embracing the valley of the river Pindus. They are said to have derived their name from Dorus, the son of Hellen, and are variously represented as inhabiting Doris, Phthiotis, and the whole country N. of the Corinthian Gulf. The last account best agrees with the historical importance of the D., who formed one of the four chief peoples of ancient Greece, and conquered the greater part of the Peloponnesus—a feat which they accomplished under the leadership of the Heraclidæ. During the historical period a great part of the Peloponnesus was subject to them. They founded numerous colonies in Asia Minor, Sicily, Southern Italy, and the islands of the Ægean. The D. are mentioned only once in Homer (Od. xix. 177), and then as a Cretan tribe: their conquest of the Peloponnesus must therefore be placed after his time. Like most mountain races, they were a stern, unpolished, earnest people. Their character is written both in their language and architecture, and stands out in striking contrast to that of their more polished neighbours.

Dor'ic Order. See COLUMN.

Do'ris, a familiar genus of Gasteropodous molluscs, including those forms familiarly named 'sea-lemons.' These molluscs belong to the order *Opisthobranchiata* of their class, and possess no shells in their adult state, but have the gills present in the form of beautiful plumes, situated towards the hinder extremity of the body, and which can be retracted or expanded at will. The head is provided with tentacles, and eyes are placed behind the tentacles. These animals are sometimes named 'sea-slugs,' from the resemblance to the more familiar land Gasteropods of that name. The sexes are united in the same individual. *D. Johnstoni* is a familiar species among the British examples of this genus.

Dor'islaus, Isaac, a Dutchman who came to England in the early part of the 17th c., and was made lecturer on history in Cambridge University by Fulke Lord Brooke in the beginning of the reign of Charles I. He lost this post for his avowed republicanism, became judge-advocate in the royal army, embraced the cause of the Parliament, helped to draw up the accusation against the king, and was murdered by several exiled royalists, 2nd May, 1849, at the Hague, where he had been sent as ambassador.

Dor'king, a market-town in the heart of Surrey, on the Mole, 29 miles S.W. of London by railway. It is picturesquely situated, and is composed in great part of fashionable villas. There are several handsome churches, among them that of St. Barnabas, with a spire 150 feet high, built by Sir G. Scott in 1859. D. has some trade in flour, chalk, and lime, and gives name to a certain breed of fowls. D. is on the Roman road between London and Chichester. Pop. reg. sub-dist. 12,396; and civ. par. 10,961.

Dor'mant (Fr. *dormir*, 'to sleep'), in heraldry, describes an animal lying on the ground with its forepaws outstretched, and its head resting on them. *Couchant* describes it with the head erect.

Dormant or **Poten'tial Vital'ity,** a term given to certain phenomena observed in some animals and plants, wherein the vitality of the organisms appears to exist in a state somewhat analogous to that we familiarly term *suspended animation* in man. Thus the seeds of plants may be kept in a dried parched state for many years, and yet spring into healthy plants when placed in their natural conditions—namely, in moist earth. The familiar examples of wheat and peas found in ancient mummy cases illustrate the occurrence of P. or D. V. in plants. And a no less remarkable instance of D. V. is the case of certain seeds which had been covered over in Greece by the refuse of some mines not worked since the classic ages. These seeds, being a few years ago uncovered, sprang up into plants, and reintroduced into that neighbourhood plants which had been unknown since the times of the ancients. In animals an example of D. V. is seen in the case of the *Rotifera* (q.v.), or 'wheel animalcules,' highly-organised beings, of minute size, and common in all our fresh-water pools. These beings may be artificially desiccated, just as they are dried in nature by the summer sun, from the pools in which they live. They may be blown about as mere dust-specks by the wind, and may continue in this mummified state for months and years. Yet on the addition of a little moisture they at once resume all the functions of their lives with renewed vigour. Other animals (such as snails), and other animalcules (such as the Bell animalcules), &c., may similarly exhibit an apparent suspension for lengthened periods of all their vital functions. Instances which are sometimes given of insects, of fishes, and of other animals exhibiting this state of D. V. are not to be accounted true examples of these phenomena. The quiescent state of an insect undergoing its metamorphosis is not to be compared to the seemingly total suspension of all the functions of life, as seen in Rotifera; and such fishes as the Lepidosirens (q.v.) or mud-fishes (see also DIPNOI), when lying packed in their mud-nests, are not destitute of vitality any more than a hybernating bear or mouse can be said to be dormant. In the one case we have apparently complete cessation of all vitality, in the other the animals are simply in a state of torpidity, but breathe and exhibit other evidences of the presence of life. When we inquire as to the conditions which affect organisms so as to produce D. V., or those in virtue of which beings of high structure can apparently have their functions temporarily annihilated, we find that biology can say nothing definite in reply. To say that D. V. ensues as a result of the withdrawal of natural surroundings (as in the drying of the Rotifera), is simply a restatement of facts, and not an explanation of the *rationale* of the phenomena. We must, however, carefully distinguish between the use of the terms *revitalise* and *revive*. We can revive the being which exhibits D. V. or suspended animation by restoring it to its due surroundings, but we cannot revitalise a dead organism. Much confusion has arisen in discussing this subject from the indiscriminate use of these terms.

Dor'mer (Fr. *dormir*, Lat. *dormire*, 'to sleep') is an attic room formed by raising a gable resting on the rafters, and projecting vertically above the sloping roof of a house, and was so called because it was a contrivance resorted to for increasing the sleeping-accommodation of a house. D.-windows (Fr. *lucarnes*) have often been made an important detail in Gothic architecture, and the flamboyant *lucarnes*, constructed in France towards the end of the 15th and beginning of the 16th centuries, were especially elegant.

Dormer Window.

Dor'mitory (Lat. *dormitorium*, from *dormire*, 'to sleep'), the sleeping-hall of a religious house, boarding-school, hospital, &c., in which a number of beds for the inmates are ranged. The D. of the Abbey of Fontinelle (constructed in the 8th c.) was 208 feet long, 27 broad, and 64 high. In later times the D. of a monastery was often a series of cells, all opening upon a long gallery.

Dor'mouse, a genus of *Rodentia* (q.v.) belonging to the family *Myoxidæ*, which differs from the true mice, being more nearly allied to the Jerboas (q.v.), squirrels, &c. The family is known by the smoothness and compressed form of the incisor teeth, the molars numbering eight in each jaw, and having transverse markings on their crowns. The genus *Myoxus*, represented by the lerot or garden D., and by the common D., is known by its members possessing ears of moderate size, and long whiskers. The front feet have four toes and a rudimentary thumb, the hinder feet five toes. The tail is long and hairy. The members of this genus are confined to the Old World, and occur mostly in Europe. The common D. attains a length of five inches, is white-throated, of a light reddish-brown on the upper, and a lighter tint of the same colour on the under parts. It is nocturnal in habits, and its nest is built usually in some secure nook in a tree. The food consists of corn and nuts. The D. sleeps during winter; hence its name. The young number three or four at a birth. The lerot occurs in S. Europe, and attains a length of eight inches. Its colour is grey, tinted with red above and white below; there is a patch of black below the eye. It commits much havoc in fruit-gardens. The fat D. or loir, found also in S. Europe, was formerly eaten by the Romans, and was fattened in cages named *gliraria*.

Dormouse.

Dorn'birn, or **Torn'büren** ('thorn-dwelling'), an industrial town of Austria, in the crown-land of Tyrol and Vorarlberg, 8 miles S. of the Lake of Constance. It has manufactures of spinning, weaving, and embroidery. Pop. town 10,678; district 23,876.

Dor'noch, (Gael. *Dor-n-ach*, 'the field between two waters') the capital of Sutherlandshire, Scotland, and the only town in the county, is situated at the mouth of the D. Firth, which, with an inward reach of 22 miles, separates Ross-shire from Sutherland. It is a royal burgh (since 1628), was formerly the residence of the Bishops of Sutherland and Caithness, and has a cathedral said to date from the 11th c., which was destroyed by fire in 1570, and partially restored in 1837. It is now used as the parish church. D. attracts many summer visitors for bathing and golfing. Along with Wick, Cromarty, Dingwall, Kirkwall, and Tain, it returns one member to Parliament. Pop. parl. bor. and civ. village (each) 514.

Firth of D., a narrow sinuous arm of the North Sea, 20 miles long, receives the Shin, Oykel, Carron, and smaller streams.

Dorogobush', or **Dorogobouj,** a town in the government of Smolensk, Russia, on the Dnieper, 50 miles E.N.E. of Smolensk. It is well built, and has ten churches. It was partly burned by the French under Eugène, in their retreat from Moscow, 27th October, 1812. Pop. 17,090.

Dor'pat, or **Dörpt** (Rus. *Guriev*, Esth. *Tartolin*), a town on both sides of the Embach, government of Livonia, Russia, 150 miles N.E. of Riga. It is mostly built of brick or wood, and has a granite bridge across the Embach, which is frozen from the end of October to the middle of March. Its famous university, founded by Gustavus Adolphus in 1632, suppressed in 1710, and re-established by Alexander I. in 1802, is now attended by 710 students, and has a library of 85,000 volumes, botanical gardens, &c. The language of the people is Esthonian, but that of literature and of the learned is German. There is an active trade. D. was founded by the Russians in 1030, and was taken by the Teutonic Knights 1223, afterwards becoming an important member of the Hanse League. It has been the seat of a bishop since the 13th c., came into the possession of Poland in 1583, of Sweden in 1625, and was partly destroyed by Peter the Great in 1704. Pop. 34,897, of whom many are Germans.

Dorse, a species of *Gadidæ* or Cod—somewhat doubtfully regarded as a distinct species—found in the northern seas and in the Baltic. From its liability to variation in colour it has received the name of 'variable cod.' Its average length is two feet. It is hardly known in Britain.

Dor'set, House of, an English family, settled in Sussex, which traces its origin from Hildebrand Sackville, one of the followers of William the Conqueror. The chief members of the family are the following:—**Thomas Sackville,** the first Earl of D. (See SACKVILLE.) **Edward Sackville,** grandson of the above, was born in 1590. James I. viewed him favourably, and put him at the head of the troops sent to aid the Elector-Palatine in the Thirty Years' War. In 1621 he was sent as ambassador to the French court, and in 1624 succeeded to the title of Earl of D. Although Charles I. was very partial to him, D. often opposed the king's unconstitutional acts, and in 1640, when he was one of the regents appointed during the king's absence in Scotland, exposed and prevented the massacres arranged to take place in Ireland in October, 1641. In 1641, as President of the Council, he strove to reconcile the king and Parliament, but mediation proving useless he espoused the royal cause, and fought bravely at Edgehill. He died at Witham, 17th July, 1652. Clarendon says he was distinguished for wit and learning. He left two sons, **Richard D.,** born in 1622, who was a member of the Long Parliament, imprisoned as an abettor of Strafford, became Lord-Lieutenant of Sussex, and died in 1677; and **Charles Sackville, Earl of D.,** who was born at Witham in 1637, went to sea under the Duke of York in 1665, and on the night before the sea-fight, in which the Dutch Admiral Opdam's vessel was blown up, composed his well-known ballad, *To all you Ladies now on Land.* He was a distinguished patron of literature, and the friend of Dryden, Waller, and Butler, whose *Hudibras* he introduced to the royal notice. He opposed James II.'s despotic measures, and was a favourite courtier of William III., whom he accompanied to Holland, and who made him Lord Chancellor. D. died at Bath, 19th January, 1706. He was highly praised by Prior, and by Pope in his *Epitaph on D.* His writings consist of satires and songs, which, though trifling, are generally elegant and piquant. His son **Lionel** was made Duke of D. by George I. in 1720, and died in

1765. The title became extinct in 1843, on the death of **Charles Germain,** nephew and successor of that Duke of D. who was Byron's youthful friend.

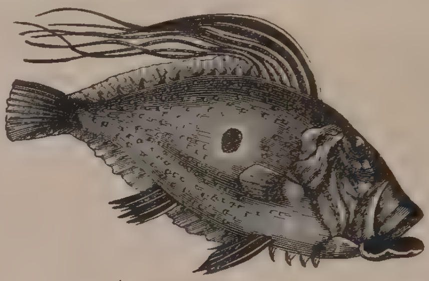
Dorsetshire, a southern county of England, bounded S. by the English Channel, W. by Devon, E. by Hampshire, and N. by Somerset and Wilts. It is level in the N., but is traversed by chalk hills (Dorset Heights) in the centre. The coast-line, 75 miles long, is deeply indented on the E. by Poole Harbour, while in the W. it forms part of Lyme Bay. It is in places precipitous, occasionally standing out in bold headlands, as at Swanage, St. Albans (934 feet high), and the Bill of Portland. The chief rivers of D. are the Stour, Trent, and Frome. In the W. the formation is oolitic, in the E. cretaceous. D. is an agricultural county, and the principal occupations are grazing and dairy and sheep farming. Area 632,272; pop. anc. county and admin. county (each), 194,517; and reg. county, 188,995. D. contains four parliamentary divisions, each of which returns one member: Eastern, 57,217; Northern, 45,763; Southern, 49,896; and Western, 41,641. There are estimated to be 89,953 acres under corn crops (barley or bere 31,196, and oats 31,188); 52,616 under green crops (potatoes 1644); 45,946 under clover, sainfoin, and grasses in rotation; 298,634 under permanent pasture and grass not broken up; and 25 under flax. Bare fallow and uncropped arable land account for 3087 acres, and small fruit is cultivated over 310 acres. Mountain and heath, used for grazing, cover 14,075 acres; and wood and plantations occupy 31,457, while 126 are laid out for nursery grounds. For live stock see separate articles, CATTLE, HORSE, PIG, and SHEEP. There is a large export trade in dairy produce, and in Portland and Purbeck building-stone, coarse marble, and potter's clay. Dorchester is the capital, and the other notable towns are Poole, Bridport, Sherborne, Weymouth, and Melcombe-Regis. There are ample means of intercommunication by the London and South-Western, Great Western, and Midland railways. D. has many interesting British and Roman remains, as barrows, stone-circles, camps, amphitheatres, &c. The ruins of Corfe (q.v.) Castle, a residence of the West-Saxon kings of England, are among the finest in the island.

The Dorset Sheep, in form of head and horns, resembles the blackfaced ewe sheep, but the whiteness of its face shows it to be less hardy. Dorset sheep are to be found in many parts of England, and also in Scotland. They are long in the leg, light in shoulder, and their average weight per quarter is from 20 to 25 lbs. The wool is of good quality, but the fleece is light, 4 to 5 lbs. being a good clip. Their chief merits are their excellence as nurses, and their great fecundity, twins with the ewes being a common circumstance. Their lambs are dropped in October or November.

Dort, or **Dor′drecht** (from Old Ger. *trift*, 'pasture' or 'meadow,' 'the pasture on the water'), an ancient town on an island on the Maas, province of S. Holland, Netherlands, 12 miles S.E. of Rotterdam, partly fortified on the land side. It is admirably situated for trade, having not only the Rhine and the Maas in its vicinity, but being furnished with numerous canals. Large rafts of wood from Switzerland and Upper Germany are floated down on the Rhine to D., which has numerous saw-mills, extensive ship-building yards, salt and sugar refineries, manufactures of tobacco, and a trade in seeds, grain, oil, and flax. D. is famous in Church history for a great synod, held in 1618-19, which condemned the doctrines of Arminius (q.v.). The hall in which the divines met is now converted into a playhouse. It is perhaps still more memorable as the place where the United Provinces, after the expulsion of the Spaniards, held their first Assembly in 1572. Pop. 32,934.

Dort′mund, a town in the province of Westphalia, Prussia, on the Cologne and Minden Railway, 47 miles N.N.E. of the former city. Its railway station is one of the largest on the Continent, with immense workshops for the manufacture of rolling stock. D. has also manufactures of woollens, linen, cotton, tobacco, and cutlery, breweries, and flour-mills, and is the centre of an important mining district. It is a very old town, and figures in the romantic and fabulous history of the Dark Ages. D. was already a town in the year 800, and was afterwards variously called, in mediæval Latin, *Throtmanni*, *Trutmanna*, *Trutmonia*, *Tremonia*; in German, *Trotmunde* and *Dortmunde*. It was a free imperial city and a member of the Hanseatic League, lost its prosperity during the Thirty Years' War, but has recovered it in recent times. Its old walls (12th c.), pierced by five gates, have been almost wholly removed. Pop. 89,663.

Do′ry, or **John Dory,** a well-known species of Teleostean fishes, usually regarded as included in the *Scomberidæ* or Mackerel family, and distinguished, as a genus, by possessing a divided dorsal fin, the front or spinous part of which is less developed than the soft portion. The body is deep, and bony plates exist along the bases of both dorsal and hind fins. The name 'J. D.' is supposed to be a corruption of the French *jaune dorée*, a term given to this fish from the brilliant yellow colour of its body. The body is compressed, and the head curiously shaped, the mouth being very protrusible. Each ray of the first dorsal fin gives off long tendril-like processes. The colour exhibits a general yellowish hue, but the tints which pass over the body as the fish is dying are as varied as they are beautiful. The food of the D. consists chiefly of smaller fry and cuttlefishes. Its flesh is highly esteemed. It is also known by a peculiar black mark on each side, which superstition ascribes to the marks of the apostle Peter's finger and thumb, as he took this fish from the water to obtain the tribute-money. The average length is about 16 inches. The D. occurs in most of the seas of Europe.



John Dory.

Dott′erel, a species of *Charadriadæ* or Plovers, occurring in Britain, in N. Europe and N. Asia, but also migrating to the S. of Europe in autumn. The plumage is of a general brownish tint on the upper parts, the cheeks and throat being white, while the breast and under parts are white. The average length of this bird is 8 or 9 inches. It is captured for food in large quantities, and is in reality shy and wary, although usually reckoned a stupid animal.

Dou′ai, or **Douay,** an ancient town of France, department of Nord, on the Scarpe, 21 miles by railway S. of Lille, and about 70 miles S.E. of Calais. Of its once formidable fortifications there are some remains, and its notable buildings and institutions are the Church of Notre Dame (partly of the 12th c.); the artillery magazine and barracks; the imperial cannon-foundry; the Hôtel de Ville, a magnificent Gothic structure, with beautiful belfry; the library (46,000 vols.); the museum of natural history, antiquities, and art; a college for the education of English Roman Catholics, a university academy, and schools for law, physics, mechanics, chemistry, mathematics, gunnery, and for the training of male and female teachers. The industrial establishments comprise machine-shops, foundries, lace and thread factories, and chemical works. D. is connected by a number of canals and by the river Scheldt with the chief towns and departments of Belgium, and it is the centre of an active trade in oil, sugar, soap, brushes, linen goods, machines, and instruments, &c. Pop. town 29,909; arrond. 133,037.

Doub′le Bass. See CONTRA-BASS.

Doub′le Con′sciousness is the name of a morbid mental condition, generally of periodic recurrence, which remains unconnected with the ordinary mental life of the patient, but the separate portions of which coalesce through memory and the ordinary laws of association, and thus form the material, if not the distinct conception, of a second personality. The stronger developments of this have occurred in the cases of hysterical and insane patients; but there is a milder form in which somnambulism, along with a consciousness of external impressions, alternates with healthy normal consciousness. The magnetic sleeper does not remember after waking what he has smelled, tasted, heard, spoken, or done during the sleep; but when subjected to magnetism again, the memory of that and all previous magnetic sleeps revives. The sense of identity is often lost in the magnetic sleeper, although the sleeper may speak with accuracy of things known to him in his usual state. It is not known what causes the 'fault' in the mental connections. It has been hypothetically assigned to the independent action of the two hemispheres of the cerebrum (Holland, *On the Brain as a Double Organ*). It is not proved that the hemispheres do act in this manner; were that known, the problem would then be to connect this independent action with the morbid conditions of D. C., and to explain how the isolation is produced and terminated, and how the experience of the isolated hemisphere is prevented from afterwards coalescing with the healthy action of the whole brain. The idea of unconscious cerebration, or of mental life without consciousness, does not to any extent explain the phenomena of D. C., although it suggests how portions of experience, lost to ordinary consciousness, may be reached by a wave of nervous excitement.

Doub'le Flat, in musical notation, a sign indicating that for the note to which it is prefixed a note two semitones lower is to be substituted. A **Double Sharp** indicates the similar substitution of a note two semitones *higher*.

Double-Shott'ing was the practice, in the naval tactics of an earlier day, of loading a gun with double the usual weight of shot for the purpose of increasing the destructive power. The design of modern cannon, and the perfect condition in which it is necessary to maintain them, render this practice impossible at the present day, while the rapidity gained by the adoption of the contrivance of breech-loading renders it unnecessary.

Doub'let (Fr. *doublet*, from *doublé*, 'double,' because lined), an article of apparel resembling a jacket, introduced into England from France about the middle of the 15th c., and worn by all classes for upwards of 200 years. Its use in England is marked by constant change of shape: the original garment was sleeveless, but sleeves were afterwards added; at one time it was tight-fitting, at another time loose; again 'pease-cod bellied,' then long-waisted; till it finally, in the reign of Charles II., lost its individuality and was superseded by the waistcoat.

Doub'ling of the Cube. See DUPLICATION OF THE CUBE.

Doubloon' (Span. *dublon* and *doblon*, 'double'), the name of a gold piece of the value of two pistoles. During the 18th c. and subsequently, the value of the D. varied at different times. For some time previous to 1772 the value had been £3 1s. 10d.; in that year the pieces were called in. They were subsequently reissued of the value of £3 4s. 8d. The value of the *dublon de Isabella*, issued in 1848, was £1 0s. 8d.

Doubs, a frontier department of France, bounded N. by Haute-Saône and Alsace, W. by Jura, E. by the Jura range, and narrowing in the S. almost to a point. It is chiefly watered by the river from which it takes its name, and has the Oignon for its western boundary. The country is very mountainous, presenting three distinct zones in climate and productions—(1) the rich vine *Plaine* to the W., between the rivers D. and Oignon; (2) the *Moyenne-Montagne*, rising to a height of about 900 feet, and affording good pasture; and (3) the *Haute-Montagne*, running from N.E. to S.W. (from 2000 to 4000 feet high), partly covered with pine forests. Agriculture is gradually improving. D. is specially rich in minerals, including iron, coal, gypsum, and marble. It possesses many mines, large furnaces, and ironworks. In addition it has many active industries, and is traversed by the Rhône-au-Rhin Canal, and by the Dijon-à-Belfort Railway. Besançon is the capital, and the other important towns are Montbéliard, Pontparner, and Baume-les-Dames. Area 2018 sq. miles; pop. 303,081.—The *river D.* rises in the S.E. of the department, flows N.E. along the French frontier, forms a sharp loop within Swiss territory, and after several windings proceeds in a S.W. direction, eventually joining the Saône below Dôle, after a course of 115 miles.

Dough (Old Eng. *dah*, from *deawian*, 'to moisten'), the mixture of flour, yeast, salt, and water, prepared by bakers for putting into the oven to make bread.

Doug'las (Gael. *Dubhglaise*, 'black stream'), the chief town in the Isle of Man, lies on a fine bay, on the S.E. side of the island, at the mouth of a small river of the same name. From the beauty of the scenery, and the salubrity of the air, it is a favourite sea-bathing place. A deep-water landing pier and pier with breakwater are provided. The older and lower part of the town is quaint and not uninteresting. Castle Mona, formerly a residence of the Duke of Athole, is now a hotel. D. has some linen, paper, and woollen manufactures. Pop. 19,525. Another town of the same name in the county of Lanark, Scotland, has a pop. civ. par. 2266; and civ. town 1018.

Douglas, the Family of. The origin of this famous Scottish family is unknown, but they were 'rooted in the country at the time when the Norman adventurers crowded in' (Burton). According to a legend, the name D. was derived from the exclamation of a Celtic chief, who, being sought by a Scottish king after a victory due to his prowess, cried '*Sholto Du-glas*' ('behold the dark-grey man'), and was rewarded with a valley in Clydesdale, which was henceforth known as the Valley of D., whence his descendants took their name. The first of the house known in history is **William of D.,** a kinsman of the powerful house of Murray, who lived at the end of the 12th and beginning of the 13th centuries, and probably drew his title from his lands on the D. Water, in Lanarkshire. He was succeeded by his eldest son, **Archibald,** or **Erkenblad of D.,** who was made a knight, and left two sons, William and Andrew. From Andrew descended the Douglases of Dalkeith and the Earls of Morton. The estates of D., now considerably enlarged, passed in succession to William and to his sons Hugh and William, surnamed the *Hardy*. This **Sir William of D.,** after various exploits in which he showed the reckless hardihood characteristic of the family, joined Wallace in 1297, yielded to Edward I., and died in prison, at York, about 1302. He held land on both sides of the Border and in various counties of Scotland. His son, **the Good Sir James of D.,** was the heroic and skilful associate of Bruce in the Scottish War of Independence. He was surnamed the 'Black D.' from his dark complexion. He was the *beau idéal* of knighthood, and was said to have fought in seventy battles and been victorious in fifty-seven. In compliance with Bruce's dying request (see BRUCE), Sir James sailed for the Holy Land, bearing the king's heart in a silver casket, and fell in a fight in Andalusia, in 1330, against the Moors of Granada. In memory of this expedition the Douglases bore a bloody heart and a crown upon their shields. The Good Sir James was succeeded by his brothers Hugh and Archibald. The latter married the daughter of John Comyn of Badenoch, and his son William became, in 1357, first Earl of D., and, through marriage, also Earl of Mar. His son James, second Earl of D., married Margaret, eldest daughter of King Robert II., and fell at Otterburn, in 1388. As he left no sons, his sister inherited the Earldom of Mar, while **Archibald D.,** surnamed **the Grim,** a natural son of the Good Sir James, succeeded to the Earldom of D. He added by marriage the barony of Bothwell to his estate, and married his eldest son and daughter to the eldest daughter and son of the king. He died in 1401. His son **Archibald** made an alliance with France, and in reward for his services in the French wars was made Count of Longueville and Duke of Touraine. He was slain at Verneuil in 1424, The fortunes of the House of D. culminated with his son **Archibald,** who also fought in the French cause. He died in 1439. At this time the Douglases held two-thirds of Scotland S. of Edinburgh, besides various estates in the N. The people viewed them as champions of Scotland against England, especially after the victory of Otterburn, and since they had, single-handed, won back the Border-lands which Edward Baliol had ceded to Edward III. Moreover, through the marriage of the Good Sir James's brother with the sister of the Red Comyn and the niece of Baliol, the Douglases could found a most plausible claim to the Scottish throne, and but for Baliol's unpopularity they would have contested the accession of Robert II. Bitter rivalry arose between the Stuart kings and the Douglases. **William,** Archibald's successor, a youth of seventeen, was murdered along with his brother in Edinburgh Castle in 1440 by King James II., a crime popularly spoken of as the 'black dinnour of Earl D.' The Scottish Earldom of D. was held by the murdered stripling's indolent grand-uncle, **James the Gross,** until 1443, when William, son of James, inherited the D. domains both in France and Scotland. This **William** of D. was lieutenant-general to James II., united Galloway to his possessions by marriage with his cousin, the Fair Maid of Galloway, and ruled almost as an independent sovereign until 1452, when James II. enticed him to Stirling Castle, under pretence of wishing a conference, and there stabbed him to death. His brother James declared war with the treacherous king, but shortly fled to England, leaving Archibald and Hugh D. to continue the struggle. They were beaten at Arkinholm in 1455 by George, fourth Earl of Angus, who belonged to a younger branch of the Douglases which was then at feud with the great house, but by which the fortunes of the family of D. were afterwards restored. James of D., who had fled to England, made a raid into Scotland with Albany in James III.'s reign, was captured, and spared on condition of entering Lindores Monastery. **House of Angus.**—This family sprang from a liaison between William, first Earl of D., and Margaret Stewart, Countess of Angus and Mar, whose descendants became Earls of Angus. After the victory at Arkinholm the fourth Earl of Angus was rewarded with the dominions of the beaten Douglases. Hence the popular remark that the 'Red D. had put down the Black,' Angus being of a florid complexion.—**George, Fourth Earl of Angus,** died in 1462, and was succeeded by **Archibald,** nicknamed 'Bell-the-Cat' (see JAMES III.), who was for some time Warden of the East Marches and Lord High Treasurer of Scotland. His eldest son fell at Flodden, his third son, Gawin D. (q.v.), entered the Church, and his son by a second marriage, Sir Archibald D. of Kilspindie, became Lord Treasurer of Scotland under James V. He was succeeded by **Archibald,** son of the George D. slain at Flodden. Archibald married Margaret, widow of James IV., and sister of Henry VIII. of England, by whom he had a daughter, afterwards mother of Henry Darnley (q.v.). During the minority of James V. Scotland was distracted by feuds between Angus and the Hamiltons. In the battle known as 'Clean the Causeway,' fought in the High Street, Edinburgh, the Hamiltons were, for a time, thoroughly beaten; and Angus, being made guardian of the young king in 1526, was practically sovereign till 1528, when James escaped from his custody. Thenceforth his power dwindled, and finally his estates were forfeited, and himself, after a stubborn resistance, was driven into England. On the death of James V. in 1542, Angus returned to Scotland, and was reinstated in his former possessions. He died in 1556. He was succeeded by his nephew, upon whose death the Earldom was held by **Archibald,** the 'Good Earl,' and from 1588 to 1591 by Sir William D. of Glenbervie, great-grandson of Archibald Bell-the-Cat. The old privileges of the D. family were restored to his son **William,** tenth Earl of Angus, who was appointed lieutenant-general of the kingdom, and privileged to lead the van in battle, carry the crown at a coronation, and give the first vote in Parliament. He became a Roman Catholic, and died at Paris in 1611. **William,** eleventh Earl of Angus, was in 1633 made Marquess of D. One of his sons was made Earl of Selkirk in 1646, another Earl of Forfar in 1666, and another Earl of Dumbarton in 1675. **Archibald,** the grandson of the first Marquess of D., was made Duke of D. in 1703, a title which expired with the decease of the first duke in 1761, when the Marquessate of D. descended to the seventh Duke of Hamilton, who belonged to a younger branch of the D. family. The D. estates, however, were in the great 'D. cause' transferred from the Duke of Hamilton to a son of Lady Jane D., sister of the first Duke of D. The new heir received the title Baron D. of D. Castle in 1790, a title which became extinct on the death of the fourth Lord D. in 1857. The D. estates then fell to the Countess of Home. **Earls of Morton.**—The Earls of Morton are lineal descendants of William of D., the first D. known to history. Sir William D. of Liddesdale, son of Sir Archibald of D., the successor to the first William of D., in 1320 obtained the lordship in Dalkeith which, along with other lands, descended to his nephew, Sir James D. of Dalkeith, whose eldest son married a daughter of Robert III.; and their grandson was, in 1458, made first Earl of Morton. The present inheritor of the title is the direct descendant of William of D., the chief of the D. family in the 13th c. **House of March and Queensberry.**—The descendants of Sir William of D. of Drumlanrig, illegitimate son of the second Earl of D., became Counts of Drumlanrig in 1628, Marquesses of Queensberry in 1633, Dukes of Queensberry in 1684, and Earls of March in 1697. In 1810, on the death of the fourth Duke of Queensberry, the title Duke of Queensberry and the lands of Drumlanrig devolved upon the Duke of Buccleuch, the title Earl of March upon the Earl of Wemyss, and the title Marquess of Queensberry upon Sir Charles D. of Kelhead. See Douglas's *Peerage*, by Wood; Chalmer's *Caledonia* (Lond. 1807); Cosmo Innes's *Registrum Episcopatus Moraviensis* (Edinb. 1846); and *Registrum Honoris de Morton* (Edinb. 1853); Hume of Godscroft's *History of the Houses of D. and Angus* (Edinb. 1748); and Burton's *History of Scotland*, especially ch. xxviii.

Douglas, Gawin, a Scottish poet, born in 1474, was the third son of Archibald Earl of Angus, surnamed 'Bell-the-Cat.' He was educated at St. Andrews University, and entering the Church, became successively Rector of Hawick, Provost of St. Giles at Edinburgh in 1501, and Bishop of Dunkeld in 1516. Party strifes finally lost him his see, and he had to take refuge at the court of Henry VIII. He is said to have received a pension from the king, and lived on terms of friendship with the foremost men in England, till his death of the plague in 1522. By his own wish, he was buried in the Hospital Church of the Savoy. D.'s first literary essay was a translation of Ovid's *De Remedio Amoris*, but this has been lost. In 1501 he wrote the *Palice of Honour*, dedicated to James IV. This is an allegorical poem, inculcating the principles of duty, its idea perhaps taken from Chaucer's *Temple of Fame*. That Bunyan borrowed from it, as has been supposed, is very unlikely. D.'s next poem was *King Hart*, an allegory of human life, in which the heart of man is represented under the type of a monarch. This work shows its author to have been acquainted with the *Piers Plowman* of Langland. A short poem in four stanzas by D., called *Conscience*, is also preserved. In 1512 he began his great work, the *Translation of the Æneid of Virgil*, which was completed just two months before Flodden. This was the first rendering of the *Æneid*, or indeed of any Latin classic, into English verse, and gives the twelve books with original prologues, characterised by a diffuse splendour of description. The work is marked both by strength and simplicity. D. is the first writer who applies the Celtic name 'Scotch' to the dialect of English used N. of the Tweed. His complete works have been elaborately edited by Small (Edinb. 1874). The first volume contains a careful and exhaustive life of the poet.

Douglas, General Sir Howard, Bart., G.C.B., son of Admiral Sir C. D., was born at Gosport in 1776, early entered the army, served in the Peninsular War in 1808-9, and was Governor of New Brunswick from 1823 to 1829. He successfully contested Liverpool in 1832 and 1835, was

Lord High Commissioner of the Ionian Islands from 1835 to 1840, and M.P. for Liverpool from 1842 to 1847. He became a general in 1851, and died November, 1861. He wrote treatises on *Naval Gunnery* and *Naval Evolutions*, *Considerations on the Value and Importance of the British and N. American Provinces*, and *An Essay on the Principles and Construction of Military Bridges*, &c.

Douglas, John, D.D., was born in 1721 at Pittenweem, Fifeshire, and after being educated at Oxford, entered the Church of England, and rapidly (1750) obtained preferment, being made in 1787 Bishop of Carlisle, and in 1792 Bishop of Salisbury. He died 18th May, 1807. D. was not undistinguished in literature. He was intimate with Dr. Johnson, and the most notable of his contemporaries. He is faintly remembered for his vindication of Milton against the forgeries of Lauder, and still more faintly for his answer to Hume in his *Criterion, or a Discourse on Miracles* (1754). D. also edited Cook's *Third Voyage*.

Douglas, Stephen Arnold, an American statesman, was born at Brandon, Vermont, 23rd April, 1813. He began life as a cabinetmaker, but afterwards studied law and settled in Jacksonville, Illinois, where he was known by the sobriquet of the 'Little Giant.' D. was chosen State Secretary in 1840, a judge in 1841, entered the House of Representatives in 1843 as a Democrat, and was a Senator from 1847 to 1861. He advocated *Popular Sovereignty* in the Territories, and in 1854 his Kansas and Nebraska Bill, repealing the Missouri Compromise, let loose a torrent of political passion over the whole country. D. was the presidential candidate of the Northern Democrats in 1860, when Lincoln was elected. He died 3rd June, 1861. D. was idolised as a leader in the Western States. A splendid monument, costing $80,000, was erected to his memory at Chicago, on the banks of Lake Michigan.

Douglass, Frederick, an American orator, was born of a negro mother and white father at Tuckahoe, in Maryland, about 1817. He was a slave, first on a plantation and afterwards in Baltimore, but having taught himself to read and write, escaped from bondage at the age of twenty-one. For a time he worked on the wharfs of New Bedford, Mass., but soon attracting notice by his gifts, was employed as an agent of the Anti-Slavery Society. In 1845 he published his *Autobiography*, and soon after visited England, where the thrilling story of his life, and his manly oratory, excited much sympathy. For some years he was editor of a paper in Rochester, N.Y., and in 1855 wrote *My Bondage and Freedom*. In 1870 D. became an editor in Washington, and in 1872 Presidential Elector for New York state; 1877-81 Marshal for Columbia; 1889 U.S. Minister at Haiti.

Doune (Gael. 'the hill'), a town in the parish of Kilmadock, Perthshire. It is famous for its fairs, the town standing at one of the entrances to the Highlands. *D. Castle* is a ruinous fort, with massive walls and towers, picturesquely crowning a steep green bank on the Teith. Pop. 940.

Dour, a town of Belgium, province Hainaut, 9 miles S.W. by W. of Mons. In its neighbourhood are several iron and coal mines; weaving, bleaching, tanning, &c., are also carried on. Pop. of commune 10,603.

Dou'ro (Celt. 'the water') or **Duero,** one of the largest rivers of the Spanish peninsula, rises in the N. of the province of Soria, flows first S.E. towards the town of Soria, then turns S., and finally W. towards and through Portugal, ultimately falling into the Atlantic at Oporto, after a course of 480 miles. For about 52 miles it forms the boundary between Portugal and Spain. It is generally rapid and unfit for extensive navigation, but traverses a naturally rich and picturesque country.

Douroucouli, a species of monkey occurring in Brazil and the Guianas. Its length is about 9 inches, while its tail measures $1\frac{1}{4}$ foot. Its soft grey-furred back has a brown line drawn from the neck to the tail. Three stripes mark the head. The belly is brownish-yellow. It sleeps during the day and hunts for small birds and insects during the night. It pairs early and does not change its mate.

Douroucouli.

Dove, a general name given to all the members of the *Columbidæ* or Pigeon family, but used only in a popular and general sense, the term being without any specialised signification. The name is probably derived from the same root as the word 'dive.'

Dove, in Christian art, was regarded as symbolical of purity, and is for that reason carved upon the tombs of infants and young girls. It was the recognised type of the Holy Spirit from the circumstance that the Spirit descended upon the Saviour in the shape of a D. To signify that at baptism the infant is admitted into the church, the D. is often carved on the covers of fonts in many English and foreign churches. Frequently a gold or silver D. was suspended from the vault of the ciborium in which the Holy Eucharist is preserved. In baptistries, also, a pigeon of gold was kept for the same purpose. In old pictures the D. frequently appears either as the symbol of purity, of the purified soul, or of the Holy Spirit. A simple gold nimbus, or one encircling a black cross, often surrounds its head, and seven rays proceeding from its head signify the seven gifts of the Holy Spirit. The figure of a D. with an olive branch is the emblem of peace, while one rising from the lips of dying saints is emblematical of the flight of the disembodied spirit. A D. with six wings, two attached to the head, two to the shoulders, and two to the feet, is a type of the Christian Church.

Do've, Heinrich Wilhelm, a German physicist and meteorologist, was born at Liegnitz, in Silesia, 6th October, 1803, studied at Breslau and Berlin, became in 1829 Professor of Natural Philosophy at Berlin, and applied himself chiefly to the investigation of meteorological phenomena, as climate, winds, &c. The sciences of optics and electricity also claim a share of his attention, his most practical discovery being probably the application of the stereoscope to the detection of forged bank-notes. He is best known in England by his treatise on the *Distribution of Heat on the Surface of the Globe*, published by the British Association in 1853.

Dovecot. Pigeons are protected by the statute 7 and 8 Geo. IV. c. 29, under which any person who unlawfully and wilfully kills, wounds, or takes any house dove or pigeon, under such circumstances as shall not amount to larceny at common law, on conviction before a justice of the peace, shall forfeit and pay over and above the value of the bird, any sum not exceeding £2. The Act does not extend to Scotland, but the breaking into a D. is under an old Scotch statute held to be theft, and severely punishable. See PIGEON.

Do'ver (probably Celt. *dfr* or *dwr*, 'water,' but possibly the Old Eng. *ofer*, 'the shore,' with a prefix), a municipal and parliamentary borough, seaport, and a great centre of international traffic, on the E. coast of Kent, at the entrance to a valley running along the N. slope of the N. Downs, 88 miles from London by the South-Eastern, and 77 by the London, Chatham, and Dover, Railway. It is the chief of the Cinque Ports (q.v.). During recent years D. has considerably increased in population and in wealth; its older streets have been widened and improved, a number of its old and interesting buildings restored, large and elegant commercial and other establishments erected, and its suburbs much extended. The principal buildings are the hotels, the marine telegraph offices, and the lines of residences built along the Esplanade, Marine Parade, and East Cliff. St. Mary's and St. James's churches, in both of which structures Norman features are still traceable, have been well restored, and the ancient Maison Dieu was restored (1861), and in part rebuilt, from designs by A. Poynter. On the N.E., on the cliffs, is D. Castle, a powerful fortress, embracing with its old and new works an area of about 50 acres, and fortified by walls, ditches, bomb-proof magazine, batteries, &c. In the barracks there is accommodation for from 3000 to 4000 men. Other heights around the town are surmounted by barracks and fortifications. The commercial activity of D. arises chiefly from the circumstance that it is the great port of intercommunication between England and the Continent. Steamers are constantly plying to Calais, Boulogne, and Ostend. Extensive works have long been carried on at the port of D., with the view of making it a harbour of refuge. Of these, one of the most important was the Admiralty Pier, commenced in 1874, designed to enclose an area of 520 acres. In 1891 a bill was passed in parliament providing for the extension of the pier and harbour accommodation at D. The Harbour Board then took over the Admiralty Pier and obtained the right to levy a tax of one shilling on every passenger using the continental service of steamers. The extension by 580 feet of the Admiralty Pier and the erection of an East Pier 2760 feet in length were also provided for by the bill, and the memorial stone was laid by the Prince of Wales on 20th July, 1893. The increase to the harbour area is estimated at 36 acres. On 6th September, 1894, was laid the first marine block of the East Pier on the bed of the sea. A submarine cable was laid from D. to Calais in 1850. D. sends one member to Parliament, and the parliamentary borough consists of the parishes of St. James and St. Mary, East Cliffe, and Dover Castle, and parts of the parishes of Buckland, Charlton, Guston, and Hougham. An important British stronghold prior to Cæsar's invasion, it was the *Dubris* of the Romans. Owing to its position on that part of the English coast nearest to France, it has frequently been the scene of important events during the history of the country. D. was the point at which Cæsar made his first attempt to land. It was created one of the Cinque ('five') Ports by Edward the Confessor. The town was restored and strengthened by William the Conqueror. It was attacked and plundered by a French fleet in 1295, and its castle has been frequently besieged. The defensive works were greatly strengthened in 1745, when a visit of the Pretender was expected, and again in 1804, when Napoleon threatened invasion. Pop. mun. bor., co-extensive with parl. bor., 33,300; and reg. dist. 40,466.

Ancient Church and Pharos, Dover.

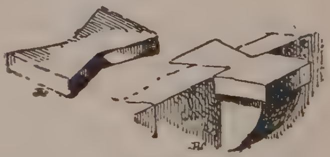
Dover, the capital of Delaware, U.S., is situated on a rising ground, 5 miles W. of Delaware Bay, and 65 miles S.S.E. of Philadelphia by railway. It has a handsome state-house, a library of 36,000 volumes, and many churches, while the streets run at right angles, and are lit with gas. There are large steam flour and saw mills, and a trade chiefly with Philadelphia in flour and fruit. Pop. 3061.

Do'veron, or **Dev'eron,** a river of Scotland, rises on the slope of the Buck of the Cabrach (Cairngorm range), Aberdeenshire, flows N. in that county for about 7 miles, and then in a generally N.E. direction, partly in Aberdeenshire, partly in Banffshire, and partly between the two, till passing Banff, it enters the sea after a course of about 55 miles. D. and its affluent the Bogie are both good trout-streams.

Dover's Powder consists of 1 part of ipecacuanha, 1 part of opium, and 8 parts of sulphate of potash. The dose is 10 to 12 grains. It is a powerful diaphoretic, producing copious perspiration, and is very beneficial at the onset of a cold. D. P. is often sold in shops under the name of *Sweating Powder.*

Dover Strait (Rom. *Fretum Gallicum;* Fr. *Pas de Calais*), the narrow seaway between Great Britain and the Continent, leading N. into the North Sea, and S. into the English Channel. It varies in width from about 20 to 25½ miles, the distance from Dover to Cape Grisnez being 21 miles, and to Calais 25½ miles. It varies in depth from 2 to 30 fathoms, and recent surveys seem to prove that its bottom is formed of homogeneous beds of chalk, and that the project of boring a submarine tunnel through these beds is practicable. A company, formed in 1872, commenced borings at Dover, but the work was stopped by government in 1882. Repeated attempts have since been made to obtain parliamentary sanction for the scheme, notably in 1888, 1890, 1891, 1893 (experimental works), and 1894 (experimental works), but without success, distinguished officers having reported against it, and the sentiment of the majority of the nation being opposed to it. In 1894 a bill was brought forward to empower the Channel Bridge and Railway Company to construct a bridge or viaduct for steam or other locomotion across D. S. An estimate of experimental expenditure was prepared (£98,900), but before the end of the session the bill was withdrawn. A petition was presented in 1894 to the Chamber of Deputies, France, urging the government to consider the schemes put forward for improving the communication between France and England. The schemes submitted were:—(1) train steam ferry, (2) tunnel under the Channel, (3) transmarine tunnel, (4) bridge over the Channel, (5) tubular railway, and (6) mixed passage. A committee of the Deputies considered the petition and reported in favour of the construction of a permanent railway and improved communication between the two countries, but beyond that they offered no suggestion.

Dove-tail, a method of joining stone and wood by which a tenon, in shape like a dove's tail, is fitted into a notch similar to it in size and shape. As wood shrinks more across the grain than along it, a D. is always a weak point in carpentry.



Dove-tail.

Dow, Dou, or **Douw, Gerard,** a Dutch painter, born at Leyden, 17th April, 1613, entered at the age of fifteen the studio of Rembrandt, and painted there for three years. The vigorous and original character of his genius is evinced by the fact that though during these three years he attained to much of Rembrandt's power of colour and of light and shade, he freed himself from the influence of the great master of chiaroscuro, and devoting himself exclusively to the study of nature, created a style which was as remarkable for its delicacy and perfection of finish as Rembrandt's was for breadth and unique effect. The threads of lace and texture of carpets are distinguishable in his smallest works, which, notwithstanding this devotion to detail, are powerful in effect and splendid in colour. His 'Dropsical Woman,' the most remarkable of his works for number of figures, correct and various expression, magical effect of light, and wonderfully minute and successful work, was bought by the King of Sardinia for 30,000 francs, and is now in the Louvre. Other works are the 'Mountebank,' 'Dentist,' 'Grocer,' 'Fiddler,' and the 'Interior of a Household,' in which the painter represents his mother reading the Bible to her aged husband. His portrait, painted by himself, was valued at Paris in 1837 at 10,700 francs. D. died at Leyden in 1680.

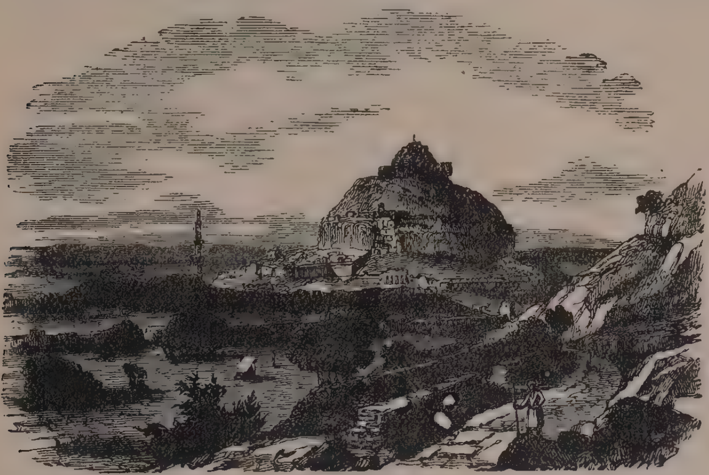
Dow'ager (Fr. *douairière*, 'one dowered,' from the Lat. *dos*, 'a dowry' or 'marriage gift'), the distinctive name of a widow with a Jointure or Dower (q.v.). It is chiefly used in England as a title in high rank to distinguish a widow from the wife of her husband's heir bearing the same name. A 'queen-D.' is the widow of a king.

Dow'er (Fr. *douaire*, from Lat. *dotarium*, and that from *dos*), in English law, is that portion of property to which a wife was entitled on the death of her husband. D. was either by *common law* or *custom*. By the first, the widow was entitled during her life to one-third of the lands and tenements possessed by her deceased husband at the time of his death. The second varied with the custom of the place. By Gavelkind (q.v.) it was one-half. The Dower Act (3 and 4 Will. IV. c. 105), however, placed the right of his widow to dower entirely in the hands of the husband while living, and enacted that women married after 1st January, 1834, could not claim D. out of land disposed of by their husbands during their life or by will; and any partial encumbrance effected by a husband became good against D. See BAR OF DOWER, JOINTURE.

Dow'lais, a town in Glamorganshire, and a station on the Brecon, Merthyr, and Rhymney railways, $1\frac{1}{2}$ miles N.E. of Merthyr Tydvil, is the seat of one of the largest ironworks in the world, the property of the Guest family. These works, which, with the collieries, employ about 11,000 men, comprise blast-furnaces, puddling-furnaces, and rolling-mills, and produce 150,000 tons of iron annually. Steel-making is also extensively carried on by Siemens' and Bessemer's processes. The town has a public library and literary institute. Pop. ecc. par. 16,807.

Dow'las, a coarse linen cloth which was widely used as a shirting before the introduction of calico, but has been almost entirely superseded for the purpose by that fabric.

Dowlat'abad, or **Daulatabad** (*Deogiri*, 'abode of prosperity'), a fortified town of India, in the territory of the Nizam of Hyderabad, on a tributary of the Godavari, 15 miles W. of Aurungabad, and 165 E.N.E. of Bombay. It is now in part deserted, and has but little trade. A strong, isolated rock-fortress, 500 feet high, commands the town. D. was the seat of government of a satrap from Delhi for many years, but on the death of Aurungzebe in 1707 the town fell to Asaph Jah, who founded the dynasty of the Nizam, and it has remained in the hands of the rulers of Hyderabad ever since. Pop. 1307.



Dowlatabad.

Down, a maritime county in the S.E. of the province of Ulster, Ireland: greatest length about 50 miles, greatest breadth 38. The coast-line of 67 miles is indented by the inlets of Belfast Lough, 3 miles broad and 15 deep; Strangford Lough, 10 miles deep, with a breadth varying from $\frac{1}{2}$ to 3 miles; and Dundrum and Carlingford Bays. The S. of the county is occupied by the Mourne Mountains, which rise in Slieve Donard to 2796 feet, while a smaller group occupies the centre. With these exceptions the soil is for the most part level, and tolerably fertile, especially on the banks of the streams, which, as well as the lakes, are generally small. The Upper Bann and the Lagan are the principal rivers. Of the 611,927 acres, constituting the land area of D., 114,990 are under corn, beans, and pease crops (oats 104,662); 68,971 under green crops (potatoes 45,109); 17,628 under flax; 67,187 (for hay) under clover, sainfoin, and grasses in rotation; and 10,357 (for hay) under permanent pasture or grass not broken up. Fallow and uncropped arable land account for 625 acres, while woods and plantations occupy 14,070. Turf bogs cover 2452 acres, marsh and barren mountain, 49,580. For live stock, see articles CATTLE, HORSE, PIG, and SHEEP. Linen is the chief manufacture, much of which is woven in the houses of the small farmers; and there are numerous flax and cotton mills. The principal exports are grain, dairy produce, pork, and hides, with hosiery, cotton, leather, thread, and coarse woollens. The chief towns are Downpatrick, Newtonards, Newry, and Donaghadee. D. contains four parliamentary divisions, each of which returns one member: East D., pop. 52,274; North D., 54,179; South D., 51,652; West D., 50,890. Pop. 267,059. See Knox's *History of the County Down.*

Down'ham Market (Old Eng. *dun*, 'a hill,' and *ham*, 'a dwelling'), a town in the county of Norfolk, on the right bank of the Ouse, 40 miles W. of Norwich, with a bell-foundry and a mustard manufactory. It was long celebrated for its butter-market, which has now been removed to Swaffham. It has also a large horse-fair. Pop. 3006.

Down'ing College, Cambridge, founded by Sir George Downing, of Gamlingay Park, whose will, dated 20th December, 1717, directed that on the failure of certain relatives to whom his estates were devised in succession, these should be employed to found a college. The charter was received 22nd September, 1800, but the buildings were not ready for the reception of undergraduates till May, 1821. The foundation consists of a master, a professor of law, and another of medicine, six fellows, and two honorary fellows. The non-resident fellows hold their fellowships for seven years. There are six scholarships and two minor scholarships; each of them being worth at least £50 per annum. In 1894 the college had 97 members of the senate, 80 undergraduates, and 262 members on the Boards.

Downpat'rick ('Hill of Patrick'), or **Down,** named from an intrenched *dun* near the cathedral, the capital of the county of Down, on the right bank of the Quoile, $26\frac{3}{4}$ miles S.E. of Belfast, by the Belfast and County Down Railway. It is divided into the English, Irish, and Scottish quarters; the streets are steep, and the houses well built. Quoile Quay, about a mile from the town, can accommodate vessels of 100 tons burden. D. has manufactures of linen, soap, and leather, imports coal, iron, salt, and bark, and exports grain, cattle, pigs, and potatoes. Until 1885 it returned one member to Parliament. Pop. 3132.

Downs (Old Eng. *duna*, Ger. *dünen*, Fr. *dunes*, 'hills'), a word found both in the Teutonic and Celtic tongues, and applied to (1) the margin of sandhills commonly forming the strand of the sea, and (2) a tract of bare sandy upland only affording pasture. Locally the name is given in England to two parallel ranges of broad low hills running in an E. direction from the middle of Hants to the sea-coast, the S. D. terminating at Beachy Head, and the N. D. coming upon the sea at Dover. These ridges, neither of which exceeds 900 feet in height, enclose the valley known as the Weald (q.v.). The well-known breed of sheep to which the S. D. give name attests the quality of the pasturage.

The *Downs* is also the name of a roadstead off the E. coast of Kent, between Deal and Ramsgate and within the Goodwin Sands. It is 8 miles long by 6 broad, and affords anchorage of from 4 to 12 fathoms.

Downton ('Hill-town'), an old town of Wiltshire, 6 miles S.E. of Salisbury, on the Avon, here divided into three streams. It has a grammar-school, a paper-factory, tanneries, and malting-houses. A conical mound still remains of its old castle. Near D. is the estate and residence of Standlinch, the gift of the nation to Lord Nelson's heirs. Pop. reg. sub-dist. 6140; and civ. par. 3430.

Down-tree, a name given in the W. Indies to *Ochroma Lagopus*, one of the *Malvaceæ* (sub-order *Bombaceæ*), the cork-wood of Jamaica, on account of its downy seeds being used to stuff beds, &c.

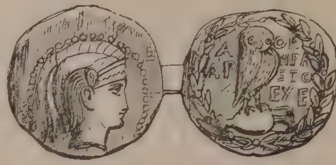
Doxol'ogy (Gr. from *doxologeō*, 'I give glory to'), a hymn of praise to God, of which there have been several in use in the Christian Church, viz.:—(1) The Little D., or *Gloria Patri*, the original form of which was 'Glory be to the Father, and to the Son, and to the Holy Ghost, world without end, Amen.' The words 'As it was in the beginning,' &c. (supposed to have been added by the Council of Nice against Arianism), began to be used in the Western Church (except in Spain) in the 7th c. (2) The Great D., or *Gloria in Excelsis*, the angelic hymn of Luke ii. 14, which has been chiefly used in the Communion Service. (3) The Trisagion, or seraphic hymn of Isa. vi. 3, but varied from the original. (4) The Hallelujah, which was either a repetition of that word itself (= 'Praise the Lord'), after Rev. xix., or one of the Hallelujah Psalms. (5) The last paragraph of the Lord's Prayer (in Matt.). See Bingham's *Eccles. Antiq.*, Walcott's *Sacred Archæology*, &c.

Doyle, Richard, one of the greatest of English comic artists, was born, of Irish extraction, in 1826. He gained his reputation originally as a clever sketcher for *Punch*, in the 5th vol. of which (1846) appeared his first contributions. In 1850, however, he threw up a connection with this periodical that was bringing fame and fortune, on account of its attacks upon Cardinal Wiseman and Roman Catholics generally. D. illustrated the works of various well-known authors, including Leigh Hunt and Thackeray, and contributed to the *Cornhill Magazine* many sketches, *e.g.*, the 'Bird's-eye Views of Society.' He published *The Continental Tour of Brown, Jones, and Robinson* (1854); a Christmas-book, *In Fairyland: Pictures from the Elf World* (1869), and afterwards devoted himself to water-colour painting. He died 11th December, 1883.

Do'zy, Reinhart, a profound Oriental scholar, was born 21st February, 1820, at Leyden, where he took the degree of doctor in 1844, and was appointed librarian of the Oriental MSS. belonging to the university, in 1850 extraordinary, and in 1857 ordinary, Professor of History. He established his reputation in the learned world by his *Dictionnaire détaillé des Noms des Vêtements chez les Arabes* (Amst. 1845). This was followed by a series of works which shed a wholly new light on the history of the Arabs in North-Western Africa and Spain during the Middle Ages. He died 26th April, 1883.

Drach'enfels ('Dragon's rock'), one of the *Siebengebirge*, or Seven Mountains, 8 miles S.E. of Bonn, rising 1056 feet above the Rhine, and crowned by a castle which commands a view as far as Cologne, 20 miles distant. The name is derived from the legend of a dragon, which inhabited a cave within it, and was killed by the hero of the *Nibelungen Lied* (q.v.).

Drach'ma, Drachm, Dram (Gr. *drachme* or *dragma*, 'a handful') was a weight, and also the principal silver coin of the Greek currency. Of the D. there were two standards of different weights and values—the Attic and the Æginetan. The former was chiefly in circulation in Northern Greece, the maritime states, and Sicily, and was equal to about $9\frac{3}{4}$d. English money; the latter was used in Bœotia, in parts of Northern Greece, and in all the Peloponnesian states except Corinth, and averaged about 1s. $1\frac{3}{4}$d. In either case the D., which always consisted of 6 obols, was the 100th part of a mina, and the 6000th part of a talent. The mina and talent were not coins, but expressions of computation denoting the weight of the money. The D. varied in weight, under the different standards, from $65\frac{1}{2}$ to 110 grains. Thus the mina at the lowest estimate = 15 oz., or nearly 1 lb. avoirdupois; at the highest = 1 lb. $9\frac{1}{3}$ oz. avoirdupois. In the modern Greek currency the D. consists of 100 lepta, and = $8\frac{1}{2}$d. sterling. The English avoirdupois D. = $27\frac{11}{32}$ troy grains; the apothecary's D. = 60 troy grains, or a little less than the D. of the Attic standard. (Hussey, *Ancient Weights and Money*.)



Athenian Drachma (exact size).

Dra'co (Gr. *Drakōn*), a famous lawgiver of Athens, whose enactments, called *thesmoi* in contradistinction to the *nomoi* of Solon, were drawn up about 621 B.C. D.'s code was one of extreme severity, the punishment of death being affixed to almost every crime. Hence it was said that the 'laws of D. were those of a dragon' (Gr. *drakōn*), and 'that they were written not in ink, but in blood.' Their influence, however, was in the highest degree beneficial, inasmuch as the administration of justice was no longer arbitrary, but placed on a settled basis. Moreover, a most salutary result of his legislation was the establishment of the Ephetæ or court of appeal in cases of unintentional homicide. The extreme harshness of his laws, however, rendered them not only unpopular, but odious; and under Solon's milder code capital punishment was abolished in the case of all crimes save murder. Owing to the disfavour of his fellow-citizens, who deemed his laws rigorous beyond endurance, D. was obliged to repair to Ægina. Here he was received at the theatre with an enthusiastic welcome that proved fatal to him; for he was stifled by the garments that were showered upon him in token of respect and admiration.

Draco, a northern constellation filling the space between Ursa Minor and Ursa Major, Hercules and Lyra. γ Draconis, a star of the second magnitude, and the brightest in the constellation, is situated in the straight line joining Deneb and Arcturus, and is celebrated as the star by which Bradley discovered the aberration of light.

Dracon'tium, a genus of plants belonging to the Arum family (*Araceæ*), natives of the E. and W. Indies. The flowers of some, like those of the Arum family, have very disagreeable odours. One species, the many-leafed D., has a powerful action on the nervous system, and is used in America for asthma.

Draft, in mercantile affairs, is a written order by a creditor addressed to his debtor calling on him to pay a certain sum to the drawer or to a third party. Acceptance (q.v.) completes the transference of the debt from the drawer to the payee.

Drag, an apparatus used for increasing the friction of a vehicle upon a road, so that in going down hill its speed may be easily controlled, and it may not press upon the horses. In its most common form it consists of an iron slipper which can be placed under one of the wheels (on the road), and is attached by a chain to the body of the vehicle. It is now for almost all fast-running carriages superseded by a Brake (q.v.), which can be applied instantaneously by the driver's hand or foot.

Drag'oman (Fr. *drogman*, Ital. *drogomanno*) is a very old word. It probably comes through the Spanish form *torsimanni* and *trujaman*, from the Arabic *tardjemān*, 'an interpreter.' The Low Latin form of the word was *turchi-*

mannus, the Low Greek *dragoumanos*. The French chroniclers Villehardouin and Joinville mention an officer named 'drughemant,' whose business it was 'enromancer,' or to put into French, the Saracenic despatches. It is now applied generally to the guide or interpreter in the Levant districts, but specially to the official interpreter attached to foreign embassies or the consular service in the Turkish empire. The D. is a recognised function in the elaborate training system of the French consulate. The D. frequently represents the consul in courts of justice when cases are being tried which affect the consul's fellow-countrymen.

Drag'on, in zoology, a name used (when qualified by the adjective 'flying') to denote certain Lizards (q.v.), such as the *Draco volans* of the Eastern Archipelago, which can sustain themselves in the air by means of a parachute-like expansion of the skin, supported on certain of the specially-extended front ribs. The name Great D. is also given to another species of lizard inhabiting tropical America, and 4-6 feet long. The Fringed D. of Java and Sumatra is an olive-grey coloured lizard, having brown bands across its back, and possessing a tail eight inches in length, while the body measures only three. Certain fishes (*e.g.*, the *Pegasus draco*) are named sea-dragons, from their weird looks, and are included in the Teleostean order. See DRAGON.

Dragon (Gr. *drakōn*, 'the keen-sighted'), in Greek mythology, a monster which may be regarded as the symbol of anarchy, and to contend with which was the task of heroes. Hercules, Apollo, and Perseus are all represented as slayers of dragons. The D. was a favourite fiction of the Greek poets; a D. kept the garden of the Hesperides, and the chariot of Medea was drawn by dragons, these animals, from their clearness of vision, according to the solar myth, being supposed to bear the sun through the heavens. In the Vedic mythology the D. Vritra is the antagonist of Indra. In the *Nibelungen Lied* the D., as in the Greek mythology, was a destructive agency which the hero set himself to cope with. In the Apocalypse the angel lays 'hold on the D., that old serpent, which is the devil.' Hence painters and sculptors often represent the triumph of Christianity over unbelief by a D. transfixed or trodden under foot. The most familiar instance of this is the picture of St. George and the D. It was a common emblem on the shields and banners of the Teutonic knights who first settled in England. The Celts selected the D. as the emblem of sovereignty, and in Christian art it was emblematic of sin. In heraldry the D. is a common emblem, and when other animals are represented as dragons behind, they are technically known as *dragonnés*. See Max Müller's *Comparative Mythology* in *Oxford Essays* for 1856, and Cox's *Manual of Mythology*.

The Fringed Dragon.

Dragon Blood, or **Gum Dragon,** a resinous exudation from the trunks of trees of various orders. Most of it is obtained from *Pterocarpus draco*, a leguminous tree of S. America, and from the red sandal-wood tree of the E. Indies. It is also yielded by *Dalbergia monetaria* of Guiana, and in Mexico by the euphorbiaceous *Croton draco*. Some is obtained from the dragon-tree of the Canaries. It is found in the caves of the Guanches or ancient inhabitants of these 'fortunate isles,' and is believed to have been used in embalming. It is not now known in America. D. B. is soluble in oils and turpentine: it enters into the composition of some of the most esteemed varnishes, is used for dyeing horn the colour of tortoise-shell, in the composition of tooth powders, various tinctures, &c. It is not now used in medicine. *Dæmonorops draco* (*Calamus draco*), a native of the Malay islands, yields also D. B., hence it is known as the D. B. palm. The resin exudes from the ripe fruits, while inferior kinds are got by boiling the fruits after they have been shaken.

Drag'onet, a genus of Teleostean fishes, belonging to the family *Gobiidæ* or Gobies, and distinguished by having the ventral fins separate and distinct, two dorsal fins, and one small gill-opening on each side. The Gemmeous D., also known as the foxfish, sculpin, and gowdie, is a familiar species. Its length is from 10 to 11 inches, and it is dazzling in colour, being yellow on the upper and white on the under parts. The first rays of the dorsal fin are greatly elongated.

Dragon-Fly, a well-known genus of *Neuropterous* insects, forming the type of the family *Libellulidæ*, which is known by the large globular head, the long abdomen, and the deep thorax. The antennæ are very short, and the mandibles or larger pair of jaws are highly developed. The variegated D.-F. is a common species, as also the cross-barred D.-F. These insects are familiar to all from their bright azure hues, the large size of their wings, and their peculiar gyrating flight, usually near pools of water. The French have named them *demoiselles*, from the grace and agility of their movements. They undergo a hemimetabolic or incomplete Metamorphosis (q.v.). The larvæ are aquatic, and appear as active grubs, provided with a powerful masticatory apparatus, like a 'mask,' with which they war on weaker insects. They breathe by means of branchiæ or gills in the hinder part of the body; the water which has been used in breathing being forcibly ejected from this cavity, and thus propels the larvæ forward. After passing ten or eleven months in the larval and chrysalis states, the insect usually attaches itself to some water-plant, and as the larval skin splits along the back, the perfect winged insect emerges therefrom, and after drying its wings, launches forth into the air.

American Dragon-Fly.

Dragon, Green, a plant belonging to the Arum family, with peculiar black fetid flowers, and a spotted stem, somewhat resembling the skin of a serpent; hence its name, and also its supposed virtue of curing the bites of serpents. It is a native of Southern Europe.

Dragonnades' (from *dragon*, 'a dragoon'), the name given to the forcible conversion of Huguenots to Catholicism by means of free quartering of soldiers upon them, which took place in the reigns of Louis XIV. and Louis XV. The Intendants, Foucault and Bâville, were the chief organisers of the movement in Poitou, Montauban, Béarn, and Languedoc; but the Catholic clergy, the pious Bourdaloue as well as the intolerant Fléchier, were its animating spirit. When in 1685 the Edict of Nantes (1598) and the Edict of Grace (Nîmes, 1629) were both revoked, the cavalry already quartered in the districts undertook to suppress the assemblies or conventicles (then pronounced to be illegal), and large districts being defined as 'insurrectionary,' they were authorised by Louvois to use every violence in carrying out the penal laws. One town in the Cévennes, St. Hippolyte, paid 240,000 livres in three months for billeting (Benoît, *Histoire de l'Édit de Nantes*). The D. were continued, whenever soldiers could be spared, down to 1750. There was no formal Edict of Toleration till 1787.

Dragon Root, a plant of the Arum family, whose tuber is used in America as a stimulant of the secretions in chronic bronchitis and other affections of the chest, and also for ulceration of the mouth.

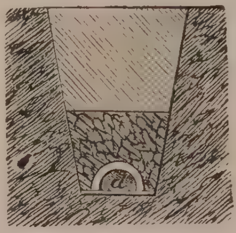
Dragon's Mouth. See BOCA.

Dragoon' (Fr. *dragon*), a name originally given to a light horseman trained to fight on foot as well as on horseback; now applied in the British service to heavy cavalry soldiers, who are armed with swords and breech-loading carbines, and who wear brass helmets. Dragoons were first raised in France in 1660 by Mareschal de Brissac. Markham (*Souldier's Accidence,* 1645) states that the dragoons of his time were armed with a 'faire dragon,' and Meyrick accordingly presumes that the soldiers took their name from their chief weapon. The *dragon* was a short firearm or carbine, and bore on its muzzle the worked head of the fabulous beast indicated—which was believed to spout fire.

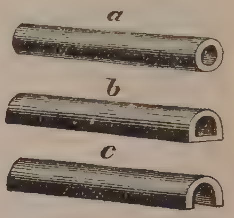
Dragör, a town on the S.E. coast of Amager, a small island in the Sound, with a harbour for small vessels, and a pop. of 1825, chiefly occupied in trading, fishing, linen-weaving, and bleaching. It is an important pilot-station, and the inhabitants collect much salvage. D. was an important place in the Middle Ages owing to the herring fishery in the Sound.

Draguign'an, the capital of the department of Var, France, at the foot of the woody Malmont, on a tributary of the Argens, 45 miles N.E. of Toulon by railway. It is the seat of a court of the first instance, and of a communal college, and has a large court house, a hospital, a public library, a theatre, a botanical garden, and fine promenades. Its manufactures are chiefly wine, oil, silks, soap, leather, and brandy. D. is an old town, and was at one time strongly fortified. Pop. commune 9816; arrond. 81,484.

Drain'age signifies cuttings in the ground to carry off superfluous water from the soil and subsoil. There are few subjects that have created more discussion than D., and of late years some have doubted its profitableness. Complaints have been made that in dry hilly regions, since D. was introduced, the fallen rain discharges itself too quickly into the rivers, swelling them inordinately, and thereby doing harm to low-lying lands. The general experience, however, is that D. has vastly increased the productiveness of land, turning marshes and barren clay-lands into fertile fields, and removing malaria from the atmosphere. The benefits from the draining of land were noticed in the days of Columella, but were not taken advantage of. Open drains and ditches have been in use from time immemorial, and in spite of scientific and practical teaching still exist to an unprofitable extent. On many farms in Great Britain the cuttings for conveying away water are uncovered, and consequently inefficient, as they fill with weeds, preventives of outfall. The arching over of many would cost comparatively little. The land reclaimed would in the course of twenty-one years' lease return at least 20 per cent. upon the outlay. The depth and width of drains are points not yet settled. The system of D. must depend on the nature of the soil. Deep drains are essentially necessary on clayey soils, not so much on friable or medium soils; neither in the latter need the pipes be placed so closely together. Drains made fifty years ago on very heavy clay land, only 12 feet apart, and 2 feet 8 inches in depth, filled with stones above the pipes, have been found to answer well; but those 42 feet apart, 5 feet deep, with 1-inch pipe have proved better. Deep drains take longer to remove the water than shallow, but the soil where 4 or 5 feet D. is practised is never liable to get sour. Drains less than 3 feet in depth are now eschewed by all practical men, so also is the placing of stones or gravel upon the tops of the pipes. To prevent the choking of drains, it is recommended that small pipes passing through fences or near trees should be of iron, as plants are sure to enter crevices in clay tiles. The tiles used now are not so uniform in size as formerly, but they are generally round, with a bore of two inches in diameter, and a length of from 12 to 15 inches. Collars preventing the encroachment of weeds or efflux of water are used at the joinings. The profit to the farmer from draining heavy wet land, 4 feet deep, at from 24 to 45 feet apart, Bailey Denton showed to be 7s. 6d. per acre. Drain-cutting has been accomplished with ploughs in some parts, but as a rule the spade prevails. These implements gradually narrow as they cut from the surface of the soil to the bottom of the drain. The main drain ought to be cut at the lowest level of the field. Into that its tributary tiles should discharge their waters right and left. Steam ploughing has done much to eradicate the furrow-draining system. See Rev. Adam Dickson's *Treatise of Agriculture*; Stephen's *Book of the Farm*; Mechi's *How to Farm Profitably*; *Monthly Magazine,* 1798; Bailey Denton's *Draining*; Robertson's *Survey of Midlothian,* 1795.



Section of an Underground Drain.



a, Pipe Tile; *b,* Sole Tile; *c,* Horse-shoe Tile.

Drainage Tubes are surgical appliances made of india-rubber or caoutchouc, of various degrees of thickness, and in some cases medicated with carbolic acid or other disinfectants. They are used to evacuate chronic collections of pus, as in empyema, when the surgeon considers it inadvisable to evacuate the pus by a free incision. They are introduced into the abscess by means of a trochar and canula, and tied so that the matter drains away slowly, either through, or more frequently along the sides of the tubes. D. T. are sometimes inserted into wounds to allow deep-seated matter to escape as soon as it is formed.

Drake, Friedrich, a German sculptor, was born at Pyrmont, 23rd June, 1805, and studied under Rauch at the Berlin Academy. His numerous works, which are chaste and massive, include statues (Jos. Jakob Moser in Osnabrück, a colossal Friedr. Wilhelm III. in the Berlin Thiergarten, and another in Stettin, Rauch and Schinkel in Berlin, an equestrian statue of King Wilhelm in Cologne, 1867, statuettes of the brothers Humboldt, of Göthe, &c.), groups (*e.g.* on the Berlin Schlossbrücke), busts (Oken, Ranke, &c.), mythological works, and genre pieces.

Drake, Sir Francis, one of the greatest of English sailors, was born in the year 1540 at Tavistock in Devonshire. He was educated, at the expense of Sir John Hawkins, in Kent, whither his father, a zealous Puritan, had been forced to flee. He went to sea when very young, and made various coasting voyages, besides visiting the Continent, until, fired by the exploits of Hawkins, he joined that commander in an ill-fated expedition to the Spanish Main. D. returned in poverty, and vowed revenge on Spain, his inflexible hatred of which was fostered by his losses and his Puritanical training. He then made several cruises in the W. Indies, where he went through many wild adventures, and became a terror to Spain. In 1572 he pillaged Nombre de Dios, and, in the same year, from a 'high and goodly tree' in Darien, first saw the Pacific, and 'besought Almighty God to give him life and leave to sail once in an English ship on that sea.' In 1577 D. sailed from England for S. America with five ships and

162 men, passed the Straits of Magellan, till then untraversed by Englishmen, and plundered and destroyed all along the coasts of Chili and Peru. He sacked various ports, took the treasure-gallion which sailed from Lima, and then, his one remaining ship, the *Pelican*, being loaded with spoils in value of about £500,000, sailed boldly for the Moluccas, rounded the Cape of Good Hope, and anchored in Plymouth harbour, 24th September, 1579. He was received with general enthusiasm, and was knighted by the Queen, and the *Pelican* was long preserved at Deptford. This voyage, though barren in geographical results, had a mighty moral effect, and emboldened D.'s countrymen for the coming struggle with Spain. In 1585-86, D. revisited the Spanish Indies, plundering Vigo on his outward voyage, sacking Santiago, and ravaging Carthagena and San Domingo. In 1587, when the Armada (q.v.) was about to sail, D., with thirty small vessels, entered Cadiz harbour, burnt a hundred storeships and galleys, then swept the coast to Cape St. Vincent, destroyed four large castles, and ended by descending on Coruña. This gallant and skilful dash at the Spanish ports, which he called a 'singeing of the Spanish king's beard,' delayed the sailing of the Armada for above a year, and enabled Elizabeth to prepare her defences. In 1588 he served as vice-admiral, under Howard, in the fleet which drove back the Armada, a result largely due to D.'s splendid seamanship and fiery daring. Had not he been checked by Howard, the rout of the Spaniards would have been even more disastrous. On returning from an unsuccessful expedition to Portugal in 1589, he was made member of Parliament for Plymouth, which he provided with water by an aqueduct, 20 miles long, built at his own expense. In 1595 he set out for the W. Indies, but unfortunately quarrelled with and finally separated from Hawkins, who shared with him the command of the fleet. After a brave but unsuccessful attack on Puerto Rico, he burnt Rio de la Hacha, Rancheia, Santa Martha, and Nombre de Dios, when a disease broke out among his men, of which the great navigator died, 27th December, 1595. More than any other man, D. was the founder of England's naval greatness, and the sincerity of his patriotism was shown in the readiness with which he sacrificed his wealth to aid in repelling the Armada. He was, says Fuller, 'chaste in his life, just in his dealings, true of his word, merciful to those that were under him, and hating nothing so much as idleness, contemning danger, and refusing no toil.' See Barrow's *Life of Admiral Sir F. D.*, and Purchas's *Pilgrims*.

Dra'ma (Gr. *drama*, from *draō*, 'I act'), or **Dramatic Po'etry,** is essentially the poetry of action. Its form is dialogue. It differs from every other species of composition, whether epic, lyric, or descriptive, inasmuch as it seeks to place before the mind an impersonal representation, by the writer, of the actions of others in a series of scenes of animated discourse and lively movements, by which the story is vividly portrayed and naturally evolved as a changing and progressive phase of human existence. In colour, interest, intensity, and charm, it surpasses all other forms of poetry, for whereas these exhibit phases of thought or feeling or fancy, D. P. deals with action, which is life itself. The elements of the dramatic art are universal. In the lowest stages of civilisation we discern rude attempts to impart amusement by dramatic representation, and even among children we see the art in embryo—in the mimicry of their seniors, and in their celebrations of weddings and funerals.

D. P. is divided into *tragic* and *comic*. The former is characterised by earnestness, the latter by mirth. Instances of vigorous dramatic composition are to be found in the Hebrew Scriptures, *e.g.*, in Job and in the Song of Solomon; and also in the ballads of the Greek rhapsodists, who doubtless combined the functions of the actor with those of the bard; but we must seek the birth of the legitimate D. in the Greek festival of Dionysus. The enthusiasm peculiar to the worship of the wine-god was in itself calculated to develop the dramatic art. Both *tragedy* and *comedy* sprung up in Greece about 580 B.C. The origin of both terms has been disputed. Tragedy (from *tragos*, 'a goat,' and *ōdē*, 'a song') is variously explained as the song at which a goat was sacrificed, or for which a goat was the prize, or in the performance of which the actors were clad in goatskins. Some derive comedy from *kōmos*, 'a revel,' others from *kōmē*, 'a village,' and *ōdē*. It may thus mean either the *revellers' song* or the *village song*. The D., according to Aristotle, had its origin in the dithyramb, and in its earliest form seems to have been little more than a choral song by a rustic smeared with the lees of wine. By-and-by an interlocutor was added, who filled up the breaks in the song by a narrative. Down to the times of Thespis (B.C. 536) and Phrynichus (B.C. 512), tragedy made but little way. The former introduced regular dialogue, and made one entire story occupy the pauses in the chorus. Thus the story became in time subordinate to the dialogue. It was not, however, till the appearance of Æschylus that the Greeks had a regular theatre. He gave the D. life and divinity, and invested it with pomp and splendour. His compositions are characterised by simplicity, harmony, and sublimity. Sophocles, thirty years his junior, and in the delineation of human nature perhaps his superior, strove in the serene contemplation of human destiny to portray ideal heroism, and to clothe all he touched with enduring loveliness and beauty. He added a third actor, and otherwise improved the stage. Euripides appealed rather to the sensibility than to the imagination of his audience. By metaphysical subtleties, eloquent disputations, startling effects, and scenes of suffering, he mars his work, while he lacks the serenity, grandeur, and religious awe which reign in Æschylus and Sophocles.

Greek comedy rose with Susarion, an itinerant mountebank (B.C. 580). Epicharmus and Phormes, according to Aristotle (Poet. sec. xi.), were the first to fashion fables, which originally came from Sicily; while Crates introduced them at Athens. The most famous names of this period, that of the Old Comedy, are Magnes, Cratinus, Eupolis, Pherecrates, and Aristophanes. Of these, the last is by far the greatest. The Middle Comedy includes about forty names. The most celebrated are Antiphanes, Eubulus, Anaxandrides, Alexis, Araros, Philippus, and Timocles. None of their works have reached us. In what respect the Middle differed from the Old Comedy, scholars are not agreed, and some critics reject this division. The New Comedy, which includes the names of Menander, Philemon, Diphilus, Apollodorus, and Posidippus, is a mixture of tragedy and comedy. It is a direct growth from Euripides, whom its poets regarded as their master. Of Menander and Philemon—the most celebrated—only fragments remain.

The Romans were not of a dramatic turn. Their earliest rude ideas of the art, and even their term for a player (*histrio*), were derived from the Etruscans; their farces (*Fabulæ Atellanæ*) from the Oscans; while the higher compositions of Livius Andronicus, Nævius, Ennius, Plautus, Cæcilius, Terence, Pacuvius, and Attius, were either reproductions or adaptations of Greek originals. Of the comic writers, we can judge only by the extant works of Plautus and Terence. The plays of the former have a Roman vigour and freshness which impart to them, notwithstanding their Greek origin, a great amount of originality; but they are inferior to those of Terence in felicity and purity of language. Of the early period of tragedy we know next to nothing; among the lofty attempts of the Augustan age we learn that the *Medea* of Ovid was much admired. The dramas of Seneca, though often bombastic and turgid, scarcely merit the vituperation of Bernhardy and Schlegel, for they contain passages of great beauty, and are interesting as the only entire Latin tragedies extant.

For fourteen centuries after Seneca, the D. slumbered in Europe. Italy was the scene of its revival. In most European countries the mysteries, miracle plays, and moralities of the Middle Ages were the germ of the modern D. (See MIRACLE PLAYS.) In Italy, however, the new D. did not spring mainly from the mediæval religious plays, but was partly a result of the Renaissance, and partly a continuation of the comic theatre of ancient Rome. The Renaissance (q.v.) called forth pieces based on Seneca, Plautus, or Terence, couched at first in Latin, but dealing with contemporary history. These were common in the 14th and 15th centuries, and among the best writers of them were Mussato, Landovico, Bernardin, and Petrarch (q.v.), the founders of the Academic school. Gradually Latin was disused in dramatic works; comedies were written in Italian by Ariosto, Aretino, and Macchiavelli; and early in the 16th c. tragedy was inaugurated by Trissino's *Sophonisba* (1515). In antagonism to this learned school there arose a vigorous popular D., not a growth of the Renaissance, but a direct descendant from the *Mimi* and *Fabulæ Atellanæ* of ancient Rome, which had lingered through the Middle Ages in the rural districts of Italy, and in the 15th c. were known as *contrasti*, as *commedia*, and as *farsa*. (See FARCE.) From these *contasti*, laughable impromptu dialogues, sprang the *commedia dell' arte*, or *scenarii*, farcical pieces, the plot of which was sketched before representation, while the dialogue was improvised by the actors. These became very popular, and helped to mould the rising comedy of France. The Italian pastoral D., which largely influenced English poetry (see ENGLISH LITERATURE), was quite aloof from the early religious plays, and purely a fruit of the Renaissance, springing from the ancient idylls, and aiming at a fanciful delineation of Arcadian and mythological scenes. The leading pastoral plays were Poliziano's (q.v.) *Orfeo* (1472), Tasso's (q.v.) *Aminta* (1513), and Guarini's (q.v.) *Pastor Fido* (1583). The pastoral gave birth to the Opera (q.v.). Comedy flourished richly in the 16th, but waned in the 17th c., the *commedia dell' arte* supplanting the *commedia erudita*, or Academic pieces, and tending to crystallise character into a few types, until, in the 18th c., Goldoni (q.v.) restored genuine comedy, and Alfieri (q.v.) re-installed classic tragedy. Among later Italian writers of tragedy are Monti, Manzoni, and Niccolini.

The Spanish D. began with the great national movement at the close of the 15th c., and, unlike the Italian D., was wholly alien from the Greek and Roman theatre, but flowed through the *entremesses* or interludes from the Catholic religious plays, on which the *autos sacramentales* or devotional dramas of many famous authors were based, and from the old chivalrous ballads and epics, whence it drew its romantic colouring. The earliest true dramas are the *Mingo Rebulgo*, a satiric pastoral, written in the first half of the 15th c., and *La Celestina*, a kind of historic comedy, written about 1450. The Spanish D. was distinguished by a florid style, intricate plots, and a pervading glow of patriotic and religious fervour. The chief Spanish dramatists were Cervantes (q.v.), Lope de Vega (q.v.), and Calderon (q.v.). Second to these were Alarcon, Molina, Moreto, and Solis. The greatest recent dramatist is Moratin (q.v.).

The Portuguese D. arose in the 16th c. with Miranda, who followed Plautus and Terence; Ferreira, whose *Ignez de Castro* was modelled on Greek tragedies; and Gil Vicente (q.v.), the greatest dramatist of Portugal, who founded a Romantic school. Since Vicente, Portugal has produced no dramatist of very high merit.

The French D. was descended from the mediæval mysteries, &c., through the farces and *soties*, or satiric pieces of the 15th c. The best writer of *soties* was Pierre Gringoire, and one of the farces, *Pierre Pathelin*, is the earliest example of genuine comedy in French. The first tragedy was the *Cleopatra* (1552) of Jodelle, who, with his followers, La Peruse and Garnier, imitated Seneca. In the 16th c., comedy, though still crude, was more vigorous than tragedy, being sprightly, fluent, and sarcastic. It was largely cast in octosyllabic verse, and its chief writers were Jean de la Taille and Larrevy. At the beginning of the 17th c. a romantic D. was arising in France, but Molière (q.v.), the greatest French dramatist, displaced the comedy of intrigue by the comedy of character and manners, and his contemporary, Corneille (q.v.), founded the French *classic* school of tragedy. This *classic D.*, which was brilliantly represented by Racine (q.v.) and Voltaire (q.v.), and which attained its zenith under Louis XIV., was marked by rigid adherence to the Unities (q.v.), by formal and often over-emphatic rhetoric; and, though generally wanting in passion and natural variety and freedom, possessed many noble reflective and declamatory passages, and great purity, stateliness, and finish of style. After the death of Voltaire, the French D. dwindled until the rise of the Romanticists (see ROMANTICISM), who, about 1830, led by Hugo (q.v.), founded a new school, after a bitter struggle with the Classicists. The best of the new romantic plays were, compared to the dramas of Corneille and Racine, less chaste and pale, more rich and turbid in diction, more flexible and musical in verse, wider in range of character, and more impassioned in its representation. The most recent French D. has greatly influenced the English stage, many of the plays of Sardou and others having been adapted for representation in England. To France belongs the honour of having produced perhaps the greatest living dramatic artist, namely, Madame Sarah Bernhardt.

The German D. has had no continuous development, and has never displayed the bright luxuriance of the English and French theatres. In the 16th c. the religious plays, under the influence of Hans Sachs (q.v.) and Ayrer, expanded into a popular D., and in the 17th c. there was marked dramatic progress in Silesia. In the 18th c. an exotic school, imitative of the French D., arose, but was checked by Lessing (q.v.), who founded a realistic and impassioned national D. The greatest German dramatists since Lessing are Göthe (q.v.) and Schiller (q.v.). For the German romantic school, including Tieck, Arnim, Halm, Körner, &c., which chose Shakespeare as model, see ROMANTICISM.

The English D. was an outcome of the mysteries, &c., through the moralities and interludes of the 16th c. The first English comedy is Udall's *Ralph Royster Doyster*, the prototype of the numerous comedies of London life, acted before 1557, and the first tragedy is *Gorboduc, or Ferrex and Porrex*, acted in 1562. From 1580 to 1596 the chief dramatists are Peele, Greene, and Marlowe, and, secondary to these, Lodge, Kyd, Munday, Chettle, and Nash. Their works were bombastic, sensuous, and charged with lawless and fiery imagination. The mature Elizabethan D., represented by Shakespeare, Jonson, Beaumont and Fletcher, Dekker, Webster, Ford, and Massinger, blended an artistic beauty born of the Renaissance with an unrivalled strength of passion and wealth of thought kindled by the national energy and progress. Shirley links the Elizabethan with the Restoration D., in which tragedy sinks into rant, and poetic comedy gives place to a comedy of manners, shameless, vigorous, and sparkling with the clearest wit. The chief names of this period, in which French influences prevail, are Dryden, Shadwell, Lee, Crowne, Otway, Rowe, Congreve—'the English Molière'—Wycherley, Vanbrugh, and Farquhar. In the 18th c. tragedy declined, Johnson and Addison attempting it unsuccessfully; but spirited, humorous comedies were produced by Cibber, Colman, Cumberland, and especially by Goldsmith and Sheridan. In the 19th c. many writers have composed noble dramatic works, especially Shelley, Landor, Coleridge, Byron, and Taylor, which are not suited for representation. Joanna Baillie, Sheridan Knowles, Talfourd, Bulwer Lytton, and Westland Marston have sought to infuse poetry into acting plays; and among the poets who have recently adopted the dramatic form are Swinburne, Tennyson, Browning, and Nichol. The present acting D., which has suffered greatly from the ascendency of spectacle and burlesque, is seen at its best in the realistic comedies of Robertson and Albery, the beautiful whimsicalities of W. S. Gilbert (music by Sir A. Sullivan), the tragedies of Wills, the sensational plays of Wilkie Collins, and the farces of Byron. See Donaldson, *Theatre of the Greeks* (1849); Schlegel, *Vorlesungen über Dramatische Kunst und Literatur* (2nd ed. Heidelb. 1817); Freytag, *Die Technik des Dramas* (Leipz. 1865); Klein, *Geschichte des Dramas* (3 vols. Leipz. 1865); Ward, *English Dramatic Literature* (2 vols. Lond. 1875); and also ENGLISH LITERATURE.

In 1850 an effort was made by Robertson in the plays of *School*, *Ours*, &c., to return to realism, while Irving followed Fechter in the revival of Shakespeare in 1874. Sir Henry Irving has been described by William Archer, the celebrated dramatic critic, as standing half-way between realism and romanticism, as representing life, but life concentrated into more intense interest. While Gilbert continues to produce his charming phantasies, melodrama still holds sway at the Adelphi, and scenic effect is to be found at Drury Lane, there has been, since the days of Robertson, an increasing rebound towards realism, a reaction from the idealistic school which has been made somewhat at the expense of truth to the exclusion of the brighter side of nature in the selection of morbid and painful themes; and the influence of Ibsen, the great dramatist of the North, has been largely felt. Unfortunately, the talent of Ibsen has been directed chiefly to the delineation of the painful and the commonplace usually with a motive rendered curiously obscure. The two most powerful of modern realistic plays have been written by Pinero, viz., *The Second Mrs. Tanqueray*, and *The Notorious Mrs. Ebbsmith*, in both of which the sex problem has been brought forward for open discussion, with a tendency towards rendering the stage the platform of a debating society. Other popular plays of the same school have been *The Idler* (Haddon Chambers), *Lady Windermere's Fan* at the St. James's, *The Dancing Girl* (Henry A. Jones) at the Haymarket, and *Sowing the Wind* (Sydney Grundy) at the Comedy.

For dramatic art in such countries as Siam, China, and Japan, the reader is referred to a short sketch entitled *Dramatic Art in the Far East*, in *Chambers's Journal*, 2nd September, 1895.

Dramm'en, the third seaport of Norway, on the Dramsfjord, at the mouth of Drams-Elv, 30 miles S.W. of Christiania. It consists of three separate parts—Bragernäs, Stromsö, and Tangen, which are connected by bridges. Its manufactures are beer, tobacco, cordage, &c., and it has the largest timber trade in Norway. Pop. 20,687.

Dra'per, John William, LL.D., an American savant, was born at Liverpool, England, 5th May, 1811, emigrated to the United States in 1833, and graduated in the University of Pennsylvania in 1836, in which year he was appointed Professor of Chemistry in Hampden and Sydney College, Virginia. In 1839 he became Professor of Chemistry in the University of New York, and two years later assisted in starting the University Medical College of New York, with which he was connected till 1868. He died 4th January, 1882. His chief works are *Text-Book of Chemistry* (1846), *Natural Philosophy* (1847), *Human Physiology* (1856), *History of the Intellectual Development of Europe* (1863), *Future Civil Policy of America* (1865), *Philosophical History of the Civil War* (1867), and *The History of the Conflict between Religion and Science* (Lond. 1874).

Dra'pery (Fr. *drap*, 'cloth'), in painting or sculpture, the clothing of the human figure. The fit disposition of D. is an important object in art, and in modern times, from the comparatively unbecoming nature of dress, offers considerable difficulties to the artist. This difficulty is sometimes eluded by draping a figure in antique costume, or in a loose cloak, but many great sculptors, and notably Thorwaldsen, have coped successfully with the disadvantages of modern costume. In representing D., attention must be paid to historic accuracy in the dress painted or chiselled, to the action represented, and to the outlines of the figure covered by the D. The object of the sculptor is to impart to D. a conventional repose and a firmness that does not prevent it from being transparent and flowing. See COSTUME and FASHION.

Draught or **Draft** of water of a vessel is the depth to which she is immersed when afloat. A scale of feet is marked at one or both ends of the ship, by which the D. can be at once known at any time.

Draughts (Fr. *les dames*, Ger. *damenspiel*), a game played by two persons on a board similar to that used in chess. Each player has twelve 'men' or pieces, one set being black, the other white. These are placed on the white (in Scotland on the black) checks, occupying at the beginning of the game the first three rows before each player. They are moved forwards in a diagonal or zigzag direction, and only one square at a time. When a piece has safely reached the adversary's end of the board, it is made a 'king,' being crowned with another piece for the sake of distinction, and thenceforth having the additional power of moving backwards. The sole object of the game is to capture or 'take' the opposing 'men,' or to hem them in so as to hinder further progress. A piece can only be taken, *i.e.*, conveyed from the board, when it is placed immediately in the way of another, and a check behind it is left blank. The victorious piece is then lifted over the one taken and placed in the empty square beyond. As a general rule, in playing, it is best to concentrate one's forces, and to keep none of the men 'at home.' Success greatly depends on getting an early king. D. is less scientific, but more popular than chess, to which it holds much the relation of bagatelle to billiards. It has been said that 'life is too short for chess,' but a game at D. occupies little time, and is a recreation, not a study. See *Handbook of Games for Gentlemen* (Lond. 1876).

Drave, or **Drau,** one of the chief tributaries of the Danube, rises in the Pusterthal on the S.E. frontier of the Austrian Tyrol, flows E. through the crown-lands of Carinthia and Styria, and E.S.E., forming the boundary between Hungary on the N. and Croatia and Slavonia in the S., to its junction with the Danube, about 10 miles below Essek. It is 382 miles long, and becomes navigable at Villach, in Carinthia, whence downwards there is considerable traffic.

Dravid'ian Languages and Peoples. The term D. has been applied by philologists to a group of cognate languages, whose present home is almost entirely confined to the S. of India. The name itself is derived from *Dravira*, the Sanskrit appellation for the Tamil country, the most ancient and powerful of the Southern Indian kingdoms; and the name Tamulian has been sometimes used for the entire group. The D. L., which all conform to a common type, belong to the more highly-developed stage of the so-called Turanian family of speech. They are agglutinative in the fundamental portions of their grammar; but they also exhibit incipient inflections, which can for the most part be reduced to separate words incorporated with the roots. Their alphabet is manifestly derived from some prototype of the Devanágarí character; but it differs from the Sanskrit proper in being rounded rather than angular, and cursive rather than either inscriptional or capital. The D. group consists of two sections, Southern and Northern. The following are the subdivisions and the numbers of persons by whom they are severally spoken:—*Southern* (1) Tamil, 15,229,759; (2) Telugu, 19,885,137; (3) Kanarese, 9,751,885; (4) Kodagu (*Coorgi*), 37,218; (5) Malayálam, 5,428,250; (6) Tulu, 491,728; (7) Toda and Kota, 1937; (8) Sinhalese, 187; (9) Mahl, 3167. *Northern* (10) Gond, 1,379,580; (11) Kandh (*Khond*), 320,071; (12) Ornon, 368,222; (13) Mal-Pahadia, 30,838; (14) Kharwar 7651; and (15) Brahui, 28,990. Telugu is spoken in the N.E. of the Madras Presidency; this language is the sweetest of the fifteen, but its literature is composed of translations from the Sanskrit. Kanarese is spoken in the Carnatic and the State of Mysore; its literature, though recent, is partly original. Tulu, which is largely mixed with the Kanarese, is spoken by persons living on the western coast between Cochin and Goa. Tamil is spoken by those who live in the tract between Madras city, Cape Comorin and Mysore; it boasts an indigenous literature, cultivated as early as the 9th c., and the Tamil race is by far the most civilised and energetic of the D. peoples. By way of accounting for the peculiarities of this language, a curious legend has become traditional in S. India to the effect that when God distributed the various languages, the Tamil nation was either forgotten or ignored. Thereupon, a deputation of Tamils was sent to implore God to give them a language. When they reached the Presence, God was walking about his garden in the cool of the evening, and He asked them what they wanted. Falling on their knees they humbly signified their grievous necessity and moved the Almighty to have pity on them. So passing from flower-bed to flower-bed, God plucked off the pods of the different plants that had seeded, and having crumpled them up in His hands, He cast the mixed seeds towards the Tamils and said: 'Take, let these be your language.' Malayálam is spoken by the inhabitants of the part known as the Malabar coast, which runs up on the W. from Cape Comorin; nearly two-thirds of this language are said to be of Sanskrit derivation. The Gonds live in Central India, the Kandhs in Orissa, the Ornons in Chota Nagpore, and the Mahlis in the districts bordering on the Ganges. Some of the tribes, dwelling as far N. as the slopes of the Eastern Himalayas, are D. in origin. It is probable, therefore, that one-fifth of the total population of India is D. See *A Comparative Grammar of the Dravidian and South Indian Family of Languages* by the Rev. R. Caldwell, LL.D.

Draw'back is used in commerce to denote the paying back, on exportation, of duties previously paid on commodities. It thus allows the commodity to be sold at its natural cost; while a bounty enables the exporter to sell below natural cost. The object of the D. is that commodities on which taxes fall may be exported for sale abroad as if they had not been taxed. It is therefore defended by Adam Smith as remedying the inequalities of taxation varying in different countries; otherwise peculiar facilities of production would be required to compete against a commodity produced and not taxed abroad. The system of warehousing imports for exportation does away with D., because it avoids taxation. In certain cases the D. exceeds the tax, and then forms a bounty. Under statutes 16 and 17 Vict. c. 107, 26 and 27 Vict. c. 33, and (the Customs Consolidation Act) 39 and 40 Vict. c. 36, persons intending to claim D. must give notice to the officer of excise; also no D. is to be paid on goods less in value than the D. claimed, or upon tobacco not wholly manufactured from imported tobacco; and goods re-landed (except in the usual way of importation), or carried to any of the Channel Islands, after D. has been paid for exportation shall be forfeit, as well as the ship from which they were re-landed, and the master of the ship or any person, by whom or by whose orders or means the goods have been re-landed, shall forfeit a sum equal to the drawback paid, or treble the value of the goods, or incur a penalty of £100, at the choice of the Commissioners. Great difficulty is often caused by the experiments to determine the gravity of samples of beer for exportation, on which the amount of D. depends. See also DEBENTURE and IMPORTATION.

Draw'ing, the art of representing objects or natural scenery in black and white or in colour upon a flat surface. In ordinary parlance a D. is a representation of an object or series of objects in outline, with or without lights and shadows, and executed in pencil, chalks, sepia, or Indian ink. In the constructive arts, a D. is a preparatory plan in which the proportions of a machine, building, &c., are accurately set out for the guidance of the constructor. In art, the term has a much wider signification. A water-colour D. may be a highly-finished painting in which no *drawn lines* appear. The term D. is also applied to a preparatory study or sketch in oils of a subject or part of a subject, to be afterwards worked up into a finished picture in oil-painting. Elementary D. is now regarded as an essential branch of primary education, and as such is taught in all schools, while in the army, and in many professions and trades, the ability readily and graphically to delineate common forms, plans, sketch-maps, scenery, &c., is regarded as an accomplishment second only in importance to writing. D. defines forms of objects by means of outline and shadow, and renders the relation between near and distant objects apparent by the help of Perspective (q.v.). According to Greek fable, a girl who drew the outline of the shadow of her lover's profile on a wall created the art. Ardices and Telephanes are said to have been the first to have indicated the roundness of the figure by the process of hatching. Monochrome, or drawing in one colour, using tints of varying depths, is said to have been first practised by Philocles and Cleanthes. The invention of this process led the way to the use of various colours in the representation of objects—in other words, to the art of painting. Among the Greeks, D. was studied rigorously and thoroughly. Pamphilus, the instructor of Apelles, required his pupils to study the art ten years. D. is the basis of all art, and while it is all-important at the commencement of an art training, it is little less so at all succeeding stages. In D. to a far greater degree than in colour, the expression—the soul, so to speak—of a picture or other work of art consists. Without D., colour has no intelligence. As the greatest merit, therefore, of the greatest work of art resides in the quality of its D., it is manifest that a thorough knowledge of the principles of the art and a perfect training in its practice are indispensable to success in high art. In teaching D., the prevalent practice in the schools of the Continent, namely, to teach the pupil to represent nature by means of light and shade, rather than, as with us, by rigid outline, is undoubtedly the preferable method, rigid outline, except in the forms of crystals, &c., being in nature practically unknown. An excellent work on D., as applied to the ornamental arts, has been written by E. S. Burchett, who lectured on geometrical and perspective D. at the National Art Drawing School, South Kensington. See Ruskin's *Elements of D. in Three Lessons for Beginners.*

Drawing and Quar'tering, the form of capital punishment for Treason (q.v.), was that the criminal should be drawn on a hurdle from gaol to gallows, and hanged; and that afterwards the body should be divided, then quartered, and disposed of according to the orders of the sovereign. It was the privilege of the sovereign to change the punishment of D. and Q. into beheading. D. and Q. are now abolished under statute 33 and 34 Vict. c. 23.

Drawing-Board, a board upon which paper is fixed in order that it may be drawn upon. For many engineers' drawings the paper is merely attached to the board by drawing-pins or by sealing-wax; but for more elaborate drawing, or for water-colours, the paper is attached by glueing all round while damp. The glue hardens very rapidly, and the paper, as it slowly dries and shrinks, is stretched perfectly smooth and flat.

Draw-Plate, a steel plate, having in it a series of holes gradually diminishing in size, through which metals to be formed into wire are drawn.

Drayton-in-Hales, or **Market-Drayton,** a town in Shropshire, on the Fern, 19 miles N.N.E. from Shrewsbury, and 153 miles N.W. from London. It is an old town, and is supposed to be the *Caer-Draithon* of the Romans. The parish church was built in the reign of Stephen. D. has manufactures of paper and haircloth, markets during the week, and several fairs in the year. Pop. reg. dist. 14,196; and reg. sub-dist. 10,292.

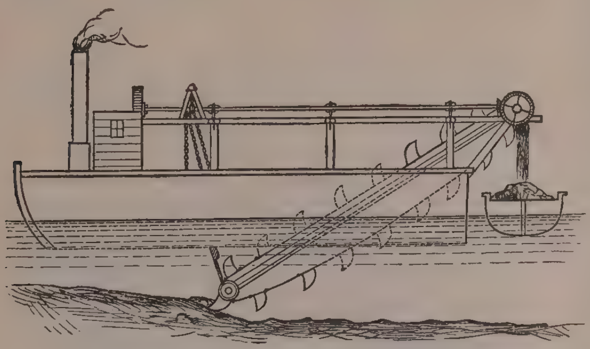
Drayton, Michael, an Elizabethan poet, was born at Hartshill, near Atherston, Warwickshire, in 1563, and is said to have been educated at Oxford, but little is known of his life. He produced *Harmonie of the Church,* his first work, a paraphrase of parts of Scripture, in 1591; *Idea: Shepherd's Garland fashioned in Nine Eclogues,* in 1593; *Idea's Mirror, Amours in Quatorzains,* a number of sonnets, and the tale of *Endymion and Phœbe,* in 1594; *Mortimeriados,* afterwards recast under the title of *The Barons' Wars,* in 1595; *England's Heroical Epistles* in 1598; *Polyolbion* in 1612-22; and *The Battle of Agincourt* in 1627. He died 23rd December, 1631, and was buried in Westminster Abbey. D. was a true poet, but forfeited popularity by the prosaic theme and tedious length of his chief work, the *Polyolbion,* a metrical guide-book to England and Wales, in buoyant Alexandrine verse, and full of noble, patriotic, and descriptive passages. *The Battle of Agincourt,* a fiery, vivid lyric, one of the finest war-poems in the language, is said to have been the model of Campbell's *Battle of the Baltic.* The most charming of D.'s works is *Nymphidia, a Tale of Faery-land,* wrought with the nimblest, brightest fancy, abounding in delicate oddities of conception and choice touches of colour. See Hooper's edition of *The Complete Works of Michael D.*

Dream'ing is the activity of the mental faculties, more or less, during sleep. Some suppose that even in the most profound sleep we dream, although the dreams may not be remembered. Of this there is no proof, and, on the contrary, it is highly probable that in profound sleep the cerebral centres, on the activity of which all our mental states depend, are in a state of complete rest. Others suppose that D. is a mark of imperfect sleep. Usually in D. there is a less complete exclusion of sensory impressions than in deep sleep, and thus the dream may be influenced by external impressions, although the mind is not conscious of them as such. In D. the cerebrum is partially active, while the sensorium, or that part of the nervous system which is the first recipient of impressions on the senses, is capable of being excited, not only by impressions on the sense organs, such as eye and ear, but by inferences transmitted to it by the cerebrum. In D. there is no volitional control over the current of thought, and there is usually an utter want of coherency in the images that appear before the mental eye. Nor does this excite any surprise in the dreamer. In D., also, trains of thought pass through the mind with great rapidity, so that, during a few minutes, events happen which in the waking state might occupy hours or even days. Time seems to be abolished. In D. sometimes sensibility to external impressions may be entirely suspended, and sometimes not. In the latter case, suggestions may be made to the mind of the dreamer, as by whispering into his ear. To such an extent may this be done, that the train of thought of the dreamer may be controlled by others, and he may even be made to act his dreams by speech or muscular movements, while all the time he is quite unconscious of any such suggestions, and may have no recollection of them when he awakes. Such forms of D. may be regarded as transitional to the state of Somnambulism (q.v.).

Dredge, a kind of net for dragging or sweeping the bottom of the sea, lakes, or rivers, and retaining the animals, &c., that enter it. The oldest and most familiar form of D. is that important item of deep-sea fishing-gear, the oyster-D. The zoologist's D., a most valuable implement of scientific research as regards marine fauna, differs from it in size and detail. The open frame takes a pyramidal form; at its base are two iron scrapers, and suspended from them is a bag of closely-netted twine, enclosed in an outer net of hide.

Dredging in deep sea and scientific exploration has of late years assumed a high importance, as making us acquainted with the fauna or life of deep-sea areas. Dredging may now be carried on at a depth of four or more miles, the chief obstacle to the descent of the D. (viz., the action of the strong under-currents, which tend to sweep the D. away from the ship in the direction of the surface) having been overcome through the use of heavy weights, which are attached to the D.-rope at intervals, and which thus gradually pull the machine to the ground. The equipment of a scientific dredging expedition is no light matter, as may be learned from a perusal of Wyville Thomson's work, *The Depths of the Sea*, in which full details as to the management of the D. in deep water, as well as other interesting information regarding deep-sea exploration, will be found.

Dredging Machine. A mechanical contrivance for raising mud, sand, &c., from the bottom of a river, dock, harbour, or canal, for the purpose of facilitating navigation or constructive operations. The most simple apparatus is the bag-and-spoon dredger, consisting of a large spoon-shaped frame, with a leather bag suspended from it, attached to a long pole. It is raised by means of a winch, a chain being attached to the spoon. For deepening canals in Holland, or for excavating for pier-foundations, &c., this dredger is much resorted to. For deepening the bed of a river and maintaining an open channel for large ships, or for cutting the bar of a river, the steam dredger with a chain-and-bucket system is invariably employed. The annexed cut shows its general features. A moveable frame or ladder carries an endless chain with a series of buckets attached. The buckets, full of material, ascend on the upper side of the ladder, and as they turn the cam at the top to descend on the under side, they empty their contents into a barge beneath. In some dredging vessels the bucket system is worked through an opening amidships, in others over their extremity. Some vessels have a double bucket system, working on each side. Large dredges are fitted with a screw propeller, and some are capable of raising 500 tons of silt per hour. An ingenious method of dredging has been patented, in which hydraulic power raises the dredged material. Two pipes, descending one on each side of a boat, are joined at their lower ends by a curved pipe with an open rake-shaped mouthpiece. By the forward movement of the boat, mud, shingle, &c., are forced into the mouthpiece, and are impelled with great speed up through the discharge-pipe by water forced down the other pipe.



Steam Dredging Machine.

Dren'the, the least populous province of Holland, between the Hanoverian frontier and the Zuyder Zee. Assen, the capital town, has a pop. of 9169. The surface is in great part sandy waste, alternating with bleak stretches of morass. The province is traversed by the D.-Hoofd and Oranje canals, and by two lines of railway. Little or no wheat is cultivated, but there is much cattle-rearing, bee-culture, and peat-digging. Four Government industrial colonies have an aggregate pop. of 10,000. Area, 1030 sq. miles; pop. 137,456.

Dres'den, the capital of Saxony, one of the states of the German Empire, is beautifully situated on both banks of the Elbe, 110 miles S. by E. of Berlin, and 78 N.N.W. of Prague. It is divided into the *Altstadt* and *Friedrichstadt* on the left, and *Neustadt* and *Antonstadt* on the right bank of the Elbe, which is here crossed by the splendid old Augustan bridge of seven arches, and by the fine iron railway (or Marien) bridge. The city has several squares, gardens, and promenades, as well as the famous Brühl Terrace overhanging the river. It is a great centre of culture, standing high in musical science, and having earned the name of the 'German Florence' on account of its rich art-collections. Its principal buildings are the uncouth Royal Palace (begun 1534), with its green domes and its rare collection of precious stones and gold and silver work; the Zwinger Palace, containing a museum of natural history, a splendid cabinet of engravings, and a collection of tools and mathematical instruments; the world-famous Museum or art gallery; the Japanese palace, remarkable for its royal library of 305,000 volumes, and for its porcelain and classical antiquities; the Frauenkirche, with a tower of 335 feet; the Catholic Hof Kirche; a Jewish synagogue; the Royal Theatre (1878), one of the finest in Europe; an arsenal; and orangery. The D. picture gallery contains about 2000 works, chiefly of the Italian and Flemish schools. Of the former, Raphael's 'Sistine Madonna,' Correggio's 'La Notte,' and Titian's 'Venus' and 'Tribute-Money,' are the most celebrated specimens; there are also pictures by Francia, Paul Veronese, Giulio Romano, Leonardo da Vinci, Bellini, Perugino, the Caracci, Guido Reni, &c. The Flemish collection is singularly rich, embracing 41 specimens of Rubens, 21 by Vandyck, many of Rembrandt, Snyders, Breughel, Ruysdael, Gerard Dow, and Teniers. Among the other more notable names represented are Holbein, Poussin, and Claude Lorraine. D. has a fine-art academy (1764), polytechnic, veterinary college, many good schools and public institutions, some light industries, and an extensive trade on the Elbe. It is the convergent point of five railways. To the S. of the city lies the romantic and picturesque region known as 'Saxon Switzerland.' Pop. 276,522.

The oldest portion of D., the Sorben colony, is known to have existed as early as 1206. In 1485 it became the residence of the Albertine line. The Reformation was here welcomed by Heinrich the Pious, 1539. The town, which had been burned in 1491, was in great part newly built under August II. and August III. By the Peace of D., the Austrian War of Succession was brought to a close, 26th December, 1745. Its fortifications were begun in 1810, and three years later followed the Battle of D. (q.v.). In the revolution of 1849 the city suffered much from barricade struggles.

The D. Conference for remodelling the constitution of the German 'Bund' sat from 23rd December, 1850, to 15th May, 1851. The Prussians occupied D. in the Austro-Prussian war of 1866.

Dresden, The Battle of, was the last of the great victories of Napoleon. This city, the central point of the French operations in August, 1813, was held by St. Cyr with some 30,000 troops, when the allied army unexpectedly appeared on the 23rd. But the advantage of a surprise was thrown away. The Austrians delayed action till the arrival of Klenau's left wing. On the 26th the attack began, but that morning Napoleon, who had been in Silesia, reached D. with his Guards. The assault, though brilliant, was repulsed, and after two days' fighting, the allies retreated on the night of the 27th. On quitting the city (7th October) Napoleon left there some 30,000, who were besieged by the Russians, and who, after a period of misery and famine, capitulated, and were made prisoners of war.

Dreux, a town of France, department of Eure-et-Loir, on the river Blaise, 45 miles W. of Paris. It has manufactures of serge and coarse cloth, tanneries, iron-foundries, and dye-works, and a trade in grain and cattle. D. was the scene of a battle in 1562, in which the Huguenots were defeated, and their leader, the Prince de Condé, taken prisoner. The ruins of the ancient castle of the Comtes de D. contain a fine chapel, built by Louis Philippe as a burying-place for the Orleans family. Pop. commune, 9364; arrond. 65,471.

Drey′se, Johann Nicolas von, the inventor of the needle-gun, was born at Sömmerda, near Erfurt, 20th November, 1787. From 1809 to 1814 he worked in the imperial armoury, Paris. Thenceforth he devoted himself to the manufacture of fire-arms, and in 1827 produced the first model of a needle-gun, an invention which he afterwards developed, and which, in 1840, was adopted in the German army. D. was placed at the head of a large manufactory of fire-arms in Sömmerda, and appointed a privy-councillor. He died 9th December, 1867.

Driff′ield, Great (Old Eng. *Driffelda*), a market-town in the East Riding, York, 196 miles from London by rail. It stands in a fertile district at the foot of the Wolds, and consists mainly of one street. The chief buildings are the corn-exchange, the mechanics' institute, and All Saints Church. D. has manufactures of wool and cotton, and several foundries, and flour and bone mills. Several tumuli have been found in the neighbourhood. Pop. civ. par. 5703.

Drift, a name applied in various senses in geology. Thus it may be used to denote sand and other loose matters which have been blown by winds, and which have been collected together to form 'sand-dunes.' These 'drifted sands' become consolidated by the growth in them of various hardy grasses, such as 'sand-grass.' Sand-dunes are most common along seaboards where high winds prevail, as on the sea-coasts of France and Spain, which face the Bay of Biscay. On the coasts of Devon, Cornwall, Norfolk, Lincoln, and Nairn, in Britain, sand-drifts may also be seen. The name D. is applied more distinctively, however, in geology to the glacial deposits belonging to the *Pleistocene*, *Recent*, or *Post-Pliocene* period of the Kainozoic rocks. These deposits are evidently the result of ice-action, and are also known under the names of 'boulder clay,' 'till,' &c. They occur in Britain as far S. as the Thames, over S. and Central Europe, and in N. America as far S. as the 39th parallel. They appear as sands, clays, and gravels, representing ice-carried débris, and, as in Wales, may occur at heights over 2000 feet above the sea-level. The fossils of the D., as might naturally be expected, are referable chiefly to living species of northern or Arctic kind; and many characteristic shells (such as *Pecten Islandicus*, *Fusus Islandicus*, *Scalaria Greenlandica*, &c.) occur in this formation. See also BOULDER CLAY.

Drill, a species of Catarrhine monkeys very nearly allied to the mandrill, and inhabiting the Guinea coast. The colour is not so brilliant as in the latter species, nor are the cheekbones so prominent. The upper parts are of a greener hue than those of the mandrill. The face and ears are black, and the soles of the feet are hairless. The D. is smaller than its neighbouring species, but in habits it closely resembles the mandrill.

Drill, a stout twilled linen fabric used for such articles of dress as require great strength and durability.

Drill, an instrument used for boring metal, stone, wood, glass, ivory, and other hard substances. Ordinary drills are made of very hard steel, and they are worked either in the lathe or the brace, or by the bow and string, &c. For rock-boring the diamond rock-D. is now generally adopted—an instrument with cutting edges made of the so-called black diamond (the boart or carbonado) of Brazil.

Drill, in agriculture, is applied to the rows in which any crop is sown, and also to the implement used for sowing seed in rows, as opposed to broadcast sowing.

Drill is the instruction of officers and men in the use of arms in the evolutions of the field. Until within the last few years the system of military manœuvres was based on a system of D., which consisted in a series of changes of formation chiefly from line to column and from column to line. But recent warfare has proved that an attack in column is—since the vast improvements lately made in the range and precision of artillery and small arms—a thing no longer possible. Again, an attack in rigid line is, owing to the impossibility of facing modern fire in any close formation whatever, equally impossible. The column and line therefore having practically ceased to exist as formations in actual warfare, the whole aim and system of D. has been changed. Attack is now only possible in skirmishing order with supports and reserves in rear. But the attack in skirmishing order pre-supposes a considerable degree of individual freedom of action; and under present conditions the aim of all D. is to develop, and at the same time to regulate, that freedom of action. Thus the scope of D. has within late years been greatly extended. The object of military training is no longer to ensure mechanical precision in the performance of unvarying evolutions, but to develop natural aptitude and judgment, so that in the advance in loose order every possible advantage offered by the ground may at once be perceived and seized by each individual combatant. The aptitude and judgment referred to, however, cannot be attained by the old system of D. In skirmishing, men are so widely scattered that their movements can no longer be controlled by word of command. A greater degree of responsibility must therefore be reposed in the non-commissioned officers and in the men themselves. But before these can be safely intrusted with this degree of responsibility and freedom of action, they must be regularly trained to act together in skirmishing order over a wide extent of country. This training it is one of the main objects of the Autumn Manœuvres to provide. For details of the new D., reference may be made to the recent regulations. See *Wellington Prize Essay*, by Lieut. F. Maurice; Captain (General, Sir) Henry Brackenbury's *Tactics of the Three Arms; Changes of Tactics Consequent on the Improvement of Weapons and other Circumstances*, by Lieut.-Col. Middleton; and *Field Exercises and Evolutions of Infantry, as Revised*.

Drill′ing, military, without lawful authority, is punishable under statute 60 Geo. III. and 1 George IV. c. 1. s. 1 (redrawn). Thus every person commits a felony, and is liable upon conviction thereof to seven years' penal servitude, who is present, or attends any such unlawful assembly, for the purpose of drilling, &c., any other person; or who trains or drills any other person without lawful authority; or who assists or aids therein. Persons who attend or are present on such occasions to be drilled or trained, commit a misdemeanour, and are liable on conviction thereof to two years' imprisonment (without hard labour) and fine.

Drin′king U′sages. The ceremony of drinking healths, or of uttering a pious, friendly, or moral sentiment before taking wine, has doubtless had its origin in the religious observances of antiquity. In the Bible we have frequent mention of a 'drink-offering' to the true God as well as to false gods, and among the Greeks and Romans a libation to the gods was a usual part of religious ceremony. Our own custom of health-drinking is probably of Teutonic origin; though we do not find the introduction of Christianity to have been followed by the suppression of drinking habits among our ancestors, or even by the diminution of them. 'The introduction of Christianity,' says Milner (*Archæologia*), 'among our ancestors did not at all contribute to the abolition of the practice of wassailing. On the contrary, it began to assume a kind of religious aspect, and the wassail-bowl itself, which in the great monasteries was placed on the abbot's table, at the upper end of the refectory or eating-hall, to be circulated among the community at discretion, received the honourable appellation of "Poculum Charitatis." This in our universities is called the "grace-cup."' The late Lord Cockburn in his *Memoirs* gives an amusing and interesting account of the fashion of drinking healths and toasts, as it prevailed in fashionable society in Scotland in the end of the last, and during the first quarter of the present century. Abroad there is a nominal drinking usage consisting in the universal expectation of servants, drivers, &c., with whom the traveller may come in contact, of a small gratuity, *pour boire* (Ger. *trinkgeld*). In the Highlands of Scotland it used to be the custom to speed the parting guest with what was called a *deoch-an-dorris* or stirrup-cup; for which the landlord of an inn made no charge. See Dunlop's *D. U. of Great Britain*, *Memoirs of Lord Cockburn*, and *Reminiscences of Changes of Social Life in Scotland* by the Very Rev. Dean Ramsay.

Drip'stone, a projecting moulding over the heads of doorways, windows, arches, niches, &c., which receives its name from the use it subserves of throwing off rain-water. From its position it is always ornamental, and in many situations in which there is no exposure to rain, this weather-moulding, as it is sometimes called, is retained simply from its value as an ornament. In Early English the D. was a small arched moulding, deeply hollowed on the under side, the ends of the arch usually resting on a corbel or boss of foliage; in the Decorated style it, like every other detail, was much enriched, being frequently crocketed and surmounted by a finial, so as practically to form a canopy; in the Perpendicular style it assumed a square form over the doorway.

Driver, or **Spanker,** in ships, the name of a large sail sometimes set upon a gaff on the mizzen-mast.

Driving, Law Regarding. Under statute, no stage-coach or public carriage is allowed to carry more passengers than it is constructed for. A space of 16 inches must be allowed to each passenger. Penalties are enacted against intoxication or negligence on the part of any one employed about the coach or carriage, and against careless or furious driving. See CARRIERS.

St. Lawrence Gate, Drogheda.

Drogh'eda (Irish Gael. *Droichead-Atha*, 'the bridge of the ford'), a seaport of Ireland, forming a county by itself, enclosed within the counties of Louth and Meath, province of Leinster, 4 miles above the mouth of the Boyne, and 31 miles N. of Dublin by railway. There is a railway viaduct 95 feet high across the Boyne, and a lattice railway bridge across the Royal Canal. Of more recent structures the chief are the waterworks, which deliver an ample supply of good water, the townhall, with assembly-room to accommodate 700 persons, the cotton-factories, and flax-mills, in which the bulk of the working population are employed. There are tanneries, breweries, a number of iron, salt, and soap works, and shipbuilding yards. At the entrance to the harbour are three lighthouses. Grain, cattle, and provisions are exported, and tea, brandy, and timber are imported. For agricultural returns, &c., see LOUTH. An important synod, summoned by the Pope's Legate, and the effect of which was greatly to extend papal authority and influence in Ireland, was held here in 1152. D., as a frontier town of the pale, was an important military station between the 14th and 17th centuries. Here Irish Parliaments were frequently held, and the right to coin money was exercised. The town was captured and its garrison destroyed by Cromwell in 1649, and in 1690 it surrendered to the royal forces after the battle of the Boyne. Of the fortifications scarce a remnant exists, and St. Lawrence Gate is the only part in any state of preservation. There is, however, a number of interesting remains of old religious houses, as the Dominican and Franciscan friaries, and the Hospital of St. Mary. Pop. of county of the town 11,873.

Droh'obicz ('the woody place'), a town of Austrian Galicia, on the Tisminica, a tributary of the Dneister, about 45 miles S.W. of Lemberg. It contains a military training school, and has important saltworks. Pop. town 17,784; district 75,642, many of whom are Jews.

Droit d'Aubaine (Lat. *alibi nati*), a usage in France, abolished in 1819, by which the moveable estate of an alien became the property of the sovereign, any will made notwithstanding. Exemptions were made in favour of the Scotch, Savoyards, Swiss, and Portuguese.

Droits of the Admiralty. See ADMIRALTY DROITS.

Droit'wich (Lat. *Salinæ*), a municipal borough, Worcestershire, in the valley of the Salwarp, 7 miles N.E. of the city of Worcester. It is connected with the Severn by a canal. The manufacture and export of salt, got from the brine-wells by evaporation, constitute the principal trade of the town. The name is derived from *wich* or *wick* (the Scandinavian *vig*, 'bay,' as salt was obtained by the evaporation of sea-water in shallow bays), and *droit*, 'tax.' It thus signifies the salt-springs where the tax was paid. Some Roman remains have been found here. Pop. parl. div. of county 48,745; reg. sub-dist. 7606; and mun. bor. 4021.

Dromathe'rium, an extinct genus of Marsupial (q.v.) mammalia, the remains of which (consisting of the lower jaw) are exceedingly interesting as forming one of the earliest traces of mammalian existence on our globe. The D. remains occur in the Triassic rocks of N. America. D. was a mammal of small size, and appears to have been very nearly related to the little banded ant-eater of New South Wales. *D. sylvestre* is the name which has been given to the D. remains. The lower jaw contains 'ten small molars in a continuous series, one canine, and three conical incisors—the latter being divided by short intervals' (Owen).

Drôme, a department in the S.E. of France, bounded on the W. by the Rhône, which separates it from the department of Ardèche, and surrounded on the N.E., E., N., and S. by the departments of Isère, Hautes-Alpes, Basses-Alpes, and Vaucluse. In the E. the country is covered with mountains (highest peak 8068 feet), giving rise to westward-flowing streams, the chief of which is the Drôme (length 103 miles). In the S. there are ranges of vine-clad hills, and fertile plains with numerous mulberry plantations, supporting an extensive local silk husbandry. One-half of the area is cultivable, and vineyards and forests occupy large tracts. The raw silk produced amounts to 585,000 lbs. annually, worth ten million francs. The four vineyards of Die, Douzere, Saillans, and Mercurol alone produce thirty-three million gallons of highly-esteemed wines named *vins du Rhône* annually; but the finest vineyard is that of Hermitage, which produces the excellent red and white wines of *Meal* and *Grieffieux* and of *Baume*, *Muret*, and *Reaucoule*. Cloth and serge are extensively manufactured; there are 130 silk factories, and numerous potteries, tanneries, &c. Silk, timber, cattle, wine, honey, wax, and olives are exported. The department is traversed from N. to S. along the banks of the Rhône by the Lyon and Avignon Railway. Valence is the chief town (pop. of commune 25,283). Area, 2518 sq. miles; pop. 306,419.

Drom'edary, a species of *Camelidæ* or Camels (q.v.), also known under the names of African and Arabian camel, and distinguished by its possessing a single hump only. This species in other respects resembles its neighbour the Bactrian camel, which has two humps, the two species being said to breed together, whilst their hybrid progeny is also said sometimes to be fertile. The D. is by far the most valuable of the two species in so far as its usefulness to man is concerned. It is a much more elegant animal than the Bactrian camel, and is altogether swifter and more agile. The D. is much used for riding, the *heixies* or 'swift camels' being highly bred and trained animals of this species. The average speed of the D. is from 8 to 10 miles per hour, but their power of passing over long tracts depends rather upon their endurance than actual speed. See also CAMEL.

Dromore' (Irish Gael. *Druim Mor*, 'great ridge'), a cathedral town in the county of Down, on the Lagan, 17 miles S.W. of Belfast by railway. The inhabitants are principally employed in the preparation of flax, and in linen manufactures and muslin embroidery. The see of D., which also gives name to a Roman Catholic bishopric, is said to have been founded by St. Colman (6th c.), and was incorporated (Act 3 and 4 Will. IV. c. 37) in the diocese of Down and Connor. Jeremy Taylor was Bishop of D. Pop. of township 2359.

Dron'theim, the German form of the Norwegian Trondhjem (q.v.).

Drone-Fly, a genus of *Diptera* (q.v.), or Flies belonging to the family *Tabanidæ*, and noted for its close resemblance to the hive-bee. The larvæ are known as 'rat-tailed maggots,' and are found in mud.

Drop'sy (Gr. *hudōr*, 'water') is an accumulation of water or serum into one or more of the serous cavities of the body, or into the meshes of the areolar tissue. It may arise from various causes, as inflammation, or effusion into the cavity of the chest after pleurisy; or it may be due to disease of the liver, heart, kidneys, or other internal organs. The treatment varies with the cause; diuretics, purgatives, diaphoretics, and tonics are all beneficial.

Drop'wort. See SPIRÆA and WATER DROPWORT.

Drosera'ceæ, the Sundew order, a natural order of Dicotyledonous plants, the leaves of which are often covered with glandular hairy-looking prolongations of the substance. There are about ninety species and seven genera known, most of which are inhabitants of bogs and marshy places. Acrid and slightly acid properties are the characteristics of the order. The exact relatives of the order are doubtful, but probably Hooker's view, that it should be placed near the *Saxifragaceæ*, is correct. It is found in Europe, India, China, Cape of Good Hope, Madagascar, N. and S. America and Australia.

Dros'te-Hüls'hoff, Annette Elizabeth, Fraulein von, was born at the family seat of Hülshoff, near Münster, 12th January, 1798. Her constitution was delicate, and her life one of almost unbroken retirement. In her later years she began to embody the deepest and tenderest experiences of the female mind in a series of lyrics and poetic tales. Her expression is at times misty, but this is far more than atoned for by her originality of thought and truthful rendering of subjects at once poetical and elevating. She is perhaps the only real poetess Germany ever produced, and certainly takes a foremost place among modern writers. She died 24th May, 1848. See Schücking's *A. von D.*

Drou'et, Jean Baptiste, Comte d'Erlon, an eminent French marshal, born 29th July, 1765, at Reims, entered a regiment of volunteers in 1792, and distinguished himself in the campaigns both on the German frontier and in the Peninsula. He was faithful to the fortunes of his master, Napoleon, and was commander of the first *corps d'armée* at Waterloo. In 1832, after the Revolution of July, he received the command of the army of Vendée, and (1834-35) held the post of Governor-general of Algeria. D., who was made a marshal in 1843, died 25th January, 1844.

Drou'yn de Lhuys, Édouard, a French statesman, was born in Paris, 19th November, 1805. He carried off all the first prizes at the Collége Louis-le-Grand, was initiated into politics as *chargé d'affaires* at the Hague, and afterwards held a similar post in Spain. In his political career D. distinguished himself mainly by his opposition to Guizot, whom he helped to overthrow in February, 1848. When Louis Napoleon was President of the French Republic, D. was Minister of Foreign Affairs, and held the same portfolio after the *coup d'état*. In consequence of the results of the Conferences of Vienna of 1855 in regard to the Crimean war, he resigned, to be recalled, however, in 1863. He resigned again in 1866, but received many imperial dignities. After the fall of the Empire at Sedan, D. withdrew to St. Helier, Jersey. He died 1st March, 1881.

Dro'vers ('drivers,' *i.e.*, of cattle) are those who buy cattle in one market to sell in another. They are traders subject to the bankrupt laws. The name is also commonly applied to those whose business is to drive cattle to or from the markets. Statute 5 Eliz. c. 12 bore hardly upon D. and was repealed by statute 12 Geo. III. c. 71.

Drowning, death from submersion in water, was commonly practised in the Middle Ages as a form of capital punishment, and as such was only abolished in Scotland in 1685 and in Austria in 1776. Much attention has been recently devoted to the subject of the recovery of persons after apparent death from D., and the following are now established rules:—(1) place the body in a horizontal position, and gently move it from a prone to a half-prone position, or retract the arms with slight force; (2) rub the limbs upwards with dry cloths; and (3) restore Respiration (q.v.) either by direct inflation of the lungs by the breath or by bellows. See ASPHYXIA.

Droyls'den, a growing suburb of Manchester, four miles E. of that city, and a station on the Lancashire and Yorkshire Railway. It has several good churches, a literary institute, spinning-mills, dyeworks, printfields, &c. Pop. civ. par. 12,810.

Droy'sen, Johann Gustaf, a German historian, born at Treptow in Pommern, 6th July, 1808; studied at Stettin and Berlin; became professor in Berlin in 1835, and Professor of History at Kiel in 1840; was elected to the National Assembly in 1848; appointed professor in Jena in 1851, and again in Berlin, 1859. His writings include translations of Æschylus and Aristophanes.

Drugg'et, a coarse woollen fabric, either woven or felted, chiefly employed as a crumbcloth for laying over carpets, or as an inferior kind of carpeting.

Drugs are medicinal substances used by the physician to cure disease and alleviate human suffering. They are derived from the animal, mineral, and vegetable kingdoms.

Dru'id, the name for priest among the ancient Celtic nations. Zeuss (*Gramm. Celt.*, vol. i. p. 8) derives it from *drui*, an old Celtic term for oak-tree. The Druids taught their pupils by means of verses, which were committed to memory, but never allowed to be written; consequently we have no record by themselves either of their doctrines or their ritual, and derive such scanty knowledge as we have of them from writers who were strangers to their language and hostile to their tenets. Cæsar (*Bell. Gall.* vi. 13) is our principal authority, although many other authors, Greek and Latin, write concerning them.

The Druidical system was skilfully and elaborately organised. Like the Magian in Persia, it drew to itself almost the entire power of the state. Its priests naturally regulated everything pertaining to divine worship. They had also the complete control of the education of the people, and further secured to themselves the exclusive interpretation both of the civil and the criminal law. If any one, high or low, opposed their decrees, 'they interdicted him from the sacrifices,' a sentence with consequences so ruinous that no one could withstand them. Besides possessing these extensive powers, the Druids were exempt from military service and taxation; consequently admission to their ranks was an object of ambition to the highest in the land, and the rivalry for the office of supreme head, or arch-D., often led to bloody warfare. The Druids held the immortality and the transmigration of souls, taught geography and astronomy, discussed the nature of things, and the powers of the immortal gods. The preparatory training of candidates sometimes occupied twenty years, and both Strabo and Lucan speak of their possessing a profound spiritual discipline. In Gaul they worshipped the Greek and Roman deities, principally Mercury, but also Mars, Apollo, Jupiter, and Minerva, to all of whom they offered human victims in sacrifice. Probably the Gauls learned the above names from their neighbours, the Italians; but in Britain, whence the Gauls derived their Druidical knowledge, the sun, under the name of *Bel*, appears to have been the principal object of worship. In the S. as well as in the N. of Scotland, the beginning of summer is still known as *Beltein* (q.v.), and the beginning of winter is in all the Gaelic-speaking districts known by a word signifying 'the fire of peace.' At both these terms the fire on every hearth throughout the land was extinguished, and every householder had to go to the D. to obtain sacred fire directly from him. None dared lend it to his neighbour. We have the memory of this old tyranny still preserved in some Highland districts, where people will on no account allow any fire to be taken out of their houses at either of the above seasons, and we have the kindling of fires upon hill-tops both in the islands and on the mainland (where those who observe it can give no account of the practice, except that it is a habit derived from their ancestors), evidently a remnant of the old fire-worship.

A Druid Priest.

The oak-grove is said to have been the favourite place of Druidical worship, and peculiar sacredness was attached to the well-known mistletoe, a parasite of the oak. Many of their temples have been well called 'groves of stone,' where several stone pillars are ranged in concentric circles, with a large slab sometimes resting on the tops of two of these pillars. Others of these 'Druidical stones,' or 'circles,' as they are popularly termed, are arranged with less regularity; but at Carnac in Brittany; Avesbury, Stanton Drew, and Stonehenge in England; Stennis in Orkney; and Callernish in Lewis, as well as in many other places—they present rude but very remarkable and imposing proofs of mechanical power and skill. Some modern antiquaries maintain that these great pillars are only monuments to the dead; but there seems no valid reason to question the general belief that, like so many of our churches, they formed both temple and tomb, and this belief is confirmed by the fact that, in very many parishes in Scotland, the Christian church is known by the name applied to the old Druidical circle, *clachan* = the 'stones.'

It is also said that Druidism was never known in Scotland. The ancient language of the country proves this opinion to be erroneous. Many places are named as the abodes of Druids. In the Gaelic Bible the magicians of Egypt are called Druids. In common discourse, a person who by persuasion acquires complete control of another is said to exercise Druidism over him, and the meteors known as shooting stars are called 'the death of a D.,' implying the belief that their souls ascended in fiery chariots. The Druidical worship was forbidden by the Emperor Claudius as early as A.D. 55. It is said that a few years later thousands of the priests were massacred in Mona, or Anglesey, by the Roman general Suetonius; but they retained power until the Celtic nations were converted to Christianity.

Drum, a well-known musical instrument of percussion. The *kettle-D.*, of which every orchestra has at least two, is the most important form of the instrument. It is made of copper, and by screws which alter the tension upon the D.-head can be tuned to any musical note within a certain limited range. The ordinary *side-D.* of military bands, and the bass or 'big' D., which is also used in the orchestra, have a sound of some sonorousness, but not of definite pitch, and are useful chiefly in marking rhythm.

Drum was the name of a somewhat uproarious evening assembly of the fashionable about the middle of the 18th c., chiefly convened for the purpose of card-playing, and so called according to Smollett, 'from the noise and emptiness of the entertainment.'

Drum, in machinery, a short hollow cylinder of iron or wood, revolving on a shaft or axis, useful for driving all kinds of mill-gearing and machinery by means of an endless belt or band. The beating apparatus in the threshing-machine is termed the D.

Drum of the Ear. Properly speaking this is the middle ear, or tympanum, although, in ordinary language, the term is frequently used to denote the membrane between the external ear and the middle ear—*membrana tympani*. See EAR.

Drum-Fish, a general name given to those fishes, which, like the Maigres (q.v.), make a kind of grunting noise, but applied more specially to the bearded D.-F. of the N. American coasts, which produces a noise closely resembling the beating of a drum. In this Teleostean fish, which is included in the family *Sciænidæ*, the chin is provided with many small *barbules* or filaments. The first dorsal fin is provided with ten spines, whilst the hind fin is two-spined.

Drum-Major, an army officer, equal in rank to a sergeant of the line, who superintends all 'time bugling,' as the calls for the men to dress, for falling in, reveille, tattoo, &c., trains the drummers and fifers, and is supposed to regulate the pace on the line of march. In the days of 'flogging' it was the duty of the D.-M. to train the drummers to wield the 'cat.'

Drumm'er, a person in every regiment, not to be confounded with any of the drummers in the regimental band of music. He conveys instructions by various beats of the drum, drums out any soldier discharged in disgrace, and used to inflict the lash when the soldier was flogged. See BEAT OF DRUM.

Drumm'er, a large species of Cockroach (q.v.) common in the West Indies, and named from the noise it makes during the night, chiefly by knocking its head against wood.

Drumm'ond, Captain Thomas Henry, a distinguished civil engineer and inventor, was born at Edinburgh, 1797, obtained a cadetship at Woolwich, and was engaged by Colonel Colby in the British trigonometrical survey of 1820. While engaged in this survey he produced the famous light known by his name (see DRUMMOND LIGHT), and also invented a Heliostat (q.v.), an instrument for the vivid and distant reflection of the sun's rays. He was appointed head of a commission to determine the boundaries of boroughs, according to the provisions of the Reform Bill of 1832. In 1835 he was raised to the post of Under-Secretary for Ireland, and before long gained the confidence of all classes by his unflagging energy and intelligence. As head of a commission he made a valuable report on a railway system for Ireland in 1836. He died, keenly regretted by his own friends and by the friends of Ireland, 15th April, 1840. See M'Lennan's *Memoir of Thomas H. D.* (Edinb. 1867).

Drummond, William, the chief Scottish poet of the 17th c., was born of an old and honourable family at Hawthornden, 13th December, 1585. D. was educated at the High School and University of Edinburgh, graduating in 1605, after which he left for the Continent to study civil law. From 1606 to 1608 he resided in France, and in 1609 returned to Scotland. Next year his father died, when D. found himself master of the family estate and of ample means, and abandoned legal studies for the life of a student in his retreat at Hawthornden. His first published work, an elegy on the death of Prince Henry, entitled *Tears on the Death of Mœliades*, appeared in 1613. In 1616 he published *Poems, Amorous, Funerall, Divine, Pastorall, in Sonnets, Songs, Sextains, Madrigals*, the prevailing tone of which is sad, for his betrothed had died in the previous year. His next work, *Forth Feasting, a Panegyric to the King's Most Excellent Majesty*, celebrated King James's visit to Scotland in 1617. In 1618 Ben Jonson spent two or three weeks at Hawthornden, an event recorded in D.'s *Notes of Ben Jonson's Conversations at Hawthornden*, discovered by Laing in the Advocates' Library, Edinburgh. In 1623 appeared his last poetic work, the *Flowers of Sion*, religious poems, to which was appended the *Cypresse Grove*, a brief prose essay on death. Two years later D. visited France, and probably the Low Countries, Germany, and Italy. He returned in 1630, and in 1632 married Elizabeth Logan, a member of the Restalrig family. In 1633 D. began his *History of Scotland under the Five Jameses*, and during his closing years was a vigorous political pamphleteer. He was an ardent royalist; and the execution of Charles I. so affected him that it is said to have hastened his death, 4th December, 1649.

D.'s verse is pensive and thoughtful, and, in general, coloured by a sensuousness derived from Spenser. The vulgar *Polemo-Middinia* (Oxford, 1691) would be a violent contrast to his usual style were its authenticity less problematical. D.'s sonnets, which gave him the title of the 'Scottish Petrarch,' show him perhaps to greatest advantage, being more natural than his longer pieces. His works contain a decided pastoral element, and his Italian studies imparted to his poetry a peculiar melody. D. stands almost alone in Scottish poetry between Gavin Douglas and Allan Ramsay.

D.'s collected works were edited by Bishop Sage and Thomas Ruddiman (Edinb. 1711); by Lord Dundrennan and Irving for the Maitland Club in 1832; and by Cunningham (1833) and Turnbull (1857). See Masson's *D. of Hawthornden* (1873).

Drummond Island, in the N.W. extremity of Lake Huron, is 20 miles long and 10 broad, and belongs to Michigan. There is a settlement here which carries on some trade.

Drummond Light, or **Limelight,** is produced by the play of an oxyhydrogen flame upon a cylinder or ball of lime, which, becoming vividly incandescent, evolves an intensely brilliant and pure white light. The oxygen and hydrogen gases are stored separately, and are only allowed to mingle near the nozzle of the blowpipe, because of the highly explosive character of the mixture. Although lime is very refractory under the blowpipe, the prolonged action of the flame upon one point causes it to crumble away, thereby destroying the steadiness of the light, but this disadvantage is in a manner met by turning the cylinder of lime on its axis by clockwork. Experiments were made with the limelight as early as 1820, but the late Captain (then Lieutenant) T. H. Drummond, R.E., in 1826, was the first to apply it practically. While conducting a trigonometrical survey of Ireland and Scotland he used the light, placing it in the focus of a parabolic reflector, for signalling between distant and lofty eminences. On one occasion he made a successful observation by means of it between stations—Ben Lomond in Stirling and Knock Layd in Antrim—95 miles apart. In 1861 the South Foreland lighthouse was fitted with the limelight apparatus. As the light results from the incandescence of the lime, there is no combustion of atmospheric air and no formation of carbonic acid gas, but in regard to the extension of the limelight to ordinary illumination, these sanitary advantages are neutralised by the inconvenience in preparing the gases and the absence of continuity of the light. It is chiefly employed to enhance scenic effects and for magic-lantern exhibitions.

Drunk'enness. See INTOXICATION.

Drunkenness. Persons completely drunk, being incapable of legal consent (see CONSENT and CONTRACT), cannot enter into a contract or obligation; but a minor degree of intoxication may be insufficient to reduce a contract, unless fraud is proved against the other party to it. D. does not excuse crime, though in minor cases it may be held to palliate it. To be drunk privately is not an offence against law; but to be drunk in a public place or licensed house is punishable by fine, to be drunk and disorderly by fine or imprisonment, and to be drunk and to refuse to quit licensed premises by fine or imprisonment (with hard labour). Under the Habitual Drunkards Act of 1879 and the Inebriates Act of 1888 any person who voluntarily (at first) submits to confinement with a view of breaking himself or herself of the habit of getting drunk, and with a view of recovering health and moral tone and strength, may be kept in confinement for any term (stated at time of application) not exceeding twelve months, and may be arrested and sent back by order of a justice of the peace to the asylum or retreat whence he or she escaped. Few persons have up to now made application under these Acts.

From the 15th report of the Inspector of Retreats under the above Acts, which has been issued in September, 1895, it would appear that so far the working of these preventive measures has proved fairly satisfactory; but, in the opinion of the inspector, no appreciable progress can be made towards repressing the habit of D. until retirement to the Retreats is rendered compulsory.

Drurajapatam', or **Durgarayapatnam** (Telugu, 'city of the minister'), a seaport of British India, district of Nellore, province of Madras, 64 miles S. of Nellore, and 60 N. of Madras. It lies on an inlet of Blackwood Harbour, the safest harbour on the Coromandel coast, and near the entrance to Pulicat Lake, which has been artificially extended to Madras city. Salt is the chief manufacture. Pop. 2008.

Dru'ry Dru, a naturalist, born in London, 4th February, 1725, was a goldsmith in the Strand for several years, but eventually abandoned himself to the study of natural history. His chief work was his *Illustrations of Exotic Entomology* (Lond. 1773-82), with its excellent drawings. D. died 15th January, 1804.

Dru'ses, a people inhabiting the less fertile parts of the mountains of Lebanon and Anti-Lebanon. They have arisen from a mingling of Kurds, Arabs, and the Mardi, a tribe from the Caspian, and have derived their name from Drusi, probably a tailor—modern *trozee*—who lived in the 11th c., and preached the divinity of Hakim, a Caliph still adored as a god by the D., and expected to come as a 'messiah' through

Central Asia from China. They also worship a golden calf, but the rites of their religion, which seems a mixture of Christian, Sadducee, and Mohammedan doctrines, are concealed. They are understood, however, to be subject to seven moral commandments: profession of unity of Hakim as God, acquiescence with his works, obedience to his orders, exclusion from their community of all infidels and demons, abjuration of all other religions, offensive and defensive alliance against the outside world, and habitual observance of truth to one another, not to members of other religions. They at present number 78,200, and are divided into two classes, the Okals and the Jakals. The Okals, or the learned section, are initiated in the mysteries of the Druse creed, profess rigid morality, and form a senate for administering affairs. The Jakals, or unlearned, can rise to the class of Okals through a long and severe novitiate. Many of the Okals retire to places of worship on lofty summits, called Holowas, several of which are dedicated to Job and other prophets. The D. are famed for their fine breed of horses, and for their skill in the use of the *djereed* or javelin. A curious belief that they are mystically connected with the Scotch, and possess the same faith, has spread among them. The D. attained their greatest prosperity in the first half of the 17th c., under the Emir Fakardin, but since his death in 1631 have been nominally subject to the Turks. With the Maronites (q.v.), or Christian tribes of the Lower Lebanon, they have had long and bitter feuds, and in 1860 horrible massacres were perpetrated by both parties. The D. are a brave and intelligent race, and do not practise polygamy. They cultivate vines and corn on the terraces which they have raised on the sides of the mountains. Their chief manufactures are shawls, mantles, &c., of silk; and for local wants, wine, arrack, yarn, and soap. Their chief town is Dair-el-Kamar (q.v.), about 50 miles S.E. of Beirut.

Druse Man and Woman.

Dru'sus, a distinguished Roman family, of which the following were the most remarkable members:—1. **M. Livius,** who became consul, B.C. 112, and who throughout his official career was the successful representative of the senatorial party, and opponent of C. Gracchus.—2. **M. Livius,** son of the former, was early a strong partisan of the senate, but subsequently displayed great skill in manipulating the mob, whom he bought over by conciliatory laws and lavish gifts. The social irritation thus caused was inflamed by the favour shown to the Latins and other foreigners, and the career of D. closed in an intricate network of conspiracy and intrigue. Arrogant in disposition, he died unregretted by all, B.C. 91. —3. **Nero Claudius,** commonly called D. Senior, stepson of Augustus, brother of Tiberius, and father of Germanicus, was born B.C. 38. He acquired the highest distinction both in administration and in war. He defeated the Rhætians (B.C. 15), subdued tumults among the Gauls (B.C. 12), and in pursuit of their allies advanced to the German Ocean. Thereafter, during a series of brilliant campaigns, he subjugated in succession the leading tribes of the Germans, and, at the expense of fearful bloodshed, established over them the supremacy of Rome. He received after death the agnomen *Germanicus*. He died, B.C. 9.

Dry'ads (from Gr. *drus*, 'an oak'), inferior divinities in the Greek mythology, who came into existence with particular trees and died with them. See NYMPHS.

Dry'den, John, an English poet, was born at Aldwincle, Northamptonshire, 9th August, 1631. He belonged to a good family of staunch Puritan principles, was educated under Busby at Westminster, and took the degree of B.A. at Cambridge in 1653. Having inherited property worth £40 a year on his father's death in 1654, he studied at Cambridge until 1657, when he entered on a literary career in London. In 1658 he produced *Heroic Stanzas on the Death of Oliver Cromwell*, and at the Restoration, changing, as Johnson says, with the nation, offered a tribute to Charles II. in his *Astræa Redux*. In 1663 he married Lady Elizabeth Howard—a union which proved unhappy. The *Wild Gallant*, his first play, and the *Rival Ladies*, a tragi-comedy, were acted in 1663, and his rhymed tragedy, the *Indian Queen*, was very successful in the following year. The Great Plague of 1665 closing the theatres, D. for a while gave up play-writing to celebrate the Dutch war and Great Fire of 1666 in his *Annus Mirabilis*. Between 1668 and 1670 he produced several plays, which won great popularity, and about this time he engaged to write three plays a year for the King's Theatre, in return for an annual share in the profits equal to £300 or £400. In 1668 he advocated rhyming tragedies in his *Essay on Dramatic Poetry*, and was chosen laureate in 1670; but in 1671 the town was set a-laughing by the *Rehearsal*, a farce written by Buckingham and Butler, ridiculing D.'s tragedies, and caricaturing him under the name of Bayes. D. continued to compose plays with less success than formerly up to 1681, when he produced *Absolom and Achitophel*, a satire—the best which had as yet been written in English—denouncing Shaftesbury's and Monmouth's schemes to oust the Duke of York from the succession. He attacked Shaftesbury again in the *Medal;* crushed Shadwell, a Whig poetaster, in *MacFlecknoe;* and defended the Church of England in *Religio Laici* (1683). After the death of Charles II., lamented in D.'s *Threnodia Augustalis*, he abandoned the Anglican for the Romish faith, a change of which the sincerity is denied by Macaulay, but maintained by Bell, one of D.'s editors. He defended his new religion in the *Hind and the Panther* (1687), an elaborate allegory, in which the different Churches appear as beasts. The Revolution removed him from the laureateship, and ended his controversial career. In his old age he had to write for a livelihood. He translated Juvenal, Persius, and Virgil (1696); wrote the *Ode on St. Cecilia's Day*, a masterpiece of changing rhythmical effects; and in 1700 published his *Fables*, adaptations from Boccaccio and Chaucer, the most graceful and fanciful of all his writings. During his closing years he was regarded as a literary dictator, holding his court at Will's Coffee-house, among the young wits and noblemen. He died on the 1st May, 1700, and was buried in Westminster Abbey.

D. does not belong to the highest class of poets, for he is wanting in imagination, passion, and tenderness. His cardinal merits are clearness, keenness, and vigour. As a playwright, seeking to combine the incompatible characteristics of the Elizabethan and the French drama, he produced hybrid tragedies and indecent comedies; strained after sublimity, and floundered into rant; offered obscenity instead of humour, and stilted rhetoric instead of eloquence. As a satirist he is unequalled among Englishmen. No other is so comprehensive, fervid, and penetrative; none unites such majesty of verse with such trenchancy of epithet; none shows such mastery of metrical logic. But he was not a satirist of the noblest type. He did not attack the wickedness of his age.

His translations are somewhat unfaithful; his bluff homeliness occasionally outrages the Virgilian art, and his tales from Boccaccio and Chaucer want the subtle charm of the original. His prose is at once dignified, incisive, and idiomatic. He was a great literary reformer as well as a great satirist; he purged English verse of conceits, and instead of a crabbed and flimsy, left a flexible, natural, and robust poetry. The best editions of D. are Bell's, in three vols., with an admirable biography; and the *Globe*, edited by W. Christie, which has the best text. Critical estimates of D. may be found in Masson's and Lowell's *Essays*, and in Taine's *English Literature*. See also Ward's *History of English Dramatic Literature* (1875).

Dry'ing Machines. A variety of contrivances are in operation, chiefly in bleaching, calico-printing, and dye-works, for effecting the rapid drying of textile substances in the various processes connected with these arts. The apparatus chiefly relied on in bleaching and calico-printing is a series of tinned-iron or copper cylinders, mounted in a frame and heated by steam, around which the material passes, and is carried forward by their revolution. A number of substances, however, such as thread and yarn in the hank, cannot be treated by such an arrangement, and for these a machine, called the hydro-extractor, is employed. It consists essentially of a cylindrical metallic drum, mounted on a pivot, so arranged that it can be turned with great velocity, and the drying is effected by the centrifugal force thus communicated to the material placed within the drum and the particles of water it contains. Drying is also effected in 'stoves' or apartments heated to a high temperature either by steam-pipes or flues.

Drying Oils. See OILS.

Dry'ophis, a genus of *Ophidia*, or Snakes, forming the type of a special family of Colubrine (q.v.) serpents, and represented by such forms as the golden tree-snake of Mexico. In these snakes, which are also represented in the Old World, the body is long and slender, and the head narrow; whilst the upper jaw is longer than the lower jaw, and the snout pointed.

Dry-Plate Processes, photographic processes by which dry sensitive plates are prepared and preserved for subsequent use, thus obviating the inconvenience of a field-operator carrying his various chemicals and a tent or dark room in which to work. In the wet collodion process the plate must be manipulated while the film is moist, because when dry it becomes insensitive and impervious to the developing liquid; but in practising the dry process the sensitive plate may be prepared at home, exposed in the camera some days or weeks afterwards, and developed at home. Dry plates are not quite so sensitive as wet plates, and consequently require longer exposure. Various dry processes are practised, and for practical details of two of the principal—the collodio-albumen process, and the dry collodion process of Dr. H. R. Morris—Hardwick's *Photographic Chemistry* may be consulted. See also Thomson's *History and Handbook of Photography*, translated from the French of G. Tissandier.

Dry-Point, a finely-pointed needle used to cut fine lines in engraving, and so called because in using it the tool alone is employed—no acid being used. The lines so produced are as durable as they are delicate.

Dry-Rot, a disease of wood caused by the attacks of various species of fungi, the root-like mycelium of which spreads through the substance, destroying all before it. The best remedy consists in careful selection of wood, 'perfect ventilation, and patient seasoning, added to the employment of such kinds of wood for particular purposes as may be most suitable to the situation they are intended to occupy.' Saturating the timber with creosote, which coagulates the albumen, and makes it enter into combinations unfit for vegetation, is one of the favourite modern remedies. D.-R. may, however, also be caused by a slow chemical combustion, quite independent of fungi. Well-seasoned timber will last long without being attacked by D.-R. In England there is found wood in many buildings a thousand years old; and wood in a perfect state of preservation was taken from behind the frieze of the Parthenon, where it had been placed 2000 years ago. Charred blocks of wood were found during Layard's excavations in Nineveh. See also KYANISING.

Dry-Stove, in gardening, is a house in which a high temperature, combined with dry air, is maintained, for the purpose of growing cacti and other fleshy plants which belong to hot, arid climates.

Du'al. The term applied in grammar to a form which exists in some languages in nouns, pronouns, and verbs, when only two persons or things are spoken of. For example, in Greek, *anthrōpos* is 'a man,' *anthrōpō*, 'two men,' *anthrōpoi*, 'men.' Sanskrit, Arabic, Ancient Greek, and Hebrew all have a D. number, the latter in nouns only. Gothic and Old English also have it to some extent, the former in verbs, the latter in the pronouns of the 1st and 2nd persons—*wit*, 'we two,' *git*, 'ye two.' The words *duo* and *ambo* scarcely warrant us in assuming that such a form ever existed in Latin. The fact that it is only in ancient languages that we find a D. form goes to prove that it is not a refinement of speech—not *an abridged form of the plural which usage afterwards limited to the number two*, as Buttmann and others have held, but that it is one of the earliest births of language; that it indicates a lack of the power of abstraction, and that it gradually disappears on the development of that power.

Du'alism, in religion, is the deification of two principles, absolute good and the greatest evil. As an absolute good and an absolute evil cannot coexist, it has often been supposed that the evil principle was originally good, but lost his first estate. But as mutation would imply inferiority and dependence, it has again been supposed that good and evil are only manifestations of one absolute being, and that evil, being only negative, will ultimately disappear. D. was a religious faith in Persia long before Zoroaster. Plutarch and Marcion were both Dualists. The Manichæism that disturbed early Christianity was a form of D. In philosophy, the term is applied to the view that there are in the known universe at least two orders of phenomena mutually independent, the laws of the one not admitting of explanation by those of the other. In metaphysics D. means the coexistence of substances of which the essences exclude each other. The metaphysical alternative is the existence of a solitary substance, of which everything else is a mode, or modification of an attribute; the scientific alternative is one aggregate of phenomena with a twofold aspect.

Dubarr'y. See BARRY, COMTESSE DE.

Dubit'za or **Dubicza** (Slav. 'the place of oak-trees'), a frontier fortress of Bosnia, on the right bank of the Unna, 6 miles above its confluence with the Save. It was frequently besieged by the Austrians, was stormed by them in 1685 and 1687, and again, after a heroic defence by the Turks, in 1788. Pop. 4080. On the opposite side of the Unna is the strong fortress of Austrian D.

Dub'lin (Irish Gael. *Dubh-linn*, 'black pool,' of which the *Eblana* of Ptolemy is probably a corruption), capital of Ireland, and one of the finest cities in the empire, is situated on the mouth of the Liffey, at the head of Dublin Bay. It is divided into two nearly equal parts by the Liffey, which runs from W. to E., and affords, with the great thoroughfare running from N. to S., from Rutland Square by Sackville Street, Carlisle Bridge, Westmoreland Street, and Grafton Street to St. Stephen's Green, a key to the topography of the city. The S. and S.E. are the most aristocratic quarter, while the business portions are the centre, N.W. and S.W. D. is surrounded by the Circular Road, nearly 9 miles long, forming a favourite drive and promenade. Offshoots of the Wicklow Mountains occur to the southward of D., and the fine mountain scenery constitutes a picturesque background to many of the street views on the S. side. The river is spanned by several bridges (including the Loop Line Railway bridge). Carlisle Bridge (re-named O'Connell Bridge by the Corporation) connects the two great thoroughfares Sackville and Westmoreland Streets, and is the point from which the finest views of the river and the public buildings are obtained. Of these latter, the chief are (on the S. side of the river) the

Bank of Ireland, formerly the Irish Parliament House, of which the old House of Lords remains substantially unaltered, while the House of Commons has been converted into the Bank of Ireland; it is a large classical edifice, with porticoes and colonnades, standing on the N. side of College Green; Trinity College (see DUBLIN UNIVERSITY), on the E. side of College Green, consisting of several quadrangles occupying an area of about 40 acres; the chief façade is a handsome elevation in Portland stone, in the Corinthian style of architecture; the College Library and Museum (in which are the Book of Kells and King Brian Boromtis' harp); the Museum of Science and Art; the Castle stands on high ground at the W. end of Dame Street, but is neither remarkable for its architectural merits nor imposing in its proportions; the cathedral of St. Patrick, with the memorial stones of Swift (once Dean here) and of 'Stella'; the General Post Office; Customhouse; the Exchange; the four courts on the N. side of the river, an imposing classical building, consisting of a centre, flanked by a square on each side, and occupied by the Superior Courts; the Roman Catholic University; Nelson's Monument (134 feet), from which a fine view of the city and environs is obtained; the Royal Irish Academy, containing a valuable collection of national antiquities; the National Gallery of Ireland, with collections of works in sculpture and painting; the Cathedral of Christ Church, to the W. of the Castle, opened after a very fine 'restoration,' in May, 1878; the Leinster Hall, on the site of the old Theatre Royal, in which concerts, public meetings, &c., are held; the O'Connell Monument, Sackville Street, &c. The societies, hospitals, institutions, and theatres are numerous. Of the parks and squares, the chief are the Phœnix, in the extreme W. of the city, and on the N. side of the river, a magnificent enclosure of 1752 acres, in which military displays frequently take place, and containing the Wellington testimonial, an obelisk 205 feet, and erected in memory of the great Duke's achievements, at the cost of £20,000; St. Stephen's Green (20 acres); Merrion Square (13 acres); College Park and Squares; Rutland Square, &c. The Rotunda, between Sackville Street and Rutland Square, is a noble suite of public rooms for concerts and festive and other meetings. D. is the seat of Anglican and Roman Catholic archbishops. The S.W. district of the town, named the *Liberties*, was once occupied by an industrious and prosperous community of silk-weavers, the descendants of a Huguenot colony that settled here in the reign of William III. The silk industry almost dying out in the locality, the Liberties became the most squalid, unattractive, and turbulent quarter of the city, but has latterly much improved. No national manufacture except that of Irish poplin centres in D., and the industrial establishments, cotton, woollen, and linen fabrics, breweries, distilleries, &c., are engaged largely in the supply of local wants; but the export of porter, whisky, cattle, and butter has much increased during recent years. Water communication with the W. and S. of Ireland is maintained by the Royal and Grand Canals; from five railway stations lines of railway radiate to different parts of the country, but the most valuable means of access is the port of D., from which large steamers ply regularly to Holyhead, Liverpool, Glasgow, &c. The harbour, which freely admits vessels of considerable draught, has been greatly improved by the construction of two breakwaters. The city returns four and the University two members to Parliament. The parl. divs. of the city are: College Green, 67,923; D. Harbour, 71,530; St. Patrick's, 64,611; and St. Stephen's Green, 65,652. D. is first mentioned by Ptolemy. It originally occupied the ridge that now forms its centre, and was occasionally called in Irish Gaelic *Drum-Col-Coille*, 'hill of hazelwood.' Its early history is veiled in obscurity. The Danes held it from 836 till the end of the 10th c. It capitulated to the English in 1169, and was subsequently visited by Henry II., who granted its first charter. The English strengthened the fortifications, and erected a castle (1220). Various charters and privileges were received from Henry III., Edward I., and Henry IV. The city, which has been in great part destroyed by fire, was rebuilt and extended from 1316. Many great improvements have been made since the 18th c. The abortive attempt at insurrection planned by Robert Emmet took place in D. in 1803. Pop. parl. bor. 269,716; and civ. city, 245,001; of whom 201,418 are Roman Catholics; 35,125 are Protestant Episcopalians; and 3492 are Presbyterians. There are in Dublin, besides the Dublin University, the R. C. University of Ireland (1854) and the Royal University of Ireland (1880).

Dublin, a maritime county of Leinster, Ireland, having the Irish Sea on the E., and inland the counties of Meath, Kildare and Wicklow. Length, N. and S. 32 miles; breadth, E. and W. 18 miles. The coast is 50 miles in length; its chief features are Dublin Bay (6 miles wide and 7 deep) and the Hill and Head (500 feet high) of Howth. Off the shore are the Skerries, Ireland's Eye and Dalkey Island. The surface is flat, with the Wicklow Hills occupying the S. border. The climate is temperate; the prevailing winds are from the W.; and the soil, for the most part shallow and gravelly, is productive in the districts around the capital and lying along the borders of Meath. The area of D. is 226,821 acres, of which 17,866 are under corn, bean, and pease crops (oats 12,922); 13,429 under green crops (potatoes 7346); 10,570 (for hay) under clover, sainfoin, and grasses in rotation; and 34,799 (for hay) under permanent pasture or grass not broken up. No flax is grown. Fallow and uncropped arable land account for 477 acres, while woods and plantations cover 3706. Marsh and barren mountain occupy 14,983 acres, and 33 acres are turf bog. (For live stock see articles CATTLE, HORSE, PIG, and SHEEP.) The principal river is the Liffey. D., the capital, and Kingstown are the chief towns, and all the manufactures of the county (sewed muslins, cottons, &c.) are carried on in and around the former. Pop. 419,216, of whom 322,822 are Roman Catholics; 77,896 are Protestant Episcopalians; and 7724 are Presbyterians. The county contains two parl. divs., each of which returns one member: North D. 75,009; South D. 74,491.

Dublin University, or **Trinity College, Dublin**, founded by Queen Elizabeth, was incorporated by charter or letters patent on the 3rd March, 1591, under the title of 'The College of the Holy and Undivided Trinity near Dublin.'

History.—In 1591 the city of Dublin presented to it, by free grant, the 'site, ambite, and precincts of the former monastery of All Saints or All Hallowes.' The building was begun on the 13th March, 1591, and was open to receive students on the 9th January, 1593. In 1595 the Queen granted to the College lands to the value of £100 per annum, and in 1610 James also granted to it lands in Armagh, Fermanagh, and Donegal. Since the foundation of the College, charters and Acts of Parliament have been passed, extending the privileges of the University, and making such alterations as were from time to time deemed necessary. In 1613 James I. granted to its Provost, Fellows, and Scholars the right of electing two burgesses to represent the University in Parliament. By the Act of Union (1800) the number of representatives was reduced to one, but the right to elect two members was restored to D. U. in terms of the Irish Reform Bill (2 and 3 Will. IV. c. 88). In 1637, by charter of Charles I., fellowships were made tenable for life; the power of making statutes was taken from the Provost and Fellows, and reserved to the crown, and the crown assumed the privilege of appointing the Provost. The statutes of Charles I. underwent considerable modification between 1637 and the middle of the present century. They were revised in 1855 on the recommendation of a royal commission, but the constitution of D. U. was not thereby materially affected. By enactment the provostship, fellowships, and foundation scholarships could only be held by members of the Church of Ireland, but the Act 36 Vict. c. 21 removed all religious disabilities. An unsuccessful attempt to affiliate D. U. with the Catholic University, Magee College (Belfast), and the Queen's Colleges of Cork and Belfast, led to a defeat of the Gladstone Government, 11th March, 1873. In 1874 it was enacted that a *University Council* should be elected to co-operate in the regulation of the studies, lectures, and examinations, and in the appointments and regulation of the tenure of office and the duties of professors. No new professorship can be created by the Provost and Senior Fellows without the consent of the Council, which consists of the Provost (or, in his absence, the Vice-Provost) and sixteen members of the Senate.

Constitution and Government.—By the charter of foundation Queen Elizabeth appointed one Provost and three Fellows and three Scholars (in name of more) to conduct the business of the corporation, confer degrees, elect officials, &c. The original constitution is still maintained, and the Provost and Senior Fellows form a board of management, whose acts must receive the sanction of the Senate.

Church Patronage.—The right of presentation to a number of livings was vested in the Provost and Senior Fellows in 1610, but all rights of church patronage were swept away by the Irish Church Act, 32 and 33 Vict. c. 42.

The *Senate* consists of the Chancellor and such Doctors or Masters as have their names on the college books.

The *Caput* of the Senate consists of the Chancellor or his official representatives, the Provost or Vice-Provost and the Senior Masters non-regent.

Order of Rank in the College.—The *Provost*, who is appointed by the crown. The *Fellows*, absolved from the obligation to enter into priest's orders by letters patent of 1874, and who become Seniors in the order of seniority, are chosen by examination. They, with the professors, form the examining staff. The Junior Fellows, with the professors, form the lecturing staff. The teaching in the obligatory courses in Arts is chiefly performed by the Junior Fellows, most of whom are tutors. *Noblemen, sons of noblemen*, and *Baronets*, who enjoy special privileges, *Doctors* in the three Faculties, *Bachelors in Divinity*, and *Masters of Arts, Surgery, and Engineering*, and Fellows and Scholars (not purely honorary), are entitled to vote at the election of parliamentary representatives, so long as their names are on the college books. There are now 4506 electors. *Fellow Commoners* have the privilege of dining at the Fellows' table. *Scholars* on the foundation, who number seventy, have free commons, pay only half the usual fees for rooms and tuition, are exempt from college charges or *decrements*, and receive from the college an annual salary (£20 Irish). *Pensioners* form the great majority of the students. *Sizars*, or poor students, have free commons, and are exempted from fees, are admitted by annual examination, and hold their sizarships for four years. The number of Sizars is restricted to thirty.

Entrance is by examination in classics, composition, &c. Each student on entrance places himself under the tuition and guardianship of a Tutor-Fellow. There are seven entrance examinations during the year, and of these the Midsummer and Michaelmas are called *principal*, and at these the candidates are examined in either French or German, in addition to the ordinary subjects and the classical course is reduced.

Terms, Course, &c.—There were formerly four terms; there are now (since 1833) only three—viz., *Michaelmas*, or October Term, beginning 10th October, ending 20th December; *Hilary*, or January Term, beginning 10th January, ending on 25th March; and *Trinity*, or Midsummer Term, beginning 15th April, ending 30th June. Students in the first and second years of their undergraduate course are named Junior and Senior Freshmen; in the third and fourth years, Junior and Senior Sophisters; in the fifth year, Candidate Bachelors; and after graduating B.A., Junior, Middle, and Senior Bachelors. Terms are kept either by residence and attendance on lectures, or by passing the term examinations.

Professors.—There are forty-five professors in Divinity, Law, Arts, and Science, and also assistant professors and lecturers. Of the professorships founded within recent years, the more important are the Professorship of Irish (founded 1840), of Ecclesiastical History (1850), Regius Professorship of Surgery (1852), Civil Engineering (1852), Arabic, Hindustani, and Persian (1856), Latin (1870), and Comparative Anatomy (1872).

Degrees are publicly conferred by the Chancellor or Vice-Chancellor in the senate or congregation of the University. No oath or declaration need be made by any candidate to obtain a degree. To take the degree of B.A. the student must keep the terms, and pass an examination at the end of his second year, and another at the close of his curriculum. A *Master of Arts* must be B.A. of three years' standing; a *Bachelor in Divinity* must be M.A. of seven years' standing; a *Doctor in Divinity* must be B.D. of five years' standing, and in priest's orders. For the degrees of Bachelor in Laws, Medicine, Surgery, and Civil Engineering, candidates must first have graduated B.A.

Studentships.—By letters patent of 1858, fourteen studentships were founded, at a salary not exceeding £100 per annum for each, tenable for seven years, and open to all religious denominations. By the Royal Letters Patent of 20th May, 1889, the studentships were made tenable for a reduced period of not exceeding five years while their number was lowered to ten. Studentships may not be held by Fellows, nor Fellowships by Students. The Senate now consists of 509 members, and there are 70 Scholars of the House, 5 Fellow Commoners, 1012 Pensioners, and 37 Sizars and Ex-sizars.

Dubnit'za, a small town in the S.W. of Bulgaria, about 25 miles E. of Kostendil. The inhabitants are employed in the ironworks and vineyards of the vicinity.

Dub'no (Slav. 'the oak-wood'), a town of European Russia, government of Volhynia, 70 miles N.E. of Lemberg in Austrian Galicia. Here from 1774 till the annexation of Western Poland by Russia the Polish nobility held their annual session. The great fairs formerly held here are now held in Kiev. Pop. 4090.

Du'bois, Guillaume, Cardinal, one of the most successful but least respectable statesmen France has produced, was the son of an Auvergnese apothecary, and was born at Brives-la-Gaillarde, 6th September, 1656. He became tutor to the Duc de Chartres, and maintained his influence by encouraging the vices of his patron. When the latter, as the Duc d'Orleans, became Regent in 1715, D. rose to the first position in France. In 1717 he contributed largely to the negotiation of what is known as the 'triple alliance' between Britain, Holland, and France, which changed, for the time, the traditional policy of his country. In 1720 he became Archbishop of Cambrai; in 1721 a cardinal. D. died at Versailles, 10th August, 1723, a victim to his intemperate mode of living. He was, however, an able statesman, and in a less vicious and sensual age might have proved a blessing to France. The *Mémoires* which appeared under his name (Par. 1829) are not authentic.

Dubov'ka, a market-town and river-port of European Russia, in the extreme S. of the government of Saratov, on the right bank of the Volga. An active trade in corn, fish, and cattle was formerly carried on between D. and Katchalinsk on the Don, but is now somewhat decayed. Pop. 16,860.

Dubuque', a flourishing city of Iowa, on the right bank of the Mississippi, 199 miles W. of Chicago. The principal buildings are the market-house, city-hall, and custom-house. It is a great depot for the Iowa lead-mining, about half a million dollars being exported annually. D. has a trade in flour, timber, shot, &c. It is connected both E. and W. with important railroads, and has a large river traffic by the Mississippi. There is a German Presbyterian Theological School here. Over seven millions of dollars are invested in the manufactories of the town, and the value of the chief annual products are as follows:—Lumber and other mill products from logs or bolts $1\frac{1}{3}$ millions of dollars; slaughtering and meat packing $1\frac{3}{4}$ millions; and carriages and waggons $\frac{2}{3}$ of a million. The town derives its name from a Frenchman who attempted a settlement in 1788, but the first permanent settlement began in 1830. Pop. 30,311.

Ducange'. See DUFRESNE.

Du'cas, Michael, a Byzantine historian, who flourished towards the middle of the 15th c. After the capture of Constantinople in 1453 by the Turks, D. sought a retreat in Lesbos, and was employed by the tributary prince of that island in various diplomatic missions to the Turkish sultans. On the annexation of Lesbos to the Ottoman Empire in 1462, he retired to Italy, and there composed his *Historia Byzantina*, commencing with the creation of the world, and ending with the taking of Lesbos. D.'s history is a valuable authority for the reigns of Joannes Paleologus and his successors Manuel, Joannes, and Constantine. It also contains a reliable account of the siege and sack of Constantinople, and has been largely used by Gibbon, who remarks that D. 'writes with truth and freedom; but the style is a barbarous obscure jargon, full of Turkish words and strange constructions.' A folio edition of the *History* was published in Greek and Latin at Paris (1649). It was also edited by Bekker (1834) for the Bonn series of Byzantine historians, along with an early Italian translation found at Venice by Ranke. It has been translated into French by Cousin.

Duc'at (Ital. *ducato*, from Lat. *dux*, 'a leader' or 'duke'), a coin, generally of gold, but sometimes of silver, first coined in Sicily in the 12th c. The D. was a favourite coin, and was issued from all the German mints, and from most of those in N. Europe. The value of a D. in Austria, Russia, and Hamburg is about 9s. 4d.; the silver D. of Sicily was valued at 3s. 4d.; and the Spanish plate D., now known as hard dollar, is worth 4s. 2d.

Duca'to, Cape (anc. *Leucatas*), the S. extremity of Santa Maura, one of the Ionian Islands (the ancient *Leucas* or *Leucadia*). It still retains the evil reputation it had of old as a promontory dangerous to the mariner. On its W. side is the famous 'Lover's Leap' of Sappho, a rugged white cliff rising 2000 feet perpendicularly from the sea.

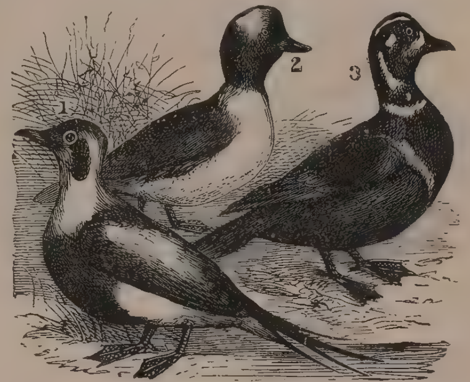
Du'ces Te'cum is the name of a writ in English law commanding a person to appear in court, and to bring with him writings or other proof which may be required in an action. If the document be his title-deed, or one that may criminate himself or his client (where he is a solicitor), he is not forced to produce it, but the excuse of the document belonging to another person, though still in the possession of the person summoned by the writ, will not be accepted by the Court. In Scotch law, a 'diligence against havers' is nearly equivalent to the English writ of D. T. See DILIGENCE, HAVERS.

Duchesne', André, an industrious French historian and genealogist, was born at Ile-Bouchard, Touraine, in 1584, became royal geographer and historiographer, and died 30th May, 1640, being crushed under a cart while on his way from Paris to his country-seat. His labours obtained for him the title of *Père de l'Histoire de France*. Among his most valued works are *Historiæ Normannorum Scriptores Antiqui* (1619), *Histoires Généalogiques des Maisons Célèbres* (1621-31), and *Historiæ Francorum Scriptores* (1636-49).—His son, **François D.**, who was born at Paris in 1616 and died in 1693, followed in his father's footsteps, finished some of his works (the elder D. left upwards of 100 volumes in MS.), and also filled the post of historiographer. He wrote chiefly on ecclesiastical history, and among his best works are a *Histoire des Papes* (1653) and a *Histoire des Cardinaux Français* (1660-66).

Duchobort'zi ('spirit-fighters'), a mystic sect in Russia, in some points resembling the Quakers, and distinguished chiefly by their disregard of the sacraments, and by having neither priests nor churches. They received their name from refusing to take the oath of military service. The first D. appeared in Moscow and other cities about the beginning of the 18th c., and during the reigns of Catharine II. and Paul I. were severely persecuted, but complete toleration was granted them by Alexander I. They then settled in the S. of Russia, on the Molochna, living in peace and order till the appearance of an impostor named Kapustin, whose doctrine of transmigration, and profession of being animated by the soul of Christ, led to dissension and bloodshed. In 1841 the sect was removed to the district of Achalkalaki in Trans-Caucasia. There they still occupy a plateau some 6000 feet above the sea, and live chiefly by cattle-rearing. They are about 3000 in number, and are divided into seven villages.

Duck, a stout linen fabric used for labourers' smockfrocks and workmen's aprons, &c.

Duck, the name applied to numerous genera and species of Natatorial or Swimming-birds, belonging to the section *Lamellirostres*, and to the family *Anatidæ* of that order. The true Ducks (sometimes included to form the sub-family *Anatinæ*, as distinguished from such forms as the *Fuligulinæ*, or pochards, mergansers), and allied birds, are distinguished by the hinder toe being small and rudimentary, by its being provided with a narrow membranous lobe, and by its being unconnected with the other toes by the web or membrane. The *laminæ*, or plate-like structures in the upper bill, are large and projecting; and the *tibiæ*, or shins (as in the pochards), are naked at their extremities. The ducks are gregarious in habits, and usually migrate in large flocks. The males are generally larger than the females, and whilst the former are gaily coloured, the latter are usually of darker tints. They frequent fresh waters, and grope for their food, consisting of insects, larvæ, worms, &c., amongst the mud. They usually moult twice a year, in June and November, and at the former period the males exhibit the less gaudy plumage of the females. The nest is rudely constructed on the ground, usually among the reeds fringing lakes and rivers. The eggs may number fourteen, and the young are markedly active from the moment after quitting the egg.



1, Old Wife Duck; 2, Buffel-headed Duck; 3, Harlequin Duck.

Good examples of this extensive sub-family (in which the *trachea* or windpipe is of curiously twisted conformation, and produces the harsh cry of these birds) are the common D. or mallard, the original stock from which our domestic varieties have been derived. (See MALLARD.) These birds in their wild state select each a single mate, the male attending the female during incubation; whilst, curiously, the ordinary domestic drakes, like the cock, usually mate with numerous partners. Included in the sub-family *Anatinæ*, with the true Ducks, are the Teals, Widgeons, Shoveller Ducks, and Pintails, all of which are described in the special articles of these names.

Duck-Bill. See ORNITHORHYNCHUS.

Duck'ing-Stool, a contrivance consisting of a rude chair fixed on the end of a beam, working on a pivot in the centre, and capable of being lowered or raised at pleasure. This beam extended over a dam or river, and its purpose was the punishment of scolding wives. The culprit was placed in the chair and ducked in the water sufficiently often to cool her temper. The use of the D.-S. began in the latter part of the 15th, and was common until the middle of the 18th c. A D.-S. preserved at Leominster was actually in use as late as 1809.

Duck'weed, a genus of minute floating plants, belonging to the natural order *Araceæ*, or, according to most modern authors, to a separate order, *Lemnaceæ* or *Pistiaceæ*. The green covering of stagnant pools is due to one of the species, the smaller D. Four in all are natives of Britain. The root, surrounded by a sheath or *ampulla*, hangs loosely in the water, while the flowers, which are rarely seen, and are without calyx or corolla, spring out from immediately beneath the little roundish green frond. They increase rapidly, and bud from the margin of the fronds.

Duclos, Charles Pineau, a witty French writer of memoirs, romances, essays, &c., was born at Dinan, 12th February, 1704. In 1746 he was made a member, and afterwards perpetual secretary, of the Academy. He died at Paris, 26th March, 1772. His chief works are his *Considérations sur les Mœurs de ce Siècle* (1750), *Mémoires pour servir à l'Histoire du Dix-huitième Siècle* and *Mémoires Secrets sur le Règne de Louis XIV., la Régence et le Règne de Louis XV.* (1791). See his *Œuvres Complètes* (Par. 1806).

Ducrot, Auguste Alexandre, a French general, was born at Nevers in 1817, served in Algeria, and in the Italian campaign of 1859, and was made general of division in 1865. On the outbreak of the German war he was placed at the head of the first division of the first army corps, under Marshal Macmahon. He fought well at Sedan, and refused to sign the capitulation treaty. Escaping from prison at Pont-à-Mousson, he took an active part in the defence of Paris, and subsequently became a member of the National Assembly (1871), and was appointed commander-in-chief of the eighth corps in 1872. He is author of *La Journée de Sedan* (1871), *De l'État-major et des Différentes Armes* (1871), and *La Vérité sur l'Algérie* (1871), &c.

Duct, an anatomical term signifying the tube which conveys the secretion away from a gland. Thus we have the D. of the liver, the D. of the parotid gland, &c.

Ductil'ity, the property possessed by various solids of being drawn out to a great length without fracture. This property is most marked in metals—gold, silver, and platinum being the most ductile. A grain of gold can be spread over an area of 225 sq. feet, and a platinum wire has been obtained $\frac{1}{30000}$th of an inch in diameter, by drawing it out in the interior of a silver wire, which was then dissolved away by nitric acid. At high temperature glass threads may be drawn of extreme thinness and flexibility. As D. is obviously a property depending upon molecular forces, it must be affected considerably by variation of temperature.

Du Deff'and, Marie de Vichy Chamrond, Marquise, born in 1697, was educated at a convent in Paris, and in 1718 married J. du D., Marquis de la Lande, a union which was shortly dissolved. She then mingled with the gayest and most polished Parisian society, and became the centre of a brilliant literary coterie. Voltaire admired her wit, and corresponded with her in prose and verse. About 1753 she nominally retired to a convent in the Rue St. Dominique, but by means of a secret stair continued to receive the most distinguished literati of the day, and among others Boufflers, Montesquieu, Hume, Walpole, Voltaire, and D'Alembert. She died at Paris, 24th September, 1780. Madame D. was an icy-hearted, dazzling woman, of a type almost peculiar to the 18th c. She left no work except her letters, which D'Alembert pronounced to be models of epistolary style.

Du'devant, Madame. See SAND, GEORGE.

Dud'ley, a town in an isolated part of Worcestershire, surrounded by Staffordshire, 8½ miles W.N.W. of Birmingham, is largely engaged in the iron and glass trades. Overlooking the town is a ruined castle. In 1876 a new church of St. Luke was opened. Pop. parl. bor. 90,252; county bor. and reg. sub-dist. (each) 45,740; and civ. par. 45,724. The parl. bor. of D. returns one member, and comprises the old parl. bor., co-extensive with the par. (in the county of Worcester), the par. of Castle Hill, the chapelries of Pensnett, Brockmoor, Quarry Bank, Brierly Hill, Reddall Hill, and Old Hill, in the parishes of Kingswinford and Rowley Regis, in the county of Stafford.

Dudley Limestone, a limestone of Silurian age, included in the subdivision of that period known as the Wenlock Series, and so named from its rich development near Dudley (q.v.), as at Wren's Nest and Castle Hill. Its chief fossils consist of Crustacea or Trilobites—among which is the famous 'Dudley locust'—corals, polyzoa, mollusca, and echinodermata.

Du'el (Ital. *duello;* Lat. *duellum,* the original form of *bellum,* 'a war between *two* parties'). Duelling, as a judicial trial, had its origin in that primitive state of society in which might is held, not only as the origin of right, but as the principle by which right is transmitted. No doubt a superstitious belief that God would directly interfere in the combat, and guilt be so ascertained, was also at the root of the practice during the Middle Ages. Trial by battle was then a congenial institution, fighting, plundering, and revenge being almost the only serious business of the feudal barons. Ludwig the Pious was the first Frankish king who allowed litigants to decide their disputes by arms. To some extent the practice was introduced into England by William the Conqueror. Females were not called on to submit to the trial, but all males were, between fifteen and sixty years old; ecclesiastics being allowed to fight by proxy. The D. has especially thriven in France. During the first eighteen years of the reign of Henri IV. 4000 gentlemen are said to have been killed in personal combat. It is to the credit of that monarch that he opposed the practice. In 1602 he alluded to it with disapprobation in an edict dated from Blois; and in 1609 he added to penalties already imposed confiscation of goods, imprisonment, and degradation of all concerned in the combat. These measures were probably, however, rather due to the influence of the Duc de Sully than to the feelings of Henri himself; nevertheless the Comte de Boutteville and the Marquis de Beuron were beheaded for fighting in opposition to the royal edict. During the minority of Louis XIV. a series of bloody combats between noblemen took place in France. On one occasion the principals, the Duc de Beaufort and De Nemours, fought with four friends on each side. Nemours and two others were killed. Such events determined the King to do all in his power to stop the practice. In 1679 he issued an edict against it, and the terms of this edict he resolutely enforced, refusing pardon to all offenders. In England the D. was never so much in fashion as in France; eventually the trial by battle was allowed so late as the reign of Elizabeth. It was allowed, indeed, though not resorted to, in the present century. (See BATTEL, TRIAL BY.) In consequence of a D. between the Duke of Hamilton and Lord Mohun in 1712, in which the former was killed by the latter, with circumstances presumptive of murder, a bill was brought into Parliament to restrain the practice, but was rejected. In 1765 a famous D. was fought between Lord Byron and Mr. Chaworth, the subject of quarrel being the quantity of game on their respective manors. Mr. Chaworth was killed. In the D. between Major Campbell and Captain Boyd in 1808, the latter was killed, and the former hanged for murder, on the dying declaration of Boyd that he had been bullied into fighting privately and without seconds. The last fatal D. in England was, we believe, between Colonel Munro and Captain Fawcett, in 1844. The former killed the latter, and fled from the country. He returned a few years afterwards, was tried and found guilty of homicide, and punished by imprisonment.

Duelling, Law Regarding.—To kill any human being with deliberate intention of doing so is, in law, murder; and the act is not palliated by the preface of a challenge, nor by the doer hazarding his own life by the deed. Nor will any provocation lessen the degree of crime. To kill a man in a *deliberate* duel under provocation of calumny, however great, constitutes *murder* against principal and second, and against the second of the deceased. Such is the doctrine of the law, but it is never strictly enforced unless the conduct of the accused has been considered dishonourable. It has been enforced where it was held proved that the man killed was coerced by his opponent into fighting privately and without seconds. To challenge any person to fight, or to cause another person to challenge a third party, or provoke him to send a challenge, is held to be a misdemeanour.

In 1844, in accordance with the spirit of the age, three new articles of war were issued, with the view of abating duelling in the army. Officers in any way concerned in a D., even negatively, by not endeavouring to prevent an intention to fight of which they are aware, are liable to be cashiered or to minor punishment. Approbation is to be given to those who, having given offence, endeavour by explanation or apology to obviate it, and to those who readily accept apology or explanation. Where adjustment is by these means found to be impossible, it is recommended to submit the matter to the arbitration of the commanding officer.

Du'et, or **Duet'to,** a piece of music for two performers. The form *duo* is also sometimes employed.

Duff, Rev. Alexander, D.D., LL.D., a distinguished missionary, was born 25th April, 1806, in the parish of Moulin, Perthshire, educated at the University of St. Andrews, and in 1829 was sent out by the Church of Scotland as its first missionary to India. At Calcutta he threw himself into the work of educating and Christianising the natives of India with great energy; and the institution which he founded in Calcutta for aiding both works became the largest of the kind in India. In 1836 D. visited Scotland, and endeavoured to diffuse a missionary spirit into its Churches; the following year, in recognition of his services, he received the degree of D.D. In 1843, with all the other Scotch missionaries in India, he joined the Free Church, and in 1851, on a second visit to Scotland, was appointed Moderator of the Free Assembly. In December, 1863, ill-health compelled D. to quit India finally. On his return to Scotland he was appointed Professor of Evangelistic Theology in the New College, Edinburgh. In 1873 he was a second time made Moderator of the Free Assembly. He died at Sidmouth, Devonshire, 12th February, 1878, and received the honour of a public funeral in Edinburgh. D.'s chief works are *New Era for the English Language and Literature in India* (Edinb. 1837); *India and Indian Missions*, *Missions the Chief End of the Christian Church*, and *Qualifications, Duties, and Trials of an Indian Missionary* (all in 1839); *The Jesuits, their Origin, &c.* (1850); and *Letters on the Indian Rebellion* (1858). D. established and for a time edited the *Calcutta Review*, and contributed materials for the celebrated India Education Despatch of 1854.

Dufour', Guillaume Henri, a distinguished Swiss general, was born at Constance, 15th September, 1787, studied at the École Polytechnique, in Paris, and became an officer of engineers under Napoleon I. in 1809. In 1831 he was appointed chief of the Swiss general staff, and directed the trigonometrical and general survey of the country, the result of which appeared in a map of Switzerland, twenty-five sheets, 1842-65. He led the Swiss army in 1847, and brought the Sonderbund War to a rapid close by the victories of Freiburg and Lucerne. For these services he received from the Diet a 'sword of honour' and a gift of 40,000 francs. His conservatism, however, alienated the democrats of Geneva, who contrived to deprive him of his public offices in 1848. Nevertheless he still acted frequently as a secret or official embassy between the Diet and the court of the Tuileries, and was returned to the Council of Geneva in 1856. An international conference as to the treatment of wounded in time of war, held at Geneva, was presided over by D. in 1864, and he also presided at the festival of the reunion of Switzerland and Geneva in 1869. D. died at Geneva, 14th July, 1875. He wrote a *Treatise on the Artillery of Ancient and Mediæval Times* (1840), a *Manual of Military Practice* (1842), and *Permanent Fortification* (1850).

Dufresne', Charles, Seigneur Du Cange, a distinguished historian and philologist, born of an ancient and noble family of Picardy, 18th December, 1610, at Amiens, at the Jesuit College of which he received his early education. He afterwards studied law at Orleans, became parliamentary advocate in Paris in 1631, but retired to Amiens to devote himself exclusively to study. D. died at Paris, 23rd October, 1688. He was familiar with the languages, the laws, the archæology, and palæography of antiquity. For erudition, at once wide and deep, he was the most distinguished man of his century. His two greatest works are the *Glossarium ad Scriptores Mediæ et Infimæ Latinitatis* and the *Glossarium ad Scriptores Mediæ et Infimæ Græcitatis*. The former, published in three vols. at Paris in 1678, was extended by the Benedictines of St. Maur to six vols. in 1733, and to 10 vols. (by the addition of a supplement by Carpentier) in 1766. The firm of Didot produced a new edition, edited by Henschel (Par. 1844), and a second supplement was produced by Diefenbach (Frankf. 1857). Of the latter work, originally published in Paris in 1688, a second edition was published by Didot. Among his historical works, the chief are the *Histoire de l'Empire de Constantinople sous les Empereurs Français* (Par. 1657), and the *Historia Byzantina* (Par. 1680). Very valuable also are the following monographs—*Johannes Einnamus* (Par. 1670), *Johannis Zonaræ Annales* (1687), and the *Chronicon Paschale* (1688). D.'s humour and his gracious and sociable disposition won for him as many friends as his vast learning gained him admirers.

Dug'dale, Sir William, one of the first of British archæologists, was born at Shustoke, Warwickshire, 12th September, 1605. Encouraged by his father in historical and antiquarian studies, he became at a comparatively early age a pursuivant-at-arms, and after the accession of Charles II., whom he had always, as a Royalist, supported, was appointed Norroy King-at-arms, and finally Garter King-at-arms, while about the same time he was knighted. He died 10th February, 1686. He bequeathed twenty-seven folio MS. volumes to the University of Oxford, which are now in the Bodleian Library, Ashmolean Museum, and Heralds' College. Among his works are *Antiquities of Warwickshire* (1656), *The Ancient Use of Bearing Arms* (1682, later ed. 1811), *Historical Memoirs of the English Laws* (1666, 3rd ed. 1680), and above all, *Monasticon Anglicanum* (1655-73), of which D. was rather the editor than the author, and of which an enlarged edition was issued by Bandinel, Caley, & Ellis in 1817-30 (later ed. 1846). The autobiography of D. is to be found in the 2nd ed. of his *History of St. Paul's Cathedral* (1658). It was reprinted by Hamper, with his journal and correspondence, in 1827.

Dugong', a genus of Sirenian (q.v.) mammalia, allied in some respects to the Cetacea or Whales, and found on the eastern coast of Africa, on the shores of the Indian Ocean, on the coasts of Ceylon, and of N. Australia. This genus is distinguished by the crescentic form of the tail-fin. The incisor teeth, which the males alone possess, are of large size, and number two in the upper jaw, none existing in the lower jaw, and the only other teeth being ten molars in each jaw. No dorsal fin is present, and the hind limbs are wholly wanting. No outer ear is developed. There is only one set of teeth, and these possess no enamel or roots. The heart in the D. is deeply cleft externally at its apex, so that the ventricles are separated for about half their extent. These animals may attain a length of 26 feet. They are herbivorous, and frequent the shallow waters of coasts and estuaries of rivers. The mammary glands are situated on the breast.

Dugong.

Duguay'-Trouin, René, a French admiral, was born at St. Malo, 10th June, 1673, and early showed a passion for the sea. As commander of a privateer in the war against England and Holland, he gained the notice of Louis XIV., who presented him with a sword, and in 1697 gave him the command of a frigate. His subsequent career was very brilliant: it was affirmed in the letters of nobility granted him that he had taken twenty ships of war and 300 merchant-ships. His fame reached its climax in 1711, when he captured Rio Janeiro, which had to be ransomed for 610,000 crusados. D.'s last achievement was, in 1731, to chastise the pirates of the Levant, who had been injuring French commerce. He died at Paris, 27th September, 1736. The *Mémoires* of D., published by Beauchamps (Par. 1740), show him to have been in private a good and modest man; his ruling passion was devotion to Louis XIV. See also *Histoire de D.* by M. De la Landelle.

Du Gues'clin. See GUESCLIN, BERTRAND DU.

Dui'da, a mountain of Venezuela, S. America, perpendicular in the S. and W., bare at the summit, and clothed where it is less steep with vast forests. It is 8500 feet high, and for hundreds of miles is a landmark to voyagers on the Orinoco.

Du'isburg, a town of Rheinland, Prussia, 15 miles N. of Düsseldorf, and connected by a canal both with the Ruhr and the Rhine. It has important woollen, cotton, hosiery, leather, soap, and glue manufactures, some sugar-refining, and a growing trade in wine and colonial produce. Coal is worked in the neighbourhood. D. is very old, being mentioned in the time of the Frankish kings. It was a member of the Hanseatic League, and came into the possession of Prussia in 1815. Pop. 59,285.

Duke (Lat. *dux*, Fr. *duc*, Span. *duque*) was originally a military title in use in the Roman Empire. It appears to have come into use along with the title of Count (q.v.), on the separation of the military from the civil command, in the reign of Constantine. All provincial generals then became dukes; 'but,' according to Gibbon, 'no more than ten among them were dignified with the rank of counts or companions, a title of honour, or rather of favour, which had been recently invented in the court of Constantine. A gold belt was the ensign which distinguished the office of the counts and dukes, and besides their pay they received a liberal allowance, sufficient to maintain 190 servants and 158 horses. They were strictly prohibited from interfering in any matter which related to the administration of justice or the revenue, and the command which they exercised over the troops of the department was independent of the authority of the magistrate.' On the decay of the Roman Empire, the more purely military rank of D. began to take precedence of that of count. In France, provinces were acquired by the various dukes, who so increased in number and in power as almost totally to eclipse the authority of the crown, the right to dispose of which they arrogated. They assumed the state of princes, coining their own money, and making war in their own name. Towards the close of the 15th c., Charles, surnamed the Bold, D. of Burgundy, was perhaps the richest and most powerful prince of his time. When Count of Charolais, in alliance with the D. of Bretagne, he made war against Louis XI., King of France. They defeated the king at Montlhéry, and threatened to take Paris. The result was a treaty by which the counties of Boulogne, Guines, and Ponthieu, with several towns on the Somme, were ceded to Charolais. With his ultimate defeat, when D. of Burgundy, on 5th January, 1477, may be said to have ended the power of the French dukes as opposed to that of the crown. The Archduke Maximilian marrying the heiress of Charles the Bold, their daughter was by treaty, in 1482, betrothed to the eldest son of Louis XI., afterwards Charles VIII., and the counties of Burgundy and Artois were handed over to France. The Duchy of Bretagne fell to François I. of France by marriage in 1532. The duchies subsequently given to members of the royal family of France, and to other distinguished subjects, were entirely subject to the crown. The holders were of the first rank of the nobility of France; but their power and position were totally different from those of the former dukes.

In England the title of D. was from the first merely a title of honour. The first English D. was the Black Prince, created D. of Cornwall by his father, Edward III., in 1335. In 1350 the same king created his cousin Henry D. of Lancaster, on whose death the king conferred the duchy on John of Gaunt and his heirs for ever, apart from the crown. The oldest extant dukedom in England is that of Norfolk. Sir William Howard was a Chief Justice of the Common Pleas in the reigns of Edward I. and Edward II. Sir John Howard, a grandson of the judge, was Sheriff of Norfolk, and held other important posts. His grandson, Sir Robert Howard, married the co-heiress of the noble house of Mowbray, and was created Lord Howard and D. of Norfolk in 1483.

The English D. ranks after the peers of the royal blood and the two Archbishops of Canterbury and York. There are now twenty-one dukes, other than members of the royal family, in England, namely, Norfolk, whose title was created as early as 1483, Somerset (1547), Richmond (Lennox and Gordon) (1675), Grafton (1675), Beaufort (1682), St. Alban's (1684), Leeds (1694), Bedford (1694), Devonshire (1694), Marlborough (1702), Rutland (1703), Brandon and *Hamilton* (1711), Portland (1716), Manchester (1719), Newcastle (1756), Northumberland (1766), Wellington (1814), Sutherland (1833), Westminster (1874), Fife (1889), and Argyll (1892). There are also four Scottish dukes and two Irish dukes, but these only sit in Parliament as marquesses, earls, viscounts, or barons. With regard to the dukedoms of Brandon and Argyll, it should be noted that the Dukes of Brandon were Dukes of Hamilton in the peerage of Scotland from 1643, and the Dukes of Argyll were Dukes of Argyll in the peerage of Scotland from 1701; neither of these is reckoned among the Scotch dukes. The Dukes of Richmond were also Dukes of Lennox in the peerage of Scotland (1675); the present D. was created D. of Gordon (United Kingdom) in 1876. Both the D. of Richmond and the D. of Hamilton are dukes in the peerage of France; and the D. of Wellington is a D. in the peerage of Spain.

In Scotland, the title of D. of Albany (q.v.)—an ancient name for Gaelic Scotland—was conferred by an Act of the Scotch Council on the brother of King Robert III., then Regent, in June, 1398. The title was forfeited by the son of the first D. Conferred again on Alexander, son of James II. of Scotland, it became extinct in 1536. It was conferred on Lord Darnley, on Charles I., on James II., on Frederick, second son of George III., and on Prince Leopold, fourth son of Queen Victoria, who died at Cannes, in France, on 28th March, 1884. His son, Leopold, born on 19th July, 1884, succeeded at his birth. See ARCHDUKE.

Duke of York's School (properly **The Royal Military Asylum**), an institution for the support and education of the sons of soldiers and non-commissioned officers at Chelsea, was founded by the Duke of York in 1801. It is managed by a board of twenty commissioners, who are appointed by the Queen, and is supported by a parliamentary grant under the Army Estimates. In 1894-95 this amounted to £10,200, or £15 more than in the preceding year. At first both male and female children were on the foundation, but now only males, who must have lost one or both parents, are admitted. Candidates must be 10-12 years of age and *likely to be fit for the army*, although the boys are under no obligation to enter the army after completing the course of education, but nearly all of them do become soldiers, and many of them enter the regimental bands. Those who are not fit for the army on leaving the school are apprenticed to trades. The boys leave the school at 14 years of age, unless they happen to be in the band, when they are allowed to remain one year longer. In 1893 the number of boys in the school was 550, and of these 151 passed out during the year. The Normal School for the training of army schoolmasters forms a branch of this institution.

Du'kinfield, a town in Cheshire, England, 7 miles N.N.E. of Stockport, has extensive collieries, cotton-factories, and fire-clay works. Pop. civ. par. 29,239.

Dulcign'o (Turk. *Olgun*, Slav. *Mkronich*, near the ancient *Olcinium*), a seaport of the principality of Montenegro, not far from the mouth of the Bojana, on the Adriatic, 18 miles S.W. of Scutari. D. was formerly included in the vilayet of Scutari, Turkey; but, together with Antivari, it was handed over to Montenegro by the Turks in 1878-1881. It is the seat of a Catholic bishop, and has a fort, and an active trade in oil and timber. Pop. 4890.

Dul'cimer, an ancient stringed instrument (probably the psaltery of the Old Testament), in which the sounds were produced by striking wires with hammers held in the hands. It was named from the sweetness (Lat. *dulcis*, 'sweet') of its sounds.

Dul'cite, or **Dul'cose,** is a sweet crystalline substance contained in several plants, in *Melanopyrum nemorum*, *Scrophularia nodosa*, *Rhinanthus crista galli*, &c.

D. is isomeric with Mannite (q.v.). They are nearly related to the sugar and starches.

Dulse, or **Dill'isk** (the first name being the form now used in Scotland, the second the pure Gaelic, employed in Ireland), denotes one of the red seaweeds very common on the British coasts and other parts of the northern hemisphere, and in the Grecian Archipelago. It is eaten either raw, roasted between hot tongs, or with vinegar, by the poorer classes. At one time it was regularly sold about the streets, and in Edinburgh, a few years ago, no cry was more familiar than, 'Wha'll buy ma dulse and tang?' Sheep are fond of it, and in Kamtchatka a kind of fermented liquor is made from it. In Iceland, where it forms an important article of food, it is sometimes boiled with milk. The name D. is also given in England to *Iridæa edulis*, while pepper-D. is *Laurentia pinnatifida*. Both are seaweeds, and are edible.

Dul'wich, a picturesque village of Surrey, 4½ miles S.S.E. of St. Paul's, London, now practically within the bounds of the metropolis.

The College of God's Gift, or D. College, founded and endowed by Edward Alleyn in 1619, consisted originally of three sides of a quadrangle, but was considerably enlarged in 1869. Originally it maintained a headmaster, under-masters, chaplain, six poor brethren, six poor sisters, and twelve poor scholars. It is now an important educational institution (700 boys) with upper and lower schools, and maintains 32 almspeople who receive £1 per week and lodging. In the picture gallery is a fine collection of old works. Pop. parl. div. of borough (Camberwell) 83,320; reg. sub-dist. 6809.

Duman'gas, a prosperous town in the island of Panay, Philippines, province of Iloilo, has a pop. of 16,860. It exports exquisite piña fabrics, and has some fisheries of trepang (sea-slug) and tortoises.

Dumas', Alexandre Davy, one of the most popular French novelists, was born at Villers-Cotterets, in Picardy, 24th July, 1803. His father, who bore the same name, was the son of the Marquis Davy de la Pailleterie by a negress, and D.'s negro descent showed itself strongly in his personal appearance, character, and even the style of his fictions. D. seems to have had a poor education, owing to the death of his father while he was a child, and little that is definite is known of him until in 1826 he is found in the household of the Duc d'Orleans. His first work was a volume of *Nouvelles*. The production, three years later, of an historic drama, *Henri III. et sa Cour*, pleasing the Parisian mania for Romanticism, made D.'s reputation. From that date onward he poured forth a prodigious number of dramas and fictions, all of which, though disfigured by a bombastic style and by egotism and licentiousness, were successful; nor was his popularity appreciably diminished when several writers, including Alphonse Karr and Eugène de Mirecourt, proved in 1844 and 1845 that a number of the works that bore his name were written by hacks in his pay. The best known of his countless works are perhaps his *Les Trois Mousquetaires* (1844), and *Le Comte de Monte-Cristo* (1841-45). The latter has gone through innumerable editions, and has probably been read by more people than any other work of the same class. D. lived a brilliant, restless, extravagant life. He began to write his own *Mémoires* in 1852, and died at Puys, near Dieppe, 5th December, 1870. See his Life by Percy Fitzgerald (Lond. 1873).—**Alexandre D.,** popularly known as *D. fils*, son of the preceding, was born at Paris, 28th July, 1824, was educated at the Collége Bourbon, and at the age of seventeen published a volume of poems, *Les Péches de Jeunesse*, which, however, had but a scant success, and D. became, like his father, a writer of dramas and novels, all of them dealing with the worst side of French life. His first essay in this direction, *La Dame aux Camélias* (1848), was interdicted when first produced, but the interdict was withdrawn in 1852. Among D.'s subsequent works are the dramas of *Visite de Noces* and *La Princesse Georges* (1871), and a pamphlet, *L'Homme Femme*, produced in 1872, and dramatised under the title *La Femme de Claude* in 1873, in which he attacks the French marriage system, *L'Etrangère* (1875), and *Entr' Actes* (1878). D. was installed as a member of the French Academy, 11th February, 1875. As a writer of French fiction he has a reputation which appears grotesquely disproportionate to his genius and literary power.

Dumb. See DEAF AND DUMB.

Dumbar'ton (Gael. *Dun-Breatun*, 'the hill-fort of the Britons'), a seaport, and the capital of Dumbartonshire, on the left bank of the Leven, close to its junction with the Clyde. It is 15¾ miles W.N.W. of Glasgow, and 58 miles W. of Edinburgh. D. has extensive shipbuilding yards, marine-engine works, iron-forges, brass-foundries, and roperies. In 1874 a pier on the Clyde was constructed, 768 feet long. D. unites with Kilmarnock, Renfrew, Rutherglen, and Port-Glasgow, in forming the Kilmarnock District, which returns one member to Parliament. At the confluence of the Leven and Clyde stands the famous rock of D., with its castle, one of the four stipulated to be kept in repair by the Articles of Union. The rock, which is of basalt, is 560 feet high, a mile in circuit at the base, and at high water is almost completely insulated. D. is, according to some, the Latin *Theodosia*, and was for a time capital of the British kingdom of Strathclyde. Pop. entire town 17,626, and parl. bor. 16,908.

Dumbartonshire, or the **Lennox,** a county in the W. of Scotland, consisting of two detached portions, the smaller of which is enclosed by Stirling and Lanark, and the larger bounded on the N. by Perth, on the E. by Loch Lomond and Stirling, and the S. by the Clyde, and on the W. by Loch Long and Argyll. Length, 35 miles; average breadth, 7½ miles. The northern part is mountainous, Ben Voirlich being 3092 feet high; the southern part is in general low, and is fertile and well cultivated. D. has nine fresh-water lakes, the largest of which is Ben Lomond. The chief river is the Leven, which falls into the Clyde. The formation consists of mica-slate in the N., with dykes of whinstone and greenstone; Lower Silurian towards the S., and Old Red Sandstone along the Clyde estuary. The principal grain crop is oats, but barley and wheat are grown, and turnips and potatoes yield large crops. The hills and high grounds furnish pasture for black cattle and blackfaced sheep. The total area of D., not including tidal water, is 170,762 acres, and of these 8774 are under corn crops (oats 7602); 3997 under green crops (potatoes 2149); 14,760 under clover, sainfoin, and grasses in rotation; and 23,024 under permanent pasture and grass not broken up—of these two latter numbers of acres 8683 are for hay. Bare fallow and uncropped arable land cover 95 acres, and small fruit is cultivated over 57. Mountain and heath occupy 73,649 acres, and woods and plantations 8553. Nursery grounds cover 21 acres. (For live stock see articles CATTLE, HORSE, PIG, and SHEEP.) The chief industries are shipbuilding and machine-making at Dumbarton, bleaching and calico-printing in the Vale of the Leven; and there are besides iron-foundries, breweries, and tanneries. Coal, freestone, limestone, ironstone, and slates are produced. D. returns one member to Parliament. Pop. civ. county 94,495; and parl. county 77,446.

Dum-Dum (Dam Damá), a town of British India, province of Bengal, in one of the twenty-four Pergannas, 8 miles N.E. of Calcutta. It has large cantonments. D.-D. was the headquarters of the Bengal Artillery from 1783 till 1853, when that branch of the service, with the exception of one brigade, was removed to Meerut. At D.-D. the Sepoys first openly resisted the use of greased cartridges (1857). The Valley of D.-D. leads to the Pir Panjal, one of the passes into Cashmere. Here the church contains monuments erected in memory of the officers and men of the Horse Artillery who were slain in the retreat from Cabul in 1841. Pop. of North D.-D. (with cantonment) 10,396; of South D.-D. (with cantonment) 11,037.

Dumfries' (Gael. *Dun-Phris*, 'the fort of the bush'), the county town of Dumfriesshire, and the chief place in the S. of Scotland, stands on a slight rising on the left bank of the Nith, 33 miles N.W. of Carlisle, and 70 S. of Glasgow by railway. It is a picturesque town, partly encircled by hills, is built mostly of dark freestone, and is clean, well lighted, and paved. Among the principal buildings are the Town Council Chamber, the Trades Hall, the County Courthouse, the County Buildings, the National Bank, and the D. and Maxwelltown Mechanics' Institute. One of the bridges, which span the Nith, was built in the 13th c. The chief manufactures are leather, hosiery, hats, and glue. The trade consists mainly in wool, freestone, wheat, oats, potatoes. By the high tides of the Solway vessels of over sixty tons can reach the quays. There are markets during the week, and four large fairs during the year. Burns was exciseman here. D. probably dates from the 8th c., and its possession was long contested between the Scottish and English kings. In the Minorite Convent at D. Bruce slew the Red Comyn in 1305. The town was plundered and burnt by the Highlanders in the Rebellion of 1745. Here Burns died in 1796. D., along with Annan, Sanquhar, Lochmaben, and Kircudbright, forms the D. district, which sends one member to Parliament. Pop. entire town and parl. bor. (each) 17,821. See Macdowall's *History of Dumfriesshire.*

Dumfries'shire, a county in the S. of Scotland, bounded S. by the Solway Firth and Cumberland, N. by Lanarkshire, Peebleshire, Selkirkshire, and Roxburghshire, E. by Roxburghshire, and W. by Kirkcudbrightshire and Ayrshire. The surface is diversified; there are high ranges on the N., W., and E., the chief peaks being Hartfell (2651), Lowther Hill (2377), and Black Larg (2231). The largest rivers are the Nith, Annan, and Esk, which divide the county into the three districts, Nithsdale, Annandale, and Eskdale. These rivers all rise in the N., and flow S. into the Solway. The geological formation is mainly Lower Silurian, with New Red Sandstone in the S. and carboniferous limestone in the S.E. The soil is fertile in the lowlands, and the high districts afford good pasture. The area of D., not including tidal water, is 688,057 acres, and of these 48,197 are under corn crops (oats 47,553); 25,040 under green crops (potatoes 3723); 83,055 under clover, sainfoin, and grasses in rotation; and 103,271 under permanent pasture and grass not broken up—of these two latter amounts 36,518 acres are for hay. Small fruit is cultivated on 84 acres, and 138 are occupied by bare fallow or uncropped arable land. Mountain and heath account for 368,993 acres and 174 are laid out as nursery grounds. Woods and plantations occupy 31,808 acres. (For live stock see articles CATTLE, HORSE, PIG, and SHEEP.) The principal minerals are coal and lead, and limestone and red sandstone are quarried. Sheep and cattle rearing is largely carried on, but the manufactures are not extensive, the chief being cotton-spinning, hosiery-making, tanning, and brewing. D. is traversed by the Caledonian and Glasgow and South-Western railways. The most important towns are Dumfries with its suburb Maxwelltown, Annan, Lockerbie, and Moffat. D. returns one member to parliament. Pop. civ. county 74,221; and parl. county 55,290.

Dummow', Dumoh, or **Damoh,** a town of British India, and capital of a district of the same name, in the Jabalpur division of the Central Provinces, 130 miles S.W. of Rewah. It is not well supplied with water, in spite of a fine tank, as the soil consists mostly of porous sandstone. D. has an extensive bazaar. The place was at one time rich in Hindu temples, but these the Mohammedans destroyed and made the stones into a fort, which since then has been demolished. Pop. 11,753.—The *district* has an area of 2831 sq. miles, and a pop. of 325,613, of whom 293,818 are Hindus, 10,231 are Mohammedans, 18 are Christians, 7167 are Jains, and 14,375 are Animistic. On the S. rises a range of lofty sandstone hills; on the E. and W. there are also hills. Much of the country consists of fertile plains where the chief crops grown are wheat, rice, and oil-seeds; some cotton is also grown. At first D. was held by the Rajputs, but towards the end of the 16th c. the Mohammedans subjugated the whole country except that portion occupied by the Gonds and other wild tribes who never submitted. In the 18th c. the Mahrattas took it and held it till 1818, when the British acquired it by treaty.

Du'mont, Pierre Étienne Louis, celebrated as the literary assistant of Mirabeau and the elucidator of Bentham, was born at Geneva, 18th July, 1759. He was trained for the ministry of the French Protestant Church, and officiated both in Geneva and in St. Petersburg. The tenor of his life was changed by his coming to England, first as reader to Colonel Barré, and next as librarian and tutor in the house of Lord Shelburne, afterwards Marquess of Lansdowne. This brought him the acquaintance of the leading English Whigs, Fox, Sheridan, and particularly of Sir Samuel Romilly. The outbreak of the French Revolution took D. to Paris, where he became the friend of Mirabeau, whom he aided in the preparation of his political writings and speeches. In 1791, on his return to England, he came in contact with Bentham, and adopted enthusiastically that philosopher's views of legislation. Bentham gave D. his manuscripts, and the latter, by translating his ideas into lucid French, made Bentham known to the civilised world. The chief are *Traités de Législation Civile et Pénale* (Gen. 1802); *Théorie des Peines et des Récompenses* (Gen. 1810); *Tactique des Assemblées Législatives* (Gen. 1815); *Preuves Judiciaires* (Gen. 1823). D. returned to Geneva in 1814, where he became a member of the Representative Council, and tried to reduce Benthamism to practice. He died at Milan, 29th September, 1829. In 1832 J. L. Duval published from D.'s MSS. *Souvenirs sur Mirabeau et sur les deux Premières Assemblées Législatives*, a book of considerable historical value. See Candolle's *Notice sur la Vie et les Écrits de M. D.* (1829).

Dumou'riez, Charles François, a French general, was born at Cambrai, 25th January, 1739, entered the army at an early age, and first saw service in the Seven Years' War. After a few years of restless wandering and varied employment, D. rose into favour at the time of the French Revolution, and attaching himself to the Jacobin Club, became first Minister of Foreign Affairs, and next general of the army against the Allies. His skilful military movements in 1792, when he won the victory of Jemapes, drove the invaders from the soil of France, saved the Republic, and made him the idol of Paris. He next overran and almost conquered the Netherlands, and would have been the first man in France had he not entered into negotiations with the enemy for the re-establishment of constitutional monarchy. The Convention denounced him as a traitor; his army refused to listen to his scheme; and he had to seek shelter in the Austrian lines. After this D.'s life was one of exile and pamphleteering. He died at Turville Park, Henley-upon-Thames, 14th March, 1823. Wellington is said to have utilised some of his hints regarding an invasion of France. The *Mémoires du Général D.*, by himself, appeared at Hamburg in 1796, and *La Vie et les Mémoires du Général D.*, at Paris (1822-24). An admirable portrait of D. is given in Carlyle's *History of the French Revolution.*

Dun, a word found both in the Celtic and Teutonic family of languages, but probably belonging to the former, and signifying in both cases a hill or fort. It is often modified into *dum* and *don*, and appears in Dunedin (Edinburgh), Dunfermline, Dundee, Dunblane, Dumbarton, Dumfries, Dunstable, Dundalk, Donegal; probably also in London, Huntingdon. The same root appears in the Ger. *dünen*, Fr. *dunes*, Eng. *downs.*

Dü'na (Lithuanian, *Dangava ;* Russ. 'W. Dvina'), one of the most important rivers in the W. of Russia, rises in the government of Tver, near the head-waters of the Volga, flows through a thickly-wooded country, first in a S.W. and then in a N.W. direction, and enters the Gulf of Riga, on the Baltic, after a course of some 650 miles. It receives the Lutschössa, Ullar, and Disna, and passes the towns Velij, Vitebsk, Poloczk, Disna, Dünaburg, and Riga, while its right bank is traversed by the Moscow and Riga Railway. The D. is navigable to ocean vessels only as far as Riga, where it is 2400 feet broad, but river craft ascend to Velij, a distance of 400 miles. Much timber is floated down the river. The Ulla is connected with the Dnieper by the Beresina Canal, thus linking together the Baltic and the Black Sea.

Dü'naburg (Russ. *Dvinsk*), a fortified town in the government of Vitebsk, Russia, on the Düna, and 100 miles S.E. of Riga by railway. It has an arsenal, a strong fortress, and a *tête-de-pont*, considered a masterpiece. Its trade is growing. D. was included in Livonia in 1277, and was destroyed by the Czar Ivan IV. in 1576. It finally became Russian in 1656. D. resisted an attack by Oudinot in 1812, but was taken by a combined French and Prussian force, under Macdonald, in the same year. Pop. 72,518.

Dunbar', a seaport in Haddingtonshire, 29 miles E. by N. of Edinburgh, with which it is connected by railway. The old harbour being difficult of access from sunken rocks at its entrance, a new harbour, the Victoria, was constructed in 1844, which is well fitted for fishermen. There are valuable herring-fisheries here. It is an ancient town, and grew up under the shelter of the castle of D., the chief seat of the Earls of D. and March, the ruins of which crown a rock near the harbour. The castle of D. played an important part in the War of Independence. It was taken by Edward I., and sheltered Edward II. after Bannockburn. In 1338 Black Agnes, Countess of D., defended it successfully for nineteen weeks against the Earl of Salisbury, in the absence of her husband. The battle of D., in which Cromwell defeated the Scots under Leslie, was fought 3rd September, 1650. Of this a graphic account is given in Carlyle's *Oliver Cromwell's Letters and Speeches*. Pop. entire town 3645.

Dunbar, William, next to Burns the greatest Scottish poet, was born in Lothian, about 1460. He took the degree of M.A. at St. Andrews University in 1479, and having wandered as a Franciscan friar through England and Picardy, seems, after 1488, to have served as a clerk to foreign embassies, and in 1500 received an annual pension of £10. Henceforth he lived chiefly at court. In 1501 he visited England, and in 1503 celebrated the marriage of James IV. with Margaret Tudor in his poem of *The Thrissill and the Rois*. A royal favourite, he obtained frequent gratuities in addition to his pension—which was raised to £80 a year—but sought a benefice, in numerous metrical petitions, in vain. After Flodden his name vanishes from the royal accounts, and he probably died about 1520. D. is a powerful and versatile writer. His works comprise picturesque elaborate allegories—such as the *Goldyn Targe* and *The Thrissill and the Rois*—and ludicrous and satirical pieces, full of a madcap, riotous humour, and a wealth of language reminding us of Rabelais. His imagination luxuriates in brilliant descriptions, or plays whimsical freaks with the most venerable and terrible themes. He paints with equal felicity the fresh beauties of a May morning and the grotesque horrors of a carnival of fiends. There is grim satiric earnestness in his *Dance of the Sevin Deidly Synnis*, deep pathos in his *Lament for the Makaris*, and an astonishing command of coarse vituperation in his *Flyting* with his friend and brother-poet, Walter Kennedy. He wrote also *The Fenyeit Freir of Tungland*, *The Twa Maryit Wemen and the Wedo*, *The Justis betuix the Tailyeouris and the Sowtaris*, *The Visitation of St. Francis*, *Dunbar's Dream*, &c. See Laing's ed. of D. (Edinb. 1834).

Dunblane', a town, but formerly an episcopal city, in Perthshire, Scotland, on the Allan, 6 miles N.W. of Stirling. Its old cathedral, said to have been founded by David I. in 1141, was rebuilt about 1240, and part of it is now used as the parish church. Leighton, Bishop of D. from 1661 till 1672, bequeathed his library to the clergy of the diocese. The building in which it is deposited bears the inscription 'Bibliotheca Leightoniana.' D. was anciently the seat of a Culdee convent. Pop. civ. town 2186.

Dun'can, Adam, Viscount D. of Camperdown, a famous British admiral, was born in Dundee, 1st July, 1731. He entered the navy as midshipman in 1746, was promoted to a post-captaincy in 1761, distinguished himself greatly under Keppel in his attack upon Havana, and under Rodney off Cape St. Vincent, became Rear-admiral of the Blue in 1789, and Vice-admiral of the Blue in 1793. In 1795 he was appointed to the command of the British fleet in the North Sea, and on 17th October, 1797, won a brilliant victory over the Dutch fleet off Camperdown. D. received a pension of £2000 a year, the thanks of Parliament, and a sword of honour from the City of London, and was created Viscount D. of Camperdown. For a time he served against the Batavian Republic, and in 1799 obtained the rank of Admiral of the White. He died near Edinburgh, 4th August, 1804.

Duncan, Thomas, a Scottish artist, was born at Kinclaven, Perthshire, 24th May, 1807. He was a distinguished pupil of Sir William Allan at the Trustee's Academy, and succeeded him as its head. His industry and ability enabled him at an early age to attain the distinctions of R.S.A. and A.R.A., and the position of Professor of Colouring and Drawing in the Academy of Edinburgh, and he seemed to be entering on an exceptionally brilliant career when he was cut off by sudden illness at Edinburgh, 25th May, 1845. D. had few rivals during his short but active life as a portrait and historical painter and a depicter of Scotch character, more especially its humorous side. Among his larger works may be noticed 'Prince Charles's Entry into Edinburgh after the Battle of Prestonpans,' exhibited in London; 'Mary Queen of Scots Signing her Abdication'; 'Martyrdom of John Brown of Priesthill, 1685'; and 'Wishart Dispensing the Sacrament on the Day of his Martyrdom, 1st March, 1548.'

Dun'cansby Head (anc. *Berubium*), the N.E. headland of Scotland, in Caithness, 1½ mile E. of John o' Groat's House. It is a wild promontory, of Old Red Sandstone, about 100 feet high, worn by the sea into deep gullies (*ghoes*), and standing out into the Pentland Firth in caverned ledges. Duncansby Stacks are two insulated columns, the haunts of myriads of aquatic birds. Near D. H. is a small village, the ferry to the Orkneys.

Dundalk' (Irish Gael. *Dun-Dealgan*, 'the fort of Delga,' a Firbolg chief in the mythic history of Ireland), a seaport of Ireland, capital of the county of Louth, at the head of D. Bay, and at the mouth of the Castleton River, 50 miles N. of Dublin by railway. The port and harbour have been much improved in recent years, and steam-vessels ply regularly to Liverpool, exporting thence cattle, grain, butter, and eggs. It returned one member to Parliament until 1885. D. was the residence of Edward Bruce during his brief tenure of Northern Ireland (1315-18). Pop. of township 12,449.—**D. Bay,** 8 miles broad, extends 7 miles inland, and is from 1 to 6 fathoms deep.

Dundas', a town in Wentworth District, province of Ontario, Dominion of Canada, on Burlington Bay, at the W. end of Lake Ontario, 40 miles S.W. of Toronto. It is situated at the head of the Desjardins Canal, on the Great Western Railway, has extensive mills and factories wrought by water-power, and a trade in agricultural produce. Pop. 3546.—A district of the province of Ontario, on the western side of the island formed by the rivers St. Lawrence and Ottawa, on the canal which connects them. Pop. 20,132. Chief village Morrisburg, pop. 1859.—A British island of the same name lies in the Pacific, off the coast of British Columbia, to the S.E. of Queen Charlotte Island, and has an area of 280 sq. miles.—**D. Strait,** in N. Australia, separates Melville Island and Coburg Peninsula, is the N. inlet of Van Diemen Gulf, and has a breadth of 20 miles.

Dundas of Arniston, the name of a Scotch family celebrated for the number of its members distinguished in the political and legal history of the country. Among the most eminent of the earlier of these are **Sir James D.,** governor of Berwick in the reign of James VI., from whom he received the honour of knighthood; **Sir James D.,** son of the preceding, who became a judge of the Court of Session in 1662, under the title—derived from the family estate—of Lord Arniston, but who lost his office because he refused to abjure the 'Solemn League and Covenant'; and **Robert D.,** grandson of the preceding (and son of Sir Robert D., who, like his father, obtained a seat on the bench), who was born 9th

December, 1685, rose to fill the posts of Solicitor-General and Lord Advocate, was returned for the county of Midlothian in the British Parliament in 1722, and in 1737 was raised to the bench under what may be considered the family title of Lord Arniston. Finally in 1748 he became Lord President. He died in 1753. His son, **Robert D.,** born 18th July, 1713, also attained to the positions of Lord Advocate and Lord President (1760). His death took place at Edinburgh, 13th December, 1787. The most notable member of the family, however, was **Henry D., Viscount Melville and Baron Dunira,** brother of the preceding. He was born in 1741, and educated for the Scotch bar, to which he was called in 1763. D. by his talents and industry won a high position, while, as a member of the General Assembly, he gave indications of that eloquence which subsequently gained him a position in Parliament. In 1774 D. was returned as member for the county of Edinburgh; in 1775 he was made Lord Advocate. His political career was more remarkable for brilliancy than for consistency. He managed to serve under Lord North, Lord Rockingham, and Lord Shelburne, and became finally the right-hand man of the second Pitt, under whom he held various offices, including those of President of the Board of Control, Treasurer of the Navy, and chief Home (or in reality War) Secretary. D. was a clever and industrious politician, if not a great statesman; and he will always be associated with the measures under the Pitt administration for enrolling volunteers to oppose a French descent, and for restoring the estates in Scotland forfeited on account of the rebellion of 1745. Under the Addington administration he was raised (in 1802) to the peerage as Viscount Melville and Baron Dunira. Four years later he was tried for 'malversation,' in his capacity of treasurer of the navy, but was finally acquitted. After this, however, he lived chiefly in retirement in Edinburgh, where he died, 27th May, 1811.

Dundee' (Gael. *Dun-Diadhaidh,* 'sacred dune or hill,' Lat. *Taodunum*), a royal burgh and flourishing seaport in the S. of Forfarshire, situated on the N. side of the Firth of Tay, 50 miles N.N.E. of Edinburgh, and 20 E.N.E. of Perth by railway. It is the third largest town in Scotland, and the chief seat of its linen manufactures, being indeed 'the maker of the sacking, the bagging, and the wrapping of the world.' It lies pleasantly between D. Law (571 feet high) and Balgay Hill, and stretches some three miles along the Tay, which has here a breadth of two miles. Its chief public buildings are the Albert Institute and Free Library, erected at a cost of £30,000; a Town-hall, in Roman Ionic, with a spire 140 feet high; the Royal Exchange, in the Flemish pointed style of the 15th c.; the Kinnaird Hall, a massive Italian edifice, capable of accommodating 2000 persons; the Infirmary, in the Tudor style, forming three sides of a square; the High School, an elegant Grecian building; handsome court buildings; and the Morgan Hospital, for the education and upbringing of 100 boys, erected at a cost of £80,000 (1867-68). To the E. of the town is the Baxter Park, a splendid expanse of 37 acres, gifted to D. by the late Sir David Baxter; to the W. on Balgay Hill there is another public park, some 60 acres in extent, and ornamented with fine woods. In 1876 swimming baths were opened which cost £5500. The prosperity of D. is in great part owing to its magnificent docks, which have been constructed since 1851, at a cost of over £700,000. There are five wet docks, a graving dock, a large tidal harbour, besides extensive sea-walls and quays, a pier, and great shipbuilding yards. The chief industries are the manufacture of flax-yarns and linen fabrics (Osnaburgs, ducks, canvas, sheetings, &c.), silks, cottons, jute, cordage, iron, machinery, kid-gloves, confections (the famous D. marmalade), &c. D. has also establishments for shoemaking by machinery, breweries, and considerable shipbuilding. The linen industry employs over fifty steam spinning-mills, several power-loom factories, besides numerous hand-labour works, and produces goods to the annual value of about £2,000,000. The value of the flax, hemp, and jute manufactures exceeds £5,500,000 yearly. D. imports directly the great bulk of the jute brought from India, and has of late years become the centre of the seal and whale-fishing trade. The success of the latter fluctuates, but over a series of years the fishing is found a remunerative industry. The other imports are timber, coal, iron, lime, tar, &c. D. has regular steam communication with London, Newcastle, Liverpool, Stockton, Glasgow, &c., and is easily accessible by railway. One of the largest iron bridges in the world was completed to cross the Tay by the North British Railway, 1877. It was only in use for a short time when the central portion of it was blown down, a passenger train being at the same time thrown into the river, by the force of a violent storm. A new bridge with a double line of rails has since been constructed in its place. The town returns two members to Parliament. D. was formerly walled, and was twice in great part burned by Edward I. (1296 and 1303). It shared a like fate at the hands of the Duke of Lancaster in 1385. In the 16th c. D. was the first Scottish town to renounce Popery, chiefly through the influence of James Haliburton. It was pillaged by Montrose in 1645, and by General Monk in 1651. Pop. civ. town 153,587; and parl. bor. 153,051.

Dundon'ald, Thomas Cochrane, Earl of, and one of the greatest of British sailors, was born at Culross, Perthshire, 14th December, 1775. At the age of seventeen he entered the navy, taking service under his uncle, Sir Alexander Cochrane, and his services as commander of the little sloop *Speedy,* particularly in the daring exploit of capturing the Spanish frigate *El Gamo* off Barcelona, gained him a post-captaincy in 1801. As commander first of the *Pallas,* and subsequently of *L'Impérieuse,* D. did great damage to Spanish commerce, and distinguished himself in European and in African waters by successful actions against the French. For leading five ships against a French fleet in the Basque Roads in 1809 he was made a Knight of the Bath, but having offended the ministry by bringing Lord Gambier, his superior officer, to a court-martial for incompetency, he was not allowed further naval service. In 1814, on the charge of originating, for stock-exchange swindling, a false rumour that Napoleon had abdicated, he was expelled from Parliament, in which he had sat since 1807 as the Radical member for Westminster, deprived of all his honours, fined £1000, and ordered to stand in the pillory. The last part of the sentence was not enforced; his constituents, who believed in his innocence, which has since been established, paid his fine, and afterwards re-elected him. From 1818 to 1828 his exploits at sea greatly furthered the national independence of Chili, Brazil, and Greece. In 1830, on the advent to power of Earl Grey's administration, D. returned to England, and was reinstated in all his honours, became commander on the N. American and W. Indian stations, and rose to the rank of Rear-admiral of the United Kingdom. He succeeded to the Earldom in 1831, and gave up his later years to naval improvements, to the invention of 'infernal machines' for the wholesale destruction of an enemy, and to writing the story of his life, which appeared in 1859 under the title of *The Autobiography of a Seaman.* He died 31st October, 1860, and was interred in Westminster Abbey. Among D.'s other works are *Observations on Rural Affairs* (1847), and *Narrative of Services in the Liberation of Chili, Peru, and Brazil* (1858).

Dun'drum Bay (Irish Gael. *Dundroma,* 'the fort on the ridge'), an inlet of the Irish Sea, County Down, 5 miles S. of Downpatrick, 10 miles wide at its mouth, and stretching 3 miles inland. The *Great Britain* was stranded here in 1846.

Dune'din, the capital of the province of Otago, New Zealand, is picturesquely situated at the head of Otago Harbour, an arm of the S. Pacific 14 miles long, and at the base and on the slopes of hills. D. was founded in 1848, and until 1861 was a small and unimportant place. The discovery of rich gold-deposits at Gabriel's Gully in that year caused a great influx of population, and D. rapidly rose to the position, which it still holds, of being the foremost commercial town in New Zealand. In spite of numerous natural difficulties it is well laid out, containing numerous streets, each 66 feet broad, and paved and lighted with gas. It is also well supplied with water from a reservoir. D. is a see of the Anglican and Roman Catholic Churches. It contains a number of fine public and private buildings, and possesses a rising university. Pop. borough 22,376; and suburbs 23,493.

Dunes, the name given to the sandhills which occur along the seaboard of Holland and Belgium as far as the frontier of France. They have been produced by the action, through an indefinite period of time, of strong winds from the German Ocean, and they serve as a natural barrier to protect the country from the destructive encroachments of the sea. In certain places they are covered with grass or heath, and pine-trees have been planted here and there. Though not available even for pasturage, they are yet invaluable as bulwarks of the rich lowlands of the interior. They occasionally attain so great an elevation as to hide the view of the sea from the steeples of the towns.

Dunferm′line (Gael. *Dun-Pharlain*, 'the fort of *Pharlain* or *Farlane*,' the legendary founder of the city), a royal burgh of Scotland, in the W. of Fifeshire, 3 miles N. of the Firth of Forth, and 16 W.N.W. of Edinburgh. It has many handsome modern structures. D. is noted for its damask linen-weaving; other industries are flax-spinning, bleaching, iron-founding, brewing, &c., and in the vicinity are large coal-mines. Along with Stirling, Inverkeithing, Queensferry, and Culross, D. sends one member to Parliament. D. was already a place of some importance in the 11th c. Malcolm Canmore and his queen Margaret founded a Benedictine Abbey here, 1070-93. The refectory, an arched gateway, and a tower still remain, but the rare old choir (1250), gave place to the present parish church in 1818-21. The latter building has a square tower 100 feet high, round the turret of which runs the inscription 'King Robert the Bruce' in open stonework. Edward I. passed the winter of 1303-4 at D., which was made a royal burgh by James VI. in 1588. D. was the birthplace of David II., James I. of Scotland, and Charles I., and its abbey is the resting-place of Malcolm Canmore, St. Margaret, Edgar, Alexander I., David I., Malcolm the Maiden, Alexander III., Robert Bruce, his queen Elizabeth and nephew Randolf, Annabella, queen of Robert III., and Robert Duke of Albany, governor of Scotland. The skeleton of Robert the Bruce was disinterred and a cast taken of the royal cranium in 1821. Pop. civ. town and parl. bor. (each) 19,647. See Dr. Henderson's *Annals of D.* (Glasg. 1878).

Dungann′on (Irish Gael. *Dun-Geanainn*, 'Geanan's fort'), a town in the county of Tyrone, province of Ulster, Ireland, 11 miles N.W. of Armagh, with manufactures of linen, coarse pottery, fire-brick, and tiles, and having in the neighbourhood the largest lime-quarries and collieries in Ulster. In 1876 a new Roman Catholic church was erected capable of holding 4000 persons. Till 1885 D. returned one member to Parliament. Pop. town 1431.

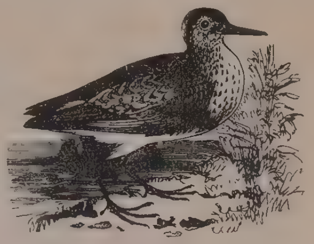
Dungar′van (Irish Gael. *Dun-Garbhain*, 'Garvan's fortress'), a seaport in the county of Waterford, province of Munster, Ireland, 40 miles E.N.E. of Cork. The inhabitants are chiefly engaged in the hake and herring fisheries, and fish, grain, butter, and cattle are exported. D. returned one member to Parliament until 1885. It is a favourite sea-bathing resort in summer. Pop. township 1408.

Dung-Beetle, a name given to several species of *Coleoptera* or beetles, belonging to the division of the Lamellicornes, distinguished by its members having the antennæ terminated by a club, formed of several flat leaf-like appendages. The popular name of these beetles has been derived from their habit of depositing their eggs amongst manure, whilst a few feed upon decaying matters of like kind. The family *Geotrupidæ*, for example, includes a familiar example of D.-B., the *Geotrupes stercorarius*, 'dor' or 'shard-borne' beetle, sometimes also named the 'watchman' beetle. This species attains a length of about an inch. It is of black colour, and infests fields for the purpose of depositing its eggs amid cow-dung. Nearly allied is the famous *Scarabæus sacer*, or sacred beetle of the Egyptians, which also deposits its eggs in manure. A North American species of D.-B. appears to roll the pellets of manure to the place where they are to be buried in the ground.

Dun′geon. See DONJON.

Dunkeld′ (Gael. *Dun-Chailliam;* in the Pictish Chronicle *Duncalden*, possibly 'hazel hill'), a village and burgh of barony, formerly a city, in Perthshire, on the left bank of the Tay, 15 miles N.N.W. of Perth, and situated amidst the most romantic scenery. The ancient cathedral, 120 feet long by 60 broad, built about 1230, is now included within the grounds of the Duke of Athole, which contain 20 sq. miles of larch-wood, together with the first larches planted in Britain. These were brought from the Tyrol in 1737, and at first treated as greenhouse plants. D. was a bishop's see from 1127 to 1688, but its ancient abbey, whose Culdees composed the cathedral chapter, was famous in the ecclesiastical annals of the kingdom at a much earlier date, and may perhaps date from the time of Kenneth MacAlpin. Pop. of entire village 613. See Skene's *Celtic Scotland*, vol. i.

Dunkirk′ (Fr. *Dunkerque*, 'the kirk of the dunes or downs'), a seaport in the department of Nord, France, on the Strait of Dover, 152 miles N. of Paris, with which it is connected by railway. It is a fortified town of the third rank, and has a tribunal of the first instance, a government navigation school, a communal college, a public library, and picture gallery. Its principal squares are the Champ de Mars, and the Place Jean Bart, in which there is a statue of the naval hero, erected in 1806. The most notable buildings are the town-hall (1644), the Gothic church of St. Eloi (1560), with a tower 280 feet high, and a fine peal of bells (since 1853), the barracks for 2000 men, an exchange, a military hospital, and a theatre. D. is the entrepot of the N., a railway centre, and the key to an extensive system of canals. It has regular steamboat communication with London, Hull, Rotterdam, St. Petersburg, &c. Its manufactures are chiefly sailcloth, fishing-nets, leather, soap, sugar, spirits, &c.; there are also valuable cod, herring, and oyster fisheries. The imports include all kinds of colonial produce. Although far from picturesque, D. annually attracts many visitors for sea-bathing. D. was founded near the church of St. Eloi by Count Baldwin of Flanders, 960, but was burned by the English in 1388. About 1400 it was fortified, and it long continued an object of contention between France, Spain, and England. In 1540 it was taken from the Spaniards by the English, in 1558 captured by the French, and in terms of peace restored to Spain. It was seized by the great Condé in 1646, but was again regained by the Spaniards. In 1658 Turenne captured D., which, according to treaty with Cromwell, was made over to England; four years later Charles II. sold it to Louis XIV. for five million livres. After the Peace of Utrecht (1713), the fortifications were razed and the harbour filled up, but their restoration was allowed by the Peace of Paris, 1783. The allies besieged D. in 1793, but were forced to retire. Pop. town 39,478; arrond. 138,292.



Dunlin.

Dun′lin, or **Purre,** a species of *Tringinæ* (or sub-family, including the sandpipers and other allies) found in Britain and other parts of Europe in winter, but more commonly on the eastern coasts of N. America. The average length is 8 or 9 inches. The plumage varies greatly with the seasons of the year, but brown hues predominate generally.

Dun′mow and Flitch of Bacon. D., Great and Little, are two villages of Essex, 9 miles E. of Bishop Stortford by railway, and 35 miles N.N.E. of London. Of Great D. the pop. is, for civ. par., 2781; of Little D., 2 miles E. of the larger village, the pop. is, for civ. par., 286. A richly-endowed priory, founded in 1104 by Lady Juga, sister of Ralph Baynard, formerly existed at Little D., and here the ancient custom of the D. Flitch had its origin during the reign of Henry III. This custom consists in presenting a F. of B. to 'whatever married couple will go to the priory, and kneeling on two sharp-pointed stones, will swear that they have not quarrelled nor repented of their marriage within a year and a day after its celebration.' From the chartulary of the monastery, now in the British Museum, it is proved that the bacon was claimed and won three times before the dissolution of religious houses. It was last awarded legitimately at the Priory Church in 1751. Since that time the custom remained in abeyance till 1851, when it was revived at Great D. The trials now take place annually before a jury of six maidens and six bachelors, and the prizes are awarded to the deserving couples. These interesting revivals of a commendable custom took place under the superintendence of J. W. Savill of D., to whom all 'claims' on the part of constant and even-tempered couples were sent.

Dunn'et Head (Gael. *Dun-Nivet*, 'the fort of the bright or open place'), the most northerly point of Scotland, in Caithness, 13 miles W. by N. of Duncansby Head, lat. 58° 40′ N., long. 3° 21′ W. It is of Devonian formation, much corrugated; has a height of from 100 to 600 feet, and supports a lighthouse.

Dunnott'ar Castle (Gael. *Dun-Oitir*, 'the fort of the low promontory'), on the coast of Kincardineshire, 73½ miles N.E. of Perth, and 1½ mile S. by E. of Stonehaven, on a rock 160 feet above the sea. It was once the seat of the Earls Marischal of Scotland, but is now a ruin. After a six months' siege it capitulated to Cromwell's troops in 1651. Many of the Covenanters were imprisoned in D. C. during the troubled times of Charles II. and James II.

Dunois, Jean, Comte de Dunois et Longueville, popularly known as the Bastard of Orleans, was the illegitimate son of Louis Duc d'Orleans, the brother of Charles VI., and was born about 1403. Aided by the great enthusiasm which Jeanne d'Arc had kindled in France, he drove back the English from Orleans and won the battle of Patay in 1429. After the death of the Maid of Orleans, D. carried on with uninterrupted success the war for French freedom, driving the English from all their conquests except Calais, and at the last even from Normandy and Guienne. He became the idol of France, was popularly styled *Le Libérateur de la France*, and deserved the admiration he inspired. Charles VII. made him his Grand Chamberlain. Louis XI., on ascending the throne, showed his dislike to D., as to the other favourites of his predecessor, by depriving him of his offices and honours. D., greatly incensed, joined the confederation of discontented nobles known as *La Ligue du Bien Public*, which brought the king to his senses and led to the Peace of Conflans (1465). By it D. was restored to his honours and posts. He died 24th November, 1468. D. had a reputation for gallantry, and in the *Mémoires Secrètes de la Cour de Charles VII.* is described as the lover of Queen Marie of Anjou. He was twice married. His first wife was the daughter of the President Lannet, and his second Marie d'Harcourt, daughter of the Comte de Montgomery. From this second marriage is descended the French family of Longueville.

Dunoon', a favourite sea-bathing village in Argyllshire, on the Firth of Clyde, 25 miles N. by W. of Glasgow. Numerous well-built villas extend along the shore both N. and S. of D., and the ruins of an ancient castle, formerly a residence of the Argyll family, crown a green conical knoll near the pier. New burgh buildings were erected in 1874. The name may be *Dun-Nodha*, 'the new fort,' or *Dun-Aoiahean*, 'the fort of guests,' or more probably *Dun-Omhain*, 'the fort of foam.' Pop. civ. town 5283.

Duns (perhaps Gael. *Dun-sith*, changed into *Dun-se*, 'fairy hill' or 'hill of peace'), a burgh of barony and market-town, Berwickshire, Scotland, 35 miles S.E. of Edinburgh, on the Whitadder, at the foot of D. Law, which is 630 feet high, and on the summit of which are traces of the camp formed by General Leslie and the Covenanters in 1639. The town is well built. D. is the birthplace of Boston (q.v.), author of the *Fourfold State*. Pop. civ. par. 3137; civ. town 2198.

Dunsinn'ane, a sub-range of the Sidlaw Hills, about 7 miles N.E. of Perth, crowned with a hill-fort of concentric ramparts. It overlooks a vast district, including Birnam Hill (q.v.).

Duns Scotus, John, one of the greatest of the schoolmen, was born about 1265, most probably at Dunse in Berwickshire, though some assert Dunston in England, and others Down in Ireland, to have been his birthplace. When a boy, he entered the Franciscan institution in Newcastle, and afterwards studied at Oxford, where he distinguished himself by knowledge of logic, law, mathematics, and scholastic theology, and where, in 1301, he was made theological professor. His lectures were listened to by crowds, there being then, we are told, 30,000 students at Oxford. In 1304 he removed to Paris, and amazed his hearers by his dialectic subtlety, which earned for him the title of the 'Subtle Doctor.' He was appointed Professor of Theology in Paris, and taught with brilliant success until 1308, when he visited Cologne, being commissioned by his order to oppose the Beguines, and found a university there. He was received at Cologne with extraordinary enthusiasm, but shortly after his arrival was cut off by apoplexy, 8th November, 1308. A legend clings to D. as to most of the great schoolmen. He is said to have been buried alive, and to have dashed out his brains against the coffin. D. holds a very important place in the history of mediæval thought. He gained an immense number of followers, known as *Scotists*, in opposition to the *Thomists*, or adherents of Thomas Aquinas, with whom D. was in utter antagonism in regard to divine grace, free-will, and especially the immaculate conception of the Virgin, a doctrine which he seems to have originated. (See NOMINALISTS and REALISTS.) His skill in starting new definitions and new themes for discussion was especially valued in an age when speculation was confined to a novel setting of orthodox doctrine. It has been said that D. sometimes anticipates Spinoza, but in such cases he probably did not see whither his dialectic tended. From the opposition shown by his followers to the revival of letters, *Dunsman*, and hence *dunce*, came to mean one stupid or slow at learning. Most of D.'s voluminous works were edited, with Life, by L. Wadding (Lyon, 1639).

Dun'stable ('the market-place of the hill'), a town in Bedfordshire, at the base of the D. chalk-downs. The principal industry is the manufacture of strawplait and bonnets. In winter great numbers of larks are captured here for the London market. The parish church, on the restoration of which £10,000 had been expended in 1876, is part of the priory founded here by Henry I. A town-hall, plait-market, and corn-exchange were erected in 1874. Pop. reg. sub-dist. 8738; and mun. bor., civ. par., and ecc. par. (each), 4513.

Dun'stan, St., was born in A.D. 925, near Glastonbury, Somersetshire. His father, Heorstan, was a wealthy thane, and his uncles were bishops of Wells and Winchester. As a youth he was remarkable for learning and skill in painting, music, and metallurgy, and quickly became a favourite of King Æthelstan, but was driven by jealous enemies from the court. He then became a monk, but by no means an austere recluse. On the contrary, he studied literature and music, gathered many pupils about him, and won the affections of a rich lady, who placed her fortune at his disposal. About this time he is said to have had a grotesque adventure with Satan, whom, according to Robert of Gloucester, he seized by the nose with his red-hot tongs for peeping into his cell at Glastonbury. On the death of his rich patroness he returned to court, which envious intriguers again forced him to quit, but King Eadmund appointed him Abbot of Glastonbury, according to the *English Chronicle*, in 943. This would render his birth in 925 very dubious, as he could scarcely be an abbot when only eighteen. According to others, he was chosen abbot in 947. On Eadred's accession in 946, D. began to shine forth as a clear-sighted, adroit, unscrupulous statesman, advocating broad and conciliatory measures. He secured the alliance of the Scottish king against the Northumbrians by ceding the country between the Forth and Tweed, but Eadwig's succession in 955 interrupted his wise schemes of consolidation. Enraged by an insult which D. offered the queen, the new king stripped him of his offices, and forced him to seek safety in Flanders; whereupon Mercia and Northumbria proclaimed Eadgar king, and recalled D., who, after Eadwig's death in 958, was elected Archbishop of

Canterbury, and during Eadgar's reign was virtually the secular as well as the ecclesiastic head of England. Instead of labouring blindly for the aggrandisement of Wessex, he endeavoured to consolidate the entire realm, and to pursue a truly national policy. Through his influence Northumbria was split into three parts, but their old rights were fully reserved to its Danish inhabitants. He enforced justice, promoted education, reformed the mint, and strove to restore purer morals among the laity and stricter discipline in the Church. Aided by the Bishops of York and Winchester, he laboured with fanatical energy to institute a celibate clergy, and expelled from the Church such priests and dignitaries as refused to separate from their wives. On Eadgar's death in 975, he procured the coronation of that king's son Eadward, and in a Witenagemot held shortly afterwards at Calne, in Wiltshire, is said to have confounded his enemies by a 'miracle.' The part of the floor on which his opponents were placed was made to give way suddenly, while D. and his party remained unhurt. But his influence fell on Eadward's assassination. The S. country proclaimed Æthelred king, the N. seceded, and D.'s long-cherished project of a united England was shivered for a time. In grief and defeat he retired to Canterbury, where he died in 988. D. possessed abundant and versatile talents, which he strenuously cultivated and applied. In Church questions he was narrow and intolerant, but as a statesman he was shrewd, liberal, and even patriotic. The ends which he inflexibly pursued were to unite England into a compact monarchy, to extend the influence of the English Church in civil affairs at home, while rendering it entirely plastic to the papal sway. D. wrote an adaptation of Benedict's *Rule of a Monastic Life*, and a *Commentary on the Benedictine Rule*. See Robert of Gloucester's *Life of D.*, *English Chronicle*, Mabillon's *Acta Sanctorum*, Kemble's *Saxons in England*, and Freeman's *History of the Norman Conquest of England*, vol. i.

Duode'cimal Scale (Lat. *duodecim*, 'twelve') is the division of unity into twelve parts, each of these again into twelve, and so on. Though it has the advantage of being divisible by 2, 3, 4, and 6, yet the decimal scale is now recognised as more convenient for our Notation (q.v.).

Duode'cimo (Lat. *duodecim*, 'twelve'), a term applied to a volume on account of the size of its page. A page D. is the 12th part of a page folio, the latter being the large sheet called a broadside once folded; just as a *quarto* is its 4th part, and an *octavo* its 8th. The well-known contractions for the three words are 4to, 8vo, 12mo.

Duode'num. The small intestine is divided into three parts: the first, 10 or 12 inches in length, immediately succeeding the stomach, is the D.; the upper two-fifths of the remainder is the *jejunum*, and the lower three-fifths the *ileum*. The D. is the shortest and widest part of the intestine. It describes in its course a curve somewhat like that of a horseshoe, in the concavity of which we find the head of the pancreas.

Dupan'loup, Felix Antoine Philibert, a French churchman, was born at St. Felix, Savoy, 3rd January, 1802. He studied theology at Paris, became a priest, and won notice as an excellent preacher and catechist. After refusing various charges in Paris, he was appointed Professor of Sacred Eloquence in the Sorbonne in 1841, and Bishop of Orleans in 1849. In 1848 he attended the deathbed of Talleyrand. In 1854 he was made a member of the Academy, and after 1850 he took part with considerable energy and keenness in politics, arguing for the rights of the Pope as a temporal sovereign against Edm. About. He was returned to the National Assembly in 1871, and voted with the Right. He died 11th October, 1878. Among his most important works are *Manuel des Catéchismes* and *Œuvres Oratories.*

Dupin', André Marie Jean Jacques, a French jurist and politician, was born 1st February, 1783, at Varzy, in the department of Nièvre. Educated at Paris, D. took the Orleanist side in French politics, opposed in 1815 in the Chamber of Representatives the proposal to proclaim Napoleon's son as his successor, defended, along with Berryer, Marshal Ney, and subsequently acted as counsel for the English officers who aided the escape of Lavalette, for Béranger in 1821, and for the *Journal des Débats* in 1830. When Louis Philippe ascended the throne after the revolution of that year, D. was made Procureur-Général in the Court of Cassation. In 1832 he was elected President of the Chamber of Deputies, and held the office for eight years. The *coup d'état* of 1851, followed by the confiscation of the Orleans estates, caused D. to retire from public life, but in 1854 he resumed his former post in the Court of Cassation. His last public act was in 1865 to protest in the Senate against the growth of Parisian luxury. He died 10th November, 1865. D. was the author of a number of valuable works, particularly on law. Among these are his treatise *Sur la Libre Défense des Accusés* (1815), which made his reputation as a Liberal advocate. See *Mémoires de M. D.* (1855-60).—**François Pierrè Charles, Baron D.,** a French geometer and statistician, the brother of the preceding, was born at Varzy, 6th October, 1784, entered the navy as an engineer, and was much employed as such in France and the Ionian Islands. In 1814 he visited Great Britain, and examined its financial, commercial, industrial, naval, and military resources, the result being his *Voyages dans la Grande Bretagne* (Par. 1820-24), and *Force Commerciale de la Grande Bretagne* (1826). D. threw himself heartily into the work of teaching artisans science, established a *Conservatoire des Arts et Métiers* at Paris, and became its Professor of Geometry. In 1824 he obtained the honour of a barony. D., who through the revolutions of 1830 and 1848 had been a Liberal, was elected a senator after the *coup d'état* of 1851. He died January, 1873. D. published numerous works, chiefly on statistical, industrial, scientific, and educational subjects.

Dupin, Louis Ellies, a French historian, born of an old Norman family, at Paris, 17th June, 1657. He studied at the Collége d'Harcourt, entered the Church, and was through life persecuted for his liberal opinions, being accused of treating the Virgin and the Fathers with disrespect. His favourite scheme was to unite the Roman Catholic, Greek, and English Churches. He died at Paris, 6th June, 1719. See Niceron's *Mémoires*.

Dup'licate, Ra'tio. See PROPORTION.

Duplica'tion of the Cube, a celebrated problem of antiquity, also known as the 'Delian problem,' from the legend that when the island of Delos was being ravaged by a pestilence, the oracular response was that the pestilence would cease if the altar of Apollo were doubled, still retaining its cubical shape. Being a case of the solution of a cubic equation, it could not be solved merely with the aid of the circle and straight line. Hippocrates of Chios reduced it to the problem of inserting two mean proportionals between two given lines, which was solved by Archimedes, Eutocius, Pappus, Nicomedes, and others, by means of higher curves.

Dupon't, Jacques Charles, a representative French Liberal politician of the early part of the 19th c., was born 27th February, 1767, at Neubourg in Normandy, and came into prominence in 1813, after the fall of Napoleon, when he acted as Vice-President of the Corps Législatif. Returned to the Chamber of Representatives for the department of Eure, and generally known as De l'Eure, D. continued a parliamentary Liberal in opposition till the revolution which drove Charles X. from the throne in 1830, when he was appointed to the Ministry of Justice, an office which he threw up in six months on account of what he considered the retrograde tendencies of the king. When the revolution of 1848 took place, D. again came to the front, being made President of the Provisional Government. In the Legislative Assembly, however, which succeeded the Constituent Assembly, D., whose opinions were too moderate, did not find a place. He died at his estate of Rougepierre in Normandy, 3rd March, 1855. By his friends he was titled *L'Aristide de la Tribune Française.*

Düpp'el, or **Dybb'öl,** a village of Slesvig, in the Sundevitt peninsula, opposite Sonderburg, noted in the Germano-Danish war for its entrenchments (*Düppeler Schanze*), built by the Danes, and taken by the Prussians after a month's fighting, 18th April, 1864.

Dupois, Charles François, the son of a village schoolmaster, was born at Trie-le-Château, 16th October, 1742. He studied law and metaphysics at Lisieux, where he was also a Professor of Rhetoric. An enthusiasm for astronomy, derived from Lalande, suggested to him that the zodiac was a kind of national calendar for agriculture and other matters, and that the explanation of the various religious myths was to be found in the constellations, interpreted by reference to the pursuits of each nation. His first publications brought him an invitation from Friedrich II. to Berlin. His chief work, *L'Origine de tous les Cultes, ou la Religion Universelle,* with atlas, appeared in 1795. As a member of the National Convention, the Council of Five Hundred, and the Legislative body, he showed moderation, and a desire for liberty based on education. As a member of the Institute (in the departments of literature and fine arts, and history and ancient literature) he advocated the claims of the Pelasgi to be considered the universal parent stock—he considered them to have come from Ethiopia—and discussed the results of the commission to Egypt, which he had helped to arrange. D. died near Dijon, 29th September, 1809. See *Notice Historique sur la Vie de D.*, by his widow (Par. 1813).

Dupuy'tren, Guillaume, a famous French surgeon and anatomist, was born at Pierre Buffière, 6th October, 1777. In 1801 he became *Chef des Travaux Anatomiques* in the Collége de la Marche, Paris. Here he made important vivisections with reference to the functions of the sympathetic and to the consequences of tying the thoracic duct; and followed Bichat into pathological anatomy, his autopsis of cases of organic lesion numbering more than 1000. D. successively became assistant, head-surgeon, and Professor of Clinical Surgery at the Hôtel-Dieu. He was made a baron by Louis XVIII. Patronised by Charles X., he wished to rival the political career of Cuvier, but failed in his candidature for a seat in Parliament. He died 8th February, 1835. D. excelled as a teacher in the class-room and in the ward, and as a brilliant surgeon; he was without extensive or accurate scientific range, and has been accused of dishonest plagiarism and of making false reports of the success of his own operations. His most important memoirs are scattered through the *Journal* of Corvisart, the *Bulletin* of the Medical Faculty, the *Medical Library* and *General Repertory of Anatomy.* See *Biographie de D.* (Par. 1855).

Duquesne', Abraham, Marquis, a famous French naval officer, born at Dieppe in 1610, first attracted public notice for gallantry in an engagement with the Spaniards near the Lerin Islands (off the coast of Alpes Maritimes department) in 1637, and afterwards successively at Coruña, Tarragona, Barcelona, &c. After the death of Richelieu, D. entered the service of Sweden, then at war with the Danes, defeated the Danish fleet (1643), was promoted to the rank of vice-admiral, but soon returned to the service of France, took part against the Frondeurs, and reduced Bordeaux. He was next engaged in chastising the Barbary pirates in the Western Mediterranean, destroyed the combined fleets of Spain and Holland under De Ruyter off the coast of Sicily in 1676, and was rewarded by Louis XIV. with the rank of Marquis. His last exploit was the successful bombardment of Genoa in 1684. D. was the only Protestant exempted from banishment on the revocation of the Edict of Nantes in 1685. He died in 1688.

Du'ra Ma'ter, a strong fibrous membrane which closely lines the interior of the skull, and forms a loose sheath in the spinal canal. The two other membranes protecting the brain are the Arachnoid and Pia Mater (q.v.)

Dura'men, or **Heart-Wood,** the innermost or oldest-formed wood in an exogenous stem. It is generally darker in colour than the external wood. See STEM.

Durance', an impetuous river of France, rises in the Hautes-Alpes, near Mont Genèvre, flows S. through the Basses-Alpes, then W., forming the boundary-line between Vaucluse and Bouches-du-Rhône, and joins the Rhône between Avignon and Tarascon, 50 miles from the sea. It is 180 miles long, but owing to its rapid current no part of its course is navigable. Much timber is floated down from the upland forests. An aqueduct has been constructed from the D. to Marseille, 51 miles long.

Duran'go, the capital of a state of the same name, Mexico, is situated 6500 feet above the level of the sea. It has a handsome square, a cathedral, four monasteries, and a Jesuit college. The climate is healthy and cool, and there are rich mines of gold, silver, and iron in the vicinity. D. has a trade in horses, cattle, and leather. The state is traversed by the Sierra Madre. The surface is rocky and the soil poor, but there are valuable mines of gold, silver, and iron. Area, 38,009 sq. miles. Pop. of town 25,626; of *state* 255,652.

Duraz'zo (the *Dyrrachium* of the Romans, whence D., as well as the *Dratch* of the Turks and the *Durtz* of the Slavs), a fortified town and seaport in the vilayet of Scutari, Albania, Turkey in Europe, on the Adriatic, exports grain, oil, and tobacco, and imports Manchester and Birmingham goods and colonial produce. D. is the Greek *Epidamnus*, which, from its favourable position on the Adriatic and fertile territory, soon became rich and powerful. The expulsion of the oligarchs ultimately led to the Peloponnesian War (q.v.). Dyrrachium did not occupy the exact site of Epidamnus, but a high and rocky peninsula near it, and received its name from the *ruggedness* of the situation. Pop. 4080.

Dür'en (the *Marcodurum* of Tacitus, meaning 'the frontier-place on the river,' from *mark*, 'a frontier,' and *dur*, 'water'), a walled town on the Roer, in the province of Rheinland, Prussia, 18 miles E. by N. of Aix-la-Chapelle. D. has manufactures of woollen cloths, paper, leather, cast-iron and steel ware, and numerous distilleries of brandy. It was besieged by Charles V. in 1543. Pop. town 21,731; district 58,463.

Dür'er, Albrecht, a great German painter, was the son of a Hungarian goldsmith, and was born in Nürnberg, 21st May, 1471. In 1486 he left his father's trade and became an apprentice of Wohlgemuth, the leading painter in Nürnberg. After his 'wanderjähre,' he executed as his masterpiece the drawing of Orpheus. He then made the unfortunate marriage with Agnes Frey which has been so touchingly described in Leopold Schefer's novel, *The Artist's Married Life* (Eng. transl., Chapman, 1848). His friends Hartman and Pirkheimer have told how unhappy this selfish woman made him. We have also the artist's journal of his travels in the Netherlands with his wife and the maid Susanna, and his letters to Pirkheimer, chiefly from Venice (published in *Relics of A. D.*, by Friedrich Campe, 1828), but these contain no complaint of his wife, whom he treated with great kindness. On his travels he was fêted by the Emperors Maximilian and Karl V., the King of Denmark, Margaret, Governess of the Netherlands, and by the painters of Brüges and Antwerp. When in Italy he met Raphael, with whom he exchanged portraits. Two portraits of D., painted by himself, still remain at the Florence and Munich galleries. He died broken-hearted, 6th April, 1528. D. was a designer, painter, architect, sculptor, and engraver on wood as well as metal. Among his pictures may be mentioned 'Marius on the Ruins of Carthage;' the 'Martyrdom of St. Bartholomew,' which the Emperor Rudolph placed in Prague; the 'Martyrdom of the Ten Thousand Saints,' which is at Vienna. Prague has also his 'Adam and Eve,' and Nürnberg has the 'Twelve Apostles.' He is considered to have thrown imaginative expression and fidelity to nature into the school of Van Eyck. Among his engravings proper may be mentioned the 'Knight and Death,' the 'Four Naked Women,' &c. D. is said to have been the first to use nitric acid. His cuts on wood and leather of the 'Passion of Jesus Christ' are well known through the cheap reprint issued by Smith & Elder; his 'Life of Mary' and 'St. Eustatius Kneeling before a Stag' are perhaps the finest of the woodcuts. Among his portraits may be mentioned 'Erasmus,' 'Melancthon,' and his friend 'Pirkheimer.' D. also published works on *Human Proportion, Fortification*, and the *Use of the Compass and Square* (edition published at Arnheim, 1603). Wonderful stories are told of his manual precision. There is in his work a fantastic element strange to the modern eye. D. was a Protestant, and the finish and truthfulness of his works evince a deep, almost austere, religious feeling.

Du′ress, in English law, is the plea of Compulsion by imprisonment or by threats (causing fear of loss of liberty, life, or member) by one who has failed in an obligation or who has committed a misdemeanour. If proved, the plea is effective. But D. is held to be no excuse for a person committing such a crime as the murder of an innocent person, though he may kill the person offering the D.

D'Ur′fey, Thomas, a writer of trifling anacreontics, &c., was born at Exeter about 1630. He was intended for the law, but took to play-writing, and became a favourite with Charles II., and a well-known author of songs, odes, and licentious comedies. Like Moore, he used to sing his own songs at his 'dinings out.' He led a jovial, careless life, and died during the reign of George I., in 1723. His songs were collected under the title *Pills to Purge Melancholy*. He wrote a satire called *Butler's Ghost, or Hudibras, the Fourth Part.*

Durham Cathedral, north side.

Dur′ham (Old Eng. *Dun-Holm*, 'the hill on the holm' or 'meadow'), an ancient episcopal city of England, and capital of the county of the same name, on the Wear, 13 miles S. of Newcastle, and 256 N.W. of London by railway. It is nearly encircled by the river, has the remains of old walls, and is mainly built on the steep sides of a hill, surmounted by an ancient cathedral and a castle. The banks of the Wear are now occupied by sloping gardens and beautiful public walks, and the river is spanned by fine bridges (two of date 1120 and one of 1170), and by a railway viaduct of eleven arches. The majority of the houses have a quaint, picturesque appearance, in harmony with the natural beauty of the spot and with the grandeur of the cathedral. In a form nearly resembling a Latin cross, the cathedral comprises bold specimens of Norman and of the various English styles, covering an area of 55,700 feet, and having a nave 81 feet wide. Its length inside is 473 feet, and its chief features are three richly ornamented towers, the highest of which (216 feet) was built in the 13th c. The Chapel of the Nine Altars, at the E. end, is in pure and elegant Early English. In the same end there is an immense circular light of fine stained glass, while the interior pillars and the screen are festooned with rare carving. Cardinal Wolsey was for some time prelate of D., and the cathedral contains the tombs of St. Cuthbert and Bede. The castle, which is in Romanesque, was founded by William the Conqueror about 1072, and contains a splendid dormitory. It was formerly the residence of the bishop, but is now appropriated to the University of D., incorporated in 1837, with power to grant degrees in arts, classics, and mathematics, in theology, and in physical science, &c. The University, which possesses a revenue of £3000 a year, has 14 professorships (30 lecturers also assist in the education) and is attended by 608 undergraduate students. It has 6 fellowships and upwards of 40 scholarships and exhibitions. There are four colleges, besides those of medicine and science. Students also are allowed to attend who are not attached to any college. Besides the cathedral, D. has six parish churches, also a county infirmary, public libraries, assembly-rooms, mechanics' institute, &c. A large reservoir has been constructed. The chief manufactures are woollens, carpets, paper, and iron and brass wares. Near D. are collieries and mineral springs. About the year 995 Bishop Ealdhun brought hither from Chester-le-Street the remains of St. Cuthbert, and built for their reception a church or shrine, and thus finally fixed the seat of the old Bernician bishopric. The cathedral, however, was first begun by Bishop William de Carilepho about 1093, and was not completed till near the end of the 15th c. In 1290 the prior and convent of D. founded a college, which was abolished on the dissolution of monasteries (1539), revived by Cromwell during the Commonwealth, and again suppressed at the Restoration. The parl. bor., consisting of the ancient city of D. and the bor. of Framwellgate, returns one member. Pop. parl. bor. 15,287; mun. bor. 14,863; and diocese 1,017,047.

Durham, a county in the N.E. of England, bounded N. by Northumberland, E. by the German Ocean, S. by Yorkshire, and W. by Cumberland and Westmoreland, has an area of 1011 sq. miles. It lies between the Tyne and the Tees, and in the W. its surface is hilly and heathy, while it has a coast-line of 32 miles, chiefly consisting of magnesian limestone cliffs. The formation throughout is mainly millstone grit, coal measures, permian, and trias. D. is famous alike for its rich coal deposits and for its Teeswater breed of short-horned cattle. It is intersected by the river Wear, and has a good soil of dry loam and clay. There are considerable dairy-farming and cattle-rearing. The chief industry, however, is coal-mining, there being over 240 collieries. Several of the pits reach to a depth of 100 fathoms, and extend horizontally for many miles. The other minerals are limestone, freestone, black marble, ironstone, slate, lead, &c.; and the manufactures include iron, chemicals, glass, pottery, and alkalies. There is also much iron-smelting and shipbuilding. D. is the capital, and the other towns are Sunderland, Gateshead, Hartlepool, S. Shields, Darlington, and Stockton. D. was included (547-827) in the Anglian kingdom of Northumbria. It was endowed at a later period with palatine privileges vested in the bishop, having the power to hold parliaments, coin money, raise taxes, &c. These privileges, which D. enjoyed in common with the counties Chester and Lancaster, were resumed by the crown in 1836. D. possesses many British and Roman antiquities, and several fine castles. D. has eight parl. divs. each of which returns one member: Barnard Castle, pop. 59,459; Bishop Auckland, 61,833; Chester-le-Street, 70,202; Houghton-le-Spring, 69,047; Jarrow, 80,607; Mid D., 67,639; N. W. D., 65,957; and S. E. D., 64,047. Pop. anc. co. 1,016,559; adm. co. 721,461; and reg. co. 1,024,369. Corn crops cover 70,294 acres; green crops, 33,183; clover, &c., 53,353; permanent pasture, &c., 272,541; small fruit and flax, 395 and 2, respectively; and 8368 acres are bare fallow. Grazing, mountain and heath occupy 42,053; nursery grounds, 61; and woods, &c., 29,294.

Durham, John George Lambton, Earl of, an English Liberal politician, was born 12th April, 1792, at Lambton Hall, in the county of Durham, and the seat of his father, a gentleman of small estate but ancient family. He was educated at Eton, served for a short time in a hussar regiment, and was returned in 1813 for his native county. D. soon showed himself an advanced Liberal, opposed the Corn-Law Bill of 1815, the Alien Acts of the Castlereagh ministry in 1816, the measures to repress public meetings after the 'Manchester massacre' of 1819, and endeavoured to pass a scheme of parliamentary reform. In 1828 he was created Baron D. Two years later he became Lord Privy Seal in the Grey administration, aided in drawing up, and was almost the sole defender in the House of Lords of, the Reform Bill of 1832. Ill-health compelled him to retire from the government, when he was made an earl, and in 1833 was sent on a special mission to Russia. During the insurrection in Canada of 1837-38, D. was sent out as Governor-General, but excited the ill-will of the Canadians, and was censured by the Home Parliament for transporting the leaders of the rebellion to Bermudas, and resigned the office. He died at Cowes, Isle of Wight, 28th July, 1840.

Durham, Simeon of, an English chronicler of the 12th c., who taught at Oxford, and wrote Latin annals of England to the reign of Henry I. His book is specially valuable for the history of the N. of England, and was continued by John of Hexham.

Du′rian, or **Durion,** a fruit-tree of the Malay Archipelago, belonging to the natural order *Sterculiaceæ*. Though it has a most offensive odour, it is one of the most delicious of fruits. 'A rich custard,' says Alfred Wallace, 'highly flavoured with almonds, gives the best general idea of it.' The unripe durians are cooked as a potherb, the pulp is salted and preserved, and the seeds, as large as pigeon's eggs, are roasted and eaten like chestnuts. It is successfully cultivated in Malaya and India, where it commands a high price. One tree will yield about 200 durians in a year. The rich creamy interior is protected by a thick, though rather soft, shell, which is armed with numerous hard spikes. The Malays are particularly fond of the fruit of the D., and, while it is approaching maturity, will always post some one to watch the trees in case of theft.

Dürk′heim, one of the prettiest towns in the government district of Rheinpfalz, Bavaria, on the Isenach, 10 miles N. of Neustad by railway. It has a famous sausage-market (since 1494), and a considerable wine trade. Many visitors are attracted by the grape-cure, and by the neighbouring salt-baths of Philippshall. D., the old *Thurnigheim*, was the residence of the Frankish dukes of the Salian branch. It was rebuilt after the destruction of the castle of the counts of Leiningen by the Elector Palatine Friedrich in 1471, and again after its devastation by the French in 1689. About a mile S.W. of D. are the beautiful ruins of the Benedictine abbey of Limburg, founded by Konrad II. in 1030. Near the abbey, and on the summit of Kastanienberg, is the *Heidenmauer* ('heathens' wall'), a rampart supposed to be of Roman origin, and enclosing an area of 2 sq. miles. Pop. 6070.

Dur′lach, a town in the Grand Duchy of Baden, Germany, on the Pfinz, 3 miles E. of Karlsruhe by railway. It lies at the foot of a vine-covered hill (the Thurmberg), and is further linked to Carlsruhe by a canal and an avenue of poplars. Its manufactures are delf-ware, tobacco, beer, vinegar, &c., and it has a well-known fruit-market. D. was the capital of Baden before Karlsruhe was founded in 1715. Pop. 8016.

Du′roc, Géraud Christophe Michel, Duc de Friuli, was born at Pont-à-Mousson, 25th October, 1772. He served as aide-de-camp to Bonaparte in the Italian and Egyptian campaigns. His services to the Consul in 1799 procured him a generalship, several important embassies, and the post of Grand Marshal of the Palace. He carried through the peace with Saxony (1806), the cession by Charles IV. of his rights to the throne of Spain, and the armistice of Znaim (1808). The scene between the Emperor and D. on the field of Markersdorf (where the latter was killed, 22nd May, 1813) is well known.

Durr′a, Dour′a, Durra Mill′et, or **In′dian Millet.** See SORGHO GRASS.

Dürr′enberg ('barren mount'), a village in the province of Sachsen, Prussia, 6 miles S.S.E. of Merseburg, with important saltworks, established in 1763, which annually produce over 20,000 tons of salt by evaporation.

Durr′enstein ('barren rock'), a village on the left bank of the Danube, Lower Austria, 44 miles W.N.W. of Vienna, with the ruins of the fortress in which Leopold Duke of Austria imprisoned Richard Cœur-de-Lion on his return from Palestine, 1191.

Dur′sley (Welsh *dwr*, 'water,' and Old Eng. *ley*, 'meadow,' *i.e.*, 'the water-meadow,' from the Broadwell spring in the vicinity), a market-town in Gloucestershire, near the Cotswold Hills, 14 miles S. by W. of Gloucester, with fulling-mills and breweries. Pop. reg. sub-dist. 5242; ecc. par. 2273; and civ. par. 2269.

Duruy, Victor, a French historian, born at Paris, 11th September, 1811, for many years Professor of History at Reims and afterwards at the École Polytechnique, especially devoted himself to historical geography. This subject he treated in several works dealing with the Roman Republic and Empire (Par. 1838), the Middle Ages (1839), France to the year 1453. In 1863 he became Minister of Public Instruction under the Second Empire. His programmes and circulars excited much criticism among both Catholics and Liberals, and his *Histoire Contemporaine*, for use in the Lyceum, was written for the purpose of political propagandism. On his resignation in 1869 the grateful Emperor made him a Senator with a 'dotation' of 30,000 francs.

Dusic′yon, a genus of *Canidæ*, or Dogs (q.v.), inhabiting S. American flat-lands, and living gregariously in burrows in a wild state. They appear to be susceptible of domestication, and possess elongated bodies, sharp muzzles, and bushy tails.

Düss′eldorf, the capital of a district of the same name, in the province of Rheinland, Prussia, on the right bank of the Rhine, where it is joined by the Düsselbach, 21 miles N.N.W. of Cologne by railway. It is a handsome town, with wide regular streets, numerous squares, fine gardens, and promenades. Its main divisions are the Altstadt, on the right bank of the Düsselbach; the Neustadt, on the Rhine (built 1690-1716); the Karlstadt, on the left bank of the Düsselbach, founded by the Elector Karl Theodor in 1787; and the modern Friedrichstadt, forming the S. side. The principal buildings are the Collegiate Church, containing the tombs of the Dukes of Jülich and Berg; the beautiful Church of St. Andrea; the old electoral palace; the governor's palace; the townhall (1567); the observatory; a public library of 62,000 vols.; and a good theatre capable of holding 1500 persons. The old castle of D., which was partly destroyed by the French in 1795, has been restored, and now contains the art academy and a collection of some 14,500 original drawings (by Lessing, Achenbach, Knaus, Schirmer, &c.), and 24,000 copperplate engravings. D. had formerly a splendid art gallery (founded in 1690, and removed to Munich in 1805), containing the most perfect collection of the works of Rubens and the other masters of the Flemish and Dutch schools. The celebrated art academy was established by Karl Theodor in 1767, was nurtured by Cornelius and Schadow, and was placed under the care of Bendemann in 1859. D. is also one of the musical centres on the Lower Rhine. Its industries are rapidly increasing, and it enjoys every advantage of position, and complete communication by river and railway. Among the manufactures are cottons, colours, leather, tobacco, chemicals, carriages, and tapestry, and there is considerable trade in books and articles of virtu. D. was a town as early as 1288, and was the residence of the Dukes of Jülich, Kleve, Berg. It was taken by the French in 1795, restored to Bavaria at the Peace of Luneville, 1801, and to the Duchy of Berg in 1806, along with which it came to Prussia in 1815. Pop. town 144,642; district (exclusive of town) 65,950.

Dust-Ball, a disease in horses, provoked by too much food composed of corn and barley-dust. The disorder affects chiefly the intestinal canal. Its presence is made known by a haggard countenance, a distressed eye, distended belly, and hurried respiration. The ball is sometimes about four inches in diameter, and as hard as iron.

Dust-Brand. See SMUT.

Dutch Gold is a very ductile and malleable alloy of copper and zinc, containing nearly 85 per cent. of the former. It can be beaten out into extremely thin leaves, resembling gold-leaf, for which it is a chief substitute. When triturated, it forms a 'bronze powder.'

Dutch Liquid was discovered in 1795 by the Dutch chemists Diemen, Paets van Trooskiyk, Bond, and Lauwerenburg. It is a compound of olefiant gas or Ethylene (q.v.) with chlorine. D. L. is readily obtained by allowing chlorine and ethylene to come in contact. It is a colourless oily liquid, having a peculiar chloroform-like odour, and a sweet aromatic taste. It is heavier than water, and boils at 82·5° C.

Dutch Rushes. See EQUISETACEÆ.

Du'tens, Louis, a French philologist and author, was born at Tours, 16th January, 1730, of a Protestant family. At the age of eighteen he wrote a tragedy, *Le Retour d'Ulysse à Ithaque*, which was acted with success at Orleans. About 1750 he came to England, where he applied himself to Oriental languages and mathematics. While chaplain and secretary to Mackenzie, the English minister at Turin, he undertook a complete edition of Leibnitz, which appeared in 1769. The latter part of his life was passed at Elsdon, Northumberland, where he had obtained a living. He belonged to the Académie des Inscriptions of Paris, the Royal Society of London, and was royal historiographer to George III. D. died 23rd May, 1812. His chief work, *Recherches sur l'Origine des Découvertes attribuées aux Modernes*, appeared in 1766. Its learning is great and curious, but it had become D.'s craze that the ancients knew everything. He is more trustworthy as a numismatist, and published valuable dissertations on Greek and Phœnician medals and on precious stones.—**Joseph Michel D.**, nephew of the above, born at Tours, 15th October, 1765, was an engineer and economist. He published, in 1804, an analysis of the fundamental principles of political economy, and in 1819, as the result of a government mission to England, his *Mémoires sur les Travaux Publics de l'Angleterre* (especially the canals). This was followed by his elaborate *Histoire de la Navigation Intérieure de la France* (1829). But his chief book is *Philosophie de l'Économie Politique* (1835). He died 6th August, 1848.

Dutro'chet, René Joachim Henri, born 14th November, 1776, at his father's country-house in Poitou. After serving in the royalist army of La Vendée, he adopted medicine as a profession, acted for a short time as military medical officer to Joseph Bonaparte, King of Spain, but latterly devoted himself to the study of physics and physiology. He entered the Académie des Sciences in 1831, and died at Paris, 4th February, 1847. His specialty was the study of the movements of fluids in plants and animals, as connected with their growth, including, of course, the embryonic structure of plants, &c. He first used the terms *endosmosis* and *exosmosis*. His experiments on the results of artificially impressing motion upon growing seeds and plants are very curious. All his theories and discoveries are to be found in his *Mémoires pour servir à l'Histoire Anatomique et Physiologique des Végetaux et des Animaux* (Par. 1837).

Dutt'eeah, or **Da'tia,** the capital of a protected state of the same name, Central India, in the agency of Bundelcand, 125 miles S.E. of Agra. It stands in a rocky district, is surrounded by walls, and has several massive buildings. The houses are somewhat packed together. In the centre of the town are the Rajah's palace and grounds, in which stands a splendid fountain from which four marble elephants spout water from their trunks. A plentiful supply of game is obtainable in the neighbourhood. Some interesting Jain temples exist at a spot about 4 miles distant from the town. Pop. 27,566. The *native state* of D., which is free of tribute, yields its rajah a revenue of £100,000, and has an army of 700 cavalry, 3040 infantry, and 160 artillery with 96 guns. Area 912·5 sq. miles; pop. 186,440, of whom 172,759 are Hindus, 8043 are Mohammedans, 20 are Jains, 5617 are Aboriginal (so described in the Census), and 1 is Christian. The state became a protectorate of the British in 1804. The Rajah, in 1817, received additional territory from the British as a reward for his loyal conduct. On his death Bijai Bahadur, his adopted son, succeeded, and he in his turn was succeeded by Bhawani Singh in 1883.

Duval', Alexandre Vincent Pineu, was born at Rennes, 6th April, 1767. He was from 1792 to 1815 one of the leading dramatic authors in France in comedy, legitimate drama, and opera-comique. His works show skill in plot, effective dialogue, and comic situations. His most successful piece was *Édouard en Écosse, ou la Nuit d'un Proscrit.* He had a bitter controversy with Victor Hugo and the Romantic School, whom he accused of ruining the stage. He died at Paris, January, 1842.

Duvau'cel, Alfred, a French savant, born in 1793, was the son-in-law of Cuvier, who instructed him in natural history. In 1817, as royal naturalist, D. undertook an expedition to Chundernagore, Sumatra, Malacca, and the valleys of the Ganges and the Brahmapootra. He made large collections, which were transmitted to Paris. He was a constant correspondent of the Asiatic Society of Paris. He describes his travels in a graphic style, without losing scientific precision. His visit to the King of Cossya and the 'Cavern of the Devil' is of especial interest. He died at Madras in August, 1824.

Duy'se, Prudens Van, a Belgian author, born at Dendermonde, 28th September, 1804, became Archivist of Ghent, and Professor of National History at the Athenæum, and died 13th November, 1859. His *History of the Poetry of the Netherlands from the 15th c.*, and his own lyrical and dramatic pieces, contributed to the revival of Flemish literature.

Dwarfs. See GIANTS AND DWARFS.

Dwell'ing-House. The legal theory in England and in Scotland is that a man's D.-H. is a sanctuary inviolable by legal execution, but there are so many exceptions to the rule that its force in law is not great. It gives no protection to one charged with a crime, nor against debt to the crown. In England the sheriff, in virtue of a writ called a Capias utlegatum (*that you arrest the outlaw*) could break into a D.-H., and seize the person against whom the writ was directed; but, outlawry in civil matters having been abolished, the writ is obsolete. In Scotland the same end is attained by letters of

Caption and their modern substitute, in virtue of which the debtor is by legal fiction seized as a rebel.

By 24 and 25 Vict. c. 96, stealing anything from a D.-H., with menace to an inmate, is felony. (See BURGLARY.) It is sometimes a considerable aggravation of the offence or crime of assault, if committed within a D.-H.

Dwight, Timothy, D.D., an American divine, was born at Northampton, Massachusetts, 14th May, 1752. His father was Colonel Timothy D., and his mother was Mary, a daughter of Jonathan Edwards (q.v.). D. graduated at Yale College, 1769. After serving as chaplain in the revolutionary army, he was ordained over the Congregational Church, Greenfield, Connecticut, 1783, and in 1795 was elected President of Yale College and Professor of Theology. Here he powerfully opposed infidelity, and gave a fresh religious life to the college. His regular sermons formed the basis of his *Theology* (1818), a work which has made his name a household word both in England and America. D. died 11th January, 1817. Among his other works are *The Conquest of Canaan, an Epic Poem* (1785); and *Travels in New England and New York* (1821).

Dwi'na, or **Dzvina** ('the double river,' comp. Sansk. *Doab*), a river of Russia, and the largest navigable stream in the N. of Europe. It is formed by the Suchona from Vologda in the W., and the Vitchegda from near the sources of the Petchora in the E., which unite below Ustiug-Veliki, their joint stream then receiving the name D., and flowing N.W. to the White Sea. The Suchona, which is regarded as the head stream, rises to the N.E. of the Bielo Lake, and receives the Jug (250 miles) and the Luza before joining the Vitchegda, which has a previous course of 600 miles. It is thereafter increased by the waters of the Vaga (290 miles) on the left, and the Pinega (320 miles) on the right side. It has a total length of 1000 miles, and a basin of some 123,900 sq. miles. Near its mouth, at Archangel, it is 4 miles broad, and about 50 miles up it has a breadth of one mile, while it is navigable as far as the Suchona. Expanding into the D. Bay, it enters the sea through four deeply-furrowed courses. These again are enclosed by a bar, over which men-of-war can only pass at flood-tide. The D. is frozen from the middle of October to the end of April. The Jekaterinen Canal (1807) and the Alexander of Würtemberg Canal connect it with the Volga.

Dyak', **Dayak**, or **Djak**, the name of the aboriginal inhabitants of Borneo (q.v.), a people of Malayan origin still numbering some 1,800,000. They are divided into five principal groups—(1) the wild nomad Mankettas of the interior; (2) the Pari or Kajan in the E.; (3) the Bijadshu in the S.; (4) the tribes of the N.W. in Sambas, Landak, Sarawak, &c.; and (5) those of N. and Central Borneo, chiefly in Brunei and the river district of Kapuas, to which belong the pirate tribes Seribas and Batangulpar. In appearance the D. is robust and muscular, of a complexion varying from the lightest to the deepest brown, with a round face and long black hair. The average height of the men is 5 feet 2 inches. Several of the coast tribes have embraced Mohammedanism, but there is gross superstition everywhere, while polygamy, and even cannibalism, at no very distant time were practised, so it is said, although there seems to be no real foundation for the report as regards the latter. Perhaps, what may have given rise to the statements, vague and unsatisfactory as they are, was the custom of 'head hunting and feasting.' A Dyak in his vengeful spirit would track down his enemy, and, if successful in his attack, would behead his stricken foe. Then hastily returning to his home, he would summon his friends to a feast, at which the ghastly object would certainly occupy a prominent position on the floor of the house in the midst of the party. But for the strictest vigilance of the authorities, 'head hunting' would again be one of the pastimes of the Dyak *brave*. The Dyaks, who are yet but little civilised, are chiefly engaged in cultivating rice, and in bartering gold-dust, diamonds, rattans, gutta-percha, &c., with the Chinese. They are slightly clad, and occupy wooden houses which are often large enough to accommodate 100 persons.

Dyce, Alexander, an English author and editor, was born at Edinburgh, 30th June, 1798. Educated at the High School of that city and at Exeter College, Oxford, D. took orders, and for a time officiated as a curate; but in 1827 settled down to literary work in London. This work consists chiefly of editions, with notes and biographies, of the English dramatists who were predecessors or contemporaries of Shakespeare, such as Peele, Greene, Webster, Middleton, Beaumont and Fletcher, Marlowe, and Shirley; editions of the poems of Shakespeare, Pope, Beattie, and Akenside, for Pickering's *Aldine Poets*, with biographies of the poets; his discovery and publication of two old plays, *Timon* and *Sir Thomas More*; *Recollections of the Table-Talk of Samuel Rogers* (1856); and above all, his *Complete Edition of the Works of Shakespeare, the Text Revised, with Account of the Life, Plays, and Editions of Shakespeare, Notes, &c.*, (1853-58). D., who was also one of the founders of the Percy Society, for the publication of old English ballads, plays, and poems, died 15th May, 1869.

Dyce, William, R.A., painter, was born at Aberdeen, in 1806, and after an education at Aberdeen University, studied art at Rome. His first work was exhibited at Edinburgh in 1827, and three or four years later he exhibited in the Royal Academy, London. His 'King Joash Shooting the Arrow of Deliverance' made him an Associate of the Royal Academy (1844), and he was appointed Professor of Painting in London University. D. was very successful as a fresco-painter, and was employed to decorate Buckingham Palace, Osborne House, the Palace of Westminster, and the House of Lords. His fresco 'The Baptism of Ethelbert,' in the last-named edifice, is much admired. Among his pictures are 'Christabel' (1855), 'The Good Shepherd' (1856), and 'The Man of Sorrows' (1860). D. was elected R.A. in 1848, and died at Streatham, 14th February, 1864.

Dyck, Sir Anthony Van, who divides with Titian the foremost rank in portrait-painting, was born at Antwerp, 22nd March, 1599, commenced to study art under Van Balen at the age of ten, and at the age of fifteen entered the studio of Rubens. The genius that manifested itself thus early was rapid in development; and on the 11th February, 1618, when still a youth of only nineteen, he was admitted a Master by the Guild of Painters at Antwerp. Two years afterwards Rubens engaged him as his assistant, and in 1621, his fame having already spread to England, James I. took him into his service. In 1623 we find him in Venice, painting portraits and studying Titian by making copies of his works. He afterwards visited Rome, where he won the patronage of Cardinal Bentivoglio, and afterwards he removed to Genoa. During his Italian tour he laboured with great assiduity, and as he painted rapidly, he produced an immense number of works, chiefly portraits. On the 4th July, 1625, he landed at Marseille, visited Paris, and thence returned to Antwerp. There he remained from 1626 to 1632, during which period he produced his finest historical pictures and many of his noblest portraits. In the latter year he repaired to England, and entered the service of Charles I., who appointed him chief court-painter, with a salary of £200 a year, and soon after conferred on him the honour of knighthood. The English nobility following the example of the king, Van D. soon found himself practically the portrait-painter for the aristocracy of England. But even when his income was princely, and his state and equipage often surpassed those of the lords who sat to him, he was haunted by ambition, and desired to devote himself to some great historical work. With this view he proposed to decorate the walls of the Banqueting Hall, Whitehall; but the king would not accede to his terms. D., who had married Mary Ruthven, grand-daughter of the Earl of Gowrie, died at Blackfriars, 9th December, 1641. He was buried with great pomp in St. Paul's. Inferior in power of colour and in dramatic instinct to Rubens, he surpassed him in the intensity and elevation with which he expressed emotion. Ease, refinement, and high chivalric sentiment are the chief characteristics of his portraits. Of his historical works the chief is the 'Crucifixion' (1627) in the cathedral at Mechlin. 'This picture,' says Reynolds, 'may be considered as one of the first pictures in the world.' His 'Sampson betrayed by Delilah,' in the Vienna Gallery, is considered by Waagen to be, in a dramatic sense, his finest work. His 'Virgin and Child Enthroned,' in the same gallery, is unsurpassed for elevation of feeling and Titianesque glow of colour. D.'s portraits are to be found in all great galleries, and many splendid specimens adorn the collections of famous English families. The grandest of all his family pictures is that of Johann Duke of Nassau, with his duchess and children, now at Panshanger. He painted a number of portraits of Charles I., one of the finest of which is in the Vienna Gallery. The finest equestrian portrait painted by Van D. is that of Francesco de Monçada, Marquis of Aytona, in the Louvre. See Carpenter's admirable *Pictorial Notices*, &c. (Lond. 1848); *Lectures on Painting by the Royal Academicians*, with introductory essay and notes by R. Wornum, Esq. (Bohn's Scientific Library); *The German, Flemish, and Dutch Schools*, based on the *Handbook* of Kugler, remodelled by Dr. Waagen, and revised by J. A. Crowe.

Dye'ing (Old Eng. *deag*, 'a dye or colour') is the art of imparting fixed and permanent colours to textile substances. The art of D. is one of great antiquity, and of vast extent and importance. The substances to which dyes are imparted are very numerous, and varied in their character and in their behaviour towards D. materials, and the dyes (see DYE-STUFFS) are in their turn equally numerous and different in their composition, properties, and tinctorial effect. There is abundant evidence that the art of D. has been practised from the most remote antiquity. The Jewish patriarch Jacob gave to his favourite son Joseph a coat of many colours, and from the Mosaic narrative we find that the art of D. had attained great perfection in Egypt during the period of the Israelitish sojourn in that land. The fame of ancient Phœnicia, and the supreme commercial position of its capital, Tyre, were largely due to the purple dye of that city. On account of its brilliancy, beauty, and costliness, cloth dyed in this colour became the badge of royalty, and to this day the phrase 'imperial purple' is still employed. The purple of Tyre was obtained from certain molluscs of the genus *Murex*, two different shell-fish, according to Pliny, distinguished as the *Buccinum* and the *Purpura* being its source. It is supposed that the brilliant D. material, murexide, obtained from guano and other sources of uric acid, is identical with the Tyrian purple of the ancients. From very ancient times the population of Hindustan has occupied a foremost position in the knowledge of the art of imparting rich and permanent colours to textiles, and been famous for the skill and artistic effect with which it combined and harmonised the richest colours in woven and printed patterns; and not a little of the knowledge of D. enjoyed by Western nations at the present time has its source among Eastern peoples.

Any texture can only be said to be dyed when the colouring material is so incorporated with or attached to it that it is not affected by washing in hot water, and when it will bear a reasonable amount of exposure to light and moisture without sensibly bleaching or fading. The affinities of the various animal and vegetable substances for the colouring principle of dyes vary greatly. As a general rule it may be said that the animal fibres—silk and wool—take up colours much more readily, and assume more brilliant hues, than either linen or cotton. Silk and wool, moreover, are in many cases dyed permanent colours by preparations which, without the aid of mordants or chemical agents, only give a fleeting stain or discolourment to vegetable fibres. Most of the red colours derived from aniline, for example, attach themselves permanently to woollen textures on a simple immersion of the substance in the beck of prepared dye, no mordant being used. But in order to dye cotton with any of the aniline reds, the goods must first be prepared in a mordant, that generally used for dyeing magenta being the stannate of soda, tannin liquor, and alum. Such mordants are intermediate agents, which have at once an affinity for the fibre to be dyed and the D. material to be employed, and by the use of different mordants a variety of shades and effects are produced with the same D. material. Colouring matters become thus divisible into two classes—(1) Dyes which are fixed, and become permanent without the intervention of any mordant. These receive the name of *substantive* colours. (2) Dyes which require for their fixation the agency of a mordant, which class is known as *adjective* colours. A large proportion of dyes belong to the second class, and in many cases the brilliancy of substances of the first class (substantive colours) is greatly increased by the use of mordants.

Dyes are communicated to textile fabrics either by a process of mechanical fixation, or by a chemical combination between the fibre and the dye. Similarly the action of a certain class of mordants, which comprises salts of tin, iron, &c., is explained by a chemical combination between the mordant and the fibre on the one hand, and the colour and mordant on the other; and a second class of mordants act by mechanically glueing or fixing the colour to the fibre. The operations of D. may be generally summarised under the following heads:—(1) Dyes mechanically fixed. This class includes the dyes known as pigment colours, which are insoluble powders in a state of minute subdivision. They are fixed by means of albumen and similar substances, which, on the application of heat, become solid and insoluble, so that the dye and fibre are in a fashion glued to each other. (2) Dyes which unite directly with the fibre. In the case of such dyes a chemical attraction is set up between the dye and the fibre on the immersion of the fabric in the dye-bath, and the colouring matter is drawn to and permanently fixed on the texture. It is only animal fibres which can be thus dyed, and aniline reds, picric acid, and archil dyes on wools are examples of this style. (3) Dyes fixed to the fibre by means of a mordant. To this class allusion has already been made, and it embraces the most important and extensively-employed substances in the D. series. (4) Dyes fixed by oxidation, in which the dye is communicated to the fibre in a state of solution, and which on exposure to the air, or by other means of oxidation, develop their colour and become permanently fixed on the fibre. Indigo blue forms the best example of this class, it being applied to the substance to be dyed as a colourless solution of white indigo (or indigo which has taken up a proportion of hydrogen into its composition) and which, on exposure to air, rapidly absorbs oxygen and again assumes its blue colour. These classes include the principal means by which dyes are united to fabrics, but there are others which cannot be referred to any of them, and which are due to a variety of special chemical or mechanical agencies. The operations of D., as carried on in manufacturing establishments, are so varied and complex that no general outline of the industry can be given.

In practice, certain preliminary operations are necessary for the preparation of textile materials for D. In order that any material may take up a uniform colour it must be in a state of chemical and mechanical uniformity. Cotton and linen fabrics go through a prolonged and tedious series of operations in Bleaching (q.v.), and similarly silk and woollen fabrics are 'scoured' to extract grease and incrusting substances. Wool and silk are very frequently dyed in the yarn before weaving, cotton is more generally operated on in the web, and linen is not very often submitted to the process of D. at all. A considerable quantity of cotton is dyed Turkey-red in the yarn, and other colours used in gingham-weaving must also of course be yarn-dyed. After D., goods are prepared for the market by washing, starching, and calendering or beetling in the case of woven cotton fabrics, and by a variety of processes in the case of silk and woollen textures, according to the nature of the cloth.

Dy'er, George, an English author, was born in London, 15th March, 1755, educated at Christ Hospital and Emmanuel College, Cambridge, and after 1792 settled in London as a writer. He died 2nd March, 1841. D. was a good scholar, and a most industrious and useful author. He took a large share in the production of Valpy's edition of the classics (141 vols.), and wrote the *History of the University of Cambridge* (Lond. 1814), *The Privileges of the University of Cambridge*, &c. (Lond. 1824), and numerous other works.

Dyer, John, an English poet, was born at Aberglasney, Caermarthenshire, in 1700, educated at Westminster School, gave up law for painting, travelled in Italy, finally settled in

England, took orders, and became rector of Coningsby in Lincolnshire, where he died 24th July, 1758. He was a pleasing and natural poet. His works consist of *Grongar Hill* (1726), an excellent descriptive poem; *Ruins of Rome* (1740), a more ambitious and less successful effort; and *The Fleece*, a Georgic in praise of sheep-shearing and the wool trade. D. had considerable poetic power, which was recognised by Gray and Wordsworth.

Dye-Stuffs, the materials used by dyers for producing colours upon textiles and other substances. D.-S. which produce their tinctorial effect directly, without the intervention of any adjunct, are termed *substantive* dyes, while others which require a secondary agent or mordant are known as *adjective* colours. On this account a variety of substances which act as mordants ought to be included in the list of necessary D.-S., although of themselves they have no tinctorial virtues. The chief mordants used in dying are various salts of tin and iron, and to a less extent of other metals, aluminous compounds, sartrates, and tannic acid. D.-S. proper are very numerous; they are drawn from the mineral, vegetable, and animal kingdoms, and an increasing number of the most important and valuable D.-S. are obtained by chemical reactions from various products of coal-tar. The chief D.-S. will be noticed under their proper headings, and here they are only briefly named and classified according to their various sources.

Animal Substances.—Carmine and other lakes, the most brilliant and valuable of all red dyes, are obtained from cochineal, the female insect of *Coccus cacti*. Kermes is a red dye produced from a closely allied insect, *Coccus infectorius*. Lac dye is an E. Indian product, extracted from a resinous exudation produced on various trees by another species of *Coccus*. Galls also are produced by the puncture of insects, chiefly of the genus *Cynips*, on various species of oak and other trees. The purple of Tyre was a product of the molluscan genus *Murex;* and the murexide dyes of modern times are prepared chiefly from guano.

Vegetable D.-S.—The vegetable kingdom is the source of by far the largest number of the tinctorial agents used in industrial processes. The most important and extensively used vegetable D.-S. is madder, the roots of *Rubia tinctoria*, widely cultivated throughout the S. of Europe. With various mordants, it yields many shades of red, purple, brown, and black, and it is the material employed for dyeing the well-known Turkey-red. It contains two chief colouring principles, alizarin and purpurin, which are now largely prepared from a product of coal-tar, this being the first instance of the artificial production of natural organic D.-S. Munjeet is the roots of a closely allied plant, *Rubia munjista*, grown in the E. Indies, and possessed of properties similar to madder. The wood of several trees yields red colouring matters, the chief of which are logwood, obtained from *Hæmatoxylon Campechianum;* Brazil wood, yielded by *Cæsalpinia Brasiliensis;* peachwood, from *Cæsalpinia echinata;* and there are one or two other species of *Cæsalpinia*, all of which, with logwood, grow in the W. Indies and tropical America. From the E. Indies two red dye-woods are obtained, sappan wood from *Cæsalpinia sappan*, and red sanders, the wood of *Pterocarpus santalinus;* and camwood or barwood, the produce of *Baphia nitida*, is imported from the W. coast of Africa. Two varieties of wood yield yellow dyes of commerce: (1) Fustic, the wood of *Maclura tinctoria*, a tree growing in the W. Indies and Central America; and (2) Zante or young fustic, the wood of *Rhus cotinus*, found in Eastern Europe and Asia Minor, the leaves of which form the sumach used in dyeing and tanning. Among other vegetable D.-S., none is of greater importance than indigo, the well-known blue dye prepared from *Indigofera tinctoria* and *I. anil*, originally natives of the E. Indies, but now also cultivated in the W. Indies and tropical America. Closely allied to indigo in its properties is woad, a preparation from our native plant the weld or woad, *Isatis tinctoria*, which in remote times was used for staining the skins of our ancestors. Safflower, which yields a fine pink dye, is the flower-heads of a composite plant, *Carthamus tinctoria*, cultivated in the S. of Europe. Alkanet, a red dye-stuff, not now much used, is the roots of *Alkanna tinctoria*. A valuable series of purple dyes, known as archil, cudbear, and litmus, are yielded by various species of lichen, chiefly *Roccella tinctoria*, found wide-spread on the coasts of warm seas. Among materials yielding various shades of orange and yellow are quercitron, the bark of *Quercus tinctoria*, a N. American oak; yellow or Persian berries, the fruit of *Rhamnus tinctoria*, which grows in Asia Minor; annatto, a substance covering the seeds of *Bixa orallana*, the al or ak root, yielded by various species of *Morinda* in E. India, and saffron, which is the pistils of a variety of *Crocus*, a substance, however, more used in pharmacy than in dyeing. Catechu and various other substances containing tannin are used for browns and blacks in dyeing.

Mineral Pigments.—The most important of these for the use of the dyer is ultramarine, a rich blue colour which primarily was obtained from lapis-lazuli, but now is artificially prepared. Artificial ultramarine is a complex substance, varying in its constitution. (See ULTRAMARINE.) Prussian blue is obtained by mixing a solution of ferro-cyanide of potassium (prussiate of potash) with a solution of a salt of iron, such as the chloride. Other mineral blues are obtained from cobalt; greens are yielded by arsenical compounds; and preparations of chromium give both yellow and green pigments. Vermilion is to some extent used as a red pigment colour by dyers.

Artificial Organic Dye-Stuffs.—The whole of the colouring-matters we include in this group are derived from one or other of the numerous products obtained from the treatment of coal-tar, but chiefly from aniline. Although the industries connected with the production of aniline dyes may be said to be still in their infancy, they have already overshadowed all others connected with the production of D.-S. in extent and importance. All colours, and almost every shade of colour, have been produced in aniline colours, and a simple enumeration of the commercial varieties which have been brought into the market would occupy columns, while to detail the variety of processes employed would require many pages. Mauve, or Perkin's violet, was the first colour introduced, the process for obtaining which having been patented by Perkin in 1856; but the subsequently discovered Hofmann red (magenta or rosaline), while itself a much more important dye-stuff, is the starting-point for obtaining nearly all the endless aniline dies now in use. Carbolic acid or phenol, naphthalin, and anthracin, all derivatives of coal-tar, are also sources of several important D.-S., the latter being the source of artificial alizarin, to which allusion has already been made.

Dyke, or **Dike** (Old Eng. *dic*, Dutch, *dyk;* lit. 'the earth dug out and thrown up'), in engineering, a mound or embankment to protect low-lying land from inundation by the sea or a river. In the Netherlands, where much of the land is below the sea-level, the art of D.-building has been carried to great perfection. The character that the Dutch bear for indefatigable industry has been due mainly to their extraordinary and successful efforts to prevent the encroachment of the sea, and to reclaim the land through extensive systems of drainage by means of dykes and other engineering resources. Dykes may be seen along the coast of Holland and the courses of the principal rivers, especially at the mouths of the Scheldt, Maas, and Rhine. They also traverse the country in every direction, being of sufficient width at the summit to carry canals and roadways alongside. These mounds are formed of clay, earth, and sand, and slope gradually from the base. On the sea or river side the gradients are easy, and to prevent the earth being washed away, a protection of reed or willow matting is laid on and secured by stakes. On the land side they are strengthened by piles and planking, the interstices being filled in with stones, and the whole covered with earth and turfed. A height of 30 or 40 feet is frequently attained by such dykes. Those of the Helder, in N. Holland, furnish an example of D.-building on a stupendous scale. In Scotland, the term D. is applied to any stone wall which serves as a fence.

Dyke, in geology, the name given to extensive masses of volcanic or igneous rocks, forming wall-like partitions, which separate the edges of otherwise continuous strata or beds. Dykes generally occur in volcanic districts, and as seen in the neighbourhood of recent or active volcanoes, they may be traced abundantly branching out in every direction. Sometimes they may be traced continuously for long distances (as in a D. 50 feet thick extending across the Yorkshire coast N.W. for 10 miles), and they may be found either to occupy the place of dislocations or fissures, or to have cut their own way through continuous strata. Dykes are usually vertical or wall-like in form, and are hence distinguished from *veins*, which may be at any angle, and even run between horizontal strata. They vary in thickness from a few inches to 60 or 70 feet. If our means of tracing dykes were at all perfect, we should probably find that they could be in almost every case traced into the parent mass of igneous rock from which they had originally flowed. In the case of 'trap-dykes,' the sides present a remarkable evenness and uniformity; and this regularity of thickness and formation often tends to show that the dykes have merely filled up previously existent fissures, and have not themselves been the original cause of the solution of continuity between strata. They are common near coal-fields, and frequently perplex mining operations from opposing a barrier, often of great and indefinite extent, to the continuous nature of the coal-seams. See COAL. Dykes are interesting objects to the geologists from the effects they have had in altering the surrounding strata—coal, limestone, and other rocks having had their texture widely altered from the intrusion of these igneous formations.

Dynactinom'eter (Gr. *dunamis*, 'power'; *actis*, 'a sunbeam'; and *metron*, 'a measure'), an instrument for measuring the intensity of the light-rays of the sun and comparing the powers of object-glasses. See Claudet's paper in the *Philosophical Magazine* for June, 1851, and Hunt's *Photography*.

Dynam'ics (Gr. *dunamis*, 'force,' or 'power') is the science which investigates the action of force; or, more correctly, the effects produced upon a given material system by a given transformation of Energy (q.v.) in a given time. In its more restricted sense, it treats of the *motions* and *equilibrium* of particles and rigid bodies under the action of moving forces, thus naturally splitting up into *Kinetics* (q.v.) and *Statics* (q.v.). When used in connection with other departments of natural philosophy, it is qualified by a prefix, as, for instance, Aërodynamics, Electrodynamics, Hydrodynamics, Thermodynamics, to each of which the reader is referred for further information. The foundation of all dynamical science is Newton's Laws of Motion, containing as they do a clear philosophical conception of the three fundamental units of space, time, and mass, without a true knowledge of which advance is impossible. The progress or history of D. is inseparably connected with the names of Archimedes, Galileo, Kepler, Newton, Bernoulli, Huyghens, D'Alembert, Euler, Clairaut, Lagrange, Laplace, Hamilton, &c. The wonderful generalised theorems of Lagrange, whose mathematical insight has perhaps never been equalled, deserve especial notice; while the new and powerful Hamiltonian analysis, Quaternions, has in the hands of its originator and others yielded such striking results already, that it seems destined to extend and strengthen the science to a degree never before dreamt of, especially in the departments of electricity and light.

Dyna'mite, a name applied to several mechanical mixtures of the explosive liquid nitro-glycerine and absorbent matter, as infusorial earth, silica, Tripoli powder, mineral ash, &c., and the name is also given to other compounds which contain, in addition to the nitro-glycerine and an absorbent, substances semi-explosive, or decomposable on explosion, as resin, charcoal, sulphur, nitrate of potash, soda, and ammonia, &c. The disastrous explosions, often without assignable cause, which accompanied the employment and transport of nitro-glycerine after its discovery, and the great danger at all times attending its use, led A. Nobel, a chemist, to experiment upon its behaviour and explosive force when absorbed by inert substances. In 1867 he announced his discovery of a preparation, to which he gave the name D., which robs nitro-glycerine of its treacherous character, while it retains its high explosive power, thereby rendering this compound one of the safest, most useful, and most powerful explosives known. In the following year Nobel read a paper on D. before the British Association at Norwich. D. is manufactured in large quantities in Germany, France, and elsewhere on the Continent of Europe, in America, and in Great Britain. Its manufacture and circulation for industrial purposes in Great Britain began with the establishment of the British D. Company's factory at the Arde Hills, in Ayrshire, towards the end of 1872. This company manufactures on a large scale two kinds of D., respectively called No. 1 and No. 2. The operations of manufacture are briefly as follow: For D. No. 1, *kieselgühr*, a porous siliceous earth, obtained in Germany, capable of absorbing three times its own weight of nitro-glycerine, is resorted to. After being calcined to oxidise the iron in it, crushed to a fine powder, and sifted, 25 parts by weight of *kieselgühr* and 75 parts by weight of nitro-glycerine are kneaded into a paste and passed through a sieve. D. No. 1, so prepared, is a loose plastic powder, with a reddish-buff colour, due to peroxide of iron. In D. No. 2, nitrate of potash and carbon take the place of siliceous earth. The proper ingredients and proportions are —71 parts by weight of nitrate of potash, 10 parts by weight of powdered charcoal, 1 part by weight of paraffin, and 18 parts by weight of nitro-glycerine. The ingredients being thoroughly incorporated, form a black moist powder, drier than D. No. 1. Both descriptions of D. are put up into paper-cased cartridges, weighing from 1 to 4 oz., for storage or use. During storage the chief danger attending the use of these cartridges arises, for if the D. is not carefully prepared, any excess of nitro-glycerine exudes through the paper wrappers, and accidental explosion might result from slight friction or concussion. Parchment, however, is said to be impervious to nitro-glycerine, and in that case, it is manifestly a great advantage to use it for cartridges. D., unlike nitro-glycerine, cannot be exploded by heat, a spark, friction, or concussion, and if ignited in any other way than by violent percussion in the open air, and in *moderate quantity*, it burns quietly away. A special committee, appointed by the British Government, carried out extensive experiments with D., and it was shown that a box containing 50 lbs. did not explode when ignited by a light, but that a violent explosion followed in similar circumstances with a large quantity. D. explodes with a force ten times greater than its weight of gunpowder, if ignited by the detonation of a fulminating capsule or fuse. Roux and Sarran, in experimenting with Vouges D. No. 2, containing 50 per cent. of nitro-glycerine, found that ignition otherwise than by fulminating powder was followed, when the material was confined, by an explosion the effect of which was only equal to twice the weight of gunpowder, whatever the temperature or pressure. It seems, therefore, that an explosion of two orders can be excited in D., one exerting a force five times greater than the other.

D., like nitro-glycerine, congeals in cold weather, in which state it is less explosive, and does not exert the same power as when plastic; heat, however, restores it to its ordinary condition. In Great Britain the industrial applications of this valuable explosive agent are confined chiefly to mining and blasting. Its efficiency in detaching large masses of rock, in removing substantial obstructions in rivers, and in breaking up large masses of cast-iron, has been amply proved. As compared with gunpowder and gun-cotton, the amount of work performed by D. is greater, with a saving of time and cost. In Germany, France, and elsewhere, it is used for artillery purposes. A penalty of £100, besides 2s. per lb. of material landed, is attached to the importation of D. into Great Britain without a license, and all, or any part, of the D., whether actually landed or remaining in any ship or boat in connection with the breach of the law, may be forfeited.

The following is a list of kindred explosives licensed for manufacture, storage, and use in Great Britain:—

Horsley's Blasting Powder, A and B, consisting of nitro-glycerine (25 per cent.) and an absorbent powder, composed of chlorate of potash, nutgalls, and charcoal.

Brain's Blasting Powder, consisting of nitro-glycerine (40 per cent.) and a pulverised preparation of fine charcoal, sawdust, and mixed chlorate and nitrate of potash.

Lithofracteur, which chiefly differs from British D. No. 2 in containing all the elements of gunpowder. An analysis by Professor Able gives the typical composition as nitro-glycerine, 42 parts; sulphur, 4; nitrate of soda, 25; sand, sawdust, charcoal, &c., 29. See also CORDITE.

Dynam'ometer, an instrument for measuring the effort exerted or the work done by a machine. There are three classes of dynamometers, viz.—(1) Those which merely indicate the effort exerted, leaving the distance and time through which it is exerted to be separately noted. Some machines of this class record the effort on paper by self-acting mechanism, as well as indicate it. (2) Those which record both effort and distance, generally in the form of a curve, of which the ordinates represent the magnitudes of the efforts exerted or resistances overcome, and the abscissæ the distances moved through,—the area consequently giving the product of these two, *i.e.*, the work done. (3) Those which, by means of suitable apparatus, record the work done; the product, that is, of the effort (or resistance), and the distance through which it is exerted. These are called integrating dynamometers. In Class 1 the ordinary friction brake and some kinds of spring balances are used for the purpose of measuring effort; to Class 2 most dynamometers used for measuring traction belong, and the steam-engine indicator; to Class 3, Ashton and Storey's power meter, &c.

Dyoor ('men of the woods'), a race of Central Africa, in the region of the Upper Nile. The Dyoors are of a noble negro race, with small development of jaw and graceful slimness of limb. They occupy a small territory, and are not over 20,000 in number. Occupying a ferruginous district, they are famed for their skill in ironwork, and provide the coin which circulates in the whole Upper Nile region—*i.e.*, spades and spear-heads. Like the Shillooks of the N., from whom they are derived, and whose dialect they use, the Dyoors can gain a livelihood in various ways. Besides working in iron, they farm, hunt, and fish, and are quick and ingenious in constructing wickerwork and pottery. The Nubian slave-dealer has greatly injured the prosperity of the Dyoors. The river D. traverses the country of the same name, and is a large tributary of the Ghazal, which it joins about 150 miles S.W. of the confluence of the latter with the Nile.

Dy'sart (Lat. *desertum*, in ecclesiastical Latin, 'a religious solitude'), a seaport and royal burgh in Fifeshire, Scotland, on the Firth of Forth, 12 miles N.N.E. of Edinburgh, has some ship-building, flax-spinning, damask-weaving, coal and iron-stone mining, fishing, &c. It is quaintly built, on a rocky site, and attracts summer visitors. Along with Kirkcaldy, Burntisland, and Kinghorn, D. forms the Kirkcaldy District, which sends one member to Parliament. D. was formerly connected with the monastery of Culross or Kirkcaldy, and near to it is the cave of St. Serf. Pop. parl. burgh 12,849; town 3022.

Dys'entery (Gr. *dus*, and *enteron*, 'the intestine') is a severe inflammation of the large intestine, accompanied with much fever and great prostration. D. is rare in temperate climates, but common in the tropics, and is one of the most fatal diseases to armies in the camp. Its origin is often ascribed to low, damp, malarious districts. The treatment consists in a change of air and the use of astringents, especially gallic acid and opium. Ipecacuanha in scruple or drachm doses is very beneficial, and is much used in India.

Dyspep'sia (Gr. 'difficult digestion') is a term used by medical writers for Indigestion (q.v.).

Dyspnœ'a (Gr. 'difficulty of breathing') is a shortness of breath that accompanies all thoracic diseases.

Dytis'cus (from Gr. *dutēs*, 'a diver'), a genus of *Coleoptera* (q.v.) or Beetles included in the section *Hydradephaga* or Water-beetles, in which the legs are adapted for swimming, the two hinder pairs being flat and fringed with hairs. The body is oval and flattened, and the mandibles or larger jaws of strong make. In D. the front legs are short, and the antennæ elongated. The tarsi of the males are wide and flattened. *D. marginalis* and *D. dimidiatus* are two familiar species, common in our brooks and ponds. The spinacles or breathing apertures in these animals are set high on the body, and are covered by the elytra or wing-cases, beneath which a supply of air for respiration is carried. These beetles are carnivorous in habits, as also are their larvæ. *D. marginalis*—the great water-beetle—is about 1¼ inch in length.

Dyv'eké, or **Duveké** (Dutch, 'a dove'), the mistress of Christian II. of Denmark, was the daughter of Sigbrit Wylms, an innkeeper, and was born at Amsterdam, 1488. She first met her royal lover at Bergen in 1507, followed him to Copenhagen (1513), and there the guilty relation was renewed notwithstanding his marriage with Isabella, daughter of the Emperor Karl V. The subsequent interference of the ambitious Sigbrit Wylms with public affairs seems to have stirred the hatred of the nobles, and either to this cause or to the baffled passion of Torben Oxe, governor of the palace, is ascribed a plot to poison D., which was successfully carried out in 1516. Among the many works of fiction founded on this story are *Dyveké*, a well-known tragedy by Samsöe, a Dane (Ger. transl. Leipz. 1810); *Täubchen von Amsterdam*, a tragedy by Marggraff (Leipz. 1839); and *Sybrecht Willms*, a romance by Ida Frick (Dresd. 1843).

Dy'vour (from the Fr. *devoir*, 'to owe'), and **Dyvour's Habit,** are terms of Scotch law. According to Skene, a D. is a bankrupt 'who, being involved and drowned in debts, and not able to pay or satisfy the same, for eschewing of prison and other pains, makes cession and assignation of all his goods and gear in favour of his creditors, and does his dyvour and duty to them, proclaiming himself bairman and indigent, and becoming debt-bound to them of all he has.' During the 17th c. dyvours were appointed by orders of the Court of Session to sit on a pillory at stated times near the market-cross of Edinburgh, in a coat or upper garment, half yellow half brown, with a particoloured cap or hood on the head. In granting the Cessio Bonorum (q.v.) it was the practice, until the passing of the Act 6 and 7 Will. IV. c. 56, to dispense with the habit, and by that statute it is abolished.

Dzigg'ethai, or **Koulan,** a species or *Equidæ* or *Solidungula* forming one of the species of wild asses inhabiting Persia, India, Mesopotamia, &c. This animal is somewhat mule-like in appearance. Its colour is reddish-brown in summer, the tints becoming greyer in winter, while a black stripe runs along the spine. The D. is a wonderfully swift and agile animal, and is hunted in Persia and India.

E.

E the second vowel and the fifth letter of the English alphabet. It exactly corresponds to the Semitic *He*, except that all the derivative alphabets have followed the Greek, which turned it to face the right, instead of the left, E instead of Ǝ. In its origin it is properly a weakened form of *a*; and many languages, especially those of India, are almost able to dispense with its use. It is particularly liable to be interchanged with the stronger vowel *a*, in passing from one cognate language to another, and consequently its philological value is small. The Greek alphabet in its later days possessed two forms of E—*epsilon*, or short E, the original letter borrowed from the Phœnician; and *ēta*, or long E, the form of which as a capital was H, the Semitic *Cheth*, or hard aspirate.

The pronunciation of E is very irregular, especially so in English. Its normal phonetic value is that of an open or long *a* or *ay*, which is hardly heard at all in English, unless in such exceptional words as 'where,' 'grey,' 'vein,' but may be universally found in Italian and French. The sound may be either short, as in French *et*, or long, as in *père*. By far the most common sound of E in English is that which is really the appropriate value of the stronger vowel *i*, which is often expressed in transliteration from foreign languages by a double E. This may be exemplified by 'me' and 'see.' This sound is also maintained for most of the diphthongs formed with E, as 'read,' 'siege,' 'receive.' But the English usage is too variable to allow of any universal rules. In Modern Greek, both the short and long E, the vowels *i* and *u*, and the diphthongs *ei* and *oi*, are all pronounced like the short English E. It must also be noticed that this letter has a strong tendency to become mute at the end of words, *i.e.*, to lose its own sound altogether; while it commonly lengthens the vowel of the preceding syllable, as in English 'cane' or French *mère*. At the same time it softens *c* or *g*, if those be the immediately preceding letters, as in 'face' and 'cage.' In some words adopted from French or Latin, as 'examine,' 'preterite,' the final E is simply useless. As an abbreviation, E most generally stands for East. It is also found in *e.g.*, for *exempli gratiâ*; and *i.e.*, for *id est*.

E, in music, a note a major third above C. The vibration ratio E : C is equal to $\frac{5}{4}$.

Ead'gar (mod. *Edgar*), an English king, the second son of King Eadmund, was born about 940, and in 956 was chosen king of Mercia and Northumberland in place of his brother Eadwig, who had enraged the churchmen, and especially Dunstan (q.v.), by an uncanonical marriage. In 960 Wessex yielded to his rule. Under E., whose policy was solely moulded by Dunstan, civil strife and the Danish descents ceased, and the English kingdom was consolidated. Among his titles was *Anglorum Basileus*, and it is said that once eight kings rowed his barge on the Dee. He is reported to have freed Wales from wolves by imposing an annual tribute of 300 wolves' heads on the Welsh. See DUNSTAN.

Eadgar the Ætheling, a grandson of Eadmund Ironside, chosen king by the English in 1066, after the battle of Hastings. His chief supporters, Eadwine and Morkere, Earls of Mercia and Northumbria, being forced to retreat before the Duke of Normandy, E. headed the deputation which offered William the crown, but afterwards fled to Scotland, where his sister Margaret married Malcolm Canmore. The Northumbrians, in league with Sweyn of Denmark, proclaimed E. king of England, but were unable to cope with William, and E. again sought refuge with Malcolm. He was afterwards a dependent at William's court, and became a friend of Robert Duke of Normandy. On Malcolm's death, in 1097, he drove Donald Bain from the Scottish throne, on which he placed his nephew Edward as an English feudatory. He is said to have accompanied Duke Robert to the Holy Land, and in the struggle between Robert and Henry I. was taken prisoner, but shortly freed by Henry. William of Malmesbury says he lived to an old age, but the date and manner of his death are unknown.

Ead'mer of Cant'erbury, a figure of some note in English history and literature, flourished in the early part of the 12th c. He became prominent in the struggle between the sees of Canterbury and York for supremacy over the Scottish Church. When King Alexander I. desired a bishop for the vacant see of St. Andrews, E. was sent by Archbishop Ralph in 1120. He was elected; but the king, wishing to have an independent Scotch bishop, would not permit his return to Canterbury for consecration. E. accordingly went back to his monastery; but repenting afterwards of this step, wrote to the king expressing his willingness to return. Alexander, however, declined; and the see of St. Andrews remained vacant till E.'s death, which took place in 1123 or 1124. His chief literary works are the *Vita Anselmi* (Life of St. Anselm), and *Historia Novorum* (history of his own times). In the *Vita* we see the dim reviving of a national spirit in our literature. The *Historia* is in the main reliable, and contains facts of interest not to be found elsewhere. A selection of E.'s writings, edited by the monks of St. Maur, is published at the end of Father Gerberon's edition of Anselm's works (Paris, 1675 and 1724). E. was a voluminous ecclesiastical biographer. Among his lives of saints are those of St. Dunstan, St. Wilfrid, and St. Oswald. These are published by Wharton in the *Anglia Sacra*, part ii. (Lond. 1691). An account of E.'s relation to Scotch church history is contained in Grub's *Ecclesiastical History of Scotland*, vol. i.

Ead'mund (mod. *Edmund*) **Ironside**, son of Æthelred the Unready, was born in 989. When Cnut invaded England on Æthelred's death in 1016, E. was chosen king by the citizens of London, and opposed the Danes with great bravery and energy. After defeating Cnut at Gillingham, Sherston, Oxford, and Brentford, he was signally beaten at Assandun, Essex, and agreed to resign Mercia and Northumbria to Cnut, himself retaining the rest of the country. Shortly after, E. was poisoned at Oxford, through the agency of Cnut or of Eadric of Mercia, in 1016, and Cnut became sole king of England. The great-granddaughter of E., Matilda, was married to Henry I.

Ead'ward (mod. *Edward*) **the Confessor**, son of Æthelred the Unready and Emma, daughter of Richard Duke of Normandy, was born in 1004, and lived in exile at the Norman court until 1042, when he became king of England on Harthacnut's death. His accession was largely due to the adroit Godwine, Earl of Wessex, whose daughter Eadgyth was married to E., and who became for a time virtual ruler of the country. E. greatly favoured the Normans frequenting his court, promoting them to high posts in the church and state. One of these unpopular strangers—Eustace, Count of Boulogne—had an affray with the men of Dover, whom E. ordered Godwine to punish. He refused, levied an army, and demanded the dismissal of the Normans; but being unable to resist the king, withdrew to Flanders, whence he was recalled in 1052 to allay the indignation of the people. Godwine died shortly afterwards, and his son Harold became actual ruler of England until E.'s death in 1066. In this reign the *Danegelt* was repealed, a digest of the laws formed, and a certain polish communicated to the English through intercourse with Normandy, while the growing influence of a Norman party prepared the way for the Norman conquest. Under E. the country was prosperous; two wars were carried on against the Welsh, and a successful expedition was sent into Scotland to support Malcolm Canmore against the usurper Macbeth. See Freeman's *History of the Norman Conquest* (Lond. 1876), and Luard's *Life of Edward the Confessor* (Lond. 1858).

Eadwi'ne (mod. *Edwin*), an English king whose history forms one of the most beautiful and romantic tales in Bede. He was the son of Ælla, king of Deira, and was born in 586. On Ælla's death in 589, E.'s uncle, Æthelfrith, seized the crown of Deira, and E. spent his youth as a homeless outlaw, until Rædwald, king of E. Anglia, espoused his cause, defeated Æthelfrith, and made him monarch of all Northumbria. According to Bede, whose account of E. is clearly inwoven with fiction, E. was at Rædwald's court visited one night by a mysterious man, who foretold his greatness if he should espouse a new faith, and bade him remember a certain sign. E. was soon the most powerful king in England, became overlord of the country from the English Channel to the Forth, where he founded Edinburgh (' Edwin's burgh ') and for eight years ruled so sternly and justly that it was said 'a woman with her babe might walk scatheless from sea to sea in E.'s day.' In 625 he married Æthelburh, a Christian princess, sister of Eadred, king of Kent. She brought with her to Northumbria various churchmen, the chief being Paulinus (q.v.), the great missionary of the N. of England. After a narrow escape from an assassin sent by Ceawlin, king of Wessex, whom he forthwith defeated, and, according to Bede, a second appearance of the mysterious man, E. was baptized at Eoforwic (York) in 627, and strongly forwarded the spread of Christianity in England. Penda of Mercia, however, a fierce pagan, bent on shaking off the Northumbrian overlordship, defeated and slew E. at Hatfield in 633, a battle which delayed the conversion of the North and Midlands. E.'s reign, from its connection with the Christianising of England, is one of the most important in English history. See Freeman's *History of the Norman Conquest*, vol. i.

Eagle (Fr. *aigle*, Lat. *aquila*, from the root *ac*, ' sharp, swift '), a genus of Raptorial birds, forming the type of the sub-family *Aquilinæ*, which group in its turn is included in the family *Falconidæ* As a sub-family, the *Aquilinæ* are recognised by their bill being straight at the base, and acutely arched towards the tip; the edges being wavy, and the nostrils being situated in front of the Cere (q.v.). The tail and tarsi are elongated, and the inner toe is of stronger make than the other three toes. The genus Aquila, including the most typical eagles, is recognised specially by the large oblique nostrils, by the wings having the fourth and fifth quills longest and of equal length, and by the tarsi being feathered to the bases of the toes. The tail is broad and rounded. The E., known popularly as the 'king of birds,' has been held to represent all that is graceful and powerful in the bird creation. It is eminently rapacious, carrying off for prey many small animals, and even attacking man himself when it is roused or irritated. The nest, or *eyrie*, is built in an exposed situation, and is rudely constructed of sticks and other materials loosely aggregated together. The eggs usually number two, and are of a whitish colour. The most celebrated and typical of the eagles is the golden E., found in both Old and New Worlds. This bird may attain a size of 3½ feet in length, the expanse of wings measuring 9 feet. The females are larger than the males. The colour is a general blackish brown, the head and neck feathers being tinted of a golden-red hue. The legs and thighs are greyish brown, and the tail a deep grey with brown bars; the feet and cere are yellow. In England the E. is extinct, but it occurs in the N. of Scotland and N. of Ireland. Other species of true eagles are the imperial E. of Asia and S. Europe, the bold E. of Australia, the former known by a white patch on the scapular feathers, and the latter by the reddish hue on the back of the neck. The reptile E. occurs only in S. America, where it lives in the dense forests and hunts for its food, consisting of birds and reptiles. The booted E. is found in Asia and Central Europe, and is of a dark-brown colour. To the allied genus *Spizaëtus* belongs the martial E. of S. Africa; while the crested or harpy E. is also included in a different group. The Sea-Eagles and Bald Eagles (q.v.), belong to the genus *Haliaëtus*. The length of these is about 3 feet, and the spread of the wings over 7 feet; the female bird being larger than the male. These species are to be found around the American coasts, and in most parts of the Eastern Tropics. They feed chiefly upon fish. The name E. is also applied to birds belonging to widely different genera from the above. Of the latter, examples are found in the E.-Hawks (q.v.); the New Holland White E., and other forms.

Reptile Eagle.

Bald Eagle.

Eagle, in heraldry, is one of the earliest charges, and holds the same position among birds as the lion among beasts. It was the emblem of St. John, of regal power, and of courage and magnanimity, and was generally borne *Displayed* (q.v.). When represented as double-headed, it is sometimes spoken of as the *imperial*; when single-headed, as the *royal* E.

Eagle, as a military standard, is first mentioned in Xenophon, who states that it was customary in Persia to have a golden E. with outspread wings borne on a spear in front of the army. This custom of the Persians was adopted in Egypt under Ptolemy Soter. The emblem of the Republic, as well as that of the Empire of Rome, was the E. armed with lightnings—the symbol of Jupiter. This device was adopted as the Roman military standard in the second consulship of Marius (B.C. 104). The E. of the Roman legions was fixed upon a long shaft or spear, with outspread wings, as about to soar into the sky, grasping the thunderbolts in its talons, and, in later times, surrounded with laurels. The eagles were first made of wood, afterwards of silver, and later of gold. On the march they were always carried by the cohorts of the van; in camp they stood in the Prætorium, fixed in the earth. Desertion or loss of E. was punished with death. As a military standard during the Middle Ages the E. had no more than an heraldic importance. Napoleon I. (1804) revived its use in the army as a fitting symbol of imperial France. The French E. is the Golden E. of Zeus plumed for flight, and bearing the lightnings in its claws. Under the Bourbons it was superseded by the tricolor, but it was restored under Napoleon III. by decree 1st January, 1852. The E. has also been adopted as their national military ensign by Russia, Germany, Austria, and the United States of America. The black double-headed E. of the Latino-German empire is represented with a head and neck looking to the right, and another head and neck looking to the left; holding the sceptre in the right talon, and the imperial globe in the left. This E. was originally single-headed, and is said to have been adopted by Karl the Great, at his coronation in Rome, as a symbol of the empire he had founded. To indicate the E. and W. Roman Empires, or the union of the imperial and kingly office, the double-headed E. first occurs on an imperial coin struck in 1325 by Ludwig of Bavaria.

Eagle, an American gold coin of the value of ten dollars, and weighs 258 grains, and contains 232·2 grains of fine gold. The half-eagle is worth five dollars.

Eagle Hawk, a borough in Victoria, $4\frac{1}{2}$ miles from Sandhurst (q.v.), and 105 miles N.W. of Melbourne (q.v.). It is in the heart of a very important gold-mining district. Pop. 7315, of whom most are engaged in mining.

Eagle-Hawk, a name given to certain species of Raptorial birds of the genus *Spizaëtus*, nearly allied to the *Aquilæ* or Eagles (q.v.). In this group the tarsi are long and slender, and the toes are long and powerful. These birds otherwise resemble the eagles, and inhabit Asia, S. America, and Africa. A good example of the group is the crested E.-H. of Guiana.

Eagle, Order of the Black, a renowned Prussian order of knighthood, was founded in 1701 by the elector of Brandenburg, on his coronation as King of Prussia. Excluding the royal family, the number of knights was at first restricted to thirty, but is now undetermined. The insignia are a blue cross and a B. E. between each of the eight arms of the cross. Knights of this order are also knights of the **Order of the Red Eagle,** founded by the Markgraf of Bayreuth in 1734, incorporated with the order of the B. E. in 1791, and reorganised in 1810.

Eagle-Owl.

Eagle-Owl, or **Great Owl,** a species of Raptorial birds belonging to the sub-family *Buboninæ* or 'eared' owls, and to the family *Strigidæ*. The genus *Bubo* is distinguished by the moderately-sized bill; by the wings having their second, third, and fourth quills longest; the tail being of moderate size and rounded, and the tarsi thickly feathered. The E. O. is found in N. Europe, and also occurs in Italy and Turkey. It is rare in Britain. Its average length is 2 feet, and its usual colour is a yellow tinged with brown, and marked on the upper parts with black or dark-brown bars and spots. The beak and claws are black. The Virginian Eared Owl is the E.-O. of America. The throat in the latter is pure white in colour.

Eagle-Wood, or **Aloes-Wood,** the wood of plants belonging to the natural order *Aquilariaceæ*, in which the trees have exstipulate leaves and exalbuminous seeds. They are natives of tropical Asia. The wood above named affords a fragrant resin, which, as a remedy for gout, has some repute in India. It is probably the *Ahalim* or *Ahaloth* of the Old Testament, and the 'aloe' of the New Testament, translated 'aloes.'

Ear (Old Eng. *edre*, Ger. *ohr*; comp. Lat. *aur-is*). The organ of hearing is usually divided by anatomists into three parts—the external ear, the tympanum or middle ear, and the internal ear or labyrinth. The first two are not essential to hearing, the mechanism of which is, strictly speaking, in the third portion or labyrinth. The external ear consists of that part of the outer ear projecting from the head called the *pinna*, which is apparently for the purpose of collecting and reflecting waves of sound into the external auditory passage or *meatus*, which, in turn, conducts the sound to the membrane of the tympanum. This external auditory canal is $1\frac{1}{4}$ inch in length, and is formed partly of cartilage and partly of bone. It is lined by an infolding of the skin, in which are numerous glands, which secrete the 'wax of the ear.' The middle ear, or tympanum (or drum), is a small cavity in the temporal bone, shut off from the external auditory canal by the membrane of the drum, but communicating with the air in the pharnyx, or throat, by means of a channel called the *Eustachian tube*. In this little chamber we find a chain of small bones, which communicate the movements or vibrations of the membrane of the drum to the labyrinth. This chain consists of three bones, namely, the *malleus*, or mallet (*a*, Fig. 2), which is attached to the membrane of the drum; the *incus*, or anvil-bone (*b*); and the *stapes*, or stirrup (*c*), the base of which is fixed into an oval opening in the labyrinth, termed the *fenestra ovalis*, or oval window, immediately below *m* in Fig. 1. Between the bones there are well-formed joints, and this arrangement has been proved by Helmholtz to form a lever which communicates to the internal ear the oscillations of the *membrana tympani* in such a manner as to diminish their extent or amplitude, while it increases their intensity.

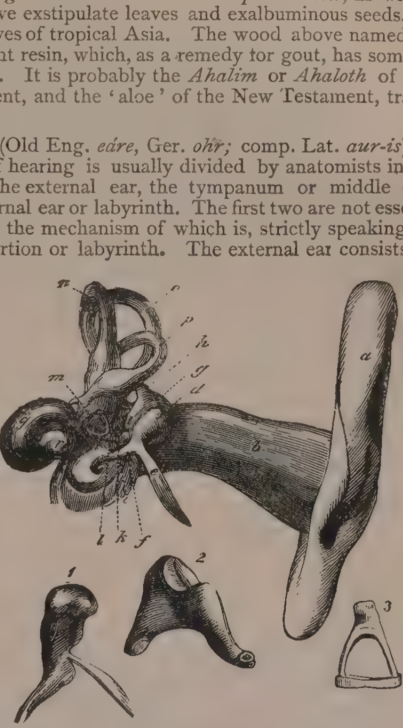


Fig. 1.—The parts of the Auditory Apparatus.

a, external ear; *b*, auditory meatus; *c*, membrane of the tympanum; *d*, head of the malleus; *e*, bony process, and *f*, handle, of the malleus; *g*, incus; *h*, and *i*, short and long processes of the incus; *k*, and *l*, articulation of incus and stapes; *m*, stapes; *n*, *o*, *p*, semicircular canals; *q*, cochlea; *r*, apex of the cochlea; 1, 2, 3, malleus, incus, and stapes, separated from each other and highly magnified.

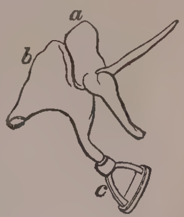

Fig. 2.

The internal ear is placed in the petrous portion of the

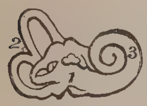

Fig. 3.

temporal bone, and on account of its complicated structure it is usually called the *labyrinth*. It consists of a cavity hollowed out of the bone, called the *osseous* labyrinth, in which there is a membranous structure of the same form, called the *membranous* labyrinth. Between the membranous and osseous labyrinths we find a fluid called *perilymph*, while in the interior of the membranous tube there is another fluid known as the *endolymph*. The osseous labyrinth is divided by anatomists into three portions, namely, a central part called the *vestibule* (1) (Fig. 3), with three canals, called from their form the *semicircular canals* (2), on the one side, and a complicated coiled part on the other side, named, from its resemblance to a snail-shell, the *cochlea* (3). In the interior of the osseous labyrinth (Fig. 3, natural size) we find corresponding portions of the membranous labyrinth, which supports ramifications of the auditory nerve. The ultimate structure consists of minute hairs immersed in the endolymph, and connected by the medium of cells, with the terminations of the auditory nerves. These hairs are believed to take up the vibrations communicated to the endolymph by the chain of bones or through the bones of the head, and to vibrate so as to affect the terminations of the nerves. The nerve filaments convey the impression to the brain, and the effect is a consciousness of sound. By most authorities the vestibule is believed to be the part of the ear by which we appreciate sound merely as sound, without reference to pitch or direction. In this part of the ear we find small masses of crystals of carbonate of lime called *otoliths*, which, lying in the endolymph, may be supposed to touch the hair-like bodies already referred to, and thus through them excite the nerves. The vestibule is the first part of the internal ear met with in the animal kingdom. The functions of the semicircular canals are not understood. Some have supposed that as they are placed in the three directions of space, they may assist in the comprehension of the *direction* of sound; others that they have to do with the sense of rotation; while a third class of physiologists suppose they assist us in the sense of equilibrium in different positions. It may be safely asserted that no good and sufficient proof has been offered for any of these views, but the balance of evidence shows that they are really connected with hearing, and not with a mere sense of equilibrium or of rotation. The cochlea is by far the most complicated part of the internal ear. The membranous portion consists of a tube called the *ductus cochlearis*, so placed in the osseous cochlea as to have a space on each side of it, the one commencing at the vestibule being called the *scala vestibuli*, or vestibular staircase, and the other termed the *scala tympani*, as it terminates at a round opening closed by a membrane known as the *fenestra rotunda*, or round window, on the other side of which is the cavity of the tympanum. In the *ductus cochlearis* we find a remarkable structure known as the *organ of Corti*, far too complicated and minute to be fully described here. It was first discovered by the Marquise di Corti, an Italian nobleman, who devoted much of his time to microscopical research. Its intimate structure is not fully understood, but suffice it to say that in it we have an apparatus specially fitted for the appreciation of sounds of different *pitch*, and of different *quality* or *timbre*. The modern theory, propounded by Helmholtz, is that in the cochlea there are numerous delicate structures tuned to vibrate to notes of a particular pitch. For further details regarding the anatomy of the E., see *Quain's Anatomy*, vol. ii., and *Sensations of Tone*, by Helmholtz, translated by Alexander J. Ellis.

Ear, Comparative Anatomy of.—In the lower animals organs of hearing are probably represented for the first time, as we proceed from lower to higher forms, in the cœlenterate *Medusidæ*, or jellyfishes, and allied forms. In these animals we meet with sacs containing fluid, with calcareous or living particles, named *otoliths*, therein suspended. This simple apparatus is evidently intended, when placed in communication with a nerve filament or its equivalent, to intensify the vibrations of sound, and to convey an auditory impression to the animal. These *auditory vesicles*, as they are called, exist, for example, around the margin of the bell-shaped disk in the jellyfishes. This simple form of sensory apparatus persists with little modification through invertebrate forms. Thus, in many Rotifera (q.v.) or 'wheel-animalcules,' a similar sac exists near the nervous ganglion. In *Annelidæ* or worms similar vesicles occur, as seen in the *otocysts* or hearing-sacs of *Arenicolæ* or lob-worms, which are placed on the nerve-cords which surround the œsophagus or gullet. In *Anthropoda*, such as crustaceans, ears may be represented (as in the lobster) by sacs containing otoliths, and also stiff hairs or bristles (*acoustic bristles*), which latter may be attached to the otoliths. The auditory organ in the lobster exists as an open sac at the base of the lesser antennæ or 'feelers,' and is supplied by a branch of the internal antennary nerve. Some nearly allied forms (*e.g.*, shrimp, *Crangon*) want organs of hearing, and in others (*Mysis* or opossum shrimps) the ear-sac is closed. In spiders and their allies (*Arachnidæ*) no specialised organs of hearing have been discovered, but in some few insects (crickets, locusts, &c.) they have been demonstrated. In the former of these insects auditory vesicles, with acoustic hairs, exist under the 'knee' joints of the front pair of legs, and in locusts on the same pair of legs. Some flies possess allied organs, whilst in many other insects the function of hearing has been ascribed to rod-like bodies borne on the antennæ or feelers. In *Myriapoda* (q.v.) (centipedes, &c.), no ear-vesicles apparently exist. In mollusca, organs of hearing are generally developed. In Lamellibranchiates (q.v.) they exist on the pedal nerve-ganglia, and appear as sacs or vesicles filled with fluid, lined with epithelium, and containing otoliths which rotate rapidly during life. In Gasteropods (q.v.) paired ear-vesicles exist behind the eye, and close to the pedal ganglia. As many as a hundred otoliths are found in *Pleurobrachiæ*, and forty in *Doridæ* or sea-lemons. In the river snails (*Paludinæ*) the ear-sac can be moved by special muscles, and an outer ear-passage is imitated in some snails. In cephalopods or cuttlefishes ear-sacs exist as rounded vesicles, usually placed near the head cartilage. It contains one or more otoliths. The organ of hearing in the various groups of vertebrates will be found to be noticed under such heads as ORNITHOLOGY, ICHTHYOLOGY, REPTILIA, &c.

Ear, Diseases of. The external E. is occasionally the seat of special affections, such as fibrous tumours, gouty concretions in gouty subjects, hypertrophy in the case of idiots, and sanguineous tumours following or accompanying attacks of acute mania. Inflammation of the external E., *otitis* or *earache*, is usually a rheumatic affection, characterised by intense pain, and generally associated with hemicrania. In *otorrhœa* there is a fetid muco-purulent discharge, owing to inflammation of the mucous surfaces or necrosis of the petrous portion of the temporal bone. The E. is also occasionally the seat of polypi. For diseases of the internal E., see DEAFNESS.

Ear-Cockles, also designated **Purples** or **Peppercorn**, a disease in wheat, produced by the *Vibrio tritici*, a species of Infusoria, in form like a worm, only more attenuated at both extremities, and of light-yellow colour. Its eggs deposited in the kernel turn at first into an unhealthy dark-green, which changes into black, and the shape becomes like that of a peppercorn. A white cottony substance fills the grain, and this dissolved in water sets the *vibriones* free in thousands. As many as 50,000, Henslow estimated, may exist in one grain, but this calculation is made at random. Farmers are much troubled with these *vibriones*, as their vitality, in dry wheat, lasts seven years, and in sowing there is nothing to indicate the presence of the animalcula, which, developed by the germination of the grain, blackens the fields in harvest.

Earl. According to Cruise (*On Dignities*, p. 53) there were three kinds of E.—(1) Where the dignity was annexed to the seisin of an entire county with *jura regalia*, including jurisdiction and the right to all royal services and estreats; this was a Palatine (q.v.); (2) where only the title was taken from a county, but no land was held, the revenue (*tertium denarium*) being derived from the profits of the pleas in the county court; (3) where the crown granted land to be held *per servitium unius comitatus*. *Comes* is the Norman equivalent of E., and is of course used in all the charters after the

Conquest. Earls are now created by letters patent, and the title is often derived from names of private estates or family names. An earldom, like a barony, was held *in capite*, the principal mansion, or, where there was none, a royal castle, of which the E. was governor, being *caput comitatus*. The 'relief' of an earldom generally consisted of arms and horses. The possessions of an E. were often called *honours;* hence the honour or estate of Richmond, Arundel, &c. Earldoms were held by the tenure of grand-serjeantry, or attendance on the *curia regis* and *magnum concilium*. In dignity the E. is after the marquess, and before the viscount. He is addressed as 'Right Honourable,' and by the crown as 'our right trusty and well-beloved cousin.' His coronet contains a circle of gold, chased and jewelled, on which are eight small golden pyramids, each with a large silver ball, and a gold strawberry-leaf on the rim between each pair of pyramids; the cap is crimson velvet, turned up with ermine, with a golden tassel.

The Old English *ealdorman* answers to the *princeps* of Tacitus, the *satrapa* and *subregulus* of Bede, the German *graf*, and the *dux* of the Latin chroniclers. He was originally elected by the national assembly, but the office came afterwards to be hereditary, though down to the Conquest the consent of king and Witenagemot seems to have been required. During the annexations the families of the sub-kings continued to act as ealdormen. Thus the ealdordom was not necessarily co-extensive with the later shire, and the ealdor was sometimes superseded by a high reeve. Generally, however, each shire had its ealdorman, who sat with sheriff and bishop in the folc-gemot, receiving one-third of the court-fees (the same as the Karoling *comes* took under capitulary, A.D. 783). As a military commander he was called *heretoga*. Where the relation of ealdorman and king has arisen out of commendation, not conquest, the hereditary descent would be sooner recognised. Cnut divided England into four earldoms, and in the time of Æthelred the term E. began to be used instead of ealdorman, a use suggested by the Danish *jarl*. Before this, the English *eorl* and *æthel* had a wider meaning, equivalent to the Latin *nobilis*, the primitive class of noble blood. *Ætheling* was gradually restricted to the king's kin. The *North People's* Law of the 8th c. puts the wer-gild of the eorl 2000 thrymsas higher than that of the ealdorman, but this is attributed to Danish ideas. Historically, the *comes*, or companion of the king's household, is more truly represented by the English notion of *gesith*, who afterwards became king's thegn, than by the general name of *eorl*, or the official title of ealdorman. The special investiture of an E. by girding on the sword, and placing the cap and cloak on the person, is now abolished. See COMES and COUNT.

Earl Marshal, originally Marshal of England, the title of a British officer of state, whose chief functions are to preside over the College of Arms, to take cognisance of matters relating to pedigrees and descents, to make proclamations of war and peace, and to grant armorial bearings. The office is believed to have been established in the reign of Richard II., who conferred it upon Thomas Mowbray, Earl of Nottingham, and it is now hereditary in the family of Howard, the head of which, and consequently E. M. at present, is the Duke of Norfolk. The last grant for the office was made on 19th October, 1672, by Charles II.

Earl'om, Richard, a distinguished engraver in mezzotint, was born in London, 1742. Among the most celebrated of his works are his *Liber Veritatis, or* 200 *Prints after the Original Designs of Claude de Lorraine* (1777); his works after Reynolds; and his *Portraits of Characters Illustrious in British History from Henry VIII. to James II.* (1810), in conjunction with C. Turner. E. died in 1822. The practice of etching has prevented the long existence of E.'s style.

Earl'ston, or **Er'cildoune,** a village on the Leader, Berwickshire, 30 miles S.E. of Edinburgh, has manufactures of ginghams, shawls, blankets, tweeds, and flannels. Near E. are the ruins of the Rhymer's Tower, so called as having been the residence of the famous Thomas Learmont, or Thomas the Rhymer (q.v.), to commemorate whom a stone with an inscription has been built into the church wall. Its name was changed from Ercildoune to Earlston from its being a seat of the Earls of March. Pop. 1060.

Early English, a style of Gothic Architecture (q.v.), the special feature of which was the introduction of the pointed arch, which hardly appeared in England till the rebuilding of Canterbury Cathedral in 1175. Down to the year 1200 the round Norman arch was still usually employed in conjunction with the pointed arch, to which it gave place at last, thereafter remaining practically banished as a feature of English architecture for three centuries. The E. E. architects, though deeply influenced by the gravity of the preceding (Norman) style, showed much originality and animation of design. They did not invent the lancet or long pointed window, but they were the inventors of the lancet style of fenestration, or the grouping of such windows together in twos, threes, fives, and sevens. The great window group, consisting of five lancets combined, and called the Five Sisters, of York Cathedral, is a good example, of such fenestration. Another distinguishing feature of the style is the use of the tooth ornament, a square four-leaved flower, generally used to enrich the deep hollow moulding of an arch. When thus used, the flowers are placed close enough to touch at the extremities.

Earn (Gael. *Erinn*, 'west'), a river and loch in Strathearn, S. Perthshire, 26 miles W. of Perth. The loch stretches 7 miles from E. to W., and is from 1 to 1½ mile broad, with a depth of 100 fathoms. The river flows out of the loch, and has an easterly course of 40 miles, falling into the Firth of Tay a mile below Abernethy.—*The Bridge of E.* is a village 6 miles S. of Perth, and lies near the mineral springs of Pitcaithley. Pop. 325.

Earn'est (Lat. *arrhæ*), or **Arles**, as it is called in Scotland, is a small sum of money given as a symbol of the completion of a bargain. The E. is not in any case essential to complete a bargain (see CONSENT, CONTRACT), it is merely a legal item of proof of agreement. In sale, however, E. causes the property to vest in the purchaser, but it does not affect the seller's right to demand the full price before delivery, if credit has not been given, or to stop the goods *in transitu* in case of insolvency. Nor does it affect any of the other rights vested in the seller prior to delivery. The question sometimes arises whether or not E. is to count as part of a stipulated price or wage. This will depend on the intention of parties. If proof of intention be otherwise insufficient, the proportion which the E. bears to the value of the subject of contract will be held to decide the question. 'If a shilling be given,' says Erskine, 'in the purchase of a ship or of a box of diamonds, it is presumed to be given merely in evidence of the bargain, or, in the common way of speaking, it is *dead* E.; but if the sum be more considerable, it is reckoned up in the price;' and, according to Blackstone, 'if it be but a penny, or any portion of the goods is delivered by way of E., it is binding.'

Earring (Lat. *inauris*, Gr. *enōtion*), an ornament pendent from, or inserted into, the lobe of the ear. Modern civilised nations regard the E. almost exclusively as a female adornment, but among less advanced and uncivilised people, it is worn by both sexes, a custom which sailors of different nationalities frequently affect. Among the ancient Greeks and Romans the E. was considered effeminate, while in Eastern countries, on the authority of Pliny, it was used by men and women alike. Earrings were worn by the English down to the 10th c. In the 16th c. the fashion was revived in England, and extended even to gentlemen, who followed the example of the courtiers of Henri III. of France. Satirical allusions to this custom are frequent in the writings of contemporary dramatists; it appears to have died out about the period of the Restoration. Earrings assume a great variety of form, and are often of the most costly description, as of gold enriched with precious stones. Pearls are valued for their spherical shape, their size, and their whiteness; but the elongated ones called *elenchi* were also in great esteem as forming a graceful pendant to the ring. Seneca speaks of one which had a couple of pearls above and below the precious stone as worth a patrimony. For elegance of design and beauty of execution, those of the Etruscans and Greeks have never been surpassed.

Ear-Shell, a genus of Gasteropodous molluscs, belonging to the family *Haliotidæ*, in which the shell is ear-shaped, with small whorls, and a large aperture. The outer lip is perforated for a siphon, and in ear-shells new holes are successively formed with the growth of the shell. No operculum exists. These shells are much used in inlaying work, on account of the beautiful tints of their nacreous or mother-of-pearl lining. They abound at the Channel Islands, and familiar species are the Ormer or Guernsey E.-S., and the Ass's E.-S.

Earth, The. It was generally believed by the ancients, and the belief still lingers among the uncivilised and uneducated races of mankind, that the E. was an immovably fixed, flat, circular disk, round which the sphere of the heavens moved in its daily revolution. Thales of Miletus (B.C. 640), and Pythagoras (B.C. 506), taught that the E. was globular in shape; but Aristarchus (B.C. 280) seems to have been the first to maintain its annual and diurnal motions. This hypothesis was developed and systematised by Copernicus, modified by Kepler, and finally established by Newton, as a consequence of the probably universal law of gravitation. To the mathematical astronomer, the close agreement between the true position of a planet or satellite and that obtained by calculation, is sufficient proof of the truth of the Newtonian system of the universe; but absolutely indisputable evidence is not wanting. The projected circular annual motion of every fixed star, in consequence of the Aberration (q.v.) of light, is an incontestable proof of the annual elliptic revolution of the E.; and the slight eastward displacement from the vertical of a mass dropped from a considerable height cannot but be due to a rotating motion of the E. The diurnal rotation of the E. is, however, made *visible* to the bodily eye by means of Foucault's beautiful pendulum experiment. A freely-suspended pendulum always tends to keep oscillating in the same invariable plane—hence a pendulum oscillating at either pole will appear to an observer on the E. to be continually changing its direction of oscillation, the change being one of rotation in a direction contrary to that of the E.'s motion. A pendulum at the equator will obviously not be affected; while one at any intermediate latitude will be influenced by the resolved portion of the E.'s rotation, which has for axis the diameter through the locality where the pendulum is. By making use of a long, slowly-oscillating pendulum, this effect is easily apparent in our latitudes within the space of an hour. The rotundity of the E., again, is proved by a variety of phenomena, such as the gradual apparent sinking of a vessel at sea, as it recedes from the observer, the invariably circular form of the E.'s shadow during a lunar eclipse, the possibility of circumnavigation, &c. By treating the E. as having been formerly a rotating fluid, Newton deduced that its form should be that of an oblate spheroid—the polar diameter being less than the equatorial, in the ratio of 229 : 230. This difference is too great, the true ratio being very nearly as 299 : 300. Sir G. Airy gave the exact dimensions as 7899·17 miles for the polar diameter, and 7925·17 miles for the equatorial. These results agree to the first decimal point with those of Bessel and Clarke, except that the latter gives two different equatorial diameters, viz., 7926·70 miles in 14° E. long., and 7924·69 miles in 104° E. long.

As important as the determination of the dimensions of the E. is the determination of its *mean density*—*i.e.*, the density of an equal homogeneous globe as compared with that of water. Newton, with characteristic sagacity, gave it as his opinion that this mean density would be found by experiment to be between five and six times that of water. His prediction has been fulfilled. Hutton and Playfair, from the observations of Maskelyne in 1774 on the perturbing effect produced by the mass of Schiehallion upon an otherwise vertical plumbline, deduced 4·71; and more recently Colonel James, from similar experiments at Arthur's Seat, obtained 5·316. Carlini and Plana, from the diminution of gravity due to ascending Mount Cenis, gave 4·39. The great uncertainty in these experiments, however, exists in the determination of the magnitude and density of the mountain with which those of the E. are compared. A more delicate and exact method is that suggested by Michel, and performed first by Cavendish (hence the name *Cavendish experiment*), but more recently by Reich of Freiberg, and Francis Baily. The principle involved is the same as in the Schiehallion experiment, viz., the comparison of the E.'s attraction with that of a known mass, which is in this case, however, not an irregular mountain, but a globe of lead. Two large balls are fixed at the extremities of a horizontally-rotatory board; and two of smaller size are attached to the ends of a horizontal bar, which is suspended by a cord over the centre of the board. By careful micrometer measurement with the telescope at some distance, the unrestrained position of rest of the bar is determined. Then by rotating the board until the larger balls are brought, on the opposite sides of the bar, each into close proximity to one of the smaller ones, an appreciable couple will be exerted upon the torsion balance in virtue of the mutual attraction of the masses. This position having been carefully measured, the board is again rotated, until the balls are in such a position as to produce upon the bar a couple equal but *opposite* to the former. From these experiments the observed attraction of a mass of lead of known volume and density can be compared with the known attraction of the E., of known volume but unknown density, and the unknown quantity is easily deducible. The difficulty here exists in the extreme delicacy of the measurements; but this very delicacy, necessitating as it does great care and precaution, renders the method the one upon which we can most depend for accuracy. Cavendish deduced 5·48, Reich 5·438, and Baily 5·66, as the mean density. Still another method was successfully applied in 1854, as far as regards the experimental part, by Sir G. B. Airy, the astronomer-royal. From a number of pendulum experiments at Harton Colliery near S. Shields, he found that the accelerating force of gravity was increased by $\frac{1}{19190}$th part for a descent of 1260 feet. This gave 6·565 as the value of the mean density—a result, however, which cannot be expected to be so accurate as that deduced from the Cavendish experiment, considering the uncertainty that exists in the determination of the density of the neighbouring rocks, and the geological configuration of the mine and vicinity. We may take, however, 5½ as being very nearly the mean density of the E.; and since the crust of the E. has only a specific gravity of from 2 to 3, it follows that the E. must be considerably denser in the interior than at the surface. But it is demonstrable that a globe of the same size and the same surface density as the E. would have, in virtue of the ever-increasing pressure as one approaches the centre, a mean density of considerably more than 5½, if the magnitude and form were due merely to the mutual gravitation of the whole. There must be some cause, then, acting upon the interior layers, so as to counterbalance the effect of pressure and render the density less than it otherwise would be. This cause is probably heat; a supposition borne out by the fact that, when digging a mine, sinking a well, or making a bore, the temperature is always found to increase with the depth about 1° F. for every 60 feet. This rate of increase must, however, according to Lord Kelvin, decrease as one descends, if the earth be a cooling body; but the decrease cannot be appreciable for the comparatively small depth to which we can penetrate. At a depth of 50 miles (a mere fraction compared to the whole diameter) the temperature would consequently be over 4000° F., a temperature at which no known substance can remain solid. We are not at liberty to infer from this that the interior of the E. is fluid, because the circumstances under which the material is exposed to this great heat are quite altered—the pressure, in fact, is considerably increased. Now, matter which expands when fused, as almost all known substances do, has its fusing point *raised* by increased pressure; and therefore, recognising the Hopkins-Thomson objection, that the known phenomena of nutation and precession are inconsistent with the internal fluidity of the E., we are forced to the conclusion that the globe is solid throughout. Lord Kelvin has further shown that the rigidity of the E. must be, on the whole, greater than that of an equal sized globe of glass, otherwise the *terra firma* would present the phenomena of tides. For the E.'s relations to the other members of the solar system, see MOON, PLANETS, SUN; and in AËROLITES, ATMOSPHERE, CURRENTS, EARTHQUAKES, GEOLOGY, GLACIERS, RIVERS, SEAS, SEASONS, VOLCANOES, WINDS, &c., the reader will find details of the more important phenomena daily occurring on our E.

Earth-Closet System. The principle of the E.-C. S. is based upon the fact that *dry earth* is one of the best known disinfectants and deodorisers. The introduction of the system, which is in successful operation in many parts of the United Kingdom, as well as in India and America, is chiefly due to the zeal, energy, and mechanical talent of the Rev. Henry Moule, vicar of Fordington, Dorsetshire. Moule's patent earth-closet resembles in outward appearance an ordinary water-closet. Under the seat is a watertight vault bedded in cement, or a moveable pail or tank, and at the back is placed a hopper or chamber for holding dry sifted earth. On using the closet for the first time a charge—$1\frac{1}{2}$ lbs. by weight, or $1\frac{1}{2}$ pints by measure—of earth is thrown into the receptacle, and after use a second charge is cast down either automatically, on the sitter removing his weight from the seat, or by his pulling a plug-handle. The simple mechanical arrangements of Moule's earth-closet admit of easy modification to meet special wants, and the vault may be emptied or the pan removed either from the outside or inside as desired. The organic matter is disintegrated and absorbed by the earth, and it is only when the earth is saturated with liquid and vapour that it fails as a deodoriser. It is essential that the earth be dry and sifted, and that no slops be thrown into the receptacle. The value of the earth-manure has been estimated at from £1 10s. to £3 per ton. Of the advantages of the E.-C. S. in agricultural districts and small communities there can be but one opinion. Wherever dry earth is obtainable, and facilities exist for the ready disposal of the manure, there the system is eminently practicable. In large centres of population its adoption can scarcely be expected, especially where the water-drainage system, with all its defects, is in operation. The labour and expense of preparing and storing large quantities of earth, and of its subsequent removal, even if facilities existed for the disposal of the manure, render the system impracticable for large cities. The most zealous advocates of the E.-C. S. do not even recommend it as practicable in towns of over 10,000 persons. The system, however, has been found to work well in gaols, barracks, factories, hospitals, and schools in the United Kingdom, and in prisons and military stations in India.

Modifications of the dry-earth system have also been practically tested in some English towns with successful results. Morrell's patent cinder-sifting ash-closet has the economic advantage over the dry-earth plan of utilising the coal-ashes which are daily produced, and as a rule the fuel refuse of a house is found to be sufficient for the inmates.

The Public Health Act of 1875 and the Public Health (London) Act of 1891 legalise the construction of earth-closets in place of water-closets in houses and elsewhere, subject to the approval of the local authority.

Earth'enware, a name applied indefinitely to pottery in which the body or paste is made of the coarser and more common materials. See POTTERY.

Earth-Houses, popularly known as *eirde* or *yird houses*, and occasionally referred to by archæologists as *weems* (Gael. *uaimh*, 'a cave'), are a class of structures peculiar to the eastern parts of Scotland. They are especially abundant in Aberdeenshire (where they are sometimes called 'Picts' houses'), but they range from Shetland to Berwickshire, and are confined, with few exceptions, to the counties bordering on the E. coast. The typical earth-house may be described as an elongated chamber, solidly built of unhewn and uncemented stones, curved and pear-shaped on the ground plan, the walls converging, and the roof formed of massive flat slabs. The whole structure is subterranean, the roof reaching to within a foot or a foot and a half of the surface level. The entrance is low and narrow, often a mere hole like a fox-earth, sloping downwards, and widening as it proceeds to the level floor about ten or a dozen feet inwards. The interior is thus a long, narrow, curved chamber, extending from 20 to 40 feet in length, and widening from 3 or 4 feet near the entrance to 8 or 9 at the further end, with an average height of from 5 to 6 feet. Sometimes the narrow part of the chamber is curved first in one direction and then in another, and occasionally a smaller chamber branches off from the larger. There is usually no provision for the admission of light and air, but several have been found provided with a smoke-hole in the roof near the further end. These singular structures are usually situated in dry knolls. One in Strathdon had a paved floor, and a well-built drain underneath it. The extreme length of chamber and passage was 58 feet. It was $3\frac{1}{2}$ feet wide immediately within the entrance, and 9 feet wide at the further end, while the height averaged about 6 feet. On the other hand, one at Eriboll in Sutherlandshire, which was 33 feet long, was not more than $3\frac{1}{2}$ feet in greatest width, and $4\frac{1}{2}$ feet high. In many cases they are accompanied by the remains of habitations above ground, probably huts of turf or wattled work. At Kildrummy, where some forty or fifty of them occurred within a radius of 2 miles, the underground structure was usually discovered by the remains of overground enclosures, the earth of which had been excavated to the depth of a foot or 18 inches, and placed as a low bounding fence round the sunken area of 10 or 12 paces square. At Kildonan, in Sutherlandshire, two of these underground structures had their entrances within the area of hut circles. They were thus evidently underground adjuncts to the overground residences of the early tribes, probably the winter dwellings of people who lived in huts in the summer season. Many conjectures as to the age and uses of these underground structures have been hazarded without the least reference to the evidence, which seems distinct enough on both points. No stone or bronze weapons have been found in any of them. The objects that have occurred in them are querns or hand-mills, stone mortars and cups, spindlewhorls, bronze pins and rings, corroded iron implements, rude pottery, and fragments of the lustrous red ware of the Romano-British period. This lustrous red ware, with embossed figures (commonly called 'Samian ware' in this country, though it is of Gallo-Roman manufacture), has been found in three E.-H. in Forfarshire, viz., at Tealing, Fithie, and Pitcur. In two other instances, viz., at Newstead, in Roxburghshire, and Crichton Mains, in Midlothian, bevelled stones, with Roman mouldings, and squared and chiselled stones, with diagonal and diamond work of Roman character, were found built into the walls of E.-H. As a class, they seem thus to belong rather to the early historic than to the strictly pre-historic period, and they were undoubtedly in use subsequent to the time of the Roman dominion in Britain. That they were occupied as dwellings is evident from the pavement, the smoke-holes, the querns, and other domestic utensils, and the accumulation on their floors of charcoal and bones of animals, which formed the refuse of the food of their occupants. They are not more uncomfortable, or much more incommodious, than many of the caves of the N. of England, which, as Boyd Dawkins has shown, have been occupied as habitations after the departure of the Romans from Britain. The best of the E.-H. give on an average a room 40 feet by 7, and 5 to 6 feet high. No structures precisely similar are known elsewhere. Several examples of a type closely analogous, however, are found in Cornwall and in Brittany. In many of the *raths* and early earthworks of Ireland there are underground structures, but they differ in form from those described above, and more nearly resemble the chambers in the larger sepulchral cairns. A double chamber of this type occurs under the area of the fortified hill of Dunsinnane in Perthshire.

Earth-Nut, or **Earth-Chestnut,** a name given to the tubers of certain plants belonging to the natural order *Umbelliferæ* (q.v.), such as the *Bunium flexuosum* and *Carum* or *B. bulbocastaneum*. The name pig-nut is given to the tubers of the latter species, on account of the fondness of pigs for these structures. These *Umbelliferæ* are harmless, and are used as esculents, like their near neighbours the parsley, celery, &c. Earth-nuts are highly esteemed in Sweden, and those of *B. ferulaceum* in Greece. The first-named species of *Bunium* is common in Britain, especially in marshy places.

Earth'quakes are sudden and more or less violent movements of the earth's surface. They are of various intensities, from a vague subterranean rumbling to a shock sufficient to set the earth into a violent undulatory motion, shattering rocks, opening chasms, destroying old lakes, or calling into existence new ones, altering, or, it may be, completely obliterating, the course of streams, submerging dry land below the sea, forming new islands, or extending the area of old territories, and all that with a suddenness and force which cannot but be attended with the overthrow of works of human construction, and the loss of much life and property.

Regarding the nature and origin of E. there has been much speculation from the earliest ages. Anaxagoras ascribed them to subterranean clouds bursting into lightning, and shaking the vaults in which they were confined; Descartes to the explosion of inflammable products in vast underground cavities; Stukeley and Priestley to electrical causes; Humboldt, Von Buch, and others to the action upon the earth's crust of waves induced in the great internal ocean of molten rock, once so generally believed in. (See EARTH.) The most scientific theory, inasmuch as it explains all known phenomena, and postulates nothing but what experience shows is highly probable, is that advanced by Mallet. He defines an earthquake as a 'wave or waves of elastic compression, in any direction, from verticality upwards to horizontality, in any azimuth, through the crust and surface of the earth, from any centre of impulse, or more than one, and which may be attended with sound-waves and sea-waves, depending upon the impulse, and upon circumstances of position as to sea and land.' The earth-shock originates as a ruptive force or explosion, due possibly to a sudden generation or condensation of steam in the vesicular cavities with which the slowly-cooling earth most probably abounds. This shock gives rise to a wave or a series of waves, each of which travels in a continually-increasing spheroidal shell, and therefore spreads over the surface in a corresponding growing circle. This circle, however, will vary considerably from the true mathematical form, inasmuch as the velocity of transmission depends upon the nature of the rock through which the shock travels, as also upon its jointed and faulted character. Experiment shows that such waves of compression travel more rapidly the more solid the rock is, and the actual rate in the Calabrian earthquake of 1857, as calculated by Mallet, was an average of 789 feet per second.

The *angle of emergence* of the wave is evidently greater the nearer the locality under consideration is to the origin of the shock—being a right angle at any place in the so-called *seismic vertical*, or line drawn vertically upwards from the position of central impulse. Here, of course, the intensity will be greatest, but it will exert no overturning power. Hence the greatest damage will not be done here, but will be on a certain closed curve, at every point of which the angle of emergence will be sufficiently small, and the intensity of the shock sufficiently great, so as to render that portion of the shock resolved parallel to the surface a maximum. If the origin of the earthquake should be below the bed of the ocean, the water directly over the seismic vertical will receive a violent blow, giving rise to an oscillatory wave, which will travel in a manner similar to the true earth-shock, but at a considerably less velocity. These statements are deduced from the theory upon dynamical principles, and are fully borne out by experience. In coast districts subject to E., the ocean-wave is more dreadful in its effects than the earthquake proper. Accompanied by a turbulent sea, traceable to no common cause, and immediately preceded by an extraordinary outdraught of water, laying bare the ocean-bed to a distance sometimes far below the low-water mark, it dashes with terrific fury upon the shore, tearing up trees and shrubs by the roots, levelling houses, and other works of human construction, and carrying high and dry upon its giant crest, seaweed, shells, fragments of wood, boats, and even large vessels. The origin of the rumblings heard before and after the passage of the shock is at once evident, being due to the more rapid transmission of the atmospheric waves produced at the surface of contact of the earth and air.

The most celebrated historic earthquake is undoubtedly that of Lisbon, 1st November, 1755. In the brief space of eight minutes, the whole city was reduced to ruins, and 50,000 inhabitants swallowed up. Perhaps the most awe-inspiring event was the disappearance, without leaving a trace behind, of the pier, with its crowds of terror-stricken fugitives. This earthquake also did incalculable damage at Coimbra, Oporto, Malaga, Fez in Marocco, where thousands of persons perished, and at the Madeira Islands. According to Humboldt, it extended over an area equal to about one-eleventh of the earth's surface, but its only effect in Scotland was the temporary alteration in level of some of our lakes. At Calabria, in Italy, there have been several destructive E. at various times, the last great one, by which about 10,000 lives were lost, occurring on 16th December, 1857. The W. Indies and the volcanic regions of S. America also suffer much from time to time. In August 1868, about 25,000 perished, and 30,000 were rendered homeless in the various towns and villages of Peru and Ecuador. Britain is fortunately rarely visited, and then but slightly. The place of most frequent occurrence is Comrie in Perthshire, and this would seem to be connected in some way with its geological position, which careful survey has shown to be on the great line of fault separating the Lowlands and the Highlands. As a rule, districts subject to E. are also volcanic. The most alarming E. of late years have been those of Ischia and Krakatoa (1883), Tarawera (1886), Morea (1886), and Charlestown, U.S.A. (1886). For catalogues and descriptions of E., and for more detailed information concerning the accompanying phenomena, the reader is referred to Mallet's works, to Von Hoff's *Veränderungen der Erdoberfläche* (parts ii., iv., and v.), to Lyell's *Principles of Geology* (vol. ii.), to Somerville's *Physical Geography*, to Daubeney's treatise *On Volcanoes*, and to Ponton's *E. and Volcanoes*.

Earth'work, in engineering construction, consists chiefly of cuttings and embankments for railways, roads, reservoirs, &c. The engineer who projects and lays out a railway has the 'quantities' of E. in cubic yards, both of excavation and embankment, calculated in detail in his office; and finds, by boring or otherwise, the nature of the ground in which the cuttings have to be made, and upon which the embankments are to rest. The work is executed by a contractor, whose price is based upon the quantities and information supplied by the engineer. Before the E. of a railway is commenced, its centre line is staked and nicked out (or marked by a little trench on the surface of the ground), its levels having been previously fixed, so that the quantity of land excavated in the cuttings may be, in general, equal to the amount required for making the embankments, in order that no soil may have to be excavated specially for this purpose. This is called 'equalising E.'

The slope or nature of the soil, the nearness of water, and other causes, occasion the special difficulties which occur in the construction of E. On ground which has a 'sidelong' slope it is often necessary to form the surface into steps before tipping upon it, that there may be no tendency for the whole embankment to slide down after it is finished. Cuttings through rock may require to be blasted. Embankments exposed to the action of water may require to be pitched with dry stone, or even protected by a masonry-face. Probably the greatest difficulty of all to be overcome in connection with E. is the construction of embankments upon soft and yielding soil. Various methods have been employed according to the special nature of the various situations, such as by efficient side-draining or giving an extra width to the base of the embankment, by the solidifying of the soil, by throwing in ballast, by raising a structure of piles, or (as across the celebrated Chat Moss) by supporting the embankment upon a raft made of hurdles or fascines or on an intermediate layer of dry peat. In the ordinary cases, where a stone facing is not necessary, the slopes of earthworks are dressed to a good surface, covered with about 6 inches of soil, and sown with grass, which is not only sightly in itself, but prevents the destruction of the faces by weathering.

Earthworks, though they have been advocated for permanent fortifications, are chiefly met with in the field. The most ordinary form is the parapet, excavated from a ditch in front or a trench behind. The exterior slope must have the inclination which the material would assume when poured loosely from a height—for ordinary soil, 45°. The top of the parapet, for defence, ought to be horizontal, or at least, parallel to the plane of site. As this, however, would interfere with the firing, it slopes gently outward from the crest (1 in 6). The inner wall, or revetment, terminates in a sloping step, or banquette, on which the defenders stand in firing. To resist musketry a parapet ought to be five feet thick; to resist heavy guns, 24 feet. On level ground, the ordinary height is 7½ feet. The parapet is often erected on a wide bank of earth or rampart; this where guns are to be used. The escarp, or slope of the ditch, ought to be continuous with the exterior slope of the parapet. Excavation is found to add 9 per cent. to the calculated bulk of most soils. The more complex forms of fieldworks (where the use of masonry is of course impossible) are of three classes—(1) Those open at the gorge, including the redan, a work of two faces forming a salient angle; the double redan, or *tête à queue d'hyronde*, which has, of course, a re-entering angle; the triple redan, with long flanks; the tenaille head, a low, two-faced work in the main ditch, and before the curtain; the lunette, an advance work, larger than the redan, with two faces and two flanks parallel to the capitals; bastion head, composed of several bastion fronts forming obtuse angles with each other. (2) Those enclosed all round, including the redoubt, which has no flanking defence from its own parapets, and which sometimes appears in the ravelin or outwork beyond the main ditch; and the bastion fort, the most complete enclosure, as each side or front consists of two faces, two flanks, and a curtain. (3) Those which consist of lines both continuous and at intervals, the separate works being always arranged so as to flank and defend one another, including lines of redans, lines of tenailles, or parapets forming a series of salient and re-entering angles, lines of bastion, or a succession of bastion-shaped parapets, each having two faces, two flanks, and a curtain; and indented lines *à la crémaillère*, composed of alternate short and long faces at right angles to each other. In rocky positions works are often entirely constructed of sandbags—tarred canvas bags holding about a bushel of earth. They are also placed on parapets to afford loopholes for riflemen.

Earth'worm, a species of *Annelida* (q.v.), belonging to the order *Oligochæta*—a group distinguished by the rudimentary nature of the bristles or *setæ* on the sides of the body, so characteristic of most other worms. The E. breathes by means of the general surface of the body, assisted by little *sacculi*, or pouches of the integument. Its body is of cylindrical shape, blunt in front, and pointed behind. The E. is a hermaphrodite, the sexual organs being contained within a limited number (8-15) of segments of the body. The position of these organs is denoted by a swelling of the corresponding joints, so as to form a prominent eminence, which, from its saddle-like appearance, has been named the *clitellum*. The eggs are contained in cocoons, and are deposited in clusters, and the young are developed directly from the eggs. The mouth is not provided with teeth or jaws, but a 'crop' and 'gizzard' exist. Certain sacs, termed *segmental organs*, found in most Annelides, communicate in the E. with the internal cavity of the body, and probably possess some excretory function. The bristles fringing the body exist in two rows, and are hooked. Earthworms effect much good in soils by opening them up and separating the solidified masses of earth, thus permitting the rain to gain access to the subsoils. Their food is entirely of a vegetable nature, while they in turn form food for moles, shrews, and allied mammals, as well as for very many birds. They appear to be nocturnal in habits. Several tropical genera and species attain a large size.

Ear'-Trumpet, an instrument adapted to relieve defective hearing, by collecting and concentrating sound, and conveying it into the ear. The ordinary E.-T. takes the form of a trumpet with a wide, bell-shaped mouth, which is turned in the direction of the sound, tapered to a bent ear-piece that is placed at the entrance to the auditory passage. It is generally made of tin or ebonite, and arranged in telescopic sections for convenience of being carried about. In another form, a bell-shaped vessel has two curved pipes connected by flexible tubes to end-pieces that either enter or cover the ears. The *auricle* is a contrivance designed for the same object, and consists of a small volute, which is inserted into the ear, with an expanded mouth. In some churches and other buildings there is placed a large funnel-shaped receiver, terminating in a circular throat and conducting pipe, from which branch off as many flexible tubes with ear-pieces as may be required.

Ear'-wax. See CERUMEN.

Ear'-wig, a genus of insects belonging to the Cursorial section of the order *Orthoptera* (q.v.), and forming the sub-family *Forficulina* or *Euplexoptera*, the latter name being given them from the beautiful structure of the hinder wings, which are thin, and have their *nervures* or supporting ribs so disposed that they can be folded like fans. The name suggests that these insects select the human ear as an occasional habitation. This, however, is not the case. The proper form of the name is 'ear-wing,' from the resemblance of the wings to the shape of the ear. The head is exserted, and has no ocelli; the front wings are small and leathery; the antennæ have fourteen joints; and the tail ends in a pair of 'forceps,' which are used by the insects in folding their wings. The pupa is like the perfect insect, but is not winged. The eggs are deposited in the earth, and are carefully watched by the mother. These insects live on vegetable matters. There are seven species indigenous to Britain.

Earwig.

Eas'dale, an island off the W. coast of Argyllshire, about 10 miles S.S.W. of Oban. It is only three-quarters of a mile long, but is widely known for its slate-quarries, which have been worked more than a century and a half. From this cause much of E. is now below the sea-level. Pop. 317.

Eas'el (Ger. *esel*, 'ass, donkey'), the wooden frame upon which artists place their pictures while in process of being painted, at a convenient height for working on the different parts. *E.-pieces*, or *E.-pictures*, are the smaller pictures of an artist accustomed to execute works on ceilings or walls.

Ease'ment, a term of English law denoting a privilege without profit which one person may have in the property of another by charter or prescription. Rights of E. include rights of way, of light and air, and of carrying on an offensive business. The analogous term in Scotch law is Servitude (q.v.).

East (Ger. *ost*, Old Norse, *aust*, probably from the same root as 'ice,' and if so, pointing out the N. of Europe for the origin of the term) is that point of the horizon at which the sun rises at the time of the equinoxes, being on the right of a person facing N. E. is also one of the cardinal points of the compass, corresponding to the true E. at those places where the needle points due N.

East'bourne, a town in the county of Sussex, 18½ miles S.W. of Hastings. It is a favourite sea-bathing place, and has a handsome parish church. Roman and Danish remains have been found here. The place has grown very much of late years; in 1821 the population was estimated at only 2007. Pop. parl. div. of county 66,460; mun. bor. 34,969; reg. sub-dist. 37,468; and civ. par. 34,278.

East Cape, the most eastern point of the Asiatic continent, projects with a bold and lofty headland into Behring Strait, opposite Cape Prince of Wales on the continent of America. Its summit, bristling with rocky pinnacles, is the site of a large and populous Tschutski village (Hooper's *Tents of the Tuski*). The same name is applied to the easternmost promontories of various countries and islands, as those of Madagascar, New Zealand, &c.

Eas'ter, as now understood and observed, is a Church festival in commemoration of the resurrection of Jesus Christ. A famous controversy in the early Church turned upon the time of the observance of E., the bearings of which will be best understood from a reference to the Gospel narratives. According to the first three Gospels, Jesus partook of the Jewish Passover with his disciples in the usual manner on the evening of the 14th Nisan, instituting on that occasion a memorial of himself (Matt. xxvi. 17-29; Mark xiv. 12-25; Luke xxii. 7-20); so that he must have been crucified on the 15th. In the fourth Gospel, on the contrary, the Last Supper took place on the 13th, and Jesus was crucified on the 14th (xiii. 1, 29; xviii. 28; xix. 14). Now the Church at first observed the Paschal festival (Heb. *Pesach*, 'the Paschal lamb'; whence the Gr. and Lat. *pascha*, the Fr. *pâque*, and the Scotch *pasch*) on the 14th Nisan, following the first three Gospels; but soon there arose a difference between the Eastern and Western Churches on this point, which got the name of the Quartodeciman controversy. In the W. there were a tendency to attach most importance to the resurrection, and a feeling that it was incongruous to stop the preceding fast on the 14th, and make a feast of that which ought to be a day of mourning for his death (the Jews of course connected the idea of rejoicing with their Passover for other reasons). The authority of the fourth Gospel was now called in by the Western Church (curiously enough that of St. John being adduced by the Eastern in support of their opposite view), to show that the Jewish Passover was completely abolished by the crucifixion of Christ on the day (14th) on which the lamb was killed, in other words, by Jesus taking the place of the lamb (cf. 1 Cor. xi. 23-26; v. 7), and that the fast ought properly to cease always on the first day of the week, to commemorate his resurrection. This feeling was further strengthened by the difficulty of adjusting the solar year to the lunar mode; and when, by the edict of Constantine (321), the *Sunday* was consecrated as a day of rest and religious observance, the Pascha was finally transferred from the 14th Nisan to the Sunday following the full moon on or next after the vernal equinox. The vernal equinox is now fixed as the 21st March, and the rule is, that if the full moon fall on a Sunday, E. is the Sunday after.

But neither tracing the festival to the resurrection of Christ nor to the Jewish Passover is in a sense going to the root of the matter. E. was properly and originally a heathen festival, which was appropriated by the Church, and applied to the resurrection. The spring equinox was observed among the ancient nations of the East as the beginning of the new year, and among almost all nations as a season of great rejoicing in honour of the sun-god, and of his return to clothe the earth with verdure, and 'fill men's hearts with food and gladness.' He appeared then to rise triumphant over darkness and death, to bring back life and light to the world. It is impossible nowadays to realise how close was the resemblance which the rites adopted by the Church in honour of Christ's resurrection bore to those practised by the Greeks, Phœnicians, Syrians, Egyptians, and many other nations, in honour of the solar deity, under the name of Adonis, Dionysus, Thammuz, Krishna, &c. The Church continued the worship of the Queen of Heaven, condemned by the prophet Jeremiah (xliv. 17), by applying it to the Virgin Mary under the very same title. The rites connected with the death and resurrection of Adonis—in which an image was laid out by women with all the ceremony and signs of grief practised at funerals, but the next day the image was taken out of its sepulchre, as it were, and their sorrow was turned into joy—were also imitated in the dramatic representations made by the Church at E. in honour of Christ.

The name E. (Old Eng. *Eoster* and *Eastre*), according to Bede is derived from the goddess Ostara (Old Swed. *Astargydia*, 'the goddess of love'; Old Norse, *ast*, 'love'), whose festival was held in the month of April, and the popular rites connected with the season, though now baptized into Christianity, had no doubt in many cases a heathen origin. For further illustration of this peculiar process of transformation consult article, CHRISTMAS. See Bingham's *Eccles. Ants.*, and J. J. Tayler's *The Fourth Gospel.*

Easter Island, Teapy Island, or **Davis's Land,** a volcanic island in the Polynesian Archipelago, 12 miles long and 4 wide, in lat. 27° 6′ S., long. 109° 30′ W. There are many colossal stone statues of unknown origin; and a wooden tablet with curious hieroglyphics was discovered in 1869. Pop. 150.

Easter Offerings, in England, are payable by every person in the parish sixteen years old or upwards, through the master or mistress of the family, at the rate of twopence per head, as compensation for personal tithe or labour. These can be recovered under the provision of statute 7 and 8 Will. III. c. 6, before justices of the peace.

Easter Law Term being formerly dependent on Easter Sunday, which might happen to fall on any day of the month between 22nd March and 25th April, both days inclusive, the Act 1 Will. IV. c. 70 was passed to remedy the uncertainty. The term now begins on 15th April and ends on the 8th May. See TERM, LEGAL.

East India Army. This name had a very different meaning in the days of the East India Company (q.v.) from that which it has now. The Company employed whatever soldiers offered themselves from any quarter—adventurers, deserters, and convicts, chiefly natives. But English officers were always employed, with liberal remuneration, and ultimately regiments were raised in England. Owing to the good pay, the terms of absence, and the liberal pensions given, the East India Company's service was highly popular. In 1857, the army of the Company consisted of 45,522 Europeans, and 232,224 natives; and these were divided into three armies, connected with and named after the Presidencies of Bengal, Madras, and Bombay. It was chiefly the natives in the first of these armies that took part in the Mutiny (1857). The Act of Parliament which in 1858 transferred the government of India to the Crown directed that these armies should be deemed Indian military forces of her Majesty, and should be 'entitled to the like pay, pensions, allowances, and privileges, and the like advantages as regards promotion and otherwise, as if they had continued in the service of the said Company.' The transfer was the cause of considerable dissatisfaction among the British troops, who maintained that they should have been consulted, or at least have obtained a bonus on re-enlisting; and ultimately those of them who chose were permitted to retire. By the legislation of 1861 and subsequent years, the Indian regular army has been reorganised. Its duty is now to serve either in India or elsewhere when required, although its expenses are defrayed out of the Indian revenue. The native portion of it had been reduced in 1874 to 123,678 men. On 1st April, 1895, the system under which each presidency had a separate command ceased, and an arrangement came into operation by which the Indian army has been divided into four commands, each under a lieutenant-general—Bengal, Bombay, Madras, and Punjab. The army is directly commanded by the commander-in-chief in India, and controlled by the Indian Government. The native regular army now consists of 145,000 soldiers. Besides these there are 19,294 men belonging to the native contingents which are supplied by the native princes of India for the defence of the country generally. They are trained and inspected by European officers, and when required will be called upon to act with the regular army. In the army estimates for 1894-95 the strength of the British forces in India is placed at 74,013 (13,319 artillery, 5679 cavalry, 354 engineers, 53,740 infantry, &c.), together with 12,445 horses and mules. From the census returns for 1891, under the heading of army, there would appear to have been in that year a grand total of 663,271; of these 29,223 were military officers, 416,997 non-commissioned officers and privates, 68,664 followers, 5119 persons upon military administrative establishments, and 143,268 whose military service was unspecified.

East India Company, the greatest corporation the world has ever known, and the association of merchants which founded the British Empire in India. The Portuguese anticipated England in opening direct commercial relations with the East. Vasco de Gama discovered the sea-road to India in 1497, and more than a century elapsed before his countrymen were deprived of their monopoly. The first charter of the English Company is dated 31st December, 1600. Akbar was the Great Mogul with whom the English merchants opened relations. The original English Company had only 125 shareholders, and a capital of £70,000, but in 1612 the capital was raised to £400,000; and about the same time permission was obtained from the Emperor Shah Jehan to erect factories at Surat, Ahmedabad, Cambay, and Gogo. The first voyages were to Surat and to other places on the Malabar coast, but the richest cargoes were brought from the Spice Islands of Java, Sumatra, &c. From this quarter the English were soon driven by the perseverance of the Dutch, who secured their monopoly by the massacre of Amboyna in 1622. But the Company steadily progressed during the 17th c. The profits were not excessive, but the honour of the English name was uniformly maintained. In 1626 a factory was established on the Coromandel coast, at Masulipatam; and in 1639, Fort St. George, now the citadel of Madras, was built on a narrow strip of land, ceded by a local prince. This was the first territorial acquisition on the mainland of India. In 1634, the wealth of Bengal was opened to the Company by permission to trade at Pippli, now a silted-up port of Orissa; in 1645, the English were established at Balasore and Hooghly, where their European rivals had long preceded them; but it was not till 1700 that the ground on which Calcutta stands was granted by the Nawab of Bengal. In 1661, the island of Bombay formed part of the dowry which Catharine of Portugal brought to her husband Charles II. In 1668 the King made it over to the Company, and in 1687 Bombay was recognised as the chief English settlement in India. Such was the origin of the three great presidencies.

The 18th c. forms a second epoch in the history of the E. I. C. In 1702, a new Company for trade with the East, with a capital of £2,000,000, was amalgamated with the E. I. C., under the title of 'The United Company of Merchants trading to the E. Indies,' with the privilege to trade to all places E. of the Cape of Good Hope to the Strait of Magellan, on condition of a loan to the state of £3,190,000 at 3 per cent. interest. This sum was independent of the trading stock of the Company, which about this time paid an average of 8 per cent. Hostilities with the French led, almost insensibly, to the growth of the Company as a great territorial power. In 1765 the financial administration of Bengal, Behar, and Orissa was ceded to the Company by the Mogul Emperor, Shah Alum, but British power in Madras was not firmly secured till the fall of Tippoo Sultan in 1799, and the Bombay Presidency acquired most of its territory in the beginning of the 19th c. Meanwhile, restrictions were occasionally laid upon the amount of the Company's dividends by the legislature; committees of the House of Commons made searching investigations into its affairs; and in 1773 an Act was passed reorganising the corporation in Leadenhall Street, and establishing a new government for India. The Court of Directors was to be composed of twenty-four persons, and the amount of stock qualifying a proprietor for a vote was raised from £500 to £1000. The Presidency of Bengal was made supreme over the other two, and the nomination of the governor was subjected to the approval of the Crown. A Supreme Court of Justice was established at Calcutta, of which the judges were also to be nominated by the Crown. In 1784, the Coalition Ministry of Fox was ejected from power, owing to the defeat in the Lords of his India Bill, which was intended to vest the whole management of Indian affairs in the hands of seven government nominees of the parliamentary majority. In 1784, however, a new bill was passed which first established 'The Board of Control,' consisting of six persons appointed by the Crown, before whom the Court of Directors were bound to lay all important documents for approval or alteration. Dundas, afterwards Viscount Melville, was the first President of this Board. In this capacity he carried a fresh Act of Parliament, in 1794, by which the monopoly of exclusive trade was extended for a further period of twenty years, subject to the annual payment of £500,000 to the state; while certain small privileges were for the first time granted to private traders. At this time the yearly sales of the Company's goods in England amounted to about £10,000,000 sterling.

The 19th c. has witnessed the extension of British rule or British influence over the whole of India, and also the final downfall of the E. I. C. In 1833, the trading monopoly was withdrawn, and with it fell all the manufactures of India which had been artificially maintained by the Company. The dividends to the proprietors of E. India stock were now paid out of the taxes on the native subjects of the Company; but it was explicitly declared that the E. I. C. exercised its political powers as trustee for the Crown, subordinate to the Board of Control. In 1853 the charter was renewed for twenty years, but the Mutiny in 1857 produced an irresistible current of public opinion in England in favour of abolishing the shadow of power and the substance of patronage which the Company still retained. Despite the strenuous opposition of the Company, the Act received the royal assent on 2nd August, 1858, which vested directly in the Crown all the powers exercised by the E. I. C. The government of British India is now vested in the Secretary of State for India and a council of not less than ten members, each of whom receives the salary of £1200 per annum. The government in India consists of the Governor-General or Viceroy, assisted by five ordinary members, one public works member, and certain extraordinary members of Council. Indian stock to the amount of £6,000,000, with interest at 10½ per cent. guaranteed by England, represented the capital of the Company until 1873, when an Act of Parliament was passed for its final absorption. See INDIA, BRITISH.

The Scottish E. I. C. was formed in 1695, but was almost still-born in the rapidity of its failure. That of Denmark, founded in 1618, was repeatedly reorganised (finally in 1792), but has long ceased to exist. The French Company, established in 1664, was dissolved in 1790, while the Ostend India Company only lasted from 1718 to 1731. The original Dutch Company dates from 1595, but several similar bodies were united into one in 1602. A company of Swedes was created in 1741, and reorganised in 1806.

East Indies, the name vaguely given in the 17th c. to that tract of country, with all its islands and peninsulas, which lies between the coast of Persia and the coast of China. It came into use to mark the imaginary correlation with the West Indian Islands, which, as is well known, were thought by their first discoverers to be connected with India; but the name now survives only in such phrases as 'East Indiaman,' for a ship trading to those parts, and the 'Honourable East India Company,' in speaking of the defunct corporation.

East'lake, Sir Charles Lock, an English historical painter, was born at Plymouth, 17th November, 1795. He was educated at Charterhouse, London, and at an early age became a pupil of the Royal Academy. When Napoleon arrived at Plymouth in the *Bellerophon*, E. made a study of him standing at the gangway, and produced the last portrait of him painted in Europe. He visited Italy in 1817, and Greece in 1819, and spent nine years (1820-29) in Rome, revelling in the picturesque aspects of Italian life. His first great picture is entitled 'Pilgrims Arriving in Sight of Rome' (1828), and it was followed by 'Christ Weeping over Jerusalem' (1841), 'Helena' (1849), 'Violante' (1853), 'Beatrice' (1855), &c. He was made a Royal Academician in 1830, President of the Royal Academy and a Knight in 1850, and D.C.L., Oxon, in 1853. E. died 23rd December, 1865, at Florence. He wrote *Materials for the History of Oil-Painting*, *Contributions to the Literature of the Fine Arts*, and translations of Goethe's *Farbenlehre* and Kugler's *History of Painting*. His work is chiefly distinguished by elevation of sentiment and delicacy of execution.—**Lady E.** (Elizabeth Rigby), also an artist and author, wrote a biography of her husband in the second series of his *Contributions to the Literature of the Fine Arts* . Died in Oct., 1893.

East'on, a town of Pennsylvania, U.S., at the confluence of the Delaware with the Lehigh, 60 miles N.W. of Philadelphia, and 75 W. of New York by railway. It is the seat of Lafayette College, has many churches, a public library, an opera-house, several newspapers, and three street railways. In the vicinity are rolling-mills, furnaces, and various factories, and there is also a trade in cotton, oil, rifles, and flour. Pop. 14,481.

East'port, a port of entry in Maine, U.S., on Moose Island, Passamaquoddy Bay, is a thriving town of the United States on the N.E. It has a harbour deep enough for the largest vessels, and defended by Fort Sullivan, and a trade in fish and timber. Steamers ply hence to Boston, Portland, and St. John. Pop. 4908.

East River, the strait between Long Island Sound and New York Bay, and separating the city of New York from Brooklyn and Williamsburg. It is 20 miles long, and 7 miles from New York is the strait known as Hellgate. This pass was formerly dangerous, but its obstructions have been removed within the last thirty years. A bridge across the E. R. to connect New York with Brooklyn, was opened 24th May, 1883. For miles the banks of the river are lined with quays, piers, and building-slips.

Eastwick, Edward Backhouse, C.B., F.R.S., a distinguished oriental scholar, was born in 1814, and was educated at the Charterhouse, and at Balliol and Merton Colleges, Oxford, at the latter of which he obtained an open postmastership in 1833. Having received an Indian nomination, he left the University before taking his degree and proceeded to India, where he joined the 6th Bombay Light Infantry regiment. In less than six years after his arrival in the country he passed as interpreter in Hindustani and Hindi, Marathi, Persian, Gujarati, and Kanarese, and received the High Proficiency Reward of 1000 rupees. During this time he served as Assistant Political Agent in Kathiawud and in Upper Scinde, and also on the staff of Sir Henry Pottinger, at Nankin, in China, by whom he was selected to convey the intelligence of the treaty and peace with China (1842). In the following year ill-health forced E. to return to Europe, and in 1845 he was appointed Professor of Urdu at Haileybury College. In 1851 he was elected a fellow of the Royal Society. On the closing of the E. India College, E. was appointed Assistant Secretary in the Secret Department of the India Office (1859), after which he became Assistant Secretary in the Political Department of the India Office, was gazetted Major of the London Rifle Brigade, was called to the Bar as member of the Middle Temple Inn of Court, and was appointed Secretary of H.M. Legation at the Court of Persia (1860). In 1862 he became Chargé d'Affaires, and negotiated the treaty for the telegraph line from the Persian frontier near Bagdad, to India. Serious differences having risen between E. and his chief the former returned to England in 1863 and left the diplomatic service. In 1866, the Marquess of Salisbury (then Lord Cranborne, and Secretary of State for India), appointed E. to be his private secretary, who in the same year was made C.B. *for services in Persia*, and later on proceeded to Venezuela as commissioner for the Venezuela Bondholders. On his return in 1868 he was elected, in the Conservative interest, M.P. for Penryn and Falmouth. Some time after this, E. became connected with an oil company which turned out a disastrous failure and involved him in very serious losses besides heavy expenses, all of which he, however, discharged in full with the assistance of his son, who also supplied the 'sinews of war' for the contest at the general election of 1874, at which E. lost his seat. In 1875 he received the degree of M.A. Oxon 'as a slight recognition of distinguished services.' During the remainder of his life he devoted himself to literature, and, besides continuously contributing to many of the leading journals, he prepared Mr. John Murray's several handbooks for India, and composed and brought out the *Kaisarnámah i Hind*, 3 vols. (unfinished), dedicated by permission to H.M. the Queen. On 16th July, 1883, E. died at Ventnor in the Isle of Wight, deeply engrossed with literary composition until almost the very last. Of the numerous works, besides those already referred to, which he published, the following may be mentioned—Translations of *History of the Arrival of the Parsees in India* (Persian), *Life of Zoroaster* (Persian), *Revolt of the Netherlands* (Schiller), *Bopp's Comparative Grammar* (see article BOPP), *Prem Sagar* (Hindi), *Bagh o Bahar*, *Gulistan*, *Anwar i Suhaili* (see article BIDPAI); also *Sindhi Vocabulary*, *Hindustani Grammar*, *Dry Leaves from Young Egypt* (1851), *Autobiography of Lutfullah* (1857), *Three Years' Residence in Persia* (1864), *Venezuela* (1866-68). E. also catalogued the Ouseley MSS. in the Bodleian Library (1852), and edited the Book of Genesis in the Dakhani language for the Bible Society (1858). E. was a Fellow of the Society of Antiquaries, member of the Royal Asiatic Society, the Asiatic Society of Paris, the Oriental Society of Germany, the Philological Society of London, and Fellow of the Society of Northern Antiquaries. He at one time edited the *Homeward Mail*, and for thirty years contributed to the *Athenæum*.

In 1880, E. was offered the title of K.C.S.I., but the despatch only found him while staying away in the hills in India, and by the time his acceptance reached England the Conservative Government had resigned. Their successors did not renew the offer, and E. died before the Conservatives returned to power. E. was a most painstaking and conscientious student and writer; his industry was immense; and from the day when he landed in India in 1836 until that on which he laid aside his pen for ever, his life was one of long, continued, unceasing application. He did his best to introduce the more accurate method of spelling Indian words, which has become more popular within recent years, and he made copies, after personal inspection, of the epitaphs of all the European tombs he was able to visit in the course of his wanderings over the Peninsula from 1875 to 1882. On being assured one day by a well-known savant at the Athenæum Club, that hard brain-work conduced to long life, E. quietly remarked, 'In that case, Professor, we two should live for ever.'

Eau de Cologne, a very celebrated perfume, invented by Johann Maria Farina of Cologne, the characteristic ingredients of which are essential oils obtained from trees of the orange tribe, such as citron, orange, bergamot, neroli, and petitgrain oils. In addition to these the 'original E. de C.' contains a proportion of lavender, rosemary, and benzoin, the whole being mixed with spirit of wine, to which an alcoholic extract of geranium flowers is added. The ingredients are very intimately mixed by frequent agitation, and allowed to settle in bulk for sixty-four days, when the perfume is ready to put up in flasks for sale. The best brands are those of the inventor.

Eau de Créole, a W. Indian aromatic liqueur, prepared by distilling the flowers of the Mammee apple or S. American apricot.

Eau de Javelle, a solution of potassium hypochlorite, which, towards the end of last century, was introduced for bleaching purposes at Javelle in France. It was soon supplanted by the so-called chloride of lime, or ordinary bleaching-powder.

Eau de Luce, a milky-white perfume of ammonia, benzoin, otto of lavender, and oil of amber. The *Aqua Luciæ* of druggists, so called from its inventor, had formerly a fictitious reputation as an antidote to snake-poison, but is now employed as a stimulant.

Eau de Millefleurs, a very complex bouquet or prepared perfume, in which the principal materials are otto of rose, bergamot oil, vanilla, violet, and jasmine essences, tincture of musk, lavender, neroli, and clove oils.

Eaux Bonnes ('good waters'), a favourite watering-place in the department of Basses-Pyrénées, France, 22 miles S. of Pau. Its warm sulphur-springs are beneficial in the early stages of consumption, and have led to the creation of a thermal establishment, frequented yearly by 6000 bathers. Pop. (resident) 812. In the vicinity are beautiful promenades and picturesque cascades.

Eaux Chaudes, a village of France, 3 miles S.W. of Eaux Bonnes, in the gorge of the valley of Ossau, has warm medicinal springs, whence its name.

Eaux Vives ('living waters'), a Swiss town in the canton of Geneva, 2 miles N.E. of Geneva, and on the margin of the lake. Pop. 7907.

Eaves'drop. The Roman law required a proprietor who had no *stillicidii servitus*, to place his building 2½ feet within his boundary. The principle was recognised by the English before the Norman conquest under the term *efesdrype*. In

Scotland there is no statute on the subject, but by custom 9 inches are required for the E.; but a proprietor may build to the confines of his property provided no drop from the building can fall on the adjoining property.

Eaves'droppers are, according to Blackstone, 'such as listen under walls or windows or the eaves of houses, to hearken after discourse, and thereupon to frame slanderous or mischievous tales.' The offence was in England punishable by fine and being compelled to find sureties for good behaviour, under statutes whose provisions seem to be extended to Scotland by 6 Anne c. 6; but the offence could be reached directly and indirectly by the common law of Scotland.

Ebena'ceæ, a natural order of Exogenous plants, comprising trees or shrubs with exstipulate leaves, polygamous flowers, persistent calices, a baccate or berry fruit, and large albuminous seeds. They chiefly belong to tropical climates. There are five genera, and the heart-wood of several species of *Diospyros* yields the ebony-wood of commerce, *e.g.*, Mauritius ebony, E. Indian ebony, and Ceylon ebony.

E'berhard is the name of several members of the Würtemburg dynasty, of whom the first, **Eberhard the Noble** (*erlauchte*), ruled from 1279 to 1325, and greatly extended the territorial possessions.—**Eberhard IV., the Quarrelsome** (*der Greiner*), grandson of the former, became Count of Würtemburg in 1343, distinguished himself in the wars of S. Germany towards the end of the 14th c., and died 15th March, 1392.—**Eberhard im Bart,** first Duke of Würtemburg, was born in 1445, eight years after the division of the territory between his father, Ludwig the Elder, and his uncle, Ulrich, the founder of the Stuttgart line. He succeeded, with the help of the Elector Friedrich, in consolidating the family inheritance, which he rendered indivisible by the Compact of Münsingen in 1482. The established constitution of Würtemburg was his work, and he also founded the University of Tübingen (1477). E. was the head of the Swabian Bund, and was raised to the ducal rank by the Emperor Maximilian I. at Worms, 1495. He died childless in February, 1496.

Eberhard, Christian August Gottlob, a German writer, born at Belzig, Prussia, 11th October, 1769, studied at Halle, wrote tales and poems which won considerable popularity, and died at Dresden, 13th May, 1845. Among his works are *Ferdinand Werner, der arme Flötenspieler* (1802); *Der erste Mensch und die Erde* (1828), a poem; and *Hannchen und die Küchlein* (1822, 20th ed. 1864), a graceful narrative poem, which has been translated into English by Cochrane, under the title of *Jenny and her Chickens* (Edinb. 1854). E. published his *Collected Works* in 20 vols. (Halle, 1830-31).—**Johann August E.,** a philosophical writer, born at Halberstadt, Saxony, 31st August, 1739. After studying at Halle and acting as a family tutor, he engaged in theological controversy, and published at Berlin his *Neue Apologie des Sokrates* (1772-73; 3rd ed. 1788), a book on the salvation of the heathen, which prevented him from rising in the Church. He remained a poor preacher at Charlottenburg until appointed in 1788 Professor of Theology at Halle. He was made Doctor of Theology and Member of the Berlin Academy of Sciences in 1808, and died 6th January, 1809. In philosophy he followed Leibnitz and opposed Kant; in theology he was one of the earlier German rationalists.

E'bernburg, a village in the Palatinate of Bavaria, about 20 miles S.W. of Mainz, on the Nahe. It is notable for the ruins of the castle of Franz von Sickingen. Within its walls many of the early Reformers found shelter, and here Ulrich von Hutten composed and printed several of his works.

E'bert, Karl Egon, a Bohemian dramatic and lyrical poet of considerable eminence and popularity, was born at Prague, 5th June, 1801; educated at Vienna and the University of Prague, and finally, after holding posts, chiefly as a librarian, settled in his native town as a poet. His poetry, mainly lyrical, is very popular among his countrymen. He also published dramas of some merit.

Eb'ionites (Heb. 'the poor': so named, according to their own account in Epiphanius, because they had sold their possessions for the common good in the time of the apostles) were a sect in the early Church who represented the Judaising tendency which saw in Christianity only the completion of Judaism by the realisation of the Messianic idea and the addition of a few isolated precepts. The E. regarded Jesus only as a man, distinguished above others for his legal piety, on which account he had been deemed worthy to be chosen the Messiah; his election to that office having been miraculously revealed at his baptism by John the Baptist. Jerusalem was still to be the seat of the theocracy, where Jesus, on his speedy return, was to restore it in surpassing splendour. In accordance with these views, the Gospel they used (the *Gospel of the Hebrews*) did not contain any account of the miraculous birth of Christ. In the Apostle Paul, as a matter of course, they saw only an apostate from the law and a false teacher, and therefore they rejected his epistles. The famous *Clementine Homilies* (q.v.) is an Ebionitish work.

There were, however, two different sections of E., one of which came nearer than the other to the orthodox doctrine of the Church. This was the Nazarites, a name originally applied to all Christians, who admitted the supernatural birth of Christ; they were distinguished for their opposition to the Scribes and Pharisees, acknowledged the call of Paul to be an Apostle to the Gentiles, and consequently did not consider the Mosaic law binding on the latter.

Eb'oli (the *Eburi* of Pliny), a town in the province of Salerno, 44 miles S.E. of Naples, with which it is connected by railway. It has several churches and convents, and an annual fair, held for twelve days. The ruins of the ancient *Eburi* stand on the *Monte d'Oro*, near the Sele, which is spanned by the remains of a fine Roman bridge. Pop. 11,536.

Eb'ony (Heb. *hobnim*, from *eben*, 'a stone,' Gr. *ebĕnos*, Lat. *ebenus*), a wood of great hardness and of deep-black hue, obtained from various kinds of trees belonging to the natural order *Ebenaceæ* (q.v.). The E.-wood is the *heart-wood* of these trees, which belong to the genus *Diospyros*. These trees in Mauritius and Ceylon afford the best E. A tree may attain a large size, and the heart-wood of the stem may of itself form logs over two feet in diameter, and often above ten feet in length. E.-wood, when felled, is usually immersed in water for periods varying from six to eighteen months, to further harden it. It is then taken out, the ends of the logs being prevented from splitting by being girt with iron rings. The wood is mostly used for inlaying and in turning, and was employed by the ancients. Commercial E. may be obtained from Leguminous plants, such as *Brya Ebenus* of America.

Ebor, see YORK.

E'bro (Lat. *Iberus*), a river of Spain, which has its source in the Cantabrian mountains, in the province of Santander, and flows S.E. through Navarre and Aragon, passing Logroño, Tudela, and Zaragoza, and falls into the Mediterranean below Tortosa, after a course of upwards of 400 miles, much of which is impeded by shoals and rapids. As its mouth is sanded up, a canal, the *San Carlos*, has been cut through the delta from Amposta to the Bay of Los Alfaques; and another, connected with the San Carlos and reaching as far inland as Zaragoza, has been completed. Besides these there is the famous *Imperial Canal*, or canal of Aragon, commenced by Karl V., which begins 3 miles below Tudela, and ends at the monastery of Monte Terero, near Zaragoza. The E. drains a basin of upwards of 25,000 sq. miles. Principal affluents on the left—the Aragon, Gallego, Segre; on the right, Xalon and Guadalope.

Ecbal'ium Officinar'um (Fr. *concombre sauvage*), commonly called the squirting cucumber, an annual plant of the natural order *Cucurbitaceæ*, is a native of the hotter parts of Europe, where it grows wild on rubbish-heaps. It is cultivated as a medicinal plant in some parts of Northern Europe, and a few acres are grown at Mitcham, in Surrey. It is a trailing plant, without tendrils, rough, and covered with stiff hairs. The fruit, like a small oblong melon, is covered with soft prickles, and is filled with a succulent tissue containing numerous black seeds, which, when the fruit is ripe, are forcibly expelled through the aperture where the stalk is attached to the fruit. This remarkable phenomenon is ascribed by Dutrochet to osmotic action within the fruit. The active principle of the plant is contained in the thick green mucus surrounding the seeds, from which is prepared the drug *Elaterium* (q.v.). For illustration see article CUCUMBER.

Ecbat'ana (Old Per. *Hagmatana*, and Old Testament *Achimetha*, probably 'treasure city,' Gr. *Engbatana* and *Ecbatana*), an ancient city of Media, which has been identified with the modern Hamadan (q.v.). E. was the summer residence of the Median, Persian, and Parthian kings, was built on a conical hill, and surrounded by seven separate walls, painted different colours, the outmost of which had a circumference of fully 28 miles. A recent theory is that there were two Ecbatanas, one at the modern Hamadan, the other at Takht-i-Suleiman, in the province of Azerbijan.

Ec'ce Hom'o (Lat. 'behold the man'), the exclamation of Pilate when he brought Christ forth bound and 'wearing the crown of thorns and the purple robe' (John xix. 5). The expression was adopted by the old masters as the title of pictures representing the Saviour thus presented to the Jews by Pilate. The greatest E. H. is that of Correggio, in the National Gallery. Guido, Morales, and other famous painters, have also treated the subject.

Eccen'tric, in machinery, a disk fixed eccentrically upon a revolving shaft, and used to transform its rotary motion into a reciprocating (approximately harmonic) one, in cases where the continuity of the shaft cannot be broken by a crank.

Eccentri'city, the name of an important element in central curves and surfaces of revolution of the second degree, being the ratio of the distance between the foci to the major axis. It is, therefore, less than unity for the Ellipse (q.v.), and greater than unity for the Hyperbola (q.v.), being equal in the former case to $\sqrt{(a^2-b^2)} : a$, and in the latter to $\sqrt{(a^2+b^2)} : a$, where a and b are the major and minor axes respectively.

Ecchymo'sis (from Gr. *ek*, 'out of,' and *cheein*, 'to pour'), a discoloration of the skin caused by the extravasation of blood in the skin or the tissues beneath it. E. is usually attended with swelling, and may be caused by disease, accidents, or injuries. E. can only take place during life, or before the vital functions have entirely ceased, so that its presence is an important condition in many cases of medical jurisprudence. E. may be diminished by the application of cold, in the cases of recently-inflicted injuries.

Ec'cles (a corruption of the Lat. *ecclesia*), a word that enters into the composition of a great number of names of places, as Eccleshall, Eccleshill, Eccleston, Ecclescraig, Ecclefechan ('the church of St. Fechan'), Ecclesmachan ('the church of St. Machan'), &c. The most important, however, is *Ecclesfield*, a town in the W. Riding of York, with manufactures of flax, linen, and cutlery. Pop. reg. subdist. and civ. par. (each) 25,885.

Ecclesias'tes (Gr. in the LXX. for Heb. *koheleth*, 'the preacher') is the title of one of the books of the Old Testament, which professes to be the utterances of the 'Preacher, the son of David, king of Jerusalem,' *i.e.*, Solomon (ch. i. 1, cf. 12). That it was the composition of Solomon was in ancient times the universal opinion, but there is now a very general opinion that the author's assumption of Solomon's name is nothing but a literary embellishment, the propriety of which would lie in Solomon's reputation for wisdom, and his ability to testify from experience of the vanity of all earthly things. Incidental indications that it was not written by Solomon are found in ch. i. 12, 16; ch. ii. 9 (unsuitable to the son of David, the only king before him in Jerusalem); ch. iii. 16; ch. iv. 1 (it is unlikely that Solomon would have described the misery and wrong caused by his own misgovernment); and ch. xii. 9-14.

As to the actual date of its composition, there are thought to be a number of indications that it was written after the Captivity:—(1) the whole nature of the language, and the prosaic character of the composition; (2) the profusion of Chaldaisms, scarcely found in any of the other books of the Old Testament; (3) the complaint about much book-making (ch. xii. 12); (4) sundry allusions to oppressive *foreign* kings then ruling (iv. 13-16; x. 16, 17, 20).

Regarding the plan of the book there has been the greatest diversity of opinion. Perhaps the most matured view is that while the book contains the germs of both the Pharisaic and Sadducaic systems, the object of the writer was to point out that the secret of true happiness, amid all the troubles of the world, consists in a true enjoyment of the good that comes from God. See Bleek's *Einleitung in das Alt. Test.* (2nd ed. Berl. 1865; Eng. trans. 1869); Ginsburg's *Ecclesiastes*; and Tyler's *Ecclesiastes*.

Ecclesias'tical Commiss'ioners for England were established by the Acts 6 and 7 Will. IV. c. 77 and 3 and 4 Vict. c. 113 (which two Acts were to some extent amended by statutes 4 and 5 Vict. c. 39, 13 and 14 Vict. c. 94, 17 and 18 Vict. c. 116, 23 and 24 Vict. c. 124, 29 and 30 Vict. c. 111, and 36 and 37 Vict. c. 64) in order to carry out the recommendations of commissions appointed to consider the state of the several dioceses in England and Wales, with reference to the amount of their revenues, and the more equal distribution of episcopal duties, the prevention of the necessity of attaching by commendam to bishoprics benefices with cure of souls; to consider also the cathedral and collegiate churches and the residence of clergy on their benefices. The Commission recommended such exchange of episcopal duties as would prevent translations and commendams, and the appropriation of part of the corporate revenues of the cathedral and collegiate churches, and of the whole endowments of the non-residentiary prebends, dignities, and offices, to establish a fund for the better provision of the cure for souls. Under these Acts, the composition of the body was materially changed: it now includes the two archbishops, all bishops, five Cabinet ministers, four Judges, the three chief deans, the Church Estates Commissioners (*ex officio*) and twelve laymen. The Church Estates Commissioners' duties are, amongst others, to control the purchase, exchange, letting, and management of lands and tithes. The method of procedure is for the Commissioners to lay a scheme before the Queen in Council, the Order in Council being afterwards registered in the diocese affected by it. But under the Ecclesiastical Leasing Acts, and in the later Acts relating to clerical residences and the spiritual provision for populous places, the Commissioners act independently. The Act first mentioned made very extensive changes in the limits of the episcopal sees, and introduced two new sees, Manchester and Ripon; it laid down the principle that all parishes should be subject to the episcopal jurisdiction in which they are locally situate, and re-arranged salaries, first-fruits, and tenths. Under the Act 23 and 24 Vict. c. 124, the lands and emoluments (except rights of patronage, residences, and lands connected therewith) of the various sees are vested in the Commissioners, subject to an obligation to provide what is an adequate endowment from time to time. These Acts dealt with the abolition of sinecures, pluralities of deans, and non-residentiary cathedral preferments, chiefly canonries, and the raising money for the cure of souls by the annexation of parishes to canonries, and of canonries to archdeaconries. The separate estates of deaneries and canonries, not suspended or annexed, and of non-residentiary prebends, are also vested in the Commissioners; and any corporation of vicars choral, priest or senior vicars, custos and vicars, warden and minor canons, &c., may transfer their lands to the Commissioners. The policy of the Commissioners is expressed in certain resolutions submitted to the Queen. Grants are given to augment the income and provide residences in certain districts. The Commissioners superintend the exchange of advowsons, the sale of livings in the gift of municipal bodies and of the Lord Chancellor, the erection of new parishes and the selection of sites for building. In fact, the Commissioners have now become the Church Building Commissioners, originally appointed in 1818 to distribute £1,000,000 in the erection of new churches. From the Commissioners' Report, 28th February, 1895, we find that in the preceding year they paid for augmentation and endowment of benefices (including terminable grants and grants under 23 and 24 Vict. c. 124; also annual payments in respect of capital sums held for certain benefices) £696,202 12s. 2d., for chancel repairs (after deducting £330 9s. 11d. received for dilapidations) £1716 7s. 6d., to bishops in respect of estates vested in or managed by the Commissioners (after deducting the net income of £53,100 12s. 9d. arising from the estates) £99,453 17s. 7d., to chapters and vicars choral (after deducting £556 16s. 9d. as share in respect of the suspended Hereford canonry) £150,814 16s. 1d., in capital sums for parsonage houses and sites £48,407 7s. 7d., for surveyors' charges, &c., £5766 11s. 7d. (rather a high item), for architects' charges £1546 6s. 11d., for income-tax (after deducting £30,644 0s. 3d., the deductions on that account from payments made to bishops, chapters, &c.) £9805 7s. 11d., and for official establishment expenses, &c. (after deducting registration fees received) £32,290 15s. 11d., certainly an exorbitant disbursement, when all the other charges are taken into consideration, and one deserving of the careful consideration of both Houses of Parliament. This charge is also indefinite since the amount received as registration fees is not given. The balance sheet showed £6,716,976 8s. 9d. in Government securities and £4,912,336 15s. 11d. in cash. The net income from all sources was £1,921,336 18s. 11d. for the year ending 1st November, 1894.

Ecclesiastical Corpora'tion in England may be *aggregate* or *sole*. The former consists of several members such as a dean and chapter, and is maintained by succession. The latter consists of one person, such as a bishop, a parson, a vicar; every holder of a benefice being regarded as a corporation *sole*, so that the temporalities vested in him do not descend to his heirs, as they otherwise would do by common law. The legal powers of an incumbent are nearly the same as those of a Tenant for Life (q.v.).

Ecclesiastical Courts are courts having jurisdiction in spiritual affairs. They are the Court of Arches, the Courts of Peculiars, the Archdeacon's Court, the Consistory Courts, the Prerogative Court of each Archbishop, the Faculty Court, and the Appeal Court of the Privy Council. The principal ecclesiastical court of the province of Canterbury is the Court of Arches. The parishes which are *peculiars* of the archbishop are under the jurisdiction of the judge of this court. The Court of Peculiars is a branch of the Court of Arches, and has jurisdiction over the parishes of the province of Canterbury in other dioceses. The Courts of Peculiars are numerous; and those with the diocesan courts and the courts of the province of York form the ecclesiastical administration of England. Formerly these courts had jurisdiction in testamentary and matrimonial affairs, but in 1857 this jurisdiction was transferred in the former matters to the Probate Court (q.v.), and in the latter to the Divorce and Matrimonial Court (q.v.); both which Courts are now merged in the Probate, Divorce, and Admiralty Division of the Supreme Court by the Judicature Acts of 1873 and 1875.

Ecclesiastical Law. See CANON LAW.

Ecclesiastical Titles Act. After the Reformation in England, successive Tudor monarchs were excommunicated by the Pope, and, on the other hand, severe statutes were passed by Elizabeth, according to which the attributing by act or speech any such authority or jurisdiction to the Bishop of Rome as he had heretofore claimed should be punishable with præmunire. From that time to 1848 there was no legal method of communication on public matters between England and Rome, although many millions of British subjects were Catholic. In 1827, Mr. Canning, as Foreign Secretary, was forbidden even to reply to a civil letter sent by the Pope announcing his succession. In 1848 the Act 11 and 12 Vict. c. 108 at last enabled her Majesty to hold diplomatic intercourse with the Pope. But it was forbidden to receive as diplomatic representative any person in holy orders in the Catholic Church, or a member of any community bound by monastic or religious vows. The Act was not made use of. After the death of Watson (the last of the old Catholic bishops) in 1584, the Pope maintained his spiritual authority in England through archipresbyters (Blackwell, Birkhead, and Harrison) until 1623, when a Bishop of Chalcedon, *in partibus*, was sent by special bull. Subsequently vicars apostolic were sent. The number fixed by Innocent XI. in 1688 was four, increased in 1840 to eight by Pope Gregory XVI., there being bishops *in partibus* as coadjutors. In Ireland the Catholic Church was always governed by ordinary bishops. In 1850 Pius IX. resolved that there should be a new division of dioceses in England, that there should be an archbishop of Westminster, and that the ordinary bishops should take their names from English towns. Wiseman, previously Bishop of Melipotamus, was made cardinal, and became first archbishop. This was done by the Bull 'Quibus Hierarchia Episcopalis in Anglia restituitur,' which was promulgated without authority from the English Government. This, and the Pastoral Letter of the new archbishop, produced a manifesto from the English clergy (see *Guardian*, 2nd April, 1851), in which they set forth the substantial identity and Catholicity of their Church before and after the Reformation. One title in the bull (St. David's) was already appropriated to an English bishop. Earl Russell then (4th November, 1850) wrote his famous Durham Letter; he was excited by the spread of Tractarianism, or Newmania, and called the bull 'insolent and insidious.' This raised a storm in the country. The result was the Act 14 and 15 Vict. c. 60, which declared the bull void, and imposed a penalty of £100 on all persons procuring, publishing, or using such bulls, or assuming the objectionable title. This Act no one has ever attempted to enforce. On the disestablishment of the Irish Church it was found to apply to the Anglican Irish bishops, and was repealed in 1871. Scotland was for some time after the Reformation under the authority of the English archpriests and vicars apostolic, but in 1629 Urban VIII. granted faculties to F. W. Ogilvie as prefect of the mission. In 1653 the secular clergy were, by decree of propaganda, erected into a missionary body. In 1731 Scotland (which had now its own vicars apostolic) was divided into a Lowland and Highland vicariate. The present tripartite arrangement dates from 1827.

Ecclesias'ticus [so called because the most important and popular of the *libri ecclesiastici* (as opposed to *canonici*), or books appointed to be read in church, though not canonical] is the Latin title of the Apocryphal book, called in the LXX. 'The Wisdom of Jesus the Son of Sirach.' The book seems to have been originally written in Hebrew, with the title 'The Proverbs of Jesus, Son of Sira'; of the original, however, nothing now remains but sundry quotations in the Talmud and Midrashim. The Greek version in the LXX. was made, according to the prologue, by the grandson (name unknown) of the author, in Egypt, in the reign of Euergetes. But this may have been either Ptolemy III. (B.C. 247-222) or Ptolemy VII. (B.C. 145-116), both of whom received the name Euergetes. Unfortunately the same ambiguity attaches to the high priest Simon described in chap. l. as if he had but recently died, as there were two high priests of that name, one who held office about B.C. 370-300, the other about 217-195. But the laudatory description is infinitely more applicable to the former, who was surnamed 'the Pious,' than to the latter, about whom Josephus has not a single good thing to tell. Now as the Simon referred to was dead, E. was probably written about 290-280, and the Greek translation made about 247-222. The aim of the book is to set forth the true nature of wisdom, and the religious and moral duties she teaches us to follow. See Ginsburg in Kitto's *Cyclo. of Bib. Lit.*

Ecclesiol'ogy is a term which was invented at Cambridge at the time of the Tractarian revival of theology at Oxford. The Camden Society, which was instituted in 1838 for the study and preservation of ecclesiastical antiquities, received latterly the name of the Ecclesiological Society. The science, which may be regarded as synonymous with Sacred Archæology, treats of—I. The arts, including architecture, sculpture, painting, engraving, and music; also furniture, plate, vestments, &c. II. Practices, ritual, symbolism, tradition, customs—1. The orders of the clergy. 2. Dignities, offices, and ministries of the Church. 3. Religious buildings, communities, and rules. 4. Distinctions among Christians, as catechumens, &c. 5. Divine service, rites, and ceremonies. 6. Discipline and ordinance. 7. Sundays, fasts, and festivals. 8. Usages and institutions. See Walcott's *Sacred Archæology.*

Ecg'berht (mod. *Egbert*), one of the greatest of the early English kings, was the son of Alckmund, ruler of Kent. Claiming the throne of Wessex in 787, he was compelled to flee before Brihtric, a stronger competitor, to the court of Karl the Great, with whom he remained studying the arts of war and of government until 800, when the witenagemot of Wessex chose him as king. At this time the 'Heptarchy' had become merged into the kingdoms of Mercia, Northumbria, and Wessex; and Mercia, under the energetic Offa, had reduced to dependence, and threatened to absorb, the two remaining divisions. But after consolidating his authority during nine years of peace, and subduing the Britons of Devon and Cornwall, E. joined the E. Anglians, who had revolted against Beornwulf of Mercia, and shattered the Mercian power in the battle of Ellandun, in 823. In 827-828 he marched into Mercia and Northumbria, compelled them to acknowledge the overlordship of Wessex, and received the submission of the Welsh. Thenceforth he reigned over the country from the Forth to the English Channel, with the title 'King of the English.' The Danes began to invade England towards the close of his reign. In 833 he suffered defeat from them at Charmouth, but won a victory over them and their allies, the southern Britons, at Hengestendun (Hengstone Hill) in 835. E. died in 836. He was an able, courageous, and aspiring ruler, and may, to a large extent, be considered the founder of the English monarchy. See Freeman's *History of the Norman Conquest*, vol. i.; Palgrave's *Anglo-Saxon;* Green's *History of the English People.*

Ech'ard, Laurence, an English historian, was born at Cassam, Suffolk, about 1671; held two livings in Lincolnshire; became archdeacon of Stowe in 1712; was presented to several benefices in Suffolk; and died 16th August, 1730. His chief works are *General Ecclesiastical History* (1702); *History of England* (1707-18); *A Gazetteer; A Description of Ireland*, &c.

Ech'elon (Fr. *échelle*, Old Fr. *eschele*, Prov. *escala*, Lat. *scala*, 'ladder'), a formation of troops in successive parallel divisions, each stationed so far to the right or left of the preceding division, as that, on advancing, it shall be in the same line with it. In this formation the different divisions have the same local relation to each other as the steps of an obliquely-placed ladder or a staircase. This formation was of considerable tactical value in former times for the different evolutions required in attack direct or oblique, or in retreat. In modern tactics, in which the grouping of men in close formation for attack would, under all but the most exceptional circumstances, prove a fatal mistake, the E., as a formation in actual warfare, is no longer in use. See DRILL.

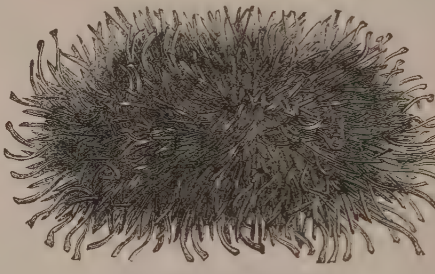
Echid'na, in natural history, a genus of quadrupeds belonging to the order *Monotremata*, and found only in extra-tropical Australia. Two species have been described, but they are believed to be the same, the differences between them being due to age and climate. The E. is about the size of the hedgehog, like which animal its back is covered with strong and very sharp spines. These are of a dirty white tipped with black, and, as in the case of the hedgehog, are erected as a means of defence. The snout is long and tubular, the tongue extensile and covered with a viscous secretion, enabling the E. to capture its food, which consists of ants. The mouth is unprovided with teeth, but on the palate there are several rows of spines, directed backwards. Each foot is armed with five powerful claws, by means of which the animal can burrow with great facility. It favours sandy localities, and is nocturnal in its habits.

Ech'imyd, a peculiar genus of Rodent mammalia, allied somewhat to the *Myoxidæ* or dormice, and inhabiting S. America. The fur is mingled in some species with spines, and has procured for the animals the name of 'spiny rats.'

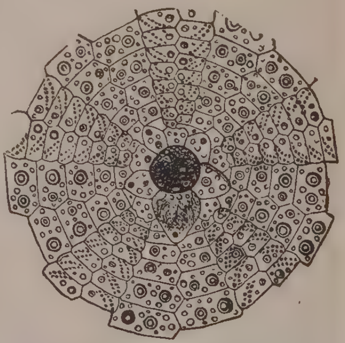
Echinoder'mata, a well-marked group of the animal world, regarded by some naturalists as entitled to rank of itself as a sub-kingdom of animals, but more usually considered to form the typical class of the sub-kingdom *Annuloida* (q.v.) or *Echinozoa.* It is represented by the sea-urchins, starfishes, sea-cucumbers, sea-lilies, and by the extinct orders *Cystoidea* (q.v.) and *Blastoidea* (q.v.). The characters of the E. are found in the general presence of a limy secretion in the skin or *perisome;* in the possession of a distinct digestive canal, a nervous system, and heart; in the presence of a water-vascular system, subserving locomotion; and in the absence of paired or lateral appendages. The symmetry of the body is readily seen to be *radial.*

Echinorhyn'chus, a genus of intestinal worms found in the digestive organs, and sometimes in the abdominal cavity of vertebrated animals. The body is round, sometimes elongated, and often shortened to a kind of sac. The proboscis is armed with hooks, by which they attach themselves to the coats of the intestines. *E. gigas* is the largest known species; it is found in the hog, and the wild boar, and the females are sometimes fifteen inches long. *E. hæruca* is a smaller species, and has been found in the liver of the cat.

Echi'nus, or **Sea-Urchin**, a typical genus of *Echinodermata* and of the order *Echinoidea*, having the body enclosed in a *test* or globular shell formed of layers of hexagonal limy plates, and which (save in a few instances—*Echinothuridæ*) is of rigid nature. The plates in all living Echini are disposed in ten double rows, which divide the shell meridionally into zones. Five of these double rows are perforated with holes for the protrusion of the numerous tube-feet or *ambulacra*, and are hence named *ambulacral areas.* The intervening and alternating five rows are not perforated, and are named *interambulacral areas.* In some cases the ambulacral areas do not extend from pole to pole of the shell, but are limited in the form of a rosette-like arrangement to the upper pole. This arrangement is named *Ambulacra circumscripta*, and is seen in the heart-urchins; and the name *A. perfecta* is applied where the ambulacral areas extend completely (as in the common E.) from pole to pole. The mouth opens at the lower pole. Around the mouth an oval membrane of leathery nature exists; whilst five plates are named *ocular* plates, from the fact of each bearing a little *ocellus*, or *eye.* The exterior of the E. shell bears numerous spines, each moveable and articulated by a ball-and-socket joint to a tubercle on the shell. The spines have gained for the Echini the name of 'sea-hedgehogs'; whilst the shell without the spines has given origin to the name 'sea-eggs,' often applied



Sea Urchin (showing spines).



Sea Urchin (showing shell, top view).

to these animals. Peculiar parasitic organisms known as *Pedicellariæ* (q.v.), occur on the exterior of the E. shell. The digestive system includes a set of five jaws—named the 'lantern of Aristotle'—gullet, stomach, and intestine. A tubular heart exists, and is connected with the alimentary canal by circular blood-vessels; and the nervous system consists of a ring surrounding the gullet and giving off five chief nerve-trunks. Breathing is subserved by a peculiar vascular and ciliated membrane, the *mesentery*, which supports and attaches the internal organs to the walls of the shell. The ambulacral system consists of a set of vessels, by which water is introduced into the shell, for the purpose of inflating the numerous little tubular feet, each provided with a terminal sucker, and by means of which these animals move slowly about. The sexes are distinct in all these forms; and in their development the Echini pass through a metamorphosis. The Echini are classified into the *Echinida* (with no more than twenty rows of plates in the shell), and the *Tesselata* (with more than twenty rows). The former group includes all living Echini, exemplified by the genus *Echinus* itself, by the 'heart' and 'cake' or flat urchins (*Spatangidæ*), by *Cidaris*, and numerous other forms.

Ec'ho (Gr. 'sound,' especially a 'returned sound'). If a series of sound-waves travelling through the air meet an opposing obstacle, a portion of the energy will be transmitted to the obstacle in the form of vibrations, which may be ultimately communicated to another region of the air as sound, while another portion will be simply *reflected* at the surface in a direction generally differing from the original one. This portion when heard constitutes an E. When the sound-waves strike the surface at right angles, the E. will be heard at the spot whence the sound proceeded; or they may be so directed after impinging obliquely upon several surfaces in succession. If the reflecting surface be close at hand, sufficient time may not have elapsed to distinguish the E. from the original sound, as in the case of large rooms or vaulted caves, when there is simply a confused *resonance*. Assuming $\frac{1}{9}$th of a second as the shortest interval between two successive sounds which can permit of them being completely distinguishable by the ear, it follows that for the perception of a distinct E., the reflecting surface must be about 60 feet distant, since sound travels at the rate of from 1050 to 1150 feet per second. A reflecting surface may be of such a form that a sound radiating from a certain spot may be so reflected as to converge at another definite spot; and thus the slightest whisper uttered at the former place may be distinctly heard at the latter, though inaudible elsewhere. An Ellipse (q.v.), with its foci, fulfils such a condition. The elliptical form of the Albert Hall quite marred the music with which its opening was inaugurated—the orchestra having been heedlessly placed at one of the foci. The Whispering Gallery of St. Paul's is also of this nature. Some echoes, again, are capable of repetition for a considerable number of times, the reflecting surfaces acting in the same manner as the mutually-inclined mirrors of a kaleidoscope. Such are the echoes of Killarney, and that of Simonetta near Milan, described by Southwell as repeating the report of a pistol sixty times. The prolonged rolls of thunder are simply a succession of echoes produced by reflection from the huge cloud-masses scattered over the sky.

E'cija, a town in the province of Sevilla, Spain, on the Xenil, 45 miles N.E. of the city of Sevilla. It stands in a fertile plain, is embosomed in trees, has a fine *alameda* or public walk, several churches, monasteries, and hospitals, and Saracenic gates and towers. It has manufactures of linens, woollens, and leather. E., the ancient *Astigis* (in Basque or Iberic, 'rock-dwelling'), became the *Colonia Augusta Firma* of the Romans, and Roman remains have been found. Pop. 23,615.

Eck, Johann Mayr von, a celebrated theological disputant, was born at Eck, Swabia, in 1486, studied at Heidelberg and Tübingen, and was appointed for his argumentative skill to the chair of theology in Ingolstadt University in 1510. His attack on Luther's *Theses*, in his *Obelisci* (1518), drew him into a public discussion with Luther and Karlstadt at Leipzig in 1519. His hatred towards the Reformers, to whom he affixed the name *Lutherans*, was implacable. Through his influence the papal bull of 1520 was issued, which condemned Luther's writings as heretical and erroneous. He was prominent in the Augsburg Diet, 1530, in the Conference of Worms, 1540, where he argued for three days with Melancthon and others, and in the Conference of Ratisbon, 1541. He died at Ingolstadt in 1543. He was self-confident, greedy, ambitious, and possessed slender talents and learning. He produced numerous polemical, ethical, and theological works, of very little value. His translations of the Bible had no success.

Eck'ermann, Johann Peter, the friend of Göthe, was born in 1792 at Winsen on the Lühe, a little town between Lüneburg and Hamburg. He studied at Göttingen in 1823, where he became private secretary to Göthe, with whom he lived on terms of the closest intimacy, and died at Weimar, 3rd December, 1854. His chief work is his *Gespräche mit Göthe*. The first part of these was published at Leipzig in 1836, the second at Magdeburg in 1848. They have been translated into all European languages. There is an American translation by Fuller (Boston, 1839), and an English by Oxenford (Lond. 1850). E.'s work is of the highest value, being a faithful picture of Göthe's domestic and literary life, and throwing a clear and full light on the varied génius of that great man. The *Gespräche* also contains, as their author himself says, 'many valuable explanations and instructions as to science, art, and the practical affairs of life.' E. also edited (1839-40) the *Sämmtlichen Werke* of Göthe, in 40 vols. A slight autobiography of E. is prefixed to the *Gespräche*.

Eckh'a, the name for the most common wheeled conveyance in India. It is a light two-wheeled cart, without springs, drawn by a pony, and covered with a cloth awning on a wooden framework. The E. is rarely used by Europeans, but natives will take long journeys in it. A good pony has been known to take a loaded E. 60 miles in twelve hours.

Eck'mühl, or **Egg'mühl,** a village in Lower Bavaria, on the Laber, 11 miles S. of Ratisbon, the scene of the defeat of the Archduke Karl of Austria by Napoleon I., 22nd April, 1809. Karl's attempt to seize the highway to Donauwörth, which would have secured the possession of Bavaria, was frustrated on the 21st by Davout; and next day Napoleon, with 65,000 men, suddenly attacking the Archduke, whose force amounted to only 28,000 men, compelled him to retreat on Ratisbon, with the loss of 6000 men and 16 guns. For his share in this engagement Napoleon created Davout, then Duc d'Auerstadt, Prince d'E.

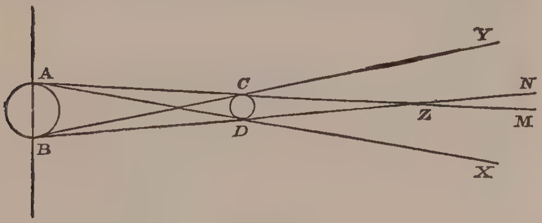
Eclamp'sia (Gr. *ek* and *lambanō*, 'I seize'), a term used to designate certain convulsive affections. E. depends upon a source of irritation of the periphery of the nerves, generally of a transient nature, and it disappears when the exciting cause is removed. It is distinct from the convulsions of hysteria, epilepsy, catalepsy, muscular convulsions, apoplexy, &c. It is an exceedingly alarming disease, and sometimes ends fatally.

Eclec'tics (from Gr. *eklegein*, 'to choose'), the name given to those philosophers who select various doctrines from earlier schools, and seek to form them into an harmonious system. The Neo-Platonic school of Alexandria is the chief eclectic school of ancient times, blending a subtle Greek dialectic with Oriental mysticism and Christian metaphysics. Bacon and Descartes, and also Hegel, have been styled the founders of modern eclecticism. The chief eclectic of recent times was Victor Cousin, whose system seems to have been based on a passage in Hegel's *Geschichte der Philosophie*. Cousin sought to combine the principles of Reid and Stewart with those of Proclus, Kant, Hegel, and others, and through his brilliant rhetoric won for his system a wide but fleeting popularity. At one time the chairs of philosophy in France were almost all held by his followers, but his eclecticism has now fallen into disrepute.

Eclip'ses (Gr. *ekleipsis*, lit. 'a leaving out,' hence 'a failing to appear.') are those astronomical phenomena in which a greater or smaller portion of a luminary is cut off from view.

This may occur in two distinct ways—either by the intervention of an opaque body between the luminary and the observer; or, if the eclipsed body be of itself non-luminous, by the interception of the light which, by its reflection, renders the body visible. To the former class belong solar E., those of Jupiter's or Saturn's satellites, as sometimes viewed from the earth, transits of Venus and Mercury, and occultations of stars; while lunar E., and the transit of a satellite's shadow over the disk of Jupiter and Saturn, may be mentioned as cases of the latter class. The word *eclipse*, however, when used without any qualification is understood as referring to either the sun or the moon; and it is in this restricted signification only that these phenomena are briefly discussed here.

A Lunar Eclipse is occasioned by the passage of the moon through the earth's shadow, necessarily accompanied by the interception of a portion of the sun's light, which would otherwise fall upon the moon's disk. This can only happen when the earth is between and in the same straight line with the sun and moon, *i.e.*, at the time of full moon. A consideration of the annexed figure will make the whole quite intelligible. A B represents a plane section through a great circle on the sun's surface, and C D a similar section of the earth's—both sections being in the same plane. Draw to these circles the four common tangents A X, A M, B Y, B N. In consequence of the much greater distance separating the earth and sun, as compared with their diameters, we may suppose these tangents to intersect at A B and C D—the extremities of two parallel diameters. Now the space C D Z is the section of a cone within which there is total shadow. This cone is called the *umbra;* and it is the entrance of the moon into this region which constitutes an eclipse—total or partial, according as the moon is wholly or partially immersed. Around this cone is another region, represented in section by Y C Z and Z D X, from which sunlight is partially excluded, and which is known as the *penumbra.* To an observer on the moon during its passage through this region, the sun would present the same appearance that it does to us during a partial solar eclipse. There is not, however, an eclipse at every full moon, since the moon's orbit does not lie in the plane of the ecliptic, but makes with it an inclination of rather more than 5°. The phenomenon is only possible when the moon at its full is sufficiently near its node; and it is found from calculation that no eclipse can take place if the node be distant from the point of the ecliptic opposite the sun by more than 11° 25′ 40″, and that an eclipse *must* take place if this distance be less than 9° 20′ 29″. The possibility of there being an eclipse within these limits depends on the relative distances of the sun and moon from the earth at the time. Even in the *umbra*, however, the moon receives solar light which has been refracted through the earth's atmosphere, and it is therefore usually distinguishable as a dark, copper-coloured disk.



Eclipse.

A Solar Eclipse is caused by the interception to a terrestrial observer of the whole or a portion of the sun's light by the opaque body of the moon. Accordingly it cannot take place but at new moon, and then, as in the case of lunar E., only when the moon, while in this position, is sufficiently near its node. The limits, corresponding to those given above for a lunar eclipse, are 15° 35′ 56″ and 17° 50′ 42″—the possibility of an eclipse happening within these again depending on the relative distances of the sun and moon from the earth. The only true difference between a lunar and a solar eclipse is that in the former the moon passes through the earth's shadow, while in the latter the earth passes through the moon's; but to a terrestrial observer the apparent differences are very striking. An eclipse of the moon is visible to all observers on the hemisphere of the earth turned away from the sun, and undergoes all its phases at precisely the same time for all observers; an eclipse of the sun is visible over a limited area, and differs in its extent and the time of its occurrence for every observer. The breadth of the earth's shadow at the moon's distance is considerably greater than the moon's diameter; that of the moon's shadow on the earth is at most a few miles, while sometimes the *umbra* falls short of the earth altogether—a phenomenon which cannot happen unless the moon's apparent diameter be less than the sun's. During a lunar eclipse the moon is always wholly immersed in the *penumbra;* during a solar eclipse the earth is never so, and hence the explanation of the fact that an eclipse of the sun is invisible at localities outside a certain closed area of the earth's surface. An eclipse of the moon is totally independent of the earth's diurnal rotation; but a solar eclipse is not. It is this consideration that renders the calculation of the latter so complicated and difficult compared with that of the former. In both, E. may be total or partial, but only in the case of the sun can there be what is termed an *annular* eclipse. This happens when the moon passes centrally over the sun's disk, the *umbra* at the same time falling short of the earth.

The earliest recorded solar eclipse is that mentioned in Chinese history as having taken place in the reign of Shingkang about 2169 B.C. It is mentioned incidentally in connection with the names Ho and Hi, two astronomers who were put to death for neglecting to predict the phenomenon. The famous total eclipse, predicted by Thales of Miletus, and which according to Herodotus interrupted the battle between the Lydians and Medes, occurred, if we accept the calculations of Sir G. B. Airy, on 28th May, B.C. 585. The total E. of Xerxes (B.C. 478) and of Agathocles (15th August, B.C. 310, according to Airy) may also be noted. In later times, we have the celebrated E. of 1434 and 1598, both total in Scotland; and that of 3rd May, 1715, the last total eclipse observed in England. The years 1868-71 will always be memorable for their total E., and for the great service done to astronomical science during their observation. That of 17th August, 1868, observed in India, is celebrated for the long duration of totality—as much as 6 minutes 50 seconds; that of 7th August, 1869, was well observed in N. America; that of 22nd December, 1870, was not successfully observed; while that of 12th December, 1871, was visible in Ceylon and Southern India. The same interesting series of E. will recur in precisely the same order after the lapse of between eighteen and nineteen years. (See METONIC CYCLE.) The most striking phenomena to a scientific observer during a total eclipse of the sun are the corona or ring of light, and the irregular red-coloured protuberances round the dark body of the moon. The corona depends greatly for its size and appearance upon the condition of the earth's atmosphere; but the protuberances are truly solar, being the huge flames of the ignited gases which form the sun's chromosphere. These flames, which can now be observed by means of a spectroscope without the aid of a total eclipse, are best considered under SUN. It is enough to mention that at the moment of totality the solar spectrum is reversed, the continuous spectrum disappearing, and the absorption lines becoming bright. (See SPECTRUM ANALYSIS.) In 1895 two total lunar, and three partial solar, E. occurred. For more detailed information regarding E., both mathematical and descriptive, see Herschel's *Outlines of Astronomy*, and Proctor's *Sun*.

Eclip'tic, the course among the stars which the sun, in virtue of the earth's annual revolution, seems to pursue—so named from the *Eclipses* (q.v.), which only happen when the moon is in or near this great circle. The E. does not coincide with the celestial equator, and accordingly the sun has an apparent annual motion in Declination (q.v.) as well as in right ascension. (See ASCENSION, RIGHT.) On the 21st of June and the 21st of December or thereabouts, the sun reaches its greatest distances N. and S. of the equator, being then at its summer and winter solstices respectively. The *obliquity* or angle of *inclination* of the E. to the equator is continually changing, being affected by the positions of the other planets, and by the earth's own Nutation (q.v.); but the difference between its extreme variations can never exceed 2° 42′. Its mean value is 23° 27′ 19″·93. The nodes, or the points at which the E. intersects the equator, are called the equinoxes, the vernal equinox occurring about the 21st of March, and the autumnal about the 22nd of September. They are subject to a slow but continuous westward motion, each having an angular annual motion of 51″·1, and therefore taking 25,362 years to make one complete revolution. This continuous variation is known as the precession of the equinoxes. (See ARIES, PRECESSION.) The E. is divided into twelve equal portions, each containing 30°, and receiving its name *originally* from the constellation which occupied the same space in the heavens. In consequence of precession, however, the *signs*, as they are called (see ZODIAC), no longer coincide with the constellation of the same name.

Ec′logue (Gr. *eklogē*, 'a selection') was at first the name of a poem, or series of poems, chosen on account of their beauty from an author's work; afterwards the term was applied to Virgil's *Bucolics*, or pastoral poems, and hence has become synonymous with a pastoral idyll. See PASTORAL POETRY.

École Polytechnique′. In 1794 the National Convention of France, to prepare young men for the public services, and especially for engineering, civil and military, created an educational institution, named at first *L'École des Travaux Publics*, but after 1st September, 1795, the E.P. Founded on the plan of Monge, the school was re-organised in 1816, and its constitution has been subsequently modified. It supplies cadets for the artillery service of the army and the fleet, for military and naval engineering, for the corps of engineers of roads, bridges, mines, &c. It is under the control of the Minister of War, and is subject to military discipline. The governing staff is military, but the teaching staff may be either military men or civilians. Admission is by competitive examination, and the competitor must be a Frenchman or naturalised, a bachelor of science, and between sixteen and twenty years of age, except in the case of officers already serving under the French flag, who are admissible to the age of twenty-five years. The outfit required costs from 500 to 600 francs, and board costs 1000 francs per annum, but assistance is given to poor students under certain conditions. The course extends to two years, in each of which special subjects require to be mastered. There is an examination at the close of the first, and the great examination at the end of the second year. The measure of success at the latter regulates the position to which cadets may at once attain.

Écoutes′ (Fr. 'listening places,' from *écouter*, 'to listen'), galleries made beneath or before a glacis to shelter troops placed there to disturb the miners of the besiegers.

Écraseur (Fr. *écraser*, 'to crush'), an instrument invented by Chassaignac, of Paris, for removing diseased parts from the living body by a rapid process of strangulation. The D. consists of a loop of fine steel chain, wire or other material, which, having been passed over the tumour or through the tissues to be removed, is gradually tightened by a mechanism in the stem, to which it is attached, until the tumour is completely separated. By this means the operation is completed with little or no hæmorrhage, and in many cases parts can be operated upon more conveniently than by the scalpel.

Ec′stasy (Gr. *ekstasis*, 'a change of anything from its ordinary place') is the term applied by Plotinus and the other Alexandrian philosophers to that faculty by which they fancied they obtained a knowledge of God and the world of universal ideas not liable to the imperfection of knowledge obtained through organic conditions, and manipulated by a finite mind. In some cases it produced immediate vision of beauty or moral perfection; to philosophers, by the gradual process of dialectics, it revealed the ideas of unity and proportion. Music, dialectics, and love or prayer, are its three sources. This faculty, called by Proclus 'illumination,' dealt with such subjects as the Alexandrian unity; the three hypostases of absolute unity, the first intelligence, and universal soul; and the doctrine of Emanation (q.v.). E. may in the same sense be applied to the vision of such mystics as Behmen, Tauler, &c. More generally, E. is applied to a mental state, in which an emotion seems to absorb the whole mental force, and leave none for will or intellect. E. is also a medical term for the morbid state in which consciousness of external objects and also voluntary motion are suspended, the mind being fixed in abstract contemplation, and the muscles generally rigid, or only partly relaxed. It is distinguished from catalepsy and trance *proper* by the presence of intelligence. The predisposing causes are all those which lower the nervous system. E. may be induced by religious excitement or mesmerism. It is probably accompanied by cerebral congestion, and often passes into epilepsy and mania.

Ec′tasis (from the Gr. *ekteinō*, 'I stretch out'), a term used to indicate aneurismal distension of the walls of the pulmonary artery or capillaries, as seen in the air-cells.

Ecthy′ma (Gr. *ekthūma*, 'a pustule') is an acute inflammation of the skin, characterised by an eruption of large round pustules, upon a hard inflamed base. The pustules are discrete and scattered, with dark-coloured crusts, which on separation often leave a brown stain or a superficial ulcer, followed by a cicatrix. The eruption seldom occurs on the face or scalp, and is most frequent during spring and summer in young adults. *E. chronicum* has three varieties—*E. infantile*, which appears in ill-fed and delicate children or in those debilitated from previous disease; *E. luridum*, in old persons whose constitution has been injured by excesses; and *E. cachecticum* in persons of unsound and cachectic constitutions of all ages. The pustules resemble those following the irritation produced by tartarised antimony. Treatment—gentle laxative and alterative medicine with diluents and abstemious regimen, and for local application solution of superacetate of lead. In the chronic form, tonics and alteratives, as nitro-muriatic acid with gentian.

Ec′toderm (Gr. *ektos*, 'without,' and *derma*, 'the skin'), the name applied to the outer of the two layers into which the tissues of Cœlenterate animals are divided. The E. corresponds roughly with the outer 'skin' of higher animals. In sponges and higher forms, the name E. is also given to the external layer of the tissues, and is used in contrast to the *endoderm* or inner layer.

Ectozo′a (Gr. *ektos*, 'without,' and *zoos*, 'living'), a name used only in a general sense in zoology for such parasites as lice, ticks, and many lower crustacea, which live upon the skin or external surfaces of other animals.

Ectro′pium, or eversion of the eyelids, is caused by swelling and protrusion of the conjunctiva, and also by morbid contractions and adhesions, or partial or total destruction, of the skin of the eyelids. E. may be cured by a simple plastic operation.

Ectrot′ic, a term used to indicate modes of treatment which aim at preventing the development of disease, as cauterisation to destroy the pustules of small-pox or limit the spread of erysipelas.

Ecuador′ (the Spanish form of 'equator'), or República Del Ecuador, a republic of S. America, so called from lying on both sides of the equator; bounded N. by the United States of Colombia, E. by Brazil, S. by Peru, and W. by the Pacific. Its area is estimated at 118,630 miles, and its pop. at 1,271,860, including 870,000 Indians. The Guayaquil is the only considerable stream in the W.; the Pastassa, Marona, Tigre, Curary, Santiago, and Napo, affluents of the Amazon, drain the E. The country is traversed by a double range of the Andes, which encloses plateaux of from 8000 to nearly 10,000 feet above the sea. The highest summits are Chimborazo, 20,608 feet, Cayambe, 19,535; Antisana, 19,282; and Cotopaxi, a volcanic cone, 18,811. The climate varies much—from the tropical heat of the low tracts to the perpetual spring of the valleys and the cold of the region of perpetual snow. The capital is Quito (q.v.), and the chief port Guayaquil. The chief exports are cocoa, caoutchouc, coffee, hides, ivory-nuts, straw hats, and Peruvian bark; the chief imports are cotton and woollen goods, wines, groceries, flour, and hardware. In 1893 the value of the former was £2,342,085, and of the latter £1,675,360. The largest export trade is carried on with France, and the largest import trade with Great Britain. In 1893 the revenue amounted to £720,950, and the expenditure to £738,908. The foreign debt, capitalised, of the republic amounts to £750,000, and the internal debt to £834,000. The constitution, dating from 1884 and modified in 1887, vests the executive in a President, elected for four years, and the legislative power in a congress of two houses. These are a senate (two senators elected by each province for four years, and half retiring every two years), and a chamber of deputies (one deputy for every 30,000 inhabitants elected every two years). E. rebelled against Spain in 1820, joined Colombia in 1822, and became an independent republic in 1830. Since 1863 there has been much civil dissension, culminating at times in actual war, and continual disputes have occurred between E. Colombia and Peru in reference to boundary questions. The army consists of 3300 officers and men, together with 30,000 national guard. One cruiser, a torpedo launch, two gunboats, and a transport constitute the navy. Duran and Chimbo are connected by a railway 63 miles long, and there are 1250 miles of telegraph in working order. The *sucré* is the coin in use in the country; it is mostly composed of silver, and is valued at 3s. 4d. No gold is in circulation.

The following is a list of the provinces of E., together with their estimated population, according to the latest returns, and their chief towns:—

Province.	Population.	Chief Town.
Azuay	132,400	Cuenca
Bolivar	43,000	Guaranda
Cañar	64,014	Azogues
Carchi	36,000	Tulcan
Chimborazo	122,300	Riobamba
Esmeráldas	14,553	Esmeráldas
Guayas	98,042	Guayaquil
Imbabura	67,940	Ibarra
Leon	107,739	Latacunga
Loja	66,456	Loja
Manabi	64,123	Portoviejo
Oriental (La Region)	80,000	——
Oro (Del)	32,600	Machala
Pichincha	205,000	Quito
Rios (De Los)	32,800	Babahoyo
Tunguraua	103,033	Ambato
Total	1,270,000	

The Archiepelago de Galapagos (area 2400 square miles, and pop. 200), is now under the control of E., and consists of Santa Cruz, San Salvador, San Cristobal, Isabela, Fernandina, Santa Maria, Espanola, Santa Fé, &c., of which Isabela is the largest, and in places rises 1400 feet above the level of the sea. The province of La Region Oriental is mainly occupied by Indians, and lies chiefly between the Amazon and the Yapurá to the E. of the Andes.

Ecumen'ical [lit. 'of the whole world,' Gr. *oikoumenikos*, from *oikoumenē* (*i.e. gē*), 'the inhabited (world)', general, universal], a term applied to ecclesiastical councils when of the whole Church, to distinguish them from provincial or diocesan synods.

Ec'zema (Gr. 'anything thrown out by heat') is one of the most common of skin diseases. It is non-contagious, and is characterised by an eruption of numerous minute vesicles, frequently confluent, extending over a surface of irregular form, and usually of considerable extent. In the fully-developed disease the skin is often red, smooth, and shining, the tissues being loaded with infiltrations. The varieties of E. are classified according to the nature of the eruption and the parts of the body affected, the more important being—*E. vesiculorum*; *E. pustulosum*, or *impetigo*; *E. papulosum*, *prurigo*, or *lichen*; *E. rimosum*; *E. chronicum*, or *psoriesis*. E. may occur symptomatically, as a consequence of some constitutional disturbance, or as an effect of local irritation of the skin. See *E.*, by Dr. T. M'Call Anderson.

E'dam ('the dam or dyke on the Ey'), a town in N. Holland, on the Ey, 12 miles N.N.E. of Amsterdam. It has a small harbour, manufactures of rope, salt, and leather, some shipbuilding, and trade in cheese and wood. It was here that the fleet of De Ruyter was constructed. Pop. 3221.

Edd'a (Old Norse, 'grandmother'), the name of two collections of Norse poems and legends. 1. *The Poetic* or *Elder E.*, containing the *Völuspá*, a lay on the origin and destruction of the world, and poems on the exploits of gods and heroes, which partly reappear in the German *Nibelungenlied* (q.v.). This E. was collected by Sæmund Sigfusson, an Icelandic priest (born about 1050, died 1133). Portions of it were translated into German by the brothers Grimm, and a complete translation was executed by Simrock (3rd ed. 1864). 2. *The Prose* or *Younger E.*, a synopsis of Scandinavian mythology, ascribed to Snorri Sturleson (born in Iceland 1178, died 1241), who probably wrote the *Prologue* and *Epilogue*, the other parts, *The Deluding of Gylfi*, and *Conversations of Bragi*, being derived from the *Elder E.* The *Elder E.* was published at Copenhagen, 1828; later editions are those of Münch (1847), and Möbius (1860). The *Prose E.* was published by Resenius (1665), and by Rask (Stockholm, 1818). A later edition is that of Sweinbjörn Egilsson (1848-49). The *Elder E.* was discovered in 1643 by the Icelandic bishop Brynjolf; the *Younger E.* in 1623 by Arngrim Johnson. See Mallet's *Northern Antiquities*, Thorpe's *E. of Sæmund*, and Magnusson and Morris's translation of songs from the *Elder E.*

Edd'oes. See Cocco.

Edd'ystone Lighthouse stands on a very dangerous reef, submerged at high water, about fourteen miles from Plymouth. The character of this reef, and its proximity to an important port, caused measures to be taken very early for the protection of shipping. In 1696 a gentleman named Winstanley obtained authority to erect a lighthouse there, and in 1700 his building, a wooden one, was finished. It was destroyed during a terrible storm in 1703, the workmen, lighthouse-keepers, and Winstanley himself all being drowned. Six years later another wooden lighthouse was built on the same site by Rudyerd, and this remained until 1755, when it was burnt down. Smeaton (q.v.), the celebrated engineer, was then called in, and constructed the graceful column 68 feet high, which defied storm and wind 1759—1882, when it was removed. The present tower, which

Eddystone Lighthouse (built by Smeaton).

was opened with great ceremony by the Duke of Edinburgh on 18th May, 1882, was designed by James N. Douglas, chief engineer to the Trinity Board. Work on the rock commenced on 23rd July, 1878, and it was estimated that the work would take five years to complete. The foundation stones were laid on 19th August, 1879, and the last stone of the masonry on 2nd June, 1881, being thus completed within three years. It is built entirely of granite from the De Lant quarries in Cornwall and from Aberdeen. A solid cylinder of granite, 44½ feet in diameter was first built up from the rock to the height of 2½ feet above high water. From this, as a base, the tower springs, leaving a terrace 4½ feet wide all round. The lantern, 133 feet high, exhibits a white double-flashing half-minute light, visible in clear weather for 17½ miles. Smeaton's tower has been placed on Plymouth Hoe.

E'delinck, Gerard, a Flemish engraver, born at Antwerp in 1649, went to Paris in 1666, where he became professor at the Gobelins, and died 2nd April, 1707. He engraved many of Le Brun's pictures, and some of Raphael's and Leonardo da Vinci's. His style was clear, brilliant, and accurate, and his works rank among the foremost of their kind.

E'den (Heb. 'delight' or 'loveliness'), according to the Book of Genesis, was the site of a garden in which the first man and woman were placed by their Maker. The only guide we have to the locality indicated is that the garden was watered by a river which was 'parted into four heads'—Pison, Gikhon, Hiddekel, and Phrath. Hiddekel and Phrath are easily identified as the Tigris (Dan. x. 4) and Euphrates; but the conjectures offered in the attempt to identify the other two have been almost innumerable. The problem is to find a locality *on the Euphrates and Tigris*, with two other rivers that would correspond to the Pison and Gikhon, and with the adjunct at the same time of regions answering to Khavilah and Cush, which were 'compassed' by these rivers respectively. (1) A number of eminent scholars (Calvin, Bochart, Huet, &c.) have fixed the locality of E. in the lower part of Babylonia, making the Pison and Gikhon the two channels by which the united stream of the Euphrates and Tigris enters the Persian Gulf. (2) Others (Reland, Calmet, Rosenmüller, &c.) have found it at the source of these two rivers, making the 'river' from which the four streams diverged to be a 'well-watered region;' the Pison and Gikhon being two small streams (Araxes, Phasis, &c.) rising, like the two large ones, in the mountains of Armenia. (3) One of the oldest and most widely-received theories, and one which has been supported by eminent scholars in modern times (Bertheau, Ewald, Kalisch, &c.), is that by the Pison was meant the Ganges (others, the Indus), and by the Gikhon, the Nile.

The subject entered on a new phase owing to the discovery in the terra-cotta library of Assur-bani-pal at Nineveh, of copies of Babylonian legends regarding the creation and primitive history of mankind. From these Assyrian inscriptions, then, the following details may be gathered. The name of Babylonia under the Cassile dynasty was Gan-Duni, which probably gave rise to the Hebrew Gan-Eden (Garden of E.). Gikhon is, letter for letter, the same as Gukhan-de, the Akkadian name (Akkad, with a capital of the same name, was Upper Babylonia, the original state) of the Arakhtu or Araxes, 'the river of Babylonia,' which joined the Euphrates at Babylon, after flowing through a deep valley which runs into the heart of Northern Arabia; so that it would literally 'compass the whole land of Cush, *i.e.*, S. Arabia. Hiddekel was the Akkadian name of the Tigris, and Pison the Pasi-Tigris; Khavilah being probably Khuliya, which was situated on the last-named stream.

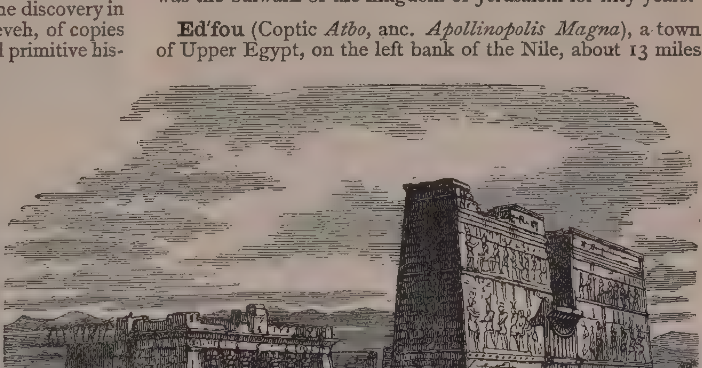
On the other hand, the mountainous region of Armenia is sometimes called in the inscriptions 'the land of the four rivers,' because in it four streams take their rise, of which three are the Araxes, Euphrates, and Tigris. It was from this region (the cradle of the Turanian race), moreover, that the Akkadians (Highlanders) originally came; and if the site of E. had been *transferred* from Armenia, in which four rivers took their rise as if from one source, to Chaldæa, the four rivers of which run into one stream, this combination of two geographies would explain the ambiguity in Gen. ii. 10-14, in which the four are described as branching off from a single parent stream, and at the same time as flowing from four distinct 'heads,' which commentators have laboured to show do not mean sources, but streams. See Smith's *Chaldæan Account of Genesis*.

Eden (perhaps from the root *dan* or *don*, 'water'), a river rising in the Pennine chain in Westmoreland, near the N.W. boundary of Yorkshire. It traverses Westmoreland and Cumberland in a N.N.W. direction, and falls into the Solway Firth after a course of 65 miles.—E., a river in Scotland, rises in the east of Kinross-shire, traverses Fifeshire, and falls into St. Andrews Bay, after a course of 20 miles. There are also lesser streams of the same name in Kent and Roxburgh.

Edenta'ta (Lat. *e*, 'without,' and *dens*, 'a tooth'), an order of Placental or higher mammalia represented by the anteaters, sloths, armadillos, pangolins, and by the aard-vark of S. Africa. They are so named from the rudimentary structure of their teeth, only one set of which is developed. They are therefore Monophyodont mammalia. Moreover, the teeth have no enamel covering or true roots. Incisors are wanting, save in one of the armadillos, and canines are generally absent. Clavicles are usually developed. The skin may develop bony plates (armadillos) or horny scales (pangolins). The testes are abdominal, and the mammary glands pectoral or abdominal. The toes have powerful nails. The E. chiefly occur in S. America, where remains of extinct E., often of large size (*Glyptodon*, *Megatherium*, &c.), are also found.

Edess'a (Gr. *Callirhoe*; mod. *Urfah* or *Orfa*), an ancient town in the N. of Mesopotamia, about 70 miles W.S.W. of Diarbekr. It is still a place of importance from its situation on the commercial highway between Aleppo and Kurdistan, and carries on morocco-leather manufactures. Pop. 39,860, of whom 2000 are Armenian Christians. Its origin is unknown. It was enlarged by Seleucus, and in his time was named E. from a Macedonian town of the same name. After the spread of Christianity E. was celebrated for its schools of theology, the chief of which, the *Schola Persica*, vigorously engaged in the Nestorian controversy against St. Cyril in the 5th c. E. was taken by Baldwin in the first crusade (1097), and made the capital of a county of the same name, which was the bulwark of the kingdom of Jerusalem for fifty years.

Ed'fou (Coptic *Atbo*, anc. *Apollinopolis Magna*), a town of Upper Egypt, on the left bank of the Nile, about 13 miles



Ruins at Edfou.

below the Lesser Cataract. The ruins of its two temples are among the most interesting in Egypt. The sculptures of the chief temples represent the progress of the Sun through the circle of the Hours. The entrance is a gateway 50 feet high, flanked by two pyramids 114 feet high. The temple, founded by Ptolemy Philometer, B.C. 181, is 145 feet wide and 424 feet long, was girt by a wall 20 feet high, and could serve as a fortress. Within the square is a covered colonnade, faced by a portico 53 feet high, with a triple row of pillars having richly-foliated capitals. The modern E. is a poor village, with manufactures of cottons and pottery.

Ed′gar. See EADGAR.

Edge′cumbe Bay or **Port Denison,** is situated on the coast of Queensland, its entrance being in 20° S. lat., 148° 10′ E. long. The town of Bowen is built on its western shore, about half way from the entrance. Its pop. is: municipality 1082; district, area 11,333⅘ sq. miles, 2788.

Edgecumbe, Mount, a conical mountain at the mouth of Norfolk Sound, on the island of Sitka, on which the Russians established the colony of New Archangel, now belonging to the United States. It has quite recently been an active volcano, and traces of its action are manifest.

Edgehill, Battle of, was fought at Edgehill in Warwickshire, on Sunday, 23rd October, 1642, between the Royalists, led by Charles I. in person, and the Roundheads under Robert Earl of Essex, son of Elizabeth's favourite. It was the first important action of the civil war. Prince Rupert, who commanded the royal cavalry, broke the left wing of the Parliamentarians, and pursued it to Keinton, where his troopers took to plunder, while Essex with his right wing compelled the Royalists to retreat. Of 4000 that fell in the battle, the larger proportion belonged to the army of Charles.

Edge′worth, Richard Lovell, an English mechanician, was born at Bath in 1744, educated at Oxford, and settled in Ireland in 1782. He was returned to the Irish Parliament, in which he spoke against the Union. E. made experiments relating to carriages, railways, &c., and in 1804 was employed by the British Government to establish telegraphic communication between Dublin and Galway. He died 13th June, 1817. Among his works are *Practical Education* (1798), written in concert with his daughter Maria; *Professional Education* (1808); *Essay on the Construction of Roads and Carriages* (1813); and various treatises on subjects connected with mechanics. See *Memoirs of R. L. E., begun by Himself and concluded by his Daughter* (Lond. 1820).—**Maria E.,** daughter of the preceding, was born at Hare Hatch, Berkshire, 1st January, 1767. In 1782 she accompanied her father, Richard Lovell E., to Ireland, and remained with him until his death in 1817. He was a part author of her first work, *Essays on Practical Education* (1798), and of her *Essay on Irish Bulls* (1801). Her knowledge of the habits and qualities of the Irish peasantry was embodied in numerous entertaining fictions. She was the friend of Scott, Moore, Herschel, &c. She died at Edgeworthstown, Longford, Ireland, 21st May, 1849. Her writings comprise *Castle Rackrent* (1801); *Belinda* (1803); *Lessons for Literary Ladies, Early Lessons, Popular Tales* (1804); *Leonora* (1806); *Memoirs of R. L. E., Tales of Fashionable Life* (1809). A collection of these appeared in London in 1825.

Edg′ing Iron, an implement of crescent form, with a spade handle, used for cutting the sides of drains.

Edg′ings, in horticulture, rows of low-growing plants to mark off a flower-bed from gravel walks or from a lawn. Stone, wood, wicker or wire work, or tuft are sometimes used for E., but the dwarf-box is most commonly employed. See HORTICULTURE.

E′dict. All the higher magistrates of Rome issued edicts. The consuls convoked the comitia, army, and senate by E.; the censors proclaimed the census by E.; the ædiles published market rules by E.; the magistrates with jurisdiction laid down every year their rules of justice by E.—the Prætor Urbanus, the Prætor Peregrinus, and the Ædilis Curulis in the *edicta urbana;* the provincial governors in the *edicta provincialia.* The E. was orally proclaimed, and also written on a white tablet suspended in the forum, so that persons standing on the ground might read it. The general E. put out by the magistrate on entering office was called *perpetuum,* as lasting through his term of office; an occasional E. was called *repentinum;* a part taken from the E. of a predecessor in office was called *tralatitium.* One E. did not differ much from another, and after the consolidation of prætorian law (*jus honorarium*) by the lawyer Julian in the reign of Hadrian, this part was stereotyped. E. was also applied to the legislative ordinances of the emperor, as supreme magistrate; these were distinguished from *decreta,* or judicial decisions on appeal or in certain classes of actions involving a delicate discretion, and *epistolæ* or *rescripta,* which was an interpretation of the law by the emperor in answer to a query. All these imperial constitutions had under the Lex Regia the force of laws.

E. in Scotland meant merely a formal public notice, at a church door or market-cross, that parties might come into a suit.

In France the ordinances of the Merwing kings, chiefly to notify prohibitions or to organise some new state department, were called edicts. The name was replaced by *capitularia* under Karl the Great, but was revived by the Capetian kings. They were signed by the king, *viséed* by the chancellor, and sealed with green wax to show their permanent character. Some edicts were named after the place of execution—*E. de Crémieu, d'Amboise,* &c.; others from their subject-matter *E. des duels, des secondes nôces,* &c. The word has now been superseded by *loi.*

Edict of Nantes, granted 30th April, 1598, by Henri IV. of France, was for long the only charter of Protestant liberties in that country. The Huguenots were declared eligible to all public posts. In certain districts, and in the houses of noblemen with full rights of jurisdiction, the exercise of the religion was declared free. Elsewhere, only thirty persons might be assembled at a nobleman's house for worship. Their petitions and suits were judged of by a specially-constituted 'Chambre de l'Édit'; and in several of the municipal constitutions and local parliaments of the S., provision was made for chambers half Catholic, half Huguenot. The speech of Henri in the 'Parlement' is given by Voltaire (vol. xxx. p. 233). 'Il faut que tous soient bons Français,' he says. The Edict was carried against vehement opposition by a speech of De Thou, in which he spoke of Pope John going to Constantinople to prevent Justin persecuting the Arians. Like the previous Edicts of Pacification of Chancellor L'Hôpital, and the subsequent Edict of Grace (Nîmes, 1629), the E. of N. was a mere compromise. It was systematically evaded, and finally revoked by Louis XIV., guided by Louvois and Le Tellier, in 1685, when the persecutions of Languedoc began. Complete toleration was not established till 1787.

Edict′al Cita′tion, in Scotch legal procedure, is the form by which a party out of Scotland, but under the jurisdiction of a Scotch court, is cited to appear before it. In former times this was done by proclamation at the market-cross of Edinburgh and at the pier and shore of Leith; it is now done by delivery of copies of the citation at the record office of the Keeper of Edictal Citations in the Register House at Edinburgh. These records are open to public inspection. In criminal prosecutions, if the accused cannot be found, he must be edictally cited by delivery of a copy to a member of his family within his home, or by posting a copy to the most patent door of the house, provided he has not left it permanently forty days previously, or by leaving a copy at place named in the bail bond (in cases of bail), or by leaving a copy at last known residence.

Ed′inburgh, the capital of Scotland, and chief town of the county of Edinburgh or Midlothian, is situated on the S. shore of the Firth of Forth, and about 1½ miles from it. The city, which covers an area of over 2 sq. miles, is built on ridges of varying height, and is environed by hills. On the S.E. rises Arthur's Seat (822 feet); to the S.W. lie the Braid Hills and the Pentlands; and to the N.W. Corstorphine Hill. Pop. entire town 263,646; parl. burgh 261,225. E. is famous for the beauty of its situation, the picturesque time-worn appearance of its old streets, and the grace and stateliness of its modern buildings. The oldest part of the city, rugged and sombre, with Gothic spires and pinnacles crowning the long slope from the Castle Rock to Holyrood, contrasts strangely with the chaste Greek structures and the bright elegant aspect of the New Town. One of the most delightful features of E. is the exquisite glimpses of the sea, of hilly and sylvan scenery unexpectedly disclosed in the heart of its busiest thoroughfares.

The city receives its name E. (Eadwinesburh) from the Northumbrian king Eadwine, who built the castle in the 7th c. It became a possession of the Scottish kings in the reign of Indulf (945-961), and was then called in Gaelic *Dun-Edin;* but the earlier name has prevailed. E. did not become the Scottish capital till a later date, being too near the English border for safety; but about the middle of the 15th c. it was recognised as the metropolis. David I. made it a burgh in 1128, and it was walled and fortified by James II.

The fact that E. was originally a walled city gives to what is called the *Old Town* its peculiar characteristics of lofty houses, narrow streets, and *wynds* or *closes*. The city was originally limited to the ridge which extends from the Castle to Holyrood House. In 1769 the North Bridge (renovated and widened in 1875) was erected, spanning the valley which contained the North Loch. The construction of the *New Town*, beginning with St. Andrew Square, quickly followed, stretching in parallel terraces between the Old Town and the Firth. Other improvements were the opening of the South Bridge in 1788, of Waterloo Place and the Regent's Bridge in 1819, and of George IV.'s Bridge in 1836. Among the comparatively recent improvements are the spacious and handsome thoroughfare, Chambers Street, and the splendid Public Library. The city is at present extending rapidly westward, and its suburbs also are increasing to the S. The buildings in the New Town are constructed almost entirely of a fine sandstone brought from the neighbouring quarries of Craigleith. Among the finest streets are George Street, the centre of the New Town, and Princes Street, which runs parallel to it on the S. From the latter, which is the chief thoroughfare, is obtained a view unsurpassed in any European capital, of the Castle Rock, a steep mass of gloomy basalt, sprinkled with verdure, crested with old grey battlements, and towering above the green shaded slopes of the gardens that occupy the former bed of the Nor' Loch. In the W. are many handsome streets and squares, one of which, Moray Place, is a magnificent specimen of the Doric style applied to domestic architecture.

The Castle, crowning the Castle Rock (380 feet in height), is the most prominent object of the Old Town. The Scottish regalia, consisting of crown, sceptre, sword of state, and silver rod, have been shown there since 1818. Queen Mary's Room and Queen Margaret's Chapel are also objects of interest. Midway between the Castle and Holyrood stands St. Giles' Cathedral, a cruciform structure, with an ancient coronal spire. Beside St. Giles' are situated the law-courts and the old hall of the Scottish Parliament, 122 feet long, with a magnificent oak ceiling, painted window, and numerous portraits and statues. Holyrood Palace occupies the site of an ancient abbey, founded by David I. in 1128, and contains a picture gallery and the apartments of Mary Queen of Scots. Among other fine buildings are the University, the Industrial Museum, Surgeon's Hall, Heriot's Hospital, the New Infirmary, the Royal Institution, National Gallery, High School, General Post-Office, Register House, St. George's Church, the Scotch Episcopalian Cathedral (erected 1874-79), Bank of Scotland, the Irvingite Church (1876), &c.

E. possesses numerous monuments, the most attractive of which is the Scott monument in Princes Street, a splendid but somewhat showy Gothic spire, erected 1840-45. In the same street are statues of John Wilson, Allan Ramsay, David Livingstone, the Duke of Wellington; in George Street, of George IV. and William Pitt; in St. Andrew Square, a column in memory of Lord Melville; and in Charlotte Square, the Prince Consort Memorial (August, 1876). Opposite the High School is the monument of Burns. On the Calton Hill (345 feet in height) are the columns of the unfinished National Monument, the Nelson Monument, and those of Burns, Playfair, and Dugald Stewart. In the graveyards of E. are the tombs of many distinguished men. In Greyfriars rest George Buchanan, Robertson, Blair, Henry Mackenzie, Allan Ramsay; in the Calton, David Hume; in the Canongate, Adam Smith, Dugald Stewart, Adam Ferguson; in the Dean Cemetery, Lord Jeffrey, Lord Cockburn, and Professor Wilson; in the Grange Cemetery, Hugh Miller and Dr. Chalmers.

E. contains numerous charitable institutions, as Heriot's Hospital, Donaldson's Hospital, Chalmers' Hospital, Fettes College, &c. The funds of George Watson's Hospital, Daniel Stewart's Hospital, Gillespie's Hospital, and Merchant Maiden Hospital, were diverted for educational purposes by the Merchant Company in 1870, under the Endowed Institutions (Scotland) Act. The city is largely resorted to for the sake of education. Besides the University, High School, Academy, Fettes College, Edinburgh Institution, Collegiate Institution, and Merchant Company's Schools, there are many lesser schools of a superior kind.

E. has no manufactures of importance. The printing, publishing, and book trade may be called its staple industry; but brewing, iron-founding, and coach-building are largely carried on. There are also large india-rubber and vulcanite works, a number of tanneries, and an increasing trade in jewellery. The city is the centre of the railway and banking systems of Scotland, and its beauties and associations attract a constant stream of visitors. It contains four parl. divisions, each of which returns one member:—Central 63,392; East 61,931; South 82,337; and West 53,565.

The society of E. is composed more largely of the learned professions than that of almost any other city. The clergy, lawyers, physicians, teachers, artists, and authors form a very considerable section of its population; and though not the commercial, it is undoubtedly the ecclesiastical, legal, and literary centre of Scotland. See Arnot's *History of E.* (1 vol. 1779); Chambers' *Traditions of E.* (1824); and Wilson's *Memorials of E. in the Olden Time.*

Edinburgh, University of, was founded by the Town Council of E. by royal charter of James VI. in 1583, and obtained the rights and privileges of the other universities in the kingdom by an Act of the Scottish Parliament passed in 1621. At first there were teachers, called regents, who instructed the students in Greek, logic, metaphysics, moral philosophy, and natural philosophy, taking the students of each year (four years) in rotation, each regent teaching every subject; but the number of chairs gradually increased, and the system was changed in 1708, when separate professorships were established—Latin, Greek, Logic and Metaphysics, Moral Philosophy and Natural Philosophy, and Mathematics (already in existence)—in place of the regents. The University now contains, as constituted in 1893, six Faculties, viz., Arts, Science, Divinity, Law, Medicine, and Music, in which over fifty University professors are appointed to teach. Under *Arts*, we find Mathematics, Humanity, Greek, Logic and Metaphysics, Moral Philosophy, Natural Philosophy, History, Rhetoric and English Literature, Sanskrit, Education, Fine Arts, and Celtic languages; under *Science*, Practical Astronomy, Agriculture and Rural Economy, Engineering, Geology, Technology, &c.; under *Divinity*, Hebrew and Semitic Languages, Ecclesiastical History, Divinity, &c.; under *Law*, Civil Law, Constitutional History, Scots Law, Public Law, &c.; and under *Medicine*, Botany, Medicine, Anatomy, Chemistry, Surgery, Natural History, &c. By the Universities Act of 1858, the privileges of the University were increased, its government was transferred from the Town Council to the Senatus Academicus, and arrangements were made for an improved course of study. The University is a corporation, including a Chancellor, elected for life by the General Council, who is head of the University; a Rector, elected for three years by the votes of the students; the Principal, appointed for life by the curators; the Professors, registered graduates, alumni, and matriculated students. Gladstone (1859), Carlyle, Lord Moncrieff, Sir William Stirling-Maxwell, the late Earl of Derby, the present Duke of Devonshire (1877), the Earl of Rosebery (1880), the late Earl of Iddesleigh, the Marquess of Lothian, the Rt. Hon. Geo. J. Goschen, and the Rt. Hon. J. P. B. Robertson (1893), have, in succession, held the rectorship. The superintendence and control of the teaching and discipline, the revenues and property of the University, are intrusted to the Senatus Academicus, formed by the Principal, who is President, and all the Professors. The E. U. grants the degrees of Master of Arts—Bachelor of Arts being now abolished — Bachelor of Medicine, Doctor of Medicine, Bachelor, and Doctor of Divinity, Bachelor, and Doctor of Laws, Bachelor, and Doctor of Science, and Bachelor, and Doctor of Music. In the session, 1894-95, there were 738 students in the Faculty of Arts, 1454 in the Faculty of Medicine, 444 in the Faculty of Law, and 68 in the Faculty of Divinity, 146 in the Faculty of Science, and 11 in the Faculty of Music: the total number being 2861. During the fifty years before 1826 there were only 168 graduates in Arts; up to 1850 the average number of such graduates was only ten yearly. Now the annual number of graduates has very largely increased, 86 having passed all the ordinary examinations for the degree of Master of Arts in 1894-95. The University Library, which originated in a bequest of about 300 volumes by Clement Little, an Edinburgh citizen, in 1580, now contains about 150,000 printed volumes, and about 700 volumes of MSS. The museums in connection with the University are the Natural History Museum, the Anatomical Museum, the Botanical Museum—at the Botanic Gardens, Inverleith Row—and the small museums attached to several of the scientific classes. The students' debating societies comprise the Dialectic, Diagnostic, Scots Law, Philosophical, and Philomathic Societies. There are above 100 bursaries and scholarships, belonging principally to the Faculty of Arts, ranging in annual value from £5 to £160, open to competition among the students. To provide for the increase of attendance at the University, a splendid building, in close proximity to the New Infirmary, was erected, containing a complete suite of class-rooms, for the use of the Medical Faculty, and University Hall, to accommodate 2000 persons for public ceremonials. Among the distinguished men who have been Professors in E. U. are Dugald Stewart, Adam Ferguson, Thomas Brown, Sir William Hamilton, David Hume, John Erskine, William Cullen, Joseph Black, James Syme, and William Aytoun. The E. U. has always been famous for its medical school, which has for long attracted students from other countries by the fame of its Professors and the excellence of its teaching. It is at present unsurpassed by any medical school in Britain or the Continent.

Edinburgh Review, a celebrated critical and political journal, the earliest of the large quarterlies, and the first great expositor of Whig principles. The opening number was published on the 10th of October, 1802. The idea of the *Review* originated with Sydney Smith; but Francis (afterwards Lord) Jeffrey became editor; and with them were associated Horner, Brougham, John (afterwards Lord) Murray, and Dr. Thomas Brown. Among the names of later contributors are those of James Mill, Hallam, Sir William Hamilton, Hazlitt, Macaulay, and Carlyle. The projectors of the *Review* found a publisher in Constable—'to whom,' says Lord Cockburn in his *Memorials*, 'the literature of Scotland has been more indebted than to any other bookseller.' The largest circulation attained by the *E. R.* was 13,000 copies in 1813; and Jeffrey, as editor, received at first £50, and afterwards £200, for each number. The literary criticisms of the *Review* were often prejudiced, but always able. Its fame, however, stands highest as a political organ. The Whig party certainly owed in great measure its subsequent brilliant triumphs to the persistent and consistent help it received from the *E. R.*

Edinburghshire, or **Midlothian,** a county in the E. of Scotland, bounded N. by the Firth of Forth, N.E. and E. by Haddingtonshire, S. by Peeblesshire and Lanarkshire, and W. and N.W. by Linlithgowshire. The surface is undulating and hilly, the chief ranges being the Moorfoots (highest point 2136 feet) in the S.E., the Pentlands (highest point 1839 feet) in the centre. There are also several isolated hills in the W., and Corstorphine Hill and Arthur's Seat near Edinburgh. The principal rivers are the Gala, which flows into the Tweed, the N. and S. Esk, which unite and enter the Firth of Forth at Musselburgh, the Water of Leith, which falls into the sea at Leith, and the Almond, which separates E. and Linlithgowshire. E. consists mostly of coal-measures, with trap in the Pentlands and Lower Silurian in the S.E. A great coal-bed, 15 miles long by 8 broad, runs beneath Carlops and Musselburgh. Area, 236,089 acres; corn crops, 34,682; green crops, 18,436; clover, &c., 34,655; pasture, 50,129; small fruit, 279; fallow, 65; mountain and heath, 60,933; nursery grounds, 317; and woods, &c., 11,110. The chief manufacture is paper; limestone and sandstone are largely quarried; coal and ironstone are extensively worked, and there are valuable herring-fisheries on the Firth of Forth. The chief towns are Edinburgh, the capital; Leith, the only large port in the county; Dalkeith, Roslin, and Pennycuik, inland; and Musselburgh, Portobello, Granton, and Newhaven on the Firth of Forth. E. returns one member to Parliament. E. formed part of the ancient English kingdom of Northumbria, and of the old earldom of Lothian. Pop. civ. county 434,159; and parl. county district 86,839.

Edison, Thomas Alva, the celebrated inventor, was born at Milan, Ohio, U.S., on 11th February, 1847. Having received an elementary education from his mother, an intelligent Scotch lady, he started as a train boy, taught himself printing, learned telegraphy, for a time was an employé of the Western Union Telegraph Company, and since then has produced many valuable inventions, such as electric lamp, steam-dynamo, carbon telephone, phonograph. In a splendid laboratory at W. Orange, N.Y., he works with a band of skilled investigators. See LIGHT, ELECTRIC; TELEGRAPH; TELEPHONE, ELECTRIC; PHONOGRAPH.

Ed'monton, a town in Middlesex, 7½ miles N.N.E. of London, with a trade in timber, carried on by means of the river Lea. E. is the burial-place of Charles Lamb, and the 'Bell at E.' acquired celebrity from its having been mentioned by Cowper in *John Gilpin*. Pop. reg. sub-dist. and civ. par. (each) 36,351.

Edmund's, St., Hall, Oxford, named after St. Edmund, Archbishop of Canterbury in the time of Henry III. In 1557 it came into the possession of Queen's College, and this society procured an Act of Congregation vesting in itself the perpetual right of nominating the principal. In 1763, George Holme, D.D., sometime Fellow of Queen's, bequeathed £1000 to the University in trust, to apply it, with accumulated interest, to the purchase of the advowson of a living, to which the principal of St. E.'s H. should be presented. The advowson of Gatcombe was purchased in 1821, to which the University first presented in 1844. The members of the Hall are admitted to the lectures given at Queen's College. There is a Vice-Principal besides the Principal, but there are no Fellows and no other foundation. In 1894 there were 35 undergraduate students, 37 members of Convocation, and 98 members on the books.

E'dom (Heb. 'red') was the territory of the descendants of Esau. Down to the time of the Captivity, E. is synonymous with Mount Seir, *i.e.*, the narrow mountainous tract extending from the Dead Sea to the head of the Gulf of Akaba, its capital being Bozrah, and its seaports Elah and Eziongeber. David added Mount Seir to the kingdom of Israel; but as the power of the kingdom of Judah declined, the Edomites extended their power to the N.W., and at last encroached on the territory of Judah as far as Hebron; while their original territory was taken possession of by the Nabathæan Arabs. In the later Jewish and Roman history, E., then called Idumæa, was composed of the southern part of

Judæa and a part of Arabia Petræa extending S.E. from the Mediterranean to the W. side of Mount Seir. Roman writers after the Augustan age use 'Idumæa' and 'Judæa' as synonymous, and soon after the destruction of Jerusalem the name disappears from history, and is merged in that of Arabia.

Edriophthal′mata (G. 'sessile-eyed'), the name given to a group of *Crustacea* (q.v.), in which the eyes are not supported on stalks (*Podophthalmata*). To the E. belong the three orders whale-lice, wood-lice, and sandhoppers. In E. a Carapace (q.v.) is rarely developed, and the head is usually separate and distinct from the body. The adult E. possess seven pairs of feet. Another character of E. is found in the fact that the mandibles or principal pair of jaws often possess *palpi*, or feelers. The eyes may be either simple or compound, and are situated in the sides of the head.

Edri′si, El, Abu-Abd′allah-Mohammed, a famous Arabian geographer, was born at Septa (mod. *Ceuta*) in 1099, studied at Cordoba, lived at the court of Roger II., King of Sicily, and died between the years 1175 and 1186. He had deepened a strong predilection for geography by wide travels, and had thus amply fitted himself for the task to which he was subsequently appointed by the Sicilian monarch. This was to prepare a globe that would embody recent observation and discovery. To collect material from various travellers and from remote corners of the world was the labour of fifteen years. But at last the globe, of pure silver, was completed, and his description of it forms the still more valuable and enduring work, *Nushat-ul-Mushtâk* (1153), which was first and badly translated into Latin by Sionita and Hesronita (Par. 1619). Many editions have appeared of isolated parts, as *Spain*, by Conde (Madr. 1799); *Africa*, by Hartmann (Gött. 1796); *Syria*, by Rosenmüller (Leipz. 1828), &c. A copy of the complete work was issued in French (2 vols. Par. 1837-40).

Educa′tion (Lat. *educo*, 'I draw out'), in its widest sense, means the drawing forth or development of the varied capacities of man's nature. The term, however, is more generally applied to the formal methods and processes by which, in time of youth, this development of the powers of man is promoted in harmonious relations and with beneficial results. E. is thus threefold, as it regards respectively the body, with which man toils; the mind, with which he thinks; and the character, in the spirit of which he lives. Physical E. treats of the laws that regulate and the exercises that develop the growth of the bodily frame, and fit it for the healthy discharge of its different functions, and includes a knowledge of human physiology and the laws of health. Intellectual E. must be carefully adapted to the strength of the mind, and to the stage of growth which it has reached; and as the chief agent in this department is the communication of knowledge, the educator must ever be on the alert to determine the most suitable subjects of study, and the best means of obtaining through them the desired educational results, and especially to guard against instruction degenerating into the mischievous process familiarly known as 'cramming.' Intellectual E. may also be viewed in the light of the various courses of study that are provided for pupils, according to the period of time during which they will be under instruction, and that are represented by primary schools, secondary schools, and universities. Recent political and economic movements have given a strong impetus to primary E. throughout the civilised world, legislators having come to see that through national E. alone will the masses be enabled to govern themselves wisely, and adequately to hold their own in the great industrial struggle for pre-eminence among the nations. This interest in E. has manifested itself in measures that seek to ensure, by compulsion if requisite, the school attendance of every child, and to improve at once the status and the professional equipment of the teacher. The main educational work of the primary schools must always consist of reading, writing, and ciphering, although in some countries these schools have been honourably conspicuous for their maintenance of higher subjects of study. The secondary schools have long been the battle-ground of many important educational controversies. At one time the chief subject of dispute was the relative educational value of classical and mathematical instruction, but this question has now been so widened as to include a consideration of the claims of science and of modern languages, particularly of our own. Signs are not wanting that the indiscriminately polemical spirit has died out, and that the programme of higher scholastic study will be definitely continued in accordance with the changed necessities and demands of modern times. The universities have also been the subject of much controversy and the scene of many changes; and one of the most difficult educational problems is how to bring the secondary schools and the universities into such relations that both may discharge their proper functions most effectively. In the E. of the emotions and the will, scholastic training holds a comparatively subordinate place; for although the teacher may effect much good, both by the example he sets and by the spirit he awakens, each individual must necessarily be exposed from youth upwards to the multifarious influences that make or mar the character of man.

It is estimated that one in every 5½ of the population of the United States attends school; one in 5 in Ireland; one in 5·6 in England and Wales; one in 6 in Scotland, Germany, and Switzerland; one in 8 in Belgium and France; one in 10 in Austria; one in 14 in Italy.

Education Societies, Laws Affecting.—The 6 and 7 Vict. c. 36 exempts from all local rates lands and buildings belonging to any society for the purposes of science, literature, or promotion of the fine arts, if supported wholly or partly by annual voluntary contributions, and which does not pay any dividend or bonus to the contributors; 17 and 18 Vict. c. 112 gives legal facilities to these societies and to educational societies for procuring sites and buildings, and for settling them in trust.

Grammar-Schools.—In 1840 an Act was passed for improving the condition and extending the benefit of grammar-schools, defined as all endowed schools, whether of royal or other foundation, founded or maintained for teaching Latin or Greek, or both of them. The intention of the founders is to be considered when the revenues are insufficient, and Latin and Greek, or either one of them, may be dispensed with under an order of a Court of Equity (3 and 4 Vict. c. 77). The Endowed Schools Act of 1850 has since then placed all these Grammar-schools under the control of the Charity Commissioners.

Sites for Schools.—By 4 and 5 Vict. c. 38 it is enacted that landlords who have an estate in Fee (q.v.), or in tail, or an estate for life—but in the two latter cases only with the consent of the person next in the remainder, if he be legally competent—being possessed of the beneficial interest, may give, sell, or exchange land, not exceeding an acre, as a site for a school to educate poor persons; and the rights of all persons in waste or common land conveyed for this purpose by the lord of the manor are barred. The Mortmain and Charitable Trusts Act of 1888 repealed all former legislation and re-enacted that gifts and assurances of land for public park, school, &c., should be free from the effect of the Statutes of Mortmain, but at the same time bound these gifts, &c., by certain restrictions.

Education under the Poor Law.—By 7 and 8 Vict. c. 101, and subsequent amending Acts, the Poor Law Commissioners may combine unions or parishes into school districts for any class of infant poor not above the age of sixteen, being orphans or deserted by their parents, or whose parents consent to the placing of the children in the district schools.

Reformatory and Industrial Schools.—The laws relating to these schools were consolidated and amended in 1866, and further amended by Statute 35 and 36 Vict. c. 21. Any offender under sixteen years old who is convicted summarily of an offence punishable with penal servitude or imprisonment, and who is sentenced to imprisonment for not less than ten days, may be sent by the justices before whom he is charged to a certified reformatory school, to be there detained for not less than two or more than five years; and the justices are bound to select a school conducted as nearly as possible according to the religious persuasion to which the offender appears to belong.

Elementary Education.—In 1870 an Act was passed to provide for public elementary E. in England and Wales. A public elementary school was defined by the Act to be one at which E. was principally elementary, and at which the charge for ordinary instruction did not exceed ninepence per week for each scholar. The object of the Act seems to have been to provide and maintain sufficient schools, and to compel children who would not otherwise receive efficient education to attend them. Fees of scholars, the parliamentary grants, and moneys raised by loan, formed the school fund. Any deficiency was to be supplied by rating. No parliamentary grant was to be made to any school board on account of instruction in religious subjects. Every child in good health who was not receiving sufficient instruction in some other manner, and who was between the ages of five and thirteen, afterwards reduced to ten under conditions, could be compelled to attend a public elementary school, if there was one within three miles of its residence, and the school board had power to impose a fine, recoverable summarily, not exceeding five shillings, with costs, for breach of this rule. This Act was followed by others, which more or less amended it, though they did not, excepting the last, in any material point change the scheme as just stated, in 1873, 1876 (directly compelling attendance), 1880, 1890, and in 1891, when ordinary elementary education at the elementary schools became *free*, so that in 1894 of 19,709 schools inspected, no fewer than 16,289 were *free* schools, and the number of *free* scholars was 4,377,741 as against 821,000 children who paid fees. In 1893 an Act was passed dealing more particularly with the half-time attendance, under which the minimum age for partial, as well as total, exemption from school attendance, was raised from ten to eleven. In Scotland, under Acts of 1872 and 1878, parents are now obliged to send their children to school, when there is one within three miles of their residence, under penalty of fine or imprisonment in case of failure. Every public school subject to inspection and in receipt of public money is open to children of any religious persuasion. The jurisdiction of presbyteries and of Church courts in Scotch schools is abolished, and transferred to the parochial school boards, these being amenable to the Educational Department in London.

Edur', or **Edar** (Idar), a Rajput state of India, the foremost of the Mahi Kantha group, in political relation with the Bombay Government, is situated to the N.E. of Baroda. The gross revenue is £52,444, half of which is absorbed by eight great feudatories and eighteen lesser nobles. E. is tributary to the Gaikwar, paying annually £3034. Area 1900 sq. miles; pop. 302,134; of whom 273,284 are Hindus, and 10,094 are Mohammedans. The soil is fertile and especially productive of fruit trees, of which the mango is very fertile. Grains of all kinds, sugar-cane, and oil-seeds are grown. Quarries are worked for a very useful building stone. The only manufacture is soap. Most of the inhabitants are Kolis, and it was a Koli dynasty that formerly ruled the country, which was ultimately conquered by the Rajputs in 1656. The Maharajah Juwan Singh died in 1868 and was succeeded by his son, Keshri Singh (born in 1861), who was educated at the Rajkumar College at Indore. The town of E. (pop. 7086) is the residence of the Rajah, but otherwise a place of no importance.

Edward the Confessor. See EADWARD.

Ed'ward I., king of England, the eldest son of Henry III. and Eleanor of Provence, was born at Westminster, 16th June, 1239. After some suspicious intrigues, E. finally sided with his father against the nobles in that struggle called the Barons' War. He shared in the defeat at Lewes (1264), but afterwards overthrew the Earl of Leicester and his party at Evesham (1265). In 1270 he left England to join in the last Crusade; and in 1272, while returning from the Holy Land, heard of his father's death. E. reached England in 1274, and was crowned in that year, together with his consort Eleanor, the daughter of the King of Castile. E.'s first work as sovereign was the subjugation of Wales. The Welsh princes had been deeply involved with the baron's party against Henry III., and soon after Edward's succession Prince Llewellyn's refusal to do homage forced on a war, which was ended by the defeat and death of that prince in 1282. The King then thoroughly reduced the country, introduced English customs, and settled the confiscated lands on his nobles. Having thus welded together England and Wales, E. bent his mind to the Union of England and Scotland. In the previous history of the two countries, there had been authentic instances of homage done by the Scotch monarchs to the English. This furnished a ground for E.'s claims; and the death of the Maid of Norway (1290) gave him an opportunity for their assertion. In 1291 he was chosen arbitrator by the thirteen competitors for the Scottish crown. The claims of these were finally narrowed down to a choice between two—John Baliol, Lord of Galloway, and Robert Bruce, Lord of Annandale. E., who was formally acknowledged feudal superior of Scotland, decided in favour of the former. The decision was given at Berwick, 17th November, 1292; and next day Baliol swore fealty to the King. The indignities heaped upon him, and the outcry of his people, soon compelled the Scottish sovereign to declare war on England. E. marched into Scotland in 1296, sacked the town of Berwick, made Baliol prisoner, proclaimed Scotland his fief, forfeited to him in consequence of her king's treason, placed garrisons in the principal towns, and appointed English governors over the country. William Wallace (q.v.) headed a revolt of the Scottish party in the spring of 1297; defeated Warrenne, Edward's regent, at Stirling in the summer of the same year; ruled Scotland for a brief space; and then at Falkirk, in 1298, was conquered by an army which E. led in person. The country was not yet, however, wholly subdued; the nobles, aided by France and led by Bruce and Comyn, still resisted. In 1305 E. again invaded Scotland, the castle of Stirling surrendered, and he was master of the land. Wallace was captured, and executed at London. In the next year Robert Bruce appeared as leader of the national party. He was crowned at Scone on 27th March, 1306, and the rising of Scotland followed. The news roused E., now an old man, to terrible fury, and he resolved on immediate invasion. Having gathered a great army, he marched north, but died 6th July, 1307, at Burgh-on-Sands, near Carlisle, when his foot was almost on the Scottish frontier.

The name of E. is an outstanding one among English sovereigns. His character was marked by iron strength and most politic sagacity. An imperious temper was relieved by generous impulses; he was cruel, and yet forgiving; vindictive, and yet merciful. As a soldier E. had no rival, and he possessed the art, so valuable to a general, of attaching to himself the personal devotion of his men. Of English kings, E. first recognised and respected the existence of an English national spirit. By his judicial reforms he gained for himself the title of the 'English Justinian'; in his reign the Court of Chancery and justices of the peace took their origin. Under his rule, if not fostered by him, can be first seen the English Parliament in something like its present shape. A greater respect for law can also be dated from E.'s reign; and this was largely due to the example of the King. His imperial policy has often been called by harsh names, and viewed in a wrong light. It was not one of vulgar aggrandisement, dictated by mere ambition; but one of annexation, to end in union. E. saw farther and clearer than any politician of his time that the French dominions of England were lost, and his aim was to consolidate the whole island of Britain into one kingdom. Wales he united to England. Hence his strenuous attempt to annex Scotland—an attempt which, if successful, might have anticipated by four centuries the ultimate benefits of the Union. See Freeman's *Essay on the Relations between the Crowns of England and Scotland*. Palgrave's *Documents and Records illustrating the History of Scotland* takes a similar view. See also Green's *History of the English People*, and for the Scottish view of E.'s character and conduct, Burton's *History of Scotland*.

Edward II., son of the preceding, was born 25th April, 1284, and was called E. of Caernarvon from his birthplace. He was the first of English royal heirs-apparent to bear a title taken from the Principality, being created Prince of Wales in 1301. E. succeeded to the throne at the age of twenty-three, but even then seems to have selected a line of policy—to loose himself from the dominance of the barons. To this end he filled the great offices of state, not with English nobles, but with men of lower rank and alien birth. A passion for favourites also inclined him to this conduct. Piers Gaveston, a Gascon, was created Earl of Cornwall, and placed at the head of affairs. The barons demanded and obtained his banishment; and when he returned, the Earl of Lancaster had him executed in 1312 on Blacklow Hill, near Warwick. While these troubles weakened E.'s power at home, his arms were unsuccessful in Scotland. Bruce and his party rapidly made head, and after a seven years' struggle reconquered from the English all but the castle of Stirling. E. resolved to march to its relief, and raised an immense army, composed of 30,000 disciplined horse, and vast numbers of wild Welsh and Irish. At Bannockburn (24th June, 1314) the great force was utterly routed; and henceforth Scotland was free from English supremacy. Just after this disgrace, E. became infatuated with another favourite, Hugh le Despenser, who was made Earl of Glamorgan. Lancaster and the barons, at once becoming jealous, entered London with their troops in 1321, and had Despenser and his father driven into exile. But E. in the next year took vigorous measures, defeated Lancaster in Wales, executed him at Pontefract, and recalled his favourite. He then concluded a truce for fourteen years with King Robert of Scotland; but this act destroyed the popularity which his mastery of the barons had won him. His queen, Isabel, went to France with her son in 1325, ostensibly to conclude a treaty; she refused to return, and intrigued there with the exiled barons, the chief of whom was Roger Mortimer. She landed with a hostile force in 1326 at Orwell, in Suffolk, having the young Prince with her, and the King was abandoned by every one. Being taken along with his favourite, Despenser was hung, and E. himself deposed at Kenilworth, and murdered at Berkeley Castle, 20th September, 1327. See Green's *History of the English People.*

Edward III., son of the preceding, was born at Windsor, 13th November, 1312, and began to reign in 1327. The government was at first administered by a regency, but in 1330 E. caused Mortimer, the real head of affairs, to be executed at Tyburn, and assumed full kingly authority. In 1328 he married Philippa of Hainaut. In 1332, Edward Baliol having dethroned David Bruce of Scotland, and being unable to preserve his usurped crown, obtained assistance from E. The Scotch were defeated at Halidon Hill, 19th July, 1333; Baliol was restored, and Berwick annexed to England. E. was now diverted from the Scottish to the French war, in regard to which he has been greatly misrepresented. The contest was forced on him by Philippe of Valois, who desired to seize E.'s duchy of Aquitaine, which had never belonged to the kings of Paris. E., anxious to avoid a struggle, placed Guienne in Philippe's hands for forty days; and when Philippe refused to restore it, war was inevitable. E.'s claim to the French throne through his mother Isabel was palpably untenable, French law excluding female succession to the crown; and was probably advanced to win over the Flemish allegiance. After several years of undecisive campaigning, E. invaded France with 30,000 men, and on 26th August, 1346, overthrew a vastly superior French army at Crécy, where his son, the Black Prince, displayed brilliant valour and slew the King of Bohemia, and where the English archery told with fearful effect upon the French, who left above 30,000 dead on the field. The battle was as severe a blow to feudalism as to France, because it proved the superiority of yeomen on foot to the most splendid chivalry. Other successes followed. In October, 1346, David of Scotland was defeated and captured at Neville's cross; Calais surrendered in 1347. At an earlier date (24th June, 1340) the naval victory off Sluys made the English masters of the sea. While E. returned home and repelled a Scottish invasion, the Black Prince ravaged central France, and on the 19th September, 1356, won a glorious victory at Poitiers with 8000 against 60,000 men, and carried Jean, Philippe's successor, captive to London. France, torn by foreign and intestine strife, seemed hopelessly crushed, but E. was weary of war. The constant need of supplies caused him to summon frequent Parliaments, the influence of which steadily increased. Peace was made by the treaty of Bretigny in 1360, E. resigning his claim to the French crown and retaining Guienne, Poitou, Calais, and Guisnes. E. reaped no lasting good from his victories. 'England,' says Freeman, 'was successful in battles, but she was thoroughly beaten in war.' In 1369, Charles, King of France, renewed the struggle; the English were driven step by step from their Continental possessions, and E.'s reign closed in gloom. His last years were embittered by the caprices of his mistress, Alice Perrers, and by the unpopularity of his administration. But the 'Good Parliament' of 1376, supported by the Black Prince—conduct which redounds more to his honour than Poitiers—attacked the abuses of the royal government, and carried several admirable reforms before E.'s death in 1377. E.'s reign is more important for its social and religious changes than for the victories with which it is ringing. It was a time in which, while Norman and Saxon were rapidly blending, while Chaucer was founding a new literature and Wickliffe heralding a religious revolution, English law was taking definite and potent form, the spirit of resistance to arbitrary power was gaining strength and courage, and scholasticism, chivalry, feudalism, and the temporal authority of the Church were fast passing away. See Freeman's *Essay on Edward III.*, Kitchen's *History of France*, and Green's *History of the English People.*

Edward IV., son of Richard Duke of York, was born at Rouen, 29th April, 1441, and during the lifetime of his father bore the title of Earl of March. On the defeat of York at the battle of Wakefield Green, 21st December, 1460, where he himself was slain by the successful Lancastrians, E. assumed the claims of his father, and marched on London, routing on his way the Lancastrians at Mortimer's Cross. He was declared king, 3rd March, 1461. On the 29th of the same month his claims received a bloody sanction by a great victory over the forces of Queen Margaret at Towton, in Yorkshire. A year after the battle of Hexham, in 1464, Henry VI., who had been in hiding, was betrayed and imprisoned in the Tower. E., who was popular in London on account of his courage, beauty, and winning manners, reigned secure until his marriage, first private and then avowed, with Elizabeth Woodville, the widow of Sir John Grey, and his conferring honours upon her relatives, offended his chief partisan, the Earl of Warwick, the 'King-maker.' The latter, for the time aided by the Duke of Clarence, entered into a conspiracy against E., and by a surprise forced him to flee to France in 1469. Henry was replaced on the throne, but E., having obtained help from Charles the Bold of Burgundy, landed in England at Ravensburne, 14th March, 1471, and on the 14th April routed the forces of Warwick at Barnet, the King-maker himself being among the slain. The next month (4th May) he almost destroyed the forces of Margaret at Tewkesbury. Margaret and her son Edward were captured. The Queen was imprisoned, her son was murdered, and Henry himself was in a day or two found dead in his bed in the Tower, the suspicion being that he was assassinated by Richard, Duke of Gloucester, the third brother of E. E. reigned undisturbed till his death, 9th April, 1483. Although he has an evil reputation for his indulgence, he was an able and powerful ruler. He founded the Absolute, or, as now styled, New Monarchy, which lasted till the end of the Tudor line. During his reign the silk manufacture is said to have been introduced into England, and in 1476 William Caxton set up his printing press in England. See Green's *History of the English People.*

Edward V., eldest son of Edward IV., was in his thirteenth year when his father died. What is called his reign lasted from 9th April to 22nd June, 1483. His uncle, Richard Duke of Gloucester, contrived to obtain possession of his person, as also that of his younger brother, the Duke of York, and got himself made protector. The young princes were then thrown into the Tower, and they disappeared, the belief being that they were murdered by Richard's orders. See Green's *History of the English People*, and Sir Thomas More's *Life of Edward V.*

Edward VI., the only son of Henry VIII., by Jane Seymour, was born at Hampton Court, 12th October, 1537. He was only ten years of age when he succeeded to the throne, and he died before attaining his majority. E. was well educated; he gave promise of high and pure character, and in religion had a strong Protestant bias. During the early part of his reign the kingdom was administered by his uncle, Lord Hertford, who had been appointed by Henry VIII. president of a council of regency, and under the title of Duke of Somerset became Protector or guardian of the kingdom. During Somerset's regency, the Scotch, who refused to marry their young queen Mary with E., were defeated at Pinkie (10th September, 1549), and vigorous efforts were made to establish Protestantism. The Six Articles were repealed; priests were allowed to marry; a new service-book, now known as *The First Prayer-Book of Edward VI.*, was drawn up; and Roman Catholic clergy who refused to submit to the changes were persecuted. The result was insurrection, which Somerset put down, but through the influence of Dudley, Earl of Warwick, he was himself deposed and executed, 22nd January, 1552. Dudley was made Duke of Northumberland, and favoured the party of Cranmer, which, among other measures, introduced the Forty-Two Articles of Religion, now reduced to the Thirty-Nine Articles of the Church of England. Under Northumberland's influence E. made a will, which he had no right to do without the consent of Parliament, excluding Mary and Elizabeth the two daughters of Henry VIII., as being illegitimate, from the throne, and vesting it in Lady Jane Grey, descendant of Mary, younger daughter of Henry VII., whom he had married to his son, Lord Guildford Dudley. E. shortly after this arrangement died at Greenwich, 6th July, 1553. See Froude's *History of England*, vols. iv. and v.; Haymond's *Life of E. VI.*; E.'s own *Journal* in Holinshed's *Chronicle*; and Green's *History of the English People*.

Edwardes, Sir Herbert, a distinguished lieutenant of the Lawrences in their administration of the Punjab, and a hero of the Indian Mutiny, was born 12th November, 1819. In 1857 he was Commissioner of Peshawur, perhaps the most important military post in India, where he not only maintained order throughout the Sepoy war, but was able to send down reinforcements, both of Europeans and staunch native troops, to the camp before Delhi. To him, as much as to any single man, was due the tranquillity of the Punjab in this crisis, and thus directly the safety of India. He died in England, 23rd December, 1868.

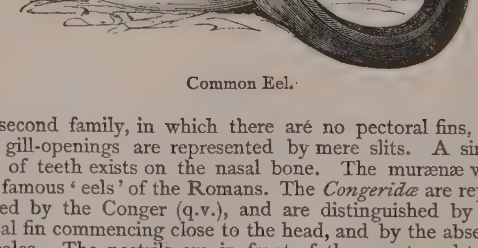
Edwards, Jonathan, a celebrated American divine and metaphysician, was born at Windsor, Connecticut, 5th October, 1703. He was the son of the Rev. Timothy E., for sixty-three years pastor of Windsor. E. entered Yale College in 1716, and took his degree of B.A. September, 1720, standing highest in his class. He studied there two years more, was licensed, preached a few months in New York, and in September, 1723, became tutor in Yale College. On 15th February, 1727, he was ordained colleague to his grandfather, in Northampton, Massachusetts. Here he laboured for twenty-three years, his church being stirred with memorable revivals in 1735 and 1740. In the full tide of his success a difference sprang up between him and his church. He held that conversion should be the term of communion. But the alienation began in 1744, when, on learning that some young members had been reading obscene books, he made their names public and called for discipline. He was dismissed in 1750, most of the people turning against him. In 1734 E. and other ministers in his county originated the Indian Mission at Stockbridge. They gave both money and influence in its support, receiving in 1739 from the Colonial Government a grant of 4000 acres, as compensation, near Stockbridge. Here E. began to preach in January, 1751. In this Arcadian retreat he found time to pursue his favourite studies. The room is still pointed out where, in about four months, he wrote *The Freedom of the Will* (Boston, 1754), the most famous of all his works, and the ablest defence ever made of the Necessarian doctrine. E. was elected President of Princeton College, and installed 16th February, 1758. Smallpox being prevalent, he was inoculated, but died from the effects, 22nd March, 1758. E. has stamped his theology indelibly upon New England character. A close student, a clear logician, a profound thinker, he must ever rank among the great fathers of the Church. In spite of his rigorous, one may say pitiless, Calvinism, he was benevolent, gentle, and devout to a degree rarely seen on earth. Among his other works are *Revival of Religion* (Bost. 1742); *Religious Affections* (Bost. 1746); *Life of Brainerd* (Bost. 1749); *Original Sin* (Bost. 1758); *History of Redemption* (Edinb. 1777); *Nature of Virtue* (Bost. 1788). **Jonathan E., D.D.,** son of above, was born 1745. He was likewise a distinguished theologian, became President of Union College, Schenectady (1799), and died 1st August, 1801.

Ed'win. See EADWINE.

Eecloo', a town of E. Flanders, Belgium, 10 miles N.W. of Ghent, and 15 miles S.S.E. of Bruges, on the railway between these places. It has large manufactures of cotton, wool, tobacco, soap, leather, salt and oil. Pop. 11,879.

Eekairee' (*Akhari*, or *Ikkeri*, 'two streets'), a semi-ruined city in the Shimoga district, province of Mysore, British India, 162 miles N.W. of Seringapatam. It was the capital of a powerful state in the 17th c., and the remains of its walls testify to the strength and extent of the place. There are many buildings of great size in ruins, and amongst them are the remains of a large temple containing curious figures of stone. A village now occupies part of the site and contains a pop. of 182.

Eel, a name given indiscriminately to fishes with elongated bodies, but restricted to certain genera of Teleostean fishes belonging to the section *Apoda* of the sub-order *Malacopteri* ('soft-finned'). The term *Apoda* indicates the absence of the *ventral* fins. The E. has soft fin-rays, and a swimming bladder communicating with the throat by a *pneumatic duct*. The body is covered by minute detached scales, which are frequently concealed by the skin. The lateral line of mucous canals exudes a large quantity of *mucus*, which protects the body in the absence of scales. The best-known families of eels are the *Anguillidæ*, *Murænidæ*, *Congeridæ*, and *Gymnotidæ*. The first family has comb-like teeth, the gill-openings being lateral. To this family belong the sharp-nosed E. and the broad-nosed E. The 'mottled muræna' exemplifies the second family, in which there are no pectoral fins, and the gill-openings are represented by mere slits. A single row of teeth exists on the nasal bone. The murænæ were the famous 'eels' of the Romans. The *Congeridæ* are represented by the Conger (q.v.), and are distinguished by the dorsal fin commencing close to the head, and by the absence of scales. The nostrils are in front of the snout, and teeth exist on the palate and vomer. The *Gymnotidæ* are represented by the electric E. of S. American rivers. This genus has no dorsal fin or scales, but possesses a long hind fin.



Common Eel.

Other eels are the 'glass-E.,' so named from their translucent bodies. The hair-tailed glass-E. inhabits the Mediterranean Sea, as does the pig-nosed species. The name sand-E. is applied to the hornels, and also to the sand-lance.

The true eels are well-known fishes, celebrated for their voracious nature, and for their tenacity of life. They occur in both salt and fresh water, and are esteemed by many as articles of food, although the flesh is rather fatty and insipid. Eels are largely captured in Holland, and are brought alive to England in 'welled' boats. They are captured in Britain and abroad by means of 'E.-pots' or 'bucks,' wicker-cages fixed usually near weirs in rivers, and also by lines baited with worms, minnows, or other bait. Spearing eels is chiefly practised in winter, whilst the eels lie in the mud.

Eel-Pout, a term applied to the Burbot (q.v.), and also to the viviparous Blenny (q.v.).

Eels (in paste and vinegar). These minute organisms are Nematoid worms belonging to the *Nematelmia* (*Scolecida*, q.v.), and to the *Anguillulidæ*. The vinegar eel is a familiar species, and is nearly allied to the *Vibrio tritici*, which produces Ear-Cockles (q.v.) in wheat. These organisms are free nematoids. They possess rudimentary eyes, and, generally, a posterior sucker. They produce few ova at a time. These organisms appear in vinegar and other fluids, probably from the ova being readily conveyed to and contained in such fluids.

Efen′di, or **Effen′di,** a title of honour among the Turks conferred upon persons occupying recognised positions in the civil service or in social life. The title is frequently affixed to the name of the office which the person holds, as *Hakim-E.*, the Sultan's first physician. The corresponding military title is *Aga*.

Effaré′, or **Effrayé** (Fr. *effarer* or *effrayer*, 'to frighten,' the former being derived from the Lat. *efferare*, 'to look wild'; the latter from *exfrigidare*, 'to freeze with terror'), an heraldic term, applied to an animal rearing as if scared or enraged.

Effeereres, or **Affeerors** (Lat. *forum*, 'a market'), were those persons who were sworn in courts-leet to settle the fine of anybody who was punishable arbitrarily or in a way not determined by statute. They also arranged the fines in the baron's court. It is said that Shakespeare was an A. at Stratford-on-Avon.

Effeirs′, or **Effeir′ing,** is a Scotch law-term signifying corresponding to or relating to. *In form as E.* means 'in legal form.'

Eff′igy (Fr. *effigie*, Lat. *effigies*, 'an image'), an image or likeness in painting, sculpture, or drawing. It is not, however, a word recognised in art; and in common use it signifies such a caricature semblance as at once manifests and stimulates contempt for the person who is the subject of it. To hang or burn a person *in E.*, is to hang or burn the E. of the person as a sign of contempt for and dislike felt towards him. The practice was much more common in the earlier half of the present century than now.

Eft (Old Eng. *efete*), a name popularly used as synonymous with Newt (q.v.). The Scotch term 'esk' or 'ask' (probably connected with 'asp') is also used as an equivalent to E.

Eg′ede, Hans, the apostle of the Greenlanders, was born 31st January, 1681, at Harstad, a village in Nordlandene, Norway. After studying at Copenhagen, he was ordained priest in 1707, and became pastor of Vaagen. His ambition was to go as missionary to Greenland, and, after many hindrances, domestic and otherwise, he sailed for that inhospitable land with his wife and family in 1721, and laboured there for fifteen years with great industry and success. Frederik IV., King of Denmark, aided the mission; and in 1740, after his return to Copenhagen, E. was made a bishop. He died in 1758. E. wrote two works on the subject of his mission, one of which was translated in 1745, under the title *Description of Greenland*.—**Povel E.**, son of Hans, born in Norway in 1708, afterwards Bishop E., translated the Bible into the Greenland tongue, and compiled a dictionary of the same, which appeared in 1750 under the title *Dictionarium Grönlandico-Danico Latinum*, and a Greenland Grammar (1760). He died in 1789.

E′ger, a town of Bohemia, on the right bank of the river E., 90 miles W. of Prague. It has manufactures of cloths, hats, and shoes, and its trade has greatly increased since it became a point of junction for three railways. E. has several churches and educational establishments. The Gymnasium in 1850 was elevated into an Obergymnasium, with eight classes. The town-house contains a painting of the death of Wallenstein, who was assassinated here, 25th February, 1634. Pop. town 18,483, district 36,740.—The *river* E. rises in the Fichtelberg, on the borders of Bavaria, 2240 feet above the sea-level, flows N.E. and E., and passing Elbogen, Saaz, Birdin, and Theresienstadt, falls into the Elbe, after a course of 195 miles.

Ege′ria, or **Ægeria,** from whom Numa feigned that he had received instructions for the institution of the rites that would be most acceptable to the gods, was the most celebrated of the four Camenæ, or prophetic nymphs, in Roman mythology.

Egg. The E. is generally named the *ovum* in physiology and zoology, and may be assumed to be represented in every group—even in the lowest—of the animal world. Thus the *nucleus* found in many *Protozoa* (q.v.) either represents the E. or the female organ which gives origin to the equivalent of an ovum. Eggs vary very much in different animals in the relative development of their parts. Every perfect E. consists of a *vitelline*, or outer membrane, of a yolk or *vitellus*, of a *germ* vesicle, and of a *germinal spot*. The E. of a hen, for example, consists of these parts or their equivalents, after impregnation, and of superadded matters (white or albumen, shell, &c.) to protect the essential part of the ovum during its development. Sometimes numerous eggs are deposited at once, or the number may be limited to one or two. The eggs most sought after in commerce are those of Rasorial birds, such as our fowls, turkeys, and their allies; whilst those of turtles are also eaten as a delicacy. The true idea of an E. or ovum is necessary to the comprehension of what is involved in the term *individual*, as used in zoology—an *individual animal* being the *total* result of the *full* development of a *single* E.

Egg, Chemistry of.—Chemically the quantity and quality of the parts of an ordinary hen's E. have been determined as follows:—The entire weight is 1000 grains, of which the *white*, consisting, in 100 parts, of 80 parts water, 15½ parts dry albumen, and 4½ parts salt, &c., weighs 600 grains; the *yolk*, consisting, in 100 parts, of 53¾ parts water, 17½ parts dry albumen, and 28¾ parts oils suspended in the yolk in minute globules, weighs 300 grains; while the shell, consisting of lime, weighs 100 grains.

Egg Trade.—Great attention is now being paid to the rearing of poultry in the United Kingdom. Stimulus was given by the Birmingham show, and the directors of the Crystal Palace have since done much to promote a love of barn-door fowls. But yet home-laid eggs cannot be obtained in sufficient numbers. Imports of eggs are gradually and rapidly increasing. In 1845 only about 70,000,000 were received, and in 1860 160,000,000. The value of imported eggs in 1860 was £336,000; in 1880, 6,228,405 great hundreds, value £2,235,451; and in 1894, 11,876,968 great hundreds, value £3,786,329. Of these Germany contributed 3,361,188 great hundreds (£937,087), Belgium 2,954,843 (£885,136), France 2,440,559 (£982,800), Russia 1,369,959 (£383,639), Denmark 1,254,914 (£422,790), and British possessions 275,448 (£99,260). From this it would appear that the French E. is more costly than the German, and the Danish E. than the Russian; and that, while we are paying the foreign E. merchant over 3½ millions sterling, the market with our own colonies is represented by so humble a sum as £99,260.

Egg'a, or **Eggan,** a town of W. Africa, in the Yoruba country, on the right bank of the Niger, a little below the point where it receives the Kudunia. Its length is variously stated at from 2 to 4 miles; the streets are narrow, the houses conical, built of clay, and sometimes stained with indigo. E. is now one of the principal settlements within the Niger Territories all of which are governed by the Royal Niger Company, holding a charter dated 10th July, 1886. The chief manufacture is a kind of blue cloth, and the chief articles of export from E. and the surrounding district are calabashes, silk, yams, potatoes, hides, india-rubber, coffee, gums, palm-oil, corn, and fish. Pop. uncertain.

Egg-Apple, or **Egg-Plant,** the name given to the edible fruits produced by species of Solanaceous plants allied to the potato. Of these species, *Solanum ovigerum* and *S. melongena* of the E. Indies are well-known examples. In the latter, the plant has a woody stem and attains a height of two feet. The fruit is in shape and size like a hen's egg, and is of white or yellowish colour. These fruits are eaten in the E. Indies.

Egg-Plant.

Egg'ar Moth, a species of Lepidopterous insects, the caterpillars of which are found on clover and broom. The adult moth is of a yellowish-brown colour.

Egg-Bird, or **Sooty Tern,** a species of the *Sternidæ* or Terns (q.v.), common in W. Indian seas, and coloured dull black above and white below. The bill is long and straight. The popular name of the bird is derived from the favour in which its eggs (numbering three, averaging 2 inches in length, and of a pale cream-colour) are held. Several other species of tern are also known under the name of E.-B.

Egg, Sea. See ECHINUS.

Eg'ham ('church-town'), town in the county of Surrey 18 miles W. from London, on the right bank of the Thames, and connected with the market-town of Staines, on the opposite bank, by a handsome bridge. The meadow of Runnymede, where King John signed Magna Charta, 15th June, 1215, is in the neighbourhood. Pop. civ. par. 10,187.

Eginhard, or **Einhard,** a Frankish historian, was born about 770 in Austrasia, and studied at Aix-la-Chapelle under the famous Alcuin (q.v.). He became a favourite of Karl the Great, who made him his private secretary and superintendent of buildings. On Karl's death, Hludwig the Pious appointed E. tutor to his son Lothar. It was once supposed that in 815 he resigned his offices and entered a monastery, while his wife at the same time took the veil; but his title, Abbot of Fontenelle, of Bladigny, &c., seems to have been merely a lay dignity, especially as his wife bore him a son after 815. Having received the relics of the martyrs Petrus and Marcelinus from Rome in 827, he placed them in his abode at Mühlheim, which he renamed Seligenstadt ('town of the blessed'), and where he founded a Benedictine abbey. He died probably in 844. The romantic tale of his loves with Emma, Karl's daughter, and of her carrying him across the palace courtyard, that the snow might not betray his nocturnal visit, is purely fictitious, as E. does not mention an Emma among the Emperor's daughters. A similar tale is recounted of a daughter of the Emperor Heinrich III. in William of Malmesbury. E.'s works include *Vita Caroli Magni*, a precious source of information in regard to the great emperor, rich in interesting details, and written in singularly excellent Latin; *Annales Regum Francorum, Pipini, Caroli Magni, et Ludovici Pii;* and *Epistolæ*, sixty-two in number, which shed considerable light on the history of his times. The best edition of E. is that by M. Teulet, with a French translation (Par. 1840).

Eglantine. See SWEET BRIER.

Eglinton, Earls of. See MONTGOMERY.

Eg'mont, Lamoral, Count, Prince of Gavre, one of the most striking historical figures of the 16th c., the descendant of an ancient and noble Batavian family, was born at the castle of Hamaide, Hainaut, in 1522. In early youth he acted as page to the Emperor Karl V. In his nineteenth year he commanded a troop of light horse in an expedition to Barbary. In 1545 he married Sabina Countess-Palatine of Bavaria, the Emperor Karl, Ferdinand King of the Romans, and the Archduke Maximilian being present at the wedding. E. was the head of a splendid embassy to England in 1553, to solicit the hand of Queen Mary for Philip II. of Spain; in the spring of 1554 he was sent on a second mission to exchange the ratifications of the marriage treaty. To him were due the victories of St. Quentin (1557) and Gravelines (1558), which the Spaniards won against the French forces. From his position and influence he became naturally involved in the struggles of the Protestants in the Netherlands. In this connection, the vacillation and weakness of his character proved his ruin. On the outbreak of the troubles he took his place side by side with his ally the Prince of Orange in the van of the malcontents; but when the Protestants arose in open insurrection, E. wavered, and finally deserted the Prince of Orange and the Protestants. The promulgation of the decrees of the Council of Trent in the Netherlands in 1564 occasioned the greatest discontent, and E. was selected to proceed (1565) on a mission to Madrid to lay before Philip the complaints of his Flemish subjects. Margaret, Duchess of Parma, whose administration as Regent of the Netherlands had been so far successful in establishing a spirit of toleration and conciliation between Catholics and Protestants, was superseded in 1567 by the cruel and bigoted Duke of Alva. The new governor called a meeting of the council of state at Culemborg House on the 9th September, 1567, and here E. and his friend Count Hoorn, who had been invited to the meeting in the interests of the country, were arrested and sent under military escort to the fortress of Ghent. For the purpose of wreaking swift vengeance on those who had allied themselves with the cause of the people and of Protestantism, Alva instituted a tribunal which became popularly known as the *Council of Blood.* Arraigned before this court on a charge of treason, resting on ninety different counts, E. and Hoorn were found guilty, were condemned to death, and were beheaded in the market-place of Brussels, 5th June, 1568. See Juste's *Le Comte d'E. et Le Comte de Hornes*, Prescott's *Philip II., King of Spain*, and Motley's *Rise of the Dutch Republic.*

Egmont, Mount, a remarkable extinct volcano, of conical form and isolated position, in the province of Taranaki, in the N. Island of New Zealand, 8270 feet above the sea.

Eg'ret, a term frequently applied to a species of heron inhabiting the southern parts of America, and passing northwards in the spring of each year. Its colour, and also that of allied species, is snowy white, the tail being of a yellowish tint. The bill is long and sharp, and of bright yellow colour. The average total length of the full-grown bird is 4 feet. The food consists of worms, fishes, and small mammals. The tail-feathers are in great request for the purpose of making brushes for switching away flies and other insects. The name E. is often very loosely employed in ornithology, and probably the separation of the egrets from the herons, advocated by some writers, is hardly warrantable.

Reddish Egret.

Egripo, or **Erripo,** an Italian corruption of the Gr. *Euripos*, 'the strait with the violent channel,' a name given first to the channel between Negropont and the mainland, and then to the town E., Egripos, or Negropont, on the site of the ancient Chalcis (q.v.).

Egypt (Lat. *Ægyptus*, Ital. *Egitto*, Fr. *Égypte*), according to its present geographical limits, is a country in Africa, extending along the basin of the Nile from the Mediterranean to a line, corresponding to 21° 50′, drawn from the 2nd cataract, Wadi Halfa, eastward to Sherm Abu Kut, on the Red Sea, and including Lower Egypt, Upper Egypt, and the northern part of Nubia, together with the peninsula of Sinai. It is bounded E. by Arabia Petræa and the Red Sea; W. by the Libyan Desert, or eastern part of the Sahara; and S. by the Nubian Desert and Nubia W. of the Nile. E. is one of the most interesting countries in the world, on account of its early civilisation, its intimate connection with sacred history, its imperishable monuments of art, and the magnificence of its ruined cities and temples. The following table gives the areas and populations of the various divisions of E., in respect of the settled lands, according to the latest census and estimates:—

Division.	Area in sq. miles.	Population.
Lower Egypt	6,204	3,965,664
Isthmus	10½	32,471
Asia	⅓	3,923
Upper Egypt	4,483¼	2,776,982
Oases	—	38,225
Totals .	10,698	6,817,265

The absolute estimated area of E. is, however, 400,000 sq. miles, of which only 13,000 are cultivated and settled. Lower E. contains 10 sub-divisions; the Isthmus, 2; Asia, 1; and Upper E., 9. Cairo is the capital, and the other important towns are Alexandria, Damietta, Tanta, Rosetta, Bulak, Port Said, Ismailia, and Suez.

General Aspect.—The great natural feature of E. is the river Nile, which flows through its entire length, and which is the means of its internal commerce, and the main support and regulator of its whole system of agriculture. In its windings through Nubia, and during its straighter course in E. Proper, the Nile (q.v.) is enclosed by a double range of low hills, sometimes 10 or 12 miles apart, but in many places approaching the river's banks precipitously. About 100 miles from the Mediterranean the stream separates into two main and several minor branches, enclosing the fertile region of the Delta. The western half of E. forms part of the Libyan Desert, and the hills which separate it from the Nile valley are called the Libyan Mountains. Those flanking the right bank of the river are the Arabian Mountains, which reach a height of 9000 feet. Between the Nile and the Red Sea the surface is for the most part hilly and barren, but there are numerous *wadis* or fertile ravines where a rich vegetation is kept alive by perennial springs. The cultivable parts of E. are the Delta, the Nile valley to the limits of the inundation, the oases in the Libyan Desert, and the fertile plains of Upper Nubia. There are also many productive tracts in the southern territories, formerly subject to E., particularly in Darfur (q.v.), but these are only partially and rudely cultivated.

Hydrography and Climate.—The length of the Nile, from the Albert N'yanza to the sea, is about 3300 miles. It receives in its upper course the Asua, the Bahr-el-Ghazel, the Sobat, the Blue Nile, and the Atbara; but below the point of confluence with the last of these, and for the final 1500 miles of its course, its waters are not further augmented by a single tributary. The Atbara, or Bahr-el-Aswad ('black river'), is the great source of the black mud or slime that gives to E. her fertility. This alluvium is regularly distributed over the flat lands by the great annual inundation of the Nile, the most singular of all hydrographic phenomena, whether as regards its results or its regularity. The river begins to rise at Khartum, at the confluence of the Blue Nile, early in April, and in Lower E. the first day of the inundation is usually the 25th of June. The flood reaches its height in three months, remains stationary some twelve days, and then gradually subsides, leaving a deposit of mud which has been estimated as amounting to 6 inches in a century. Any irregularity of excess or deficiency in the inundation seriously affects the productiveness of the land, but this seldom happens. Much waste country is being reclaimed by improved irrigation and an extension of the system of canals. The climate is extremely dry, as the whole of E. Proper lies within the 'rainless zone.' The year is practically divided into two seasons, spring and summer, the summer heat being tempered by the fresh northerly or Etesian breeze. Of all the prevailing winds, the most oppressive and unhealthy is the Khamsin, or hot wind of the S., which blows during April and May. After the inundation, *i.e.*, in November or later, the soil gives forth exhalations which favour ophthalmia, dysentery, and other diseases. The temperature in Lower E. varies from 50° to 100° F., while it is some 10° higher in the southern parts of Upper E., where also the climate is healthier. The plague, which is rarely severe in its visitations, does not usually ascend far above Cairo.

Geology and Mineralogy.—The Libyan and Arabian hill ranges are cretaceous, consisting chiefly of durable sandstone, and being covered in part by nummulitic limestone. Of this limestone are built the three pyramids of Gizeh. A belt of granitic rocks, about 50 miles broad, stretches along the S. of Upper E., beginning at the cataract of Assouan, and extending into Nubia. It is a wild region, presenting bold cliffs towards the Nile, which is occasionally forced into splendid cataracts. Besides those already mentioned, the chief rocks are syenite, basalt, breccia, alabaster (at Tel-el-Amarna), and porphyry. To a great extent the surface is covered with the shifting desert sands. The alluvium brought down by the Nile consists partly of quartzose sand, and partly of argillaceous earth. At Gebel Zabara there are emerald-mines. Among the other minerals are marble, salt, nitre, natron, and sulphur.

Botany, Agriculture, and Zoology.—The botany of E., which is confined within the Nile valley, is singularly rich, and includes many European trees and plants. The most notable trees are: the date-palm, the doom-palm, the acacia, the tamarisk, and the sycamore. There is an extensive cultivation of sugar-cane, cotton, indigo, opium, hemp, tobacco, &c.; while among the fruits are the orange, apricot, pomegranate, lemon, and fig, besides apples, pears, peaches, plums, grapes, melons, and cucumbers. The lotus, or water-lily of the Nile, is still found, but the famous papyrus has retired far up the river. Agriculture has long been a favourite occupation, the system of irrigation having been carried to great perfection. The chief cereals are wheat, barley, rice, millet, maize, and durra. In 1895 the area under cultivation amounted to 5 million acres. The fauna of E. proper is extensive, including, besides all the usual domestic animals, the jackal, hyæna, ichneumon, jerboa, the camel, the crocodile, the soft tortoise, the ostrich, &c. Among the animals formerly common were the hippopotamus, rhinoceros, and giraffe. There are many aquatic birds, and several kinds of serpents, of which the most deadly are the asp and the cerastes. The most notable insect is perhaps the sacred beetle (*Scarabæus sacer*). Of fish the Nile affords a plentiful supply, while locusts and mosquitoes are the scourge of the country.

Manufactures and Commerce.—The modern Egyptians are in great part an agricultural people, but the various manufacturing industries have been greatly developed of late years. Much attention has been devoted to the cultivation of sugar-cane in Upper E., and the banks of the Nile are fast becoming dotted with sugar-factories, and about 87,000 acres are now under sugar cultivation. There are also large cotton-factories, several dyeing and cotton-printing establishments, extensive iron-foundries, and some ship-building. The other manufactures are pottery, firearms, woollen cloths, carpets, glass, and red caps. As in ancient times, E. has once more become the highroad of Eastern commerce, nearly all the trade to and from India passing now through the Suez Canal (q.v.). The vast traffic between E. and England is for the most part in goods in transit, chiefly from India. It consists of exports to England, amounting (1894) to £9,284,801; imports from England, £4,065,814. There is, however, an important export trade in native produce, the principal articles of which are beans, wheat, cotton, cotton-seed, hides and skins, oilcake, onions, rags, sugar (from the cane), and raw wool: gum, ivory, hides, ostrich feathers, come from the Sudan; senna and wax from Abyssinia; tamarinds from Dar-fur; cotton and sugar from Upper E., besides mother-of-pearl, shells, drugs, &c. The chief imports are butter, cheese, coal, coffee, cotton-yarn, hardware, woollens, cotton manufactures, flour, indigo, furniture, millinery, rice, sacks, silk, soap, wine, and wood for fuel: indigo, shawls, come from the East; sheep and tobacco from Turkey and Syria; cottons, woollens, and hardware from England and Germany; and cloth, furniture, and millinery from France and Austria.

Railways and Finance.—The railways of E. belong to the state, and have a total length of 1255 miles. The two main lines are those from Alexandria to Suez, and from Cairo to Minieh, up the Nile Valley. It is intended to carry the latter as far as Khartum. On 2nd December, 1893, the Khedive opened a steam tramway, 50 miles long, connecting Ismailia and Port Said, and constructed for the purpose of conveying passengers and mails. There are also 1922 miles of telegraph wires belonging to the government. The Eastern Telegraph Company has also lines from Alexandria and Port Said to Suez. The state expenditure for the year 1894-5 was estimated at £9,840,000, and the revenue at £10,516,500, while in the same year the aggregate state debt amounted to £104,406,890. No financial accounts were ever published until the establishment of the English and French control in 1880. Fresh arrangements were made, which will powerfully aid the development of the resources of Egypt, consequent upon the usurpation of power by Arabi Pacha and the intervention of Great Britain to restore the power of the Khedive in 1882. The modern coins are the piastre (of 40 paras) = 2½d., the 50-piastre piece (gold) = 10s. 5d., and the £E. = 20s. 6d.

Government and Army.—The ruler of E. paid to the Sultan, as tribute, £681,667, in 1894-5. In 1866 the succession was made direct from father to son, instead of, according to the Turkish law, the eldest heir, and in 1867 Ismail, the ruling prince, received in a firman from the Sultan the title of *Khedive* or sovereign. The administration is in the hands of a Council of State of six ministers appointed by the Khedive and a British financial adviser whose adhesion is required to any financial scheme proposed by the Egyptian Government. The Egyptian army is under the command of an English general, and officered partly by Englishmen and partly by Egyptians. Its total strength is 13,000, while the English army of occupation, which since the rebellion of 1882 has remained in Egypt, is over 3,000. Beyond a few gunboats and yachts E. possesses no navy.

Education and Religion.—Much is being done for the spread of education in E. There are some 6700 elementary schools, 15 government colleges, and 21 higher grade schools. Unfortunately female education is neglected. Most of the Egyptians are Mohammedans, but the Copts number 600,000.

History.—Upper E. was once called Meroë, and at another time Cush or Ethiopia, both which names were afterwards carried to Abyssinia. The local name of E. itself is Chemi (Ham or Sham, also said to mean 'the black'); the Hebrew name was Mizraim, one of the tribes of the children of Ham. The Greek names, Ægyptus and the Land of Copts, were at first applied to the Delta alone. E. probably contained two races, that seen in the kings who ruled at Sais, and that seen in the kings and gods of Thebes. The first is marked by a retreating forehead, a forward mouth, and an excessive length from chin to the back of the head; it is still seen in the modern Fellah and the Galla tribe S. of Abyssinia. The second has an intellectual head, with upright forehead and aquiline nose. According to one view the latter was a conquering race, owning the land, to which it gave its warriors, religion, and language; the former tilled the land and paid the taxes (Morton's *Crania Ægyptiaca*). The first king of the old empire is Mena or Menes ('the eternal,' Minos and Menu), the founder of Mennefer or Memphis ('good port') and of the earliest religious rites. His date varies from 3000 to 2000 B.C., the Greek lists of Eratosthenes, Manetho, and the tablets of Abydos being in almost constant contradiction. He is the first of six dynasties, some of which lived at This (Gr. Abudos), ruling over the land between Lycopolis and Tentyra. Another Thinite king, called Kakan, introduced the worship of the bulls Apis and Mnevis, and the goat Baentattu. In a later Memphite dynasty is the name of Ser or Serbes, afterwards made the god Aiemapt on account of the encouragement he gave to medicine and building with polished stones. The history of the fourth (Memphite) dynasty is contained not merely in Greek glosses, but in local inscriptions. Senefru conquered the 'Shepherds of the East,' near the *mafka* mine in Sinai; Khufu (Cheops) built the great pyramid (*mer* or *abmer*) at Ghizeh, near which Caviglia and Mariette discovered the Temple of the Sphinx. Cheops also conquered Thebes (which had by this time absorbed This, Elephantine, Heracleopolis, and Heliopolis) and Tih, or the hill country in Sinai, where inscriptions may be seen at Wadi Magarah. Besides the *primitive* deities, such as Ra, the Sun (who formed a trinity with Mut, the mother, and the hawk-headed Chonso, a moon-god), the *secondary* deities, Kneph, the ram-headed spirit, Ptah, the fire-god, Thoth, the ibis-headed god of letters or pillar-god, Hathar or Venus, and Bast, goddess of chastity, were now worshipped. Isis and Osiris were at first demigods, and their popularity changed from time to time. Their sons were Horus, the hawk-headed, and Anubis, the jackal-headed. Osiris had been killed by Typhon, the hippopotamus. Nephthys was the sister of Isis. This period is marked by the first *cavo rilievo* and painting in monochromes; it has an extensive hieroglyphic language. The following are some of the principal deities and countries :—

 . . . . *Amn*, Amen, Jupiter.

 . . . . *Bast*, Bubastis, Diana.

 . . . . *Hathar*, Athyr, Venus.

 . . . . *Heshar*, Osiris.

 . . . . *Ptah*, Vulcan.

 . . . . *Mut*, wife of Amen-Ra, Thermontis.

 . . . . *Ra*, the Sun.

 . . . . *Teti*, Thoth, Mercury.

 . . . . *Khem* or *Min*, Chem. (Ithyphallic god).

 . *Assuru*, Assyria.

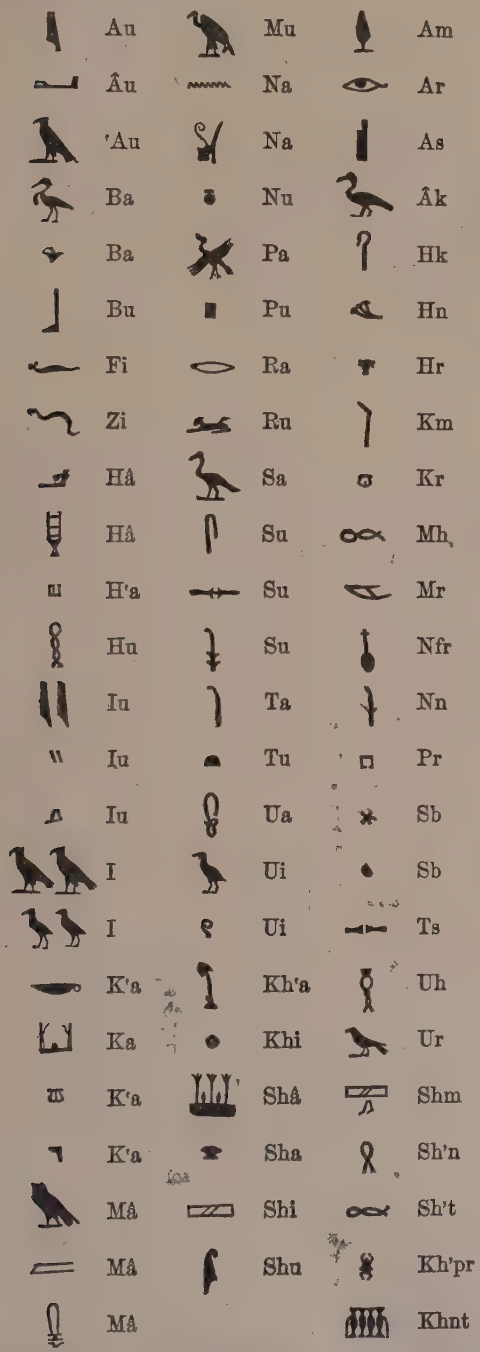
 . . . . *Kenus*, Nubia.

The fifth dynasty is called Elephantine, the name of a city on an island in the Nile, just below the cataract at Syene. The kingdom of Elephantine may have reached N. to Silsilis, and S. to the cataract at Abousambul in Nubia. The kings are now distinguished by the termination Ra. One of them, Ptahhept, is the author of the moral precepts on the Prisse Papyrus. The sixth dynasty (Memphite) includes Nitocris, the 'rosy-cheeked queen,' and there is a trace of an expedition against the Herusha, or inhabitants of the Waste, on the N.E. There were probably contemporary dynasties at This, Thebes, Memphis, and Elephantine. There was also a race of kings at Heracleopolis ruling from Memphis up the river to Lycopolis. A king of Heracleopolis (perhaps Amenemha III.) constructed the Lake Mœris to drain off excessive inundation and to store against deficient inundations. Another king of Heracleopolis built the Labyrinth with 1500 cells—the Tomb of the Sacred Crocodiles described by Herodotus. In the city of Chois, in the Delta, there was an independent dynasty, of priests, who saw the invasion of the Hykshos, or shepherd kings, called 'lepers' in the British Museum Papyrus, probably an Arabian or Phœnician race, who fixed themselves at Memphis and confined the native rulers to Thebes. But these names lead into what Dr. Birch—occupying a middle place between the extravagant chronology of Bunsen and the sober estimates of Sharpe—calls the Middle Empire, consisting of twelve dynasties from 2000 B.C. to 1600 B.C. This period ends just before the reign of Rameses I., whose date in Sharpe's chronology is *circa* 1200 B.C. A more interesting era is that of Thothmosis III., *circa* 1322 B.C., when it seems almost certain that the sovereign power of E. was concentrated at Thebes (Tape, or '*the* city'). Before going to that era, a few names must be mentioned. Osirtesen I., king of Thebes, perhaps before the conquest by Cheops of Memphis, built the tombs of Beni Hassan; adapted hieroglyphics to represent not objects or even words merely, but syllables and letters; divided the year into the seasons of vegetation, harvest, and inundation, containing twelve months of thirty days, to which the five additional days, called by the Greeks *epagomenai*, were added; and encouraged the application of steel to the arts of peace and war. Thebes and Memphis combined against the Hykshos, or Caphtorites, whom they drove into the N.E., and who left behind in the name Pelusium their Canaanitish name of Philistines. Amunothph I. (1430?) first married a black-skinned wife, thus obtaining Ethiopia as far as Tombos or Napata. Negroes now appear in the sculptures as domestic and agricultural servants. It was in the 14th c. B.C. that Zeph-net-Phœnich, the biblical Joseph, introduced the ryot tenure to Lower E., the land-tenants paying a fixed rent of one-fifth. It is not clear whether the biblical Pharaoh was king of Memphis or of Bubastis. The Hebrew immigrants, called *Shemmo*, or 'strangers,' were placed in Goshen ('upper lands') and the town of Succoth ('the tents'). Memphis and Thebes are again brought together by the marriage of Thothmosis II. to Nitocris, but a striking difference is still to be observed between the architectures of Upper and Lower E., between excavated tomb and pyramid, between the work of free men and that of slaves. The Egyptians knew at this time the wedge, the lever, the inclined plane, but not the screw, the pulley, or the wheel and axle. They had, however, two-wheeled carriages in place of the primitive boards strapped on the backs of two asses. From 1322 to 990 B.C. we have the Theban kings supreme in E. The horizon of history widens in the reign of Thothmosis III., whose warlike and commercial expeditions to Nubia and Syria are chronicled on the sandstone wall at Karnak. King Amunothph II. is probably the Pharaoh under whom Moses led out the Israelites, who, identified with the old Phœnician invaders, had latterly been treated with severity. Thothmosis IV. (builder of the Great Sphinx) was succeeded by Amunothph III. (lord of Mendes, and called by the Greek epitomists Memnon), whose name is found very often in the granite district of the Second Cataract. He built the musical Colossus at Luxor, and married Tii, a foreign woman painted pink. He cultivated the cat-headed goddess Bast, and tried to introduce from Ethiopia the worship of Atennefru, 'the most lovely disk' of the sun. The next king persecuted all religion except the solar, and drove out the Greek settlement at Sais, which had flourished there for centuries, and whose movement gave rise to the legends of Erechtheus, Cadmus, and Danaus in Greece. Rameses I. (first king of the nineteenth dynasty) is succeeded by Seti or Oimenephthah I., whose alabaster sarcophagus, discovered by Belzoni, and now in the Sloane Museum, is the most beautiful of Egyptian monuments. Rameses II. warred against the Khita (Gr. Bactrians), supposed by Gladstone to be the Ketæi of the Odyssey. See the Sallier Papyrus (British Museum), called the 'Iliad of Egypt.' Besides the Memnonium and the Hall of Columns, he built the well at Contra Pselcis for the gold-miners who crossed the desert with their asses to Gebel-Ollaki. He sent his negro prisoners to the N., and his Asiatic prisoners to the S. The names on the monuments of Oimenephthah II. suggest among his enemies the Sharutana or Sardinians, the Turska or Etruscans, the Shakalusha or Sicilians, the Luka or Lycians, and the

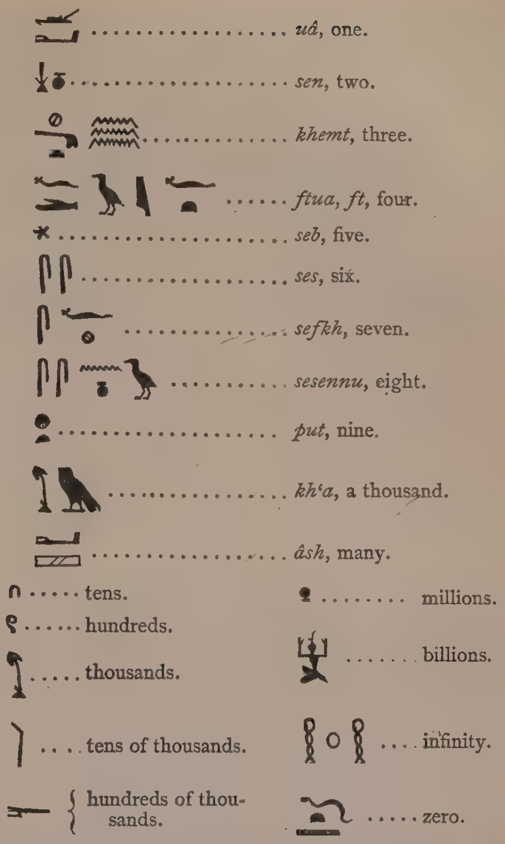
Ruins of the Temple of Quorneth, at Thebes.

Akaiwsha or Greeks (formerly called Hanebu or Ionians). This king is supposed by some to be the Pharaoh of the Exodus. A new route has been suggested for the Israelites, viz., by the isthmus between the Mediterranean and the Lake Serbonis, full of seaweeds and reeds. See Brugsch Bey's lecture before the International Congress of Orientalists, 17th September, 1874 (*Academy*, 26th September, 1875). After a period in which the Harris Papyrus indicates the presence of a Syrian usurper, Rameses III., the Solomon of E., called by Herodotus Rampsindus, with the help of his Council of Thirty, reorganised the social classes. His lists of victories refer to the Pulusata (Pelasgi), Tsekkarin (Teucrians), Uashasha (Osci). Rameses XII. is connected with the worship of Khons (the Moon), whose temple contained the *Cynocephali*, or living apes. The College of Sacred Tribes (*rekhkhet*), and the doctors of magic (*rekhgetamon*, 'those acquainted with hidden words,' the *chartummins* of Exodus), sent the ark of Khons to cure a princess in Bakhtan (thought to be Ecbatana). By this time additional gods had appeared—in Nubia, Chem, the god of generation, who carries a whip; Sebek or Seb, the crocodile—in the Delta the sun was called, not Amen-Ra, but Atham and Mando; Neith was the queen of heaven, who gave kings and sages inspiration through the sacred acacia-tree. The period (B.C. 945-697) is marked by the rise of Tanis and Bubastis and the E. of the Delta, the decay of Thebes, civil wars, and the Ethiopian invasion. At Thebes the Ramessid dynasty is succeeded by the high-priests of Amen, who were conquered by Shishank (Gr. *Sensonchoses*) of Bubastis, an ally of the Jews. Amid many striking differences of custom (*e.g.*, the Egyptians worshipped animals, the priests shaved the head, the people marked their bodies, food was placed in tombs, trees were planted in temple-yards), both Egyptians and Jews practised circumcision, abhorred swine-flesh, and reckoned sunset as the beginning of the day, and much religious ceremony is common to the two nations. Shishank gave the military class freedom from taxation. For two centuries there seems now to have been great confusion. Tanis, the seat of the export trade in corn, linen, and drugs from E., rose into importance, to be succeeded by Sais, on the Canopic branch of the Nile, where Bocchoris the Wise enacted the law that no debtor should be put in prison, and that there should be a written acknowledgment of every debt. Sais itself, as well as Thebes and Memphis, succumbed to the Ethiopian king Piankhi. There is some confusion between this expedition and that of Sabaco or So, whom Manetho makes the first of the twenty-fifth or Ethiopian dynasty. The Assyrian cuneiforms now throw light on Egyptian history, and Tirhakah, the third Ethiopian king, is the contemporary of Hezekiah, and the opponent of Sennacherib and Esarhaddon. The latter organised a portion of E. into a subject state governed by twenty small kings. Tirhakah or Rutamen renewed the contest with Assur-bani-pal, and after this we find a line of native kings (distinguished by basalt monuments) consolidating power at Sais in the W. Delta (B.C. 697-523). Among them Psammetichus I. is prominent. Necho developed the Egyptian navy, and after his conquest of Syria had been nullified by Nebuchadnezzar of Babylon, he constructed the great trench from the Bitter Lakes to the marshes at Pelusium, and by one account anticipated the Periplus of Hanno by sending his ships round the Cape. Another Psammetichus (B.C. 588) was the friend of Zedekiah, and probably in his reign Jeremiah wrote his Lamentations at Hieropolis. Hophra (Gr. Apries) and Aahmes continued to encourage Greek influences in both trade and the army. Amasis, who owed his elevation to a revolt of the old army (the Calasiries and Hermotybies, all tenants of six acres of crown-lands, serving compulsorily for three years) against the mercenaries, made Naucratis the chief port of E. Amasis also established the power of E. in Cyprus. After his death Cambyses reduced the whole country, and from 523-332 B.C. the Persian rule is broken by successive rebellions. By the laws of the Sais supremacy, death was inflicted for murder and perjury and even for killing a slave; killing a child was punished by three days' imprisonment with the dead body. Whereever possible, the punishment fell on the guilty limb. The accumulation of interest was limited to double the sum originally lent. Parricide was punishable by burning. There was no limit to the number of wives permitted by law; only the priests were monogamists. The priests were in four classes—the Soteno, wearing the tall ball-topped linen cap; the Nowto, wearing the flat ring or plate of gold; the Othphto ('dedicated,' Gr. *katochoi*), under monastic vows of seclusion; the Bachano, or hired servants of the rest. The number of local names given to products shows the vigour of industry, viz., ammonia, from the oasis of Ammon; syenite, from Syene; natron and nitre, from Mount Nitria; alabaster, from Alabastron; topaz and sapphire, from the islands of Topazion and Sapirene in the Red Sea; emerald from Mount Smaragdus, &c. In sculpture, critics already distinguish the Ethiopic, Assyrian, Greek, and later Egyptian or Saitic schools. The first is marked by unnatural stoutness, the second by clumsy action, the third by tasteless show of anatomical knowledge, the fourth by grace and strength, without the awful majesty of the early monuments. No clay models were used, and respect for the dead prohibited an intimate knowledge of the human muscles. E. under Darius formed part of the African satrapy, paying as tribute 700 silver talents, the revenues of Lake Mœris, and 120,000 measures of corn. After three native *meleks* or Satraps, Mandophth took advantage of the Persian disasters in Greece to assert his country's independence (B.C. 487), but the tyranny of Xerxes or Kshairsha (who absorbed the army of E. into his own) succeeded, and after the more successful revolt of Marus, who hired Athenian troops, and Amyrtæus in Lower and Upper E., Artaxerxes Longimanus reconquered E. in 440 B.C. About 400 B.C. Nepherites of Mendes (first of thirtieth or Sebennyte dynasty), allying himself with Sparta under Agesilaos, again broke the Persian rule, which, in spite of the attacks of Artaxerxes Mnemon, was not re-established till 349 B.C., when Artaxerxes Ochus destroyed the kingdom of the Copts. At this time Anaxagoras visited E., and Herodotus; and later came Eudoxus the astronomer, who formed the *octaëterid* (period of eight years or ninety-nine months); Chrysippus the physician, and Plato. In 332 B.C. Alexander the Great entered E., meeting with little resistance. He respected the native religion, and divided the country into two monarchies or judgeships, both of which were filled by Egyptians. The reign of Ptolemy Soter extends from 322-284 B.C., the early part of it under the nominal sovereignty of Philip Arrioæus and Alexander Ægus. The defeat of Perdiccas was followed by the conquest of Jerusalem, Phœnicia, Coele-Syria, and Cyprus, and by the defeat of Antigonus. Ptolemy's rule was beneficent, but he kept the two races asunder by declaring that the children of mixed marriages were barbarian. In return for the knowledge which the Greeks brought to the Museum or College of Philosophy at Alexandria, they got the use of papyrus, a great multiplier of books, for which only linen, wax, bark, or tree leaves had been used before. Ptolemy introduced a proper coinage in gold, silver, and bronze into E. His drachma weighed about 55 grs., so that the silver talent was about £150 in value. The chief coins were the gold tetrastater (8 drachmas) and the silver tetra-drachma. Under Ptolemy Philadelphus (B.C. 284-246), the son of Soter and Berenice, a connection springs up between Rome and E. Philadelphus built the Pharos lighthouse and the troglodytic Berenice on the Red Sea, which was joined to Coptos by a road that passed Smaragdus (rich not only in emeralds but in porphyry and *breccia verde*), and was furnished with four great inns or watering-houses. Arsinoë (near the modern Suez) and the Temple of Isis on the island of Philæ (properly Abou-lakh, 'city of the frontier') were also built. The population of E. was estimated at 7,000,000, the army at 220,000, maintained on a revenue of 14,800 talents (£2,250,000) and 1,500,000 artabas of corn (5,000,000 bushels). The Museum Library contained 200,000 Greek papyri. Its directors were the accomplished Demetrius Phalereus and Zenodotus, one of the earliest editors of Homer. There, too, was Ctesibius, the inventor of the water-clock; Theocritus, the Sicilian idyllist; Callimachus, writer of elegiacs and professor of poetry at the Museum; Strato, the physicist, a pupil of

Theophrastus; Timocharis, the astronomer, who by observation of the fixed stars prepared the discovery of Hipparchus that the equinoctial point had moved; Aristarchus, who anticipated the Copernican theory. The king caused Manetho, a priest of Heliopolis, to write his list of kings from the hieroglyphs. The following list of alphabetics in common use may be here inserted:—



The phonetic names of the numerals are as follow. It would appear that up to 10 the vertical bar was repeated as required, but after that other characters were used:—



uâ, one.
sen, two.
khemt, three.
ftua, *ft*, four.
seb, five.
ses, six.
sefkh, seven.
sesennu, eight.
put, nine.
kh'a, a thousand.
âsh, many.
tens.
millions.
hundreds.
billions.
thousands.
tens of thousands.
infinity.
hundreds of thousands.
zero.

The empire of E. included parts of Pamphylia, Cilicia, Lycia, and Caria. The reigns of Ptolemy Euergetes, Philopator, and Epiphanes occupy the period, B.C. 246-180. Some of the exploits of the 'Benefactor' in Syria and Ethiopia are chronicled in the famous bilingual inscription at Canopus. The Museum flourished. Aristophanes, the grammarian, the inventor of the long and short marks, the aspirate, and the accent, put new life in the public readings, and Eratosthenes, 'the surveyor of the world,' by his theory of shadows laid the foundation of astronomical geography. He also wrote a history of E. in correction of Manetho. Apollonius of Perga first taught conic sections, and Archimedes, the friend of Conon, invented his *cochlea*, or screw-pump, so useful in Egyptian irrigation. By the battle of Raphia, Philopator recovered the Syrian provinces which Antiochus the Great had seized, but during the minority of Epiphanes (the Illustrious), notwithstanding the tutorship undertaken by Rome, they were again lost to E. The love of letters still lived in the Ptolemies, but along with it a fatal moral corruption. Ptolemy Philometor Eupator and Euergetes II. fill up the space from 180-116 B.C. Roman intervention saved the whole empire from being seized by Antiochus Epiphanes, and assisted at the divisions between the two brothers. Philometor, who gave some of the highest state offices to Jews, offended his own Coptic subjects by putting Greek inscriptions on the new temples. A change is noticeable in the architecture of the time. The screen in front of the great portico is almost removed by having a doorway made in it between every pair of columns. Corporations of monks begin to appear, and from the contemporary documents we find that sales of slaves and gifts to the Church for the benefit of the dead were common. Euergetes, who recognised the independence of the Maccabees, and warred in Syria against his sister Cleopatra, was a monster of cruelty and sensuality. As regards literature, the honour done to critics (such as

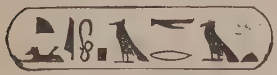


FIG. 1.—Cleopatra.

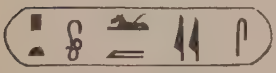

FIG. 2.—Ptolemy.

Aristarchus) is symbolized in the sculpture called the 'Apotheosis of Homer.' The leading figure of the time is, however, Hipparchus, who, with an instrument having a plane parallel to the equator and a gnomon parallel to the earth's pole, observed the equinox and its precession, which he said was along the ecliptic, and not the equator. With him we may put Hero, the ingenious mechanic, whose pneumatic toys are still admired. Agatharcides has left an intelligent account of his survey of the Red Sea, and some attempts were made at a passage to India. Dioscorides was reached. From 116-51 B.C. we have the reigns of Cleopatra Cocce with Ptolemy Soter II., and then, with Ptolemy Alexander I., Cleopatra Berenice, Ptolemy Alexander II., and Ptolemy Neus Dionysus. The period is one of intrigue, civil violence, and vice in high places. The Alexandrian Jews begin to count for something in the political world. Lucullus, the Roman ambassador, finds the Old and the New Academy in debate at Alexandria. Diodorus Siculus is astonished by the fervour with which, outside Alexandria, snakes, crocodiles, cats, ibises, and bulls are still worshipped. The Egyptians still believed in a creation by Ra, the Sun, acting on the river Nile, and in a bodily resurrection, which explains the importance of embalmment. They still buried with the mummy *The Book of the Dead*, explaining the method of judgment passed upon souls. King, priest, and soldier were still the only landholders, and the thirty judges of the three great cities still administered the eight books of the law. Caricature begins to appear on the monuments. According to Strabo bad government had reduced the revenue to 12,500 talents, and the population to 3,000,000. Cyrene and Cyprus successively fall into the hands of Rome, and along with commerce literature also declined. The reign of Cleopatra and her brothers, with the episodes of Julius Cæsar and Mark Antony, occupies the period, B.C. 51-30. The Museum was burned, but the equally large library of Pergamos was placed in the Temple of Serapis. During the three centuries of the rule of the *Lagidæ* changes had occurred in the religion. Ptah and Serapis had become the chief gods; and the moon, which had formerly appeared on the heads of gods, now takes a separate individuality under the name of Soh. The new hieroglyphic characters were the cameleopard, mummy on a couch, ship with sails, and chariot with horses; more words are spelled with letters; and with the papyrus the enchorial or demotic writing with few symbols was gradually displacing the hieratic. From this time to A.D. 640, E. is a Greek province of the Roman Empire. The equestrian prefect was not amenable to the senate. A vigorous judicial system was set on foot. The chief native magistrates were the keeper of the records, the police judge, the prefect of the night, and the *exegetes* or interpreter. Even these officers, however, were not Roman citizens; they were merely imperial freedmen. No municipal government was allowed. The Julian civil year of 365¼ days, beginning on 29th August, was introduced, so that E. had three calendars—the Julian; the popular year, beginning on 18th July, the day of the heliacal rising of the Dog-star; and the astronomical year of 365 days with a moveable first day. Augustus was anxious to prevent oppression by the tax-gatherers, and by his orders the canals were cleared, and the Nilometer at Elephantine built, which shows a maximum rise of twenty-five royal cubits and four handbreadths. Strabo (who travelled to E. under the prefecture of Gallus) describes the wealth and business of Alexandria. The Roman Empire did not extend beyond the *dodecaschœnos* (70 miles) beyond Syene, and this frontier was often troubled by the Ethiopian Arabs of Queen Candace. The worship of Isis and Serapis penetrated to the court of Rome, and Virgil distinctly teaches the Egyptian millennium. Afterwards there was a law against the Egyptian and Jewish superstitions. The pretensions of Caligula to divine honours formed the pretext of an attack by the Greeks on the Alexandrian Jews, whom they wished to deprive of civil rights; the embassy of Philo proved less powerful than that of Apion the grammarian, and not till the time of Claudius did the Jews regain their privileges. Claudius also stopped the oppressive practice of Roman citizens travelling through E. free of expense; he restored an independent coinage. The trade with India in silk, precious stones, ginger, spices, and that with Africa in ivory, rhinoceros teeth, hippopotamus skin, tortoiseshell, apes, and slaves, converging on the Coptos-Berenice route, grew rapidly. The linen trade of Upper and the cotton trade of Lower E. were large, and Alexandria was the largest granary in the world. The excellence of Egyptian chemistry is shown in the Arabic name *al-chemi*, the Egyptian art. Their colours were prepared by the use of a mordant liquid, and their ink (used chiefly on the mummy cloths) was made of nitrate of silver. Naphtha, or rock-oil, bears an Egyptian name. The trade in papyrus in all its varieties, from Hieratic and Fannian down to emporetic (used for wrapping parcels), increased its area. In the reign of Nero (A.D. 55-68) Christianity makes many converts in Alexandria—Jews, Egyptians, and Greeks. Wild Arab tribes from Lower Ethiopia, especially the 'headless' Blemmyes, infested the frontier. The prefect's decree issued on the accession of Galba illustrates the revenue-tyranny which it was intended to stop. Vespasian, whom the Alexandrian Greeks called Cybiosactes ('the scullion'), owed his reception in Alexandria very much to Dion Chrysostom, the rhetor, and Apollonius of Tyana, the impostor; for the philosophers now constituted an important class. In Domitian's time we have from Juvenal a satirical account of E. He testifies to the military oppression, and says the people left nothing unworshipped except the goddess of chastity. Plutarch's narrative of the same age describes the habits of the priests in shaving the whole body, wearing only linen, and refusing some meats as impure. The intellectual creed was then becoming Manicheeism, and less regard was paid to external observances. Serapis was the supreme ruler, and the other members of the triangular trinity, Isis and Horus, were invested with more pleasing human attributes. Trajan (A.D. 98-108) rebuilt the Bitter Lakes Canal on a new route from Memphis. In consequence of civil war between the Cyrene Jews and Alexandria he also deprived the former of citizenship. The philosophical reputation of the capital was sustained by Justin Martyr and Athenagoras, both converts. The beginning of the reign of Antoninus Pius (A.D. 138) is remarkable as the end of the Gothic period of 1460 years, which was called the 'Return of the Phœnix.' This happened when Claudius Ptolemy, the author of the *Syntaxis* or *Almagest*, containing the record of eclipses for eight centuries, and the name-father of the old solar system of cycles and epicycles, was the leading savant of Alexandria. The *Itinerary* of Antoninus gives a description of the six great roads in E., and this is supplemented by the *Periplus* of Arrian, who notes the appearance of glass and sugar in the Red Sea trade. The reign of Aurelius (A.D. 162-181) is without political events except the rebellion of Cassius, but the Library was then in its glory, and was attended by many grammarians, with Athenæus the Deipnosophist at their head. They give employment to the two trades of 'quick writers' and 'book writers.' Lucian, then secretary to the prefect, darts his humour at the immoveable superstitions of the country. At this time the orthodoxy of the old religion seems to have centred at Canopus (a town which gave its name to the jars for holding the soft parts taken from the mummy). There, in the sacred processions, the singer repeated the *Book of Hymns* and the rules for the king's life; the soothsayer, with his hour-glass and palm-branch, repeated the books on the moon's phases and the fixed stars and their risings; the scribe, with his flat rule, knew the geography of the world and the books concerning the planets and the furniture of the temple; the robe-master, with the sacrificial vase and rod of justice, knew the books concerning the sacred heifers, education, first-fruits, and the order of worship and of festivals; the prophet or ventriloquist, with the great water-pot or speaking-bottle, knew the hieratic books concerning the laws, the gods, the temples, the revenue. These were thirty-six of the Books of Thoth; the other six, on diseases and medicines, were learned by the Pastophoroi, who carried an image of the god in a small shrine. At Alexandria, on the other hand, the Eleusinian mystery (of a serpent carried in a basket) was well known; and it is thought the priesthood had generally an *esoteric* faith which, by such names as the 'Secret of Abydos,' they endeavoured to conceal. In spite of persecution the catechetical school of Clemens was continued by Origen, and shortly after Caracalla built a temple to Isis at Rome, and Egyptians entered the Roman senate. The great names of Saccas, Plotinus, Longinus, and Porphyry, which adorned Alexandria during the beginning of the 3rd Christian c., are elsewhere described; and the numerous changes and struggles of Christian doctrine, of which E. was the scene, belong to the history of the Church. In the feeble reign of Gallus (A.D. 251) famine induced a plague, ulcer of the tonsils, which greatly reduced the population. For a short time (A.D. 260) E. was independent of Rome under the soldier Alexander Æmilianus. In A.D. 270 Zenobia of Palmyra made an attempt to gain E., which, after a few months' success, was defeated by Aurelian, but both Saracens and Palmyrans continued to assail the province, and Firmus, a wealthy paper-merchant, with the help of Arabs and the Coptic population, made himself independent for a time in Upper E. Frequent rebellions of lesser size were followed by the great one of Achilleus against Diocletian, who had just resigned Nubia to the native tribes. With the rise of Byzantium the Greek element begins to yield to the native Egyptian; theology displaces philosophy; Iamblichus seems insignificant by the side of Arius and Athanasius. Indeed, after the division of the Empire the Patriarch or Bishop of Alexandria seemed at times almost independent of Constantinople. The paralysis of political power is shown in the system of patronage by which towns without charters paid a government official for his unauthorised protection. When Jovian restored Christianity (A.D. 363), the monastic system was already in full vigour among the Cœnobites, the Anchorites, and the Remoboth. About A.D. 379 the Saracens approach the N.E. frontier, and being many of them Christians, side with the Egyptian Homoousians against the Arian Greeks. The radical policy of Theodosius did not entirely destroy the Pagan worship, still practised in secret at Canopus, but it did destroy the great Serapis Library of 700,000 volumes. The lamp of philosophy was still held up by Proclus and his followers. The government divided E. into Upper Libya or Cyrene, Lower Libya or the Oasis, the Thebaid, Ægyptiaca or W. Delta, Augustanica or E. Delta, and Heptanomis or Arcadia. The tax-gatherers were called 'counts of the sacred largesses,' and had a great crowd of *numerarii* (clerks). About A.D. 450 a Nubian invasion almost extinguished Christianity in Upper E. On the other hand a series of ecclesiastical quarrels, in which the national mind was interested, was settled by the edict called 'Henoticon,' issued by the Emperor Zeno in A.D. 477, which passes by the decrees of Chalcedon, calls Mary the 'Mother of God,' and admits that the decrees of Nicæa and Constantinople contain everything necessary. In the reign of Anastasius (A.D. 501) the Persians under Kobades overran Syria, and laid waste the greater part of the Delta up to the very walls of Alexandria. Under Justinian a singular strife went on between the Coptic patriarchs, who were Jacobites, and the Melchite or Royalist patriarchs, who were armed with the authority of civil prefects. This lasted till the Persians took Antioch, and the defence of the Egyptian frontier was practically left to the monasteries on the Elanitic Gulf. A change in the government was made by the thirteenth edict of Justinian, from which it appears that the Augustalian Cohort of 600 men was charged not only with the defence of the province, but with supervising the collection of the 800,000 artabæ (4,000,000 bushels) of corn. In the reign of Heraclius (A.D. 618) the Persian Chosroes became master of the whole of E. for ten years. He even built a palace in Alexandria. Heraclius drove out the Persians, but for several years he paid a tribute to the Caliph Omar, and in A.D. 638-640, Amrow, the son of Ase, partly through the treachery of some native Egyptians, overcame the brave resistance of the Greek garrisons. The terms of the Moslem conqueror were:—'Pay tribute, embrace the Koran, or die.' At first E. paid two gold pieces for every male of military age. By Omar's famous order the Library was used for heating the baths. The history of E. now becomes part of the history of Arabia and the Arabs. It was governed from a new city, Musr or Cairo, between Memphis and Heliopolis, and these cities were pulled down to build mosques and other public buildings. In A.D. 868, the local governor of the Abbaside caliphs usurped the sovereignty, and founded the Tooloonide dynasty, which lasted till A.D. 906. The power of the caliphs was again interrupted by Mahdee, the governor of E. Africa (A.D. 912-934), and Mohammed, a Turkish officer in the Arabian service (A.D. 936-970). The descendants of the former founded the Fatimite line of caliphs, who till A.D. 1171 ruled at Cairo independently of Bagdad, taking a large share in the wars of the Crusades. The Eyubite dynasty was succeeded by a race of Baharite sultans, or Meleks, consisting of Turkoman Mamlukes, who joined Syria to E., and held the Abbasides in subjection. The Circassian Mamlukes (A.D. 1382-1517) were crushed by Sultan Selim I. at Heliopolis. The conqueror organised an independent government of E. by a Pacha and twenty-four Beys, headed by the Sheik of Belad. The army and power of taxation, subject to certain conditions, were left with the Mamluke aristocracy. Under this arrangement there was frequent revolt. When Napoleon went in 1798 to free E., Britain intervened on behalf of the sovereign rights of the Sultan, but its success was neutralised by the *coup d'état* in 1811 of Mehemet Ali, who murdered nearly all the Mamluke Beys (some escaping into Dongola) and reigned till 1848, the Hatti Sheriff of 1841, guaranteed by the Great Powers, confirming the succession to his heirs. Ali's government was a contrast to the savage oppression of the Beys. He established regular courts of justice, and introduced European manufactures and machinery. But there was only the form of representative government, and the wars in which the Vali (or Viceroy) and his son Ibrahim took part made necessary an enormous taxation and a heavy conscription. The leading class under this military regime was the Osmanlis. Ali took part in the Greek war of independence, and after the conquest of Syria in 1835 might have got rid of his nominal superior, the Sultan Mahmoud II. But in 1840 the Quadruple Alliance intervened in favour of Abdul Medjid. He died in 1849, and was succeeded by his son, Ibrahim, and by Abbas Pacha, superseded in turn by Saîd Pacha in 1854. By his co-operation M. de Lesseps commenced the construction of the Suez Canal, which was opened in 1869. Saîd was succeeded in 1863 by his nephew, Ismaïl, who was deposed in 1879. His son, Mohamed Tewfik, succeeded him. He placed the finances of the country under the joint control of England and France, and this so exasperated the military party that they step by step became absolute masters of the government and resources of the country under the leadership of Arabi Pacha. England could not tolerate the existence of a military despotism in Egypt, and as France declined to co-operate, England sent its own fleet (June-July, 1882) under Lord Alcester, and an army of about 10,000 men under Lord Wolseley, to restore the authority of the Khedive and to secure its highroad to India. The fleet bombarded and destroyed the forts of Alexandria, then occupied the city. The army occupied Ismailia on the Suez Canal for its base. It pressed on thence to Kassassin, where the army was massed and delivered its great blow at the enemy in his entrenchments at Tel-el-Kebir so effectually on 12th September that Arabi's power was ruined. The British army then entered Cairo, and British authority was promptly recognised throughout Egypt. The departure of the British troops was, however, countermanded on account of the war in the Sudan. Mohamed Tewfik died on January 7th, 1892, and was succeeded by his son Abbas. By an Anglo-Turkish Convention, signed May, 1887, it was agreed that the British troops should leave in three years, but it was not ratified by the Sultan, and the question of the British retirement from the protectorate of Egypt remains unsettled.

Egyp′tian or **Al′pine Vul′ture,** a species of *Vulturinæ*, distinguished (as are other members of the genus *Neophron*) by the long bill with the nostrils situated at its middle, by the third quill being the longest of the wings, by the wedge-shaped tail, and by the front of the head, throat, and cheeks being destitute of feathers. This bird, sometimes named 'Pharaoh's chicken,' is coloured of a general white, the quills of the wings being dark brown. The sexes are coloured alike, the plumage of the young being brown. This bird is carefully protected from injury in Egypt by laws, and subsists on carrion of all kinds. The nest is made upon a rock, and the eggs are three or four in number, and of grey colour. It inhabits S. Europe, N. Africa, and Asia.

Ehr′enberg, Christian Gottfried, an eminent German naturalist, was born at Delitsch, in the province of Saxony, Prussia, 19th April, 1795, and studied at the universities of Leipzig and Berlin. He graduated in medicine in 1818. His devotion to botany soon gained him a high reputation, and caused him to be sent along with Hemprich in an expedition despatched to the East in 1820 by the Academy of Sciences. In spite of fatigues to which Hemprich succumbed, E. travelled through Syria, Egypt, Abyssinia, and other parts of Africa, and returned to Berlin in 1826 with a great collection of hitherto unknown plants and animals. The results of his labours were seen in several valuable works. E. set out with Humboldt in 1829 on his Ural and Altai expedition, and here he laid the foundation of his great work, *Organisation, Systematik, und Geographisches Verhältniss der Infusions-thierchen* (completed in 1838 at Leipzig). Some of E.'s conclusions regarding Infusoria are now disputed, but he was the first to study their organisms scientifically. In 1847 he was appointed Ordinary Professor of Medicine. He died at Berlin, 27th June, 1876.

Ehrenbreit′stein ('Broad stone of honour'), a town and fortress in the province of Rheinland, Prussia, on the right bank of the Rhine, connected with Coblenz, on the opposite bank, by a bridge of boats and a beautiful railway bridge. The town has two Roman Catholic churches, a synagogue, and a mineral spring celebrated as early as the 14th c. There is a trade in wine, corn, tobacco, &c. The fortress, the 'Gibraltar of the Rhine,' is accessible only on the N.W. side, which is protected by a triple line of formidable defences mounted with 400 guns. On the top of the rock is a platform used as a parade ground, under which are arched cisterns capable of holding a water-supply for the garrison for three years. E. was originally a Roman fort. The French reduced it in 1799 by famine, and dismantled and blew it up at the peace of Luneville in 1801. Prussia was put in possession of it by the Congress of Vienna in 1814, and it is now one of the most formidable fortresses in the world. Pop. 5800.

Eib′enstock ('Place of yews'), a town in Saxony, 16 miles S.S.E. of Zwickau, with manufactures of tin, tobacco, chemicals, lace, and muslin. Pop. 6626.

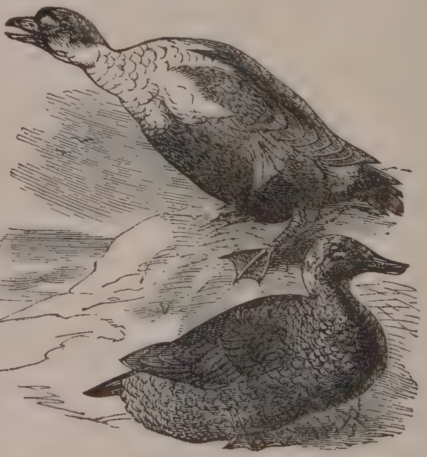
Eich′horn, Johann Gottfried, the most eminent of the Rationalistic theologians of Germany in his time, was born at Dörenzimmern, in the principality of Hohenlohe-Oehringen, 16th October, 1775. He studied at Göttingen, and was Professor of Oriental Languages at Jena (1775-88), and at Göttingen from 1788 till his death, 25th June, 1827. He was the first among professional theologians to deal with Scripture freely on the footing of a mere literary work; the principle on which he studied the Bible being expressed in his apostrophe to the writers:—'However great my respect for you, ye holy men, never let me fall into the superstitious idolatry already deprecated by yourselves, or deem it irreverent to submit your productions to the strictest rules of human criticism.' His *Einleitung in das Alte Testament* (Leipz. 1780-83), which was the first work entirely devoted to the subject, and which was received with extraordinary favour, produced a great effect both on the manner of treating the subject generally, and on the prevalent views in regard to the particular subjects on which he touched. Of his *Einleitung in das Neue Testament* (Gött. 1804-10), the most prominent part was his theory of an 'urevangelium,' or original gospel, in which the same process of grouping and comparison which had been applied to the various readings in order to purify the text is used in regard to the variations of the narratives for the purpose of arriving at the true original gospel. E. also wrote voluminously in political as well as literary history.

Eich′stadt, formerly **Aichstädt** (*i.e.*, 'oak-town'), a town of Bavaria, 30½ miles S. of Nürnberg, in a deep valley on the Altmühl. It is a bishop's see, is well built, and has an ancient appearance. The principal buildings are the palace of the ducal family of Leuchtenberg, with its beautiful park, the cathedral founded in 1259, with the grave of St. Wilibald, the town-house built in 1444, and the old castle of St. Wilibald, which has been converted into a barrack. There are manufactures of cloth, pottery, and ironmongery. There are besides several breweries. E. has had municipal rights since 908. Pop. 7508.

Eich′wald, Eduard, Russian naturalist, was born at Mitau, Courland, 4th July, 1795, studied at Berlin from 1814 to 1817, and after having travelled in France and England, was appointed Professor of Zoology and Midwifery at Kasan in 1823, travelled during 1825-27 through the countries around the Caspian Sea and the Caucasus, and in 1829 explored the W. of Russia. In 1838 he was named Professor of Zoology and Mineralogy at the Medico-Chirurgical Academy of St. Petersburg. He afterwards studied geology and palæontology, and undertook scientific expeditions to Esthonia, Finland, the Tyrol, Italy, Sicily, and Algeria. E. was a voluminous author.

Ei′der, a river of N. Germany, which rises about 12 miles S. of Kiel in Holstein, and after a course of 100 miles enters the North Sea at Tönning, the capital of the district of Eiderstedt. Throughout the greater part of its course it divides Slesvig from Holstein. It is navigable to Rendsburg, whence ships can pass to Kiel Bay on the Baltic, by means of the Slesvig-Holstein, or E. Canal. Much of its course is bordered with costly dykes to protect the adjacent land from inundation.

Ei′der-Duck, a well-known genus of *Anatidæ* or ducks, but included in the sub-family of the *Fuligulinæ* or Pochards (q.v.). The genus *Somateria* has the bill divided at its base by feathers, and the front of the bill is flat, whilst its *laminæ* or 'fringes' are very wide. The wings have their first and second quills longest. As in the pochards, the hinder toe is short, with a broad membranous web. The common E.-D. is found in the N. parts of Britain, but comes further S. in winter. It averages rather more than 2 feet in length. The male is white on the neck and back, the primary and secondary feathers being dull black, and the tertiary feathers



King Eider-Ducks.

white, whilst they droop over the darker wings. The breast and belly are black, with white patches in the flanks. The top of the head is deep black, the sides of the head being white. The bill and legs are green. The colour of the female is a ruddy brown, marked with darker tints. The nest is placed in detached rocks and islands. The eggs are five or six, and are pale-green in colour, and the E.-D. produces two broods annually. The king E.-D. is rare in Britain, but common in Greenland. It has a black and white body, and red beak and legs; and the male possesses a warty protuberance on the base of the upper bill. These ducks afford the 'down' used in making quilts and some articles of dress, which is obtained from the nests, and is plucked by the parent birds from their own breasts to cover and warm the eggs during incubation. The eggs and down are successively removed from the nest, the bird laying fresh eggs and supplying new down; whilst ultimately the male bird is called upon to supply down from his breast; and on his darker down being seen in the nest, the fowlers cease their operations. The eggs are very palatable, and the flesh is not unpleasant to taste. About half a pound of down is stated as the quantity obtainable annually from a single nest. The down is imported in the form of balls, weighing each 3 to 4 lbs. These ducks can be domesticated, especially in marine localities. The islands of Britain, Fern Island, Norway, and Sweden, are the chief haunts of the E.-D. in Europe, whilst it is also plentiful on the North American coasts.

Eigg or **Egg Island,** a small hilly island, 6 miles long and 3 broad, belonging to Inverness county, and 12 miles W. of Arisaig. The highest point, the 'Scuir of E.,' is 1339 feet above the sea. E. has a manse and schoolhouse, some Danish remains and two hamlets, Laig and Kildonan. Pop. 233.

Eight-Foil, in heraldry, eight leaves issuing from a central ball; sometimes called a double quatrefoil.

Ei'kon Basil'ike (Gr. 'the royal image'), a book issued in 1649, professedly written by Charles I., whose policy it explained. It was divided into twenty-eight sections, each ending with prayer, and was the work of John Gauden, Bishop of Exeter.

Eil'enburg ('the town on the island,' Celt. *eilean*, 'an island'), a strong town of Prussian Saxony, on an island of the Mulde, here spanned by two bridges. It has manufactures of woollens, cotton, tobacco, and wax, tileworks, and a trade in cattle. Pop. 11,506.

Eim'beck, properly **Ein'beck,** an ancient town of Prussia, 38 miles S.S.E. of the town of Hanover, on the Ilme, near its confluence with the Leine. Its chief industries are stocking-weaving, tanning, spinning, and manufactures of tapestry and cloth. It was formerly one of the Hanse towns, and in the Middle Ages was famous for its beer.

Einsied'eln, a town in the Canton of Schwyz, Switzerland, 3000 feet above the sea-level, is noted for its Benedictine Abbey, containing a black image of the Virgin, to which miraculous powers are ascribed, and which annually attracts 150,000 pilgrims. Zwingli was parish priest of E. in 1516. The existing abbey dates from about 1720. It has a library of 28,000 volumes and 840 MSS. Pop. 8502.

Eire, or **Eyre, Justices in.** These were originals of the present justices of assize. They were first appointed in A.D. 1176, with a delegated power from the king to make circuits once in seven years. Under Magna Charta the circuit was made annual. The office having become a sinecure, was abolished by 57 Geo. III. c. 61.

Eis'enach (Lat. *Isenacum*, Ger. *eisen*, 'iron'; 'the place on the water impregnated with iron'), a walled town, the capital and residence of the Grand Duke of Sachsen-Weimar-Eisenach, 45 miles W. of Weimar, is romantically situated in the Thuringian forest. It is a station on the Sächsisch-Thüringisch Railway, and is easily reached from any part of Germany. Among its principal buildings are the Grand-Ducal residence, the gymnasium, originally a Dominican cloister, where Luther received part of his education, and the churches of St. Georg and St. Nikolaus, the latter built in the 12th c. It has manufactures of woollens, fustian, worsted, linen thread, pottery, and sealing-wax, dye-works, and many flourishing mills. E. is the birthplace of Sebastian Bach. The castle of the Wartburg (q.v.), where Luther remained in hiding for ten months after the Diet of Worms, and translated a considerable portion of the Scriptures into German, occupies a wooded height in the vicinity. Pop. town 21,399; district 31,915.

Eis'enberg ('iron hill-fort'), an old town in the Duchy of Sachsen-Altenburg, on an affluent of the Elster, 2½ miles from Krossen, on the Weissenfels-Zeitz-Geraer Railway, with manufactures of leather, woollens, linens, shoes, porcelain, and stoneware, and a trade in corn and wood. Among the most noteworthy buildings are the castle of the Grand Duke and a beautiful church in the New Italian style, erected between 1676 and 1692. Pop. 5814.

Eis'enerz ('iron ore'), a town in a deep valley of Upper Styria, separated from the market-town of Nordenberg by the lofty Erzberg, 5010 feet high. This mountain forms the centre of the iron and smelting trade of Styria. The mines have been worked for 1000 years. The ore is now quarried rather than mined—the sides of the mountain being cut away in some places to a depth of 30 fathoms, in others even to that of 90 fathoms. The ore is rich, and from it is manufactured a steel unsurpassed in Europe. Pop. town 5719; district 7969.

Eis'enstadt ('iron town,' Hung. *Kis Marton*), a small free town of Hungary in the county of Oedenburg, 7 miles N.N.W. of the town of that name. It possesses a Franciscan monastery, containing the burying-place of the Esterhazy family, who have also a magnificent palace in the vicinity, built in 1683, and enlarged in 1805. In its noble park, on the slope of the Leitha Hills, are splendid greenhouses and orangeries.

Eis'leben (Lat. *Islebia*), a town of Prussian Saxony, 18 miles W. of Halle, and a station on the Halle-Nordhausen-Kassel Railway. Luther was born and died here. Two days before his death he founded the existing Royal Gymnasium. The house in which he was born has been turned into a school, where orphans receive free education. Pop. 23,175.

Eisteddfods (pron. *eisteff'ods*), the name applied to the periodical assemblies of Welsh bards for competition in native music and song. They are of great antiquity, reaching back as far as the time of Howel Dha. At present they keep alive a certain kind of national feeling, but attempt to reanimate a dead literature.

Ejec'tion and Intru'sion is a term of Scotch law, E. denoting the violent taking possession of land or a house, and I. denoting entry into the void possession of the subject without permission of the owner or order of a judge. A tenant illegally remaining in possession was liable to an action of E. and I., and unless his defence could be instantly verified, he was required to find security for the violent profits. Summary petitions for removing or for ejection have now in practice taken the place of the older actions of E. and I. The liability for the violent profits remains as before.

Eject'ment. By the Common Law Procedure Act of 1852, former procedure in E. was abolished in England. The process is now by writ (called 'Recovery of Land' since the Judicature Act) directed to the person to be ejected and to all entitled to defend possession of the property claimed. No pleadings are allowed in this action. When half a year's rent is in arrear, and the landlord or lessor has a right to reenter for non-payment, he may bring action of R. of L., and on proof that there were not sufficient goods to satisfy Distress (q.v.), he shall recover judgment and execution. But on the tenant paying rent and costs before trial, proceedings are to cease. Where the term is under seven years and the rent under £20 per annum without fine the landlord or lessor may obtain possession by summary proceedings before two justices of the peace, and before the County Court where the value of the holding or the rent does not exceed £50, and where the tenant has paid no fine or premium. Any sort of E. may be decided by the County Court when the value of the property is not more than £20 per annum.

Ekaterinburg′, or **Jekaterinburg**, a town of Russia, government of Perm, on the E. side of the Ural Mountains, and 160 miles S.E. of the town of Perm, with which it was connected by rail in March, 1878. It occupies a hilly plain on the high-road to Siberia, is the centre of the mining industry of the Ural Mountains, the largest town in the government and in the Ural region, and has broad straight streets, splendid buildings, including two cathedrals and ten churches, gardens, parks, &c. There are also a museum of mineralogy and an imperial mint. The cutting and polishing of precious stones is a principal branch of industry, but the prosperity of the town is due mainly to the rich mines in its vicinity. At a short distance are the iron-foundries of Issetsk; 7 miles off are the gold-mines of Beresovsk; and 16 miles distant is Pyschinsk, where the gold is separated from the earth by amalgamation. The town was founded in 1722, and named after the wife of the Czar Peter the Great. Pop. 33,405.

Ekaterinodar′, or **Jekaterinodar′** ('Catherine's gift'), a town in Russia, the capital of the Kuban or Black Sea Cossacks, in a swampy district on the Kuban, 100 miles above its mouth. Most of the houses are of clay, though some are of wood, and thatched with straw. E., built in 1792, is the seat of the Cossack Hetman. It has a wooden fort or *kreport*, in the enclosure of which stand the Hetman's residence, the military hospital, and the cathedral. Pop. 42,623.

Ekaterinoslav′, or **Jekaterinoslav**, a government in S. or New Russia, between Kharkov and Pultava on the N., Kherson on the W., Taurida on the S., and the Sea of Azov and the country of the Don Cossacks on the E.; area 26,148 sq. miles; pop. 1,978,400. From the southern exposure of the land, apricots, peaches, cherries, mulberries, almonds, figs, vines, melons, and water-melons thrive in the open air. Agriculture and the breeding of silkworms, of Merino sheep, and of cattle are successfully pursued. There are magnificent coal-beds, occupying an area of upwards of 1300 sq. miles.

Ekaterinoslav, the capital of the government, on the right bank of the Dnieper, 250 miles N.E. of Odessa, founded in 1784 by Potemkin, as a summer residence for Catharine II. It has broad streets, but is filthy, and has an unfinished appearance. It is a bishop's see, has extensive cloth manufactures, and is the emporium of the trade to Odessa. Pop. 51,572.

Ek′logite, a kind of garnet rock, composed of light-green smaragdite enclosing crystals of pale garnet. It occurs in the Sau-Alp in Styria, in the island of Syra, and at Münchberg in Bavaria. It is a tough firm rock, and when polished is employed for ornamental purposes.

Ekouk Tank, an irrigation work on the borders of the province of Bombay and the Nizam's dominions in India, 4 miles N. from Sholapur and 205 S.E. from Bombay. A dam of earthwork, with masonry flanks, 7200 feet long and 72 feet high, is thrown across the Adela river, a tributary of the Kistna. The lake thus formed has an area of 6½ sq. miles, and five villages have been submerged; but 35,840 acres have been brought under irrigation. There are three distributaries—two on a high level, 4 and 18 miles long respectively, for monsoon crops; and one, 28 miles long, for perennial irrigation. The water was first distributed in 1871.

Elæag′nus, a genus of Exogenous plants belonging to and forming the type of the natural order *Elæagnaceæ*. In this latter group the plants are trees or shrubs, with exstipulate leaves and unisexual flowers. The fruit is a shelled *achene*. The genus E. itself is represented by the oleaster of S. Europe and the Levant, and by the small-leaved oleaster, which bears clusters of red edible berries, mottled with scaly leaves. The former species is often cultivated in Britain for its silvery foliage. It is sometimes named the 'wild olive.' *Shepherdia argentea* of N. America is also included in this group, and yields an edible fruit.

Elæocarpa′ceæ, a group of Exogenous plants, elevated by some botanists to the rank of a natural order, but by others included in the natural order *Tiliaceæ*, or the Linden (q.v.) order. The typical genus, *Elæocarpus*, is represented by *E. cyaneus* and *E. serratus*. These trees are chiefly East Indian species. The fruit of *E. serratus* is eaten in Ceylon. *E. cyaneus* inhabits Australia. In E. plants the petals are deeply cut, and the anthers dehisce or open at their apices.

Elæococc′a, a plant genus belonging to the *Euphorbiaceæ* (q.v.) or 'spurgewort' order. The seeds afford oils (hence the name), the oil obtained from *E. verrucosa* being used for food in Japan.

Elæoden′dron (Gr. 'oil-tree'), a genus of Exogenous (Polypetalous) plants belonging to the order *Celastraceæ* or the 'spindle-tree' order. The fruit of E. is a stone-fruit or *drupe*, and that of some species (such as *E. Kubu* of S. Africa) is eaten. The fruit of *E. Argan* of N. Africa affords oil. *E. croceum* of S. Africa affords a timber known as 'saffron-wood,' much used in building and for making furniture.

Elagab′alus, or **Heliogab′alus**, the first Roman emperor of Asiatic extraction, was born at Emesa about A.D. 205. His original name was Varius Avitus Bassianus; he adopted that of E. as pontiff and favourite of the Syro-Phœnician Sun-god so named (Syr. *ela*, 'a god,' and *gabal*, 'to form'; 'the forming or plastic god'), which was worshipped at Emesa. Through the intrigues of his grandmother, Julia Mæsa, he succeeded Macrinus, the destroyer of Caracalla, after his rival had been defeated at Antioch (A.D. 218) and subsequently slain. The reign of E., who assumed the name of Marcus Aurelius Antoninus, lasted for three years nine months and four days, and was deeply stained by heartless cruelty and by vices of the most loathsome nature. E. was murdered, and his body cast into the Tiber, A.D. 222.

Eland, a genus of *Antilopidæ* or Antelopes (q.v.), distinguished by having the horns—each about 18 inches long—spirally keeled, but of nearly straight conformation; by the equal-sized limbs, and the presence of a short mane on the neck. Its colour is a light or greyish brown. The tail is tufted and the muzzle broad. The E. is the largest of the antelopes of S. Africa, and may attain the size of a large ox or cow. Its food consists of grasses and herbage, and it is noted for its powers of long abstinence from water. The flesh is accounted very palatable. The E. is gregarious in habits.

Eland.

El′anet, certain species of Raptorial birds belonging to the genus *Elanus*, and nearly allied to the kites or *Milvinæ*.

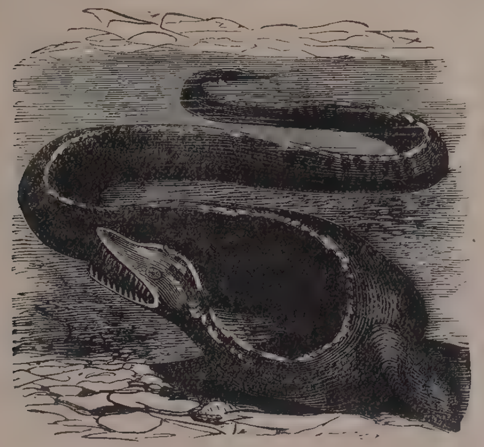
Examples are found in the black-winged falcon, and in the black-shouldered hawk. The former occurs in Africa and Asia, and in New Zealand, the latter in America. These birds have the bill broad at its base. The wings are long, and the second quills are the longest. The tail is long and forked, and the outer toe is much shorter than the inner. The genus *Elanoides* is nearly related to *Elanus*, and is exemplified by the swallow-tailed falcon of America. The wings have the second and third quills longest, and the hinder toe is elongated.

Elaph'rium, a genus of plants belonging to the natural order *Connaraceæ* (q.v.), which is sometimes included in the nearly-allied order *Amyridaceæ* or 'myrrh' order. The genus is represented by the *E. tomentosum*, which yields a resin named *Tacamahac*, whilst Mexican Elemi (q.v.) is obtained from *E. elemiferum*.

E'laps, a genus of poisonous Colubrine (q.v.) snakes, forming the type of the family *Elapidæ*, in which group the head is square, the snout short, and the front teeth of the jaws longest. In the genus *E.* (represented by the bead-snake of N. America), no smooth teeth exist behind the fangs. The Cobra di Capello (q.v.) belongs to the *Elapidæ*.

Elasmobran'chii, an order of *Pisces* or fishes, represented by the Shark (q.v.), Dog-fish (q.v.), Ray (q.v.), Skate (q.v.), and their allies. The order is distinguished by the skull and lower jaw being well developed. No distinct cranial or skull bones can be distinguished, and the skull is cartilaginous in its nature. The spine may be osseous, cartilaginous, or represented by a soft Notochord (q.v.). The scales consist of bony plates, granules, or tubercles, often furnished with spines. The pectoral and ventral fins are developed, the latter being abdominal in position. No clavicles exist. The heart has a *bulbus arteriosus*, which is rhythmically contractile, provided with striped muscular fibres, and possessing several rows of valves. The gills exist in the form of pouches, which open externally by slits (as in sharks), or by a single gill-aperture (as in *Chimæra*). The order is divided into the *Holocephali*, represented by the *Chimæra* or 'king of the herrings'; and the *Plagiostomi*, represented by the sharks, rays, &c. The former group has a single gill-aperture, or persistent notochord; the first ray of the dorsal fin forms a spine, and the mouth is placed at the extremity of the head. The latter subdivision has the transverse mouth placed on the under surface of the body, and the gills open by numerous gill-slits.

Elasmosaurian, a large marine reptile, the remains of which have been found in England and America among the chalk formations of the Secondary or Mesozoic period. It would appear that the E. was a kind of reptilian whale, possessed of vertebræ of the size of an ordinary elephant's, of a long and flexible neck, of short paddle-like fins, of a long, narrow, flat muzzle. Spout holes were near the eyes, and the long sharp teeth were eminently adapted for catching and feeding on fish. The E. must have been at least 45 feet long.



Elasmosaurian (restored).

Elasti'city, in physical science, is the property possessed by probably all kinds of matter, in virtue of which they tend to recover their original form or dimensions after disfigurement by some external force. No substances, however, are perfectly elastic, *i.e.*, can of themselves perfectly regain their original condition after having been subjected to an appreciable strain. Those which most nearly approach this ideal perfection are the gases, whose E. is defined as the ratio of the increment of pressure to the compression produced by it. The same definition holds for liquids, but their E. is of little practical importance on account of their generally small compressibility. In both liquids and gases the E. is wholly one of volume, form and figure being not of the least consequence. Not so, however, with solids. Here change of form constitutes distortion, and distortion is not necessarily accompanied by change of bulk. It is found that within certain limits the law is practically accurate that the distortion is proportional to the force, or, as Hooke first enunciated it, *ut tensio sic vis;* but for every solid substance there is a certain limiting strain, beyond which E. ceases to act, the *rigidity* or resistance to change of form is overcome, and *fracture* ensues. (See STRAIN.) Plastic solids are those whose E. of figure is very imperfect; and they pass by insensible gradations into *viscous* fluids, which have only E. of volume. Continuous rise of temperature, as a rule, renders solids more and more plastic, till they become liquid and ultimately gaseous; and therefore rise of temperature diminishes E. of figure and increases E. of volume. All these phenomena follow as a direct consequence of the molecular theory of the constitution of matter, when it is considered that the difficulty of permanently altering the relative positions of contiguous particles is greater the closer they are, and especially so if, when condensed, the particles are subject to mutually attractive forces, which are of little moment, on account of the introduction of new dynamical conditions, when the particles are sufficiently separated.

Elasticity, in physiology. Many of the structures of the body possess the property of E., by which movements are effected without the expenditure of force in muscular contraction. Thus there is a strong elastic band termed the *ligamentum nuchæ* in the back of the neck of the large ruminants and pachyderms, stretching from the spinous processes of the dorsal vertebræ to the occiput, by which the heavy head is sustained without muscular fatigue. The larger arteries of the body possess a highly elastic coat, by the agency of which the jet-like pulsation communicated by the heart to the blood is converted into a continuous uniform motion. The lungs and walls of the chest, by their E., assist in ordinary expiration without any muscular action. Muscles are highly elastic, so that after contraction they return to their former length. Finally, elastic structures are found in the neighbourhood of all joints, so as to break the shock in such movements of the body as walking, running, leaping, &c.

El'ater, the name given in botany to the *spiral elastic fibres* contained within certain vegetable cells, and which by their elasticity aid in scattering the spores or germs of such lower plants as horse-tails or *Equisetaceæ*, &c. In many cases these E. are hygrometric, that is, are affected by the varying effects of dryness and moisture.

Elater, a genus of *Coleoptera* (q.v.) or Beetles, forming the type of a distinct family (*Elateridæ*), in which the body is hard, the antennæ short and serrated, and the head sunk in the thorax as far as the eyes. The limbs are also short. They are sometimes named 'spring-beetles,' from the fact that when laid on their backs they can spring into their normal position. Many are luminous in the dark. See CLICK-BEETLES, WIREWORM, &c.

Elat'erite, or **Elas'tic Bitu'men,** is a flexible or elastic mineral substance allied to bitumen, possessed of a blackish-brown colour and a resinous lustre. It burns readily with a yellow flame, giving out a bituminous odour, and as it effaces pencil-markings, it has been called mineral caoutchouc. It was found originally in an old lead-mine in Derbyshire, but it is nowhere abundant.

Elate'rium, a drug used in pharmacy, and obtained from a green mucous or glutinous matter surrounding the seeds of *Ecbalium purgans*. It is prepared by allowing the juice of the ripe fruit to stand until it deposits a sediment, which is dried and collected. It is of a pale-greenish colour, and is a powerful hydragogue cathartic or purgative, and is used in dropsy, &c. Its properties depend on a crystalline substance called *elaterin*. As a drug it was employed by the Greeks and Romans. It varies much in strength, and should be administered at first in $\frac{1}{16}$-grain doses until its proper effect is ascertained.

Elatina'ceæ, or 'water-pepper' order, a group of Exogenous plants, occurring in all quarters of the globe, and distinguished by their being small annuals growing in marshes. The leaves are stipulate and opposite, and the flowers are small and axillary. The sepals and petals vary in number from three to five. The seeds are exalbuminous, and attached to a central placenta. The natural order E. is allied to the *Rutaceæ*. The type-genera are *Elatine*, *Bergia*, and *Anatropa*.

El'ba (Fr. *Elbe*), an island of Italy in the Mediterranean, is included in the province of Livorno, and lies between Corsica and Tuscany, being separated from the mainland by a strait (Piombino) about 5 miles wide. It is the Ilva of the Romans, and the Æthalia of the Greeks, the latter of which names is supposed to have been suggested by the smoke of its many iron-smelting furnaces. About 18 miles in length, it varies in breadth from 2½ to 10 miles, while the coasts are bold and deeply indented with good harbours. It is mountainous, and rises to a height of 3,500 feet in Monte della Campana. Among the productions are iron, loadstone, marble, wine, wheat, olives, and Southern fruits. The capital is Porto Ferraio (pop. 5652). The Treaty of Paris designated E. as the residence of Napoleon I., who, however, only remained here from 14th May, 1814, till his escape on the 26th February, 1815. Area, 90 sq. miles; pop. 22,315.

Elbe' (Lat. *Albis*, Bohem. *Labe*), the largest river of N. Germany, has its source in numerous springs on the Bohemian side and in the highest part of the Riesengebirgs, 4538 feet above the level of the sea. It flows in a sweeping curve through the N. of Bohemia, past Königgrätz, Melnik, Theresienstadt, and Leitmeritz; then, after making its way through the Mittelgebirgs of Bohemia, it enters the kingdom of Saxony, passing Pirna, Dresden, and Meissen. It then flows past Torgau, Wittenberg, and Madgeburg in Prussian Saxony, and further on it forms the boundary of Hanover and Mecklenburg, Lauenburg and Holstein, passing Hamburg, Altona, and Glückstadt, and falling into the German Ocean at Cuxhaven, after a course of 720 miles. Close on its embouchure its breadth varies from 9 to 13 miles. It drains an area of 55,590 sq. miles, and receives in its course more than fifty affluents, of which the most important on the right are the Iser, the Elster, and the Havel; on the left, the Moldau, Eger, Mulde, and Saale. It becomes navigable at Melnik for the large E. wherries at Pirna, and at Hamburg, by the help of the tide, for the largest merchant vessels. Its navigable course is 520 miles long, 340 of which belong to Prussia. Steamboats carrying freight sail regularly between Hamburg and Magdeburg; passenger steamboats ascend the river from Dresden through Saxony and Bohemia. The development of the trade of the E. was long checked by oppressive tolls and imposts. The Elbe Navigation Act of 25th June, 1821, greatly relaxed these. Other ameliorations followed, till at length, 1st July, 1871, all existing tolls were abolished.

El'berfeld, a town in the circle of Düsseldorf, Rheinland, Prussia, on the Wupper, a little to the S.W. of Barmen, and 30 miles S.S.W. of Köln by railway. It is one of the principal manufacturing towns in Europe, and has a beautiful town-hall, an academy of design, one Roman Catholic, and four large Protestant churches, &c. Its chief manufactures are European and Asiatic silks, half-silk fabrics, ribbons, cottons, linens, carpets, india-rubber, cloths, paperhangings, patent leather, buttons, chemicals, machinery, pianofortes, and organs. It is celebrated for the tint and permanence of its Turkey-red dye. There are numerous weaving and spinning factories, with steam-engines, mechanical looms, and hand and power looms, employing some 10,000 men and 3000 women, and producing goods to the value of about £2,000,000 yearly. In addition, there are dye-works, large cotton-printing establishments, extensive bleaching-fields, machine factories, other metal works, breweries, brandy distilleries, &c. Many French artists are here employed as pattern-designers. E. is the seat of several large commercial companies. Pop. 125,899.

Elbeuf, or **Elbœuf** ('new town,' from Fr. *bœuf*, 'a dwelling,' from the Norse *by* or *biggen*), a town in the department of Seine-Inférieure, France, on the left bank of the Seine, 75 miles N.W. of Paris by railway. It has been noted since the 16th c. for its manufactures, which are now in a more flourishing state than ever, embracing the production of double-milled cloths, woollens, waterproofs, flannels, billiard-table covers, &c. Its chief buildings are the churches of St. Etienne and St. Jean Baptiste, both of which have beautiful stained-glass windows. E. has an active river trade with Paris, Rouen, and Havre. Pop. of commune, 21,404.

El'bing, a town in W. Prussia, on a navigable river of the same name, 3 miles S. of its entrance into the Haff, and 35 E.S.E. of Danzig by railway. It is modern in appearance, and has ten Protestant churches, a Roman Catholic church, a synagogue, a gymnasium (since 1536), a public library of 28,500 vols., and an institution (*Cowlesche Stiftung*), founded by Cowle, an Englishman, for the upbringing of 400 poor children. Its manufactures are cottons, linens, hosiery, colours, leather, tobacco, beer, chemicals, gold and silver wares, and there are also several large works for the production of machinery and locomotive engines. The exports by water are chiefly wheat, rye, oats, and timber. Kahlberg, a beautiful bathing place, on the Neerung, is the great summer resort of the Elbingers. E. was founded by Hermann Balk, a German knight, together with colonists from Lübeck, in 1237. It was an important member of the Hanse League, and became Prussian in 1772. Pop. 41,576.

El'bow. This is formed by the junction of the lower end of the humerus with the upper ends of the radius and ulna. See ARM.

Elburz', a lofty mountain range, extending along the whole southern shore of the Caspian Sea in the Persian provinces of Ghilan, Mazandarin, and Dahistan. The highest summit is believed to be Demavend (q.v.). Elburz or Elbruz is also the name of the highest summit of the Caucasus (q.v.) range.

El'che (anc. *Illici* or *Elice*, Basque *illia*, 'a town,' 'the town on the hill'), an interesting old town of Spain, in Valencia, 16 miles S.S.W. of Alicante, in a sterile, hilly district, surrounded by a plantation of about 70,000 palm-trees, which lends to the place the appearance of an African oasis, and which is itself surrounded by maize-fields, and by plantations of olive and carob trees. Pop. 22,703, who manufacture leather, and carry on a good trade in dates and blanched palm-leaves for processions. To the west of E. is the town of Crevillente (pop. 8016), with many tanks and subterranean aqueducts of Moorish construction.

Elch'ingen, a village of Germany, Bavaria, on the left bank of the Danube, 8 miles below Ulm, and the seat of a once famous Benedictine abbey. Near this spot on the 13th October, 1805, the Austrians were defeated by the French under Ney, upon whom the title of Duke of E. was afterwards conferred.

El'cho, Lord, the Right Hon. Francis Wemyss-Charteris-Douglas, eldest son of the eighth Earl of Wemyss, was born 4th August, 1818, and was educated at

Eton and Christ Church, Oxford, where he graduated in 1841. In the same year he entered Parliament as representative of East Gloucestershire, attaching himself to the party of Sir Robert Peel. Having become a convert to free-trade principles, he resigned East Gloucestershire in 1846, but in the following year was returned as a 'Liberal Conservative' for Haddingtonshire, where his family have great local influence. He continued to represent the same constituency till 1883, when he was elevated to the House of Lords on the death of his father. He has not at any period of his career taken a foremost place in the great political movements of his time. He has, however, identified himself with, and laboured with praiseworthy devotion in the furtherance of, some of the most urgent social questions of the age. He may be said to have created the volunteer movement in 1859, and has assiduously laboured for the efficiency of this arm of the national service. He succeeded his father as Earl of Wemyss and March in 1883. His son (the present Lord E.), born in 1857, represented Haddingtonshire (1883-85), and Ipswich (1886-95).

El'der, literally one of the older men, who in ancient times were naturally appointed to public offices requiring wisdom and experience, was afterwards a person, of whatever age, who held such an office (Gen. l. 7). It was to the elders of Israel that Moses declared his commission (Exod. xii. 21). Seventy were chosen, along with Aaron, Nadab, and Abihu, to attend Moses on Mount Sinai (Exod. xxiv.); and other seventy were appointed to help him as judges (Num. xi.). When the nation was settled in Canaan, the elders administered the law in the cities (Deut. xix. 12); and the office continued under the judges (Judges ii. 7), the kings (1 Sam. xxx. 26, 1 Chron. xxi. 16), the captivity (Ezra x. 14), and after the restoration (Ezra v. 5, vi. 14). Under the Maccabees, at which time, probably, the Sanhedrim (q.v.) was instituted, they are still mentioned as a separated class (1 Macc. vii. 33). In the time of Christ they are mentioned along with the scribes, chief priests, and council as one of the classes from which the Sanhedrim was chosen; see Luke xxii. 66, in which passage they are spoken of as a body—*presbutĕrion.* An E. in the Christian Church, into which the title and office were adopted, was a kind of overseer, whose duties were to preach (Titus i. 9) and visit the sick (James v. 14). The order even included the apostles (1 Tim. iv. 14, 2 Tim. i. 6, 2 John 1, 3 John 1), although elsewhere the apostles are distinguished from them (Acts xv. 6). (See BISHOP.) Elders are also lay officials in Presbyterian churches who act with the presbyters or ministers in the administration of Church discipline and government, having an equal vote with the latter in all Church courts. They are sometimes called *ruling* elders, as distinguished from the *teaching* elders or pastors, as the name, which is a translation of the Gr. *presbuteros*, belongs more properly to the latter than to the former. In the Church of Scotland, the duties of an E., as specified in the *Buik of the Polecie of the Kirk*, ratified at the Assembly of Glasgow, 1581, are as follow:—(1) To watch diligently upon the flock committed to their care, both publicly and privately, that no corruption of religion or manners enter therein. (2) To be careful in seeking the fruit of the seed (of the Word) sown among the people by the pastors and doctors. (3) To assist the pastors in examination of them that come to the Lord's table, and in visiting the sick. (4) To cause the Acts of the Assembly to be put in execution. (5) To be diligent in admonishing all men of their duty, according to the rule of the gospel. (6) To bring things that cannot be corrected by private admonition before the eldership (kirk-session). (7) Their principal office is to hold assemblies with the pastors and doctors, for establishment of good order and execution of discipline. See *Autobiography and Diary of James Melvill.*

Elder, a genus of Exogenous plants, belonging to the natural order *Caprifoliaceæ*, or 'honeysuckles.' The species of E. are small trees or shrubs, with pinnate leaves, and small flowers, arranged in umbellate and racemose cymes, the corolla being wheel-shaped and five-cleft, whilst the pistil has the ovary partly adherent to the calyx, and possesses three stigmata on the ovary. The fruit is a berry. The common E. is a well-known shrub, the young wood of which contains a large amount of soft or cellular pith. It occurs in Europe, N. Asia, and N. Africa, and is found equally at home under a tropic sun and an arctic cold. The flowers yield a volatile oil, and the berries are used in making 'E.-flower wine.' Both leaves and inner bark have a purgative action. The flowers also yield a distilled water used in perfume-making and also in confectionery, and known as 'E.-flower water.' E.-flower wine is made in England chiefly at Christmas-time, the berries being gathered mostly in Kent, where there are large plantations of E.-trees. The old wood of E. is hard, and used for making parts of fishing-rods and other instruments. The younger wood is easily wrought, and is used in the manufacture of toys. Other species of E. are the scarlet-berried E. of S. Europe and Siberia, the juice of whose berries possesses narcotic properties. The dwarf E. furnishes a purgative from its inner bark, and its flowers are employed in making E.-flower water. The latter is made by adding 2 gallons of water and 3 oz. rectified spirits to 10 lbs. of E.-flowers. About 1 gallon of E.-flower water is distilled from these ingredients.

El'don, Baron, John Scott, an eminent English lawyer, was born 4th July, 1751, at Newcastle-upon-Tyne. His father, William Scott, was a humble man, who at various times was a coal-dealer and a public-house keeper, and made so much money by speculation, that he was able to give his sons, William (afterwards Baron Stowell) and John, a good university education. John was trained at Newcastle and University College, where he gained a fellowship. The most remarkable event in his college career, however, was his elopement with Miss Elizabeth Surtees, a Newcastle lady, and their marriage at Blackshiels in Scotland, 19th November, 1772. 'Bessy,' as Scott always called her, proved to be an excellent wife, and nothing could equal his affection for her. At first, owing to the dislike shown to the marriage by 'Bessy's' relatives, the pair were in straitened circumstances, and Scott abandoned his study for the Church (for which he was originally educated) for the study of law, and was called to the bar in 1776. By his extraordinary perseverance and industry, and aided by help from his own and his wife's relatives, with the latter of whom he had become reconciled, he acquired in 1787 a great practice at the equity bar. He entered Parliament, and his promotion under the auspices of Pitt was very rapid. He filled in succession the posts of Solicitor-General and Attorney-General, and Chief Justice of the Court of Common Pleas. Finally, in 1801, as Baron E., he became Lord Chancellor, an office which he held till 1827 in the Addington, Pitt, and Liverpool administrations. In 1821 E. was made an earl, and did not retire from public life till 1835. His wife died in 1831, and he himself followed her, 3rd January, 1838, leaving a large fortune. E. was a man of sagacious, astute, and vigorous intellect. He was not a wise or deep thinker. He had no living grasp of moral principle, but he knew thoroughly what would work for the time; and therefore, in spite of an absence of any strong convictions, theological or political, he was a determined opponent of parliamentary reform and Catholic emancipation. With the public and in society he was extremely popular through a certain charm of manner; and although he could not write grammatically, his judgments are still greatly valued. See Lord Campbell's *Lives of the Chancellors*, and Twiss's *Life of Lord E.*

El Dora'do (Sp. 'the golden or gilded land,' from the Lat. *aurum*, 'gold'), an imaginary region in America, supposed to lie between the Orinoco and the Amazon, whose riches were believed to eclipse the treasures of Mexico and Peru. Its capital, Manoa, was said to be partly built of gold, and to stand on a great lake with golden sands, called Parima. The whole country was believed to glitter with veins of gold. Humboldt found a belief in E. D. among the tribes of the Upper Orinoco, and describes a Lake Parima whose rocks of sparkling mica-slate may have given rise to the story. Francisco Orellana, one of Pizarro's companions, descended the Amazon to the sea in search of E. D., and spread a belief in it through Spain, where men became seized with a mania to find the fabulous city. Numerous expeditions sought it, one party setting out as late as the year 1770. Walter Raleigh made his ill-starred expedition to Guiana in the hopes of reaching this Utopia, which was as imaginary as the Greek Hesperides. The name is now applied to an auriferous district in N.E. California.

Eleat′ic School, derived its name from Elea, on the W. coast of Lower Italy, where its founder, Xenophanes, of Colophon, settled about 560 B.C. It included Parmenides, Zeno, Melissus, and to some extent, Empedocles. Before them the two great Greek schools had been (1) the Ionian, or physiological, which explained the production of the world from a primitive substance, such as air or water; and (2) the Pythagorean, or mathematical, which asserted that number, with its two elements, odd and even, combining in unity, was the true cause or principle of all particular existences. The Eleatic criticism on this was that 'out of non-being being cannot come,' and that 'non-being cannot exist.' If, then, being existed, it must embrace all existence. The dependence of real things was assumed to be not only rational (in the sense of corresponding to the general notions formed by the human mind), but even verbal, for the Greeks were then unacquainted with foreign languages, and confounded Greek thought with human. The Eleatics, therefore, resorted to the most abstract and elementary concept—God or the All, the one self-existent, eternal, intelligent, immoveable being, not a person distinct from the created world, but underlying and interpenetrating the world and all possible worlds as their true substance and life. The dogma of the system was elaborated by Parmenides. He distinguished between truth, or ideas obtained by the intelligence, and opinions, or ideas obtained by the senses, and therefore modified by organization. The Eleatic is the great type of consistent Pantheism.

Elecampane.

El′ecampane, a genus and species of Composite plants, of an aromatic kind, and which possesses tonic and diuretic properties. It is not common in Britain, but occurs in marshy spots in S. Europe. The root is the valued part of the plant, and seems to depend for its properties on the possession of a starchy principle named *Inuline*. The E. belongs to the *Corymbiferæ* or chamomile section of the *Compositæ*, in which the florets of each flowerhead are similar and usually tubular.

Elec′tion, the Doctrine of, was developed from the apostle Paul's view of the relation to each other of the two great divisions of mankind, the Jews and the Gentiles. In the Epistle to the Romans he seeks to explain a material and historical fact, to wit, the repugnance of the majority of the Jews to the gospel, a repugnance which would deprive them of the advantages anciently promised to them, and in a manner give the lie to God, who had promised them salvation. But this partial hardening of Israel, which, as revealed by the fact, entered into the secret counsels of God, was destined to become the occasion of the conversion of the Gentiles. When these should be brought in, then all Israel would also be saved. Meantime individual Jews were sacrificed to the great designs of God, but what were these in comparison? (Rom. ix. 20-24). Judaism in the time of the apostle proclaimed the E. of the Jews and the reprobation of the Gentiles. To oppose this notion, St. Paul, in his illustration of Jacob and Esau (Rom. ix.), insisted on this, that Jacob was elected without his merit in order to make the Jews feel that their national privileges would not necessarily make them partakers of the true grace of God, far less give them a monopoly of it. And in following out this idea to its last consequences, he had to set forth that reprobation arose, not from demerit, but from the free will of God. Augustine applied this conception purely to individuals, and made the decree of God unconditional, or entirely independent of the human will. His theory differed from all previous views in respect of the imputation of Original Sin (q.v.), concerning which he held that the will of the natural man is only *free* to do evil, his opponent Pelagius holding that man, though needing the aid of the grace of God, has the power of choosing between good and evil. In the Scholastic period the Pelagian controversy was revived between the Thomists (q.v.) and the Scotists (q.v.). After the Reformation, Roman Catholics, Arminians, and especially Socinians, endeavoured to reconcile the divine decrees with human liberty. Calvinists and Lutherans denied all co-operation on the part of man, although the latter restrict predestination to the elect, and the former in general assert the freedom of the will. See Hodge's *Systematic Theology*.

Election, in law. In England, one is said to have an E. when he has two or more alternatives, but having made his choice, he is bound by it, and may not act inconsistently. For Scotch law see APPROBATE and REPROBATE.

Election Laws, Parliamentary.—Procedure at an E. is regulated by several statutes, viz., the Reform Act of 1832, the Representation of the People Act of 1867, the Ballot Act of 1872, the Representation of the People of the United Kingdom Act of 1884, and the Redistribution of Seats Act of 1885. The most important of these is the Ballot Act, by which secret voting was for the first time introduced into municipal and parliamentary elections in the United Kingdom. The Act makes provisions for the time and place of elections, for the nomination of candidates, for the form and official marking of the ballot paper, for the sealing of the ballot boxes at the close of the E., and for opening and counting the votes, in presence, if desired, of the agents of the candidates. This Act also defines *treating* to be the candidate or his agent paying or being accessory to paying for any meat, drink, or entertainment to any one, to influence his vote. *Undue influence* is defined to be threats of any force, violence, or restraint, or any abduction or fraudulent device by which the exercise of the electoral franchise is impeded or prevented. These offences are punishable by fine or imprisonment, and votes so influenced are void. By the Acts of 1884 and 1885 further restrictions were passed against bribery; the expenses of candidates were defined and greatly reduced. See BRIBERY.

Election of Scottish Peers.—The sixteen representative peers must be elected from the Scottish peerage. No British peer created since the Union has a title to vote or to be elected; and in the case of the Duke of Queensberry, which occurred immediately after the Union, it was resolved in the House of Lords that a Scotch nobleman created a British peer subsequent to the Union was not entitled to vote in the election of representative peers; and in the case of the Duke of Hamilton, in 1711, it was determined that a Scottish nobleman created a British peer after the Union was not entitled to sit in the British House of Lords. (See statute 6 Anne c. 23.) These resolutions were, however, subsequently reversed. (See statutes 10 and 11 Vict. c. 52, 14 and 15 Vict. c. 87, and 15 and 16 Vict. c. 35.) When a new Parliament is summoned, the peers of Scotland are called by proclamation to meet and elect their representatives, who, of course, do not retain their seats beyond the life of that particular Parliament. The E. takes place at the palace of Holyrood. The court of review in all questions connected with the representation of the peerage of Scotland is the House of Lords.

Elections, Parish.—At the E. of guardians and all other elections, the votes are to be taken in *writing*, and the rights of voting in owners and ratepayers are assimilated by 7 and 8 Vict. c. 101. Besides this statute there are others, as well as the Election of Guardians Consolidated Order of 1877, which deal with the same matter. A plurality of votes is allowed;

thus, if rated at less than £50, one vote; between £50 and £100, two votes; between £100 and £150, three votes; between £150 and £200, four votes; between £200 and £250, five votes; and if it amount to or exceed £250, six votes. When a person is owner and occupier, he may vote in both capacities.

Elec'tors (Ger. *kurfürsten*, from *kur* (obsolete), 'an elector,' and *fürst*, 'a prince') were at first in Germany seven great feudatories—the King of Bohemia, the Duke of Saxony, the Markgraf of Brandenburg, the Count-Palatine of the Rhine, and the Archbishops of Trier, Mainz and Köln—who were intrusted to choose the mediæval Roman emperors. The office of Cæsar was in theory open to every baptized man above the rank of a serf, but became bound up with the German kingdom, which was thus likewise rendered elective, after the accession of Konrad I., in 911. The place of election was Frankfurt-on-the-Main, and vote could be given by deputy. The E. were entitled to hold the chief offices under the emperor, to possess the royal dignities except the title of majesty, to retain several electorates at once, to obtain new allodial estates and imperial fiefs without special permission, and to form a distinct college in the diets. Their choice was commonly the heir or a relative of the late emperor, and was generally bought by large concessions, especially if they made an emperor's son King of the Romans in his father's lifetime. In 1648 an eighth elector was added; in 1692 the Duke of Braunschweig-Lüneburg received the dignity; and in 1803 the electorates of Würtemburg, Baden, Hesse-Cassel, and Salzburg were added, and those of Mainz and Trier set aside. The office was abolished in 1806, but the title elector was held by the Elector of Hesse-Cassel till 1866.

Electors, Qualifications of. Parliamentary Electors may be divided into (1) County Electors; (2) Borough Electors, and (3) Electors for the Universities.

(1) A person may claim to be entitled to the county franchise either as owner or occupier—as *owner* of freehold, copyhold, or leasehold; or, as *occupier* of lands and tenements, payer of rates and (sometimes) resident. Such a *freeholder* must be one of inheritance of an estate of the value of 40s. per annum; or must be a freeholder not of inheritance but for life or lives, where the clear annual value above all charges is not less than £5, or if he be an actual and *bonâ fide* occupier of the same, or if he be a possessor of the same through devise, promotion, or marriage settlement. Such a *copyholder* must be a possessor of lands, for one life or any larger estate, where the clear annual value above all charges is not less than £5, and of which he has been in actual possession, or of which he has received the rents and profits during six calendar months next previous to the 15th July in the year in which he claims, unless he has become owner within that period through devise, promotion, or marriage settlement. Neither freeholder nor copyholder can vote for the county where his estate entitles him to vote for a borough. Such a *leaseholder* must be a lessee, or an assignee, or a sub-lessee of any lands of any tenure, originally of a term of not less than 60 years, where the clear annual value above all charges is not less than £5—or a lessee, assignee, or sub-lessee of any lands of any tenure, originally of a term of not less than 20 years, where the clear annual value above all charges is not less than £50. Actual possession of premises or receipt of rent and profits for his own use for twelve calendar months next previous to the 15th July in the year in which he claims. Such an *occupier* must be on the 15th July in any year, and must have been during twelve months next previous to the same 15th July, an occupier as owner or tenant of some land or tenement within the county where the clear annual value is not less than £10, and must have been rated and have paid his poor rate during that period or someone else must have paid it for him.

The owner or tenant of some dwelling house may be entitled to the county franchise as an *inhabitant occupier*, provided he has not been absent from, or has not let to another person, the house for which he claims, and has been rated and has paid his poor rate on or before 20th July, which has been due in respect of his premises up to the preceding 5th January. Joint occupiers may claim under the £10 qualification. A *lodger* may also be entitled to the county franchise when he has occupied, separately as a lodger, lodgings within the county for the whole of the twelve months next previous to the 15th July in the year in which he claims, and provided he has not been absent more than four months during that period and then only on duty in connection with any office or employment taken by him, and provided the clear annual value of the lodgings, if let unfurnished, is of £10 or upwards.

(2) A person may claim to be entitled to the borough franchise either as a £10 occupier; or as a householder; or as a lodger; or as a freehold tenant of a city or town which is a county in itself, or as a freeman and liveryman of the City of London, or a freeman or burgess in a city or borough other than the City of London. Such a £10 *occupier* must have occupied, as *owner* or *tenant*, land or tenement within the borough where the clear annual value is not less than £10, and where he has resided, or within seven miles of it, during six months next previous to the 5th July in the year in which he claims (four months' absence allowed on duty) and provided he has been rated and paid his poor rate for the twelve months next previous to the 5th July in the year in which he claims, and assessed taxes, due before the 5th January, on or before the 20th July. Such a *householder* must be on the 15th July in the year in which he claims, and must have been during the twelve months (four months' absence on business allowed) next previous to that 15th July, an *inhabitant occupier*, as *owner* or *tenant* of some dwelling house or part of such separately occupied within the borough, provided he has been rated and paid his poor rate (for twelve months next previous to the 5th January) on or before the 20th July. Household franchise in counties and boroughs are now the same under the Act of 1884. Such a *lodger* must have occupied separately as a lodger, during the twelve months next previous to 15th July in the year in which he claims, *lodgings*, part of a dwelling house within the borough, where the clear annual value, if let unfurnished, is of £10 or upwards. He is allowed four months' absence on business. The county and borough lodger franchise are now the same under the Act of 1884.

(3) A person may claim to be entitled to the University franchise—at *Oxford*, as a *member of Convocation, i.e.*, Chancellor, Vice-Chancellor, Doctor of Divinity, Civil Law, Medicine, or Master of Arts, having his name on the books of a College or Hall—at *Cambridge*, as a *member of the Senate, i.e.*, Chancellor, Vice-Chancellor, Doctor of Divinity, Science, Law, Medicine, Letters, Bachelor of Divinity, Master of Arts, Law, Surgery, having his name on the Register—at *London*, as a *member of Convocation, i.e.*, being a person on the register of graduates, of full age, and not legally incapable—at *Dublin*, as a Fellow, Scholar, or Full-Graduate *on the books*.

Electric Bell consists of a hammer, which, being moved backward and forward by an electro-magnet that alternately attracts it and releases it, strikes a bell. A current is provided by a battery of one or two Leclanché cells placed on the circuit. There is a *push* piece which on being pressed completes the circuit. Then the current flows along and round the electro-magnet, which thereupon attracts the soft iron placed upon the lever, at the other end of which is the hammer. The current passes through the lever and leaves it where a spring tipped with platinum has rested against the platinum end of a screw; a wire connects this screw with the zinc pole of the battery. When the lever is attracted the circuit is broken, because the spring ceases to be in contact with the screw, and the current no longer flowing, the electro-magnet no longer attracts the armature, whereupon the lever and hammer resume their former positions, contact is re-established, and the hammer is again attracted.

Elec'tric Clock is a timepiece whose direct motive power is electricity. The name is, however, frequently applied to an ordinary clock which is regulated by electric currents transmitted at intervals from a standard clock. As examples of purely electric clocks we may mention those of Alexander Bain (of Edinburgh) and C. Shepherd (of London). About

1843, Bain, availing himself of Œrsted's discovery of the action upon a magnet of a continuous electric current, invented an electro-magnetic pendulum, and employed it to drive a clock-train. The bob of this pendulum consists of a hollow coil of insulated wire, whose terminals are connected with two insulated springs fixed at the point of suspension of the pendulum. The N. poles of the two permanent bar-magnets project, one at each side, into the horizontal bore of the coil, and over them the pendulum oscillates freely. When the coil is traversed by a current, it becomes magnetised, and is repelled by the one bar-magnet and attracted by the other, the pendulum thus marking one half oscillation. By this motion the current is broken by a sliding bar moved by the pendulum, and the bob returns through the action of gravity. Its momentum carries it and the slider sufficiently far so as to complete the circuit and remagnetise the coil, and thus the oscillation is maintained and the clock-train driven in the usual manner. In Shepherd's E. C. an ordinary pendulum is maintained in vibration by the constant impact of a small weight. An armature of soft iron, movable on a pivot, is raised at every right-hand oscillation of the pendulum by an electro-magnet, and the armature transmits its motion by levers to the weighted arm, which on the breaking of the circuit is retained by a detent. The left-hand oscillation of the pendulum releases the weight, and in falling it gives a steady impulse to the pendulum. The wheelwork and hands are propelled by distinct electric currents, whose circuits are completed by the pendulum touching contact springs. Powerful batteries are required for Shepherd's E. C., and these call for much attention. As a timekeeper it surpasses Bain's, but experience has proved that in all clocks propelled directly by electricity, without the intervention of a regulating clock, there abides an element of uncertainty of action that is unsatisfactory, and that has influenced their rare adoption. Much greater success has attended the application of electricity to regulate ordinary clocks, and to keep them in perfect accord with a standard clock. This is accomplished by the transmission at regular intervals of an electric current from the standard clock to the pendulum of the subsidiary clock, which is thereby retarded or accelerated as the case may be, and made to beat second for second with the standard clock. Any number of secondary clocks may thus be controlled by a standard clock. The controlling system of Jones (of Chester), in which a modification of Bain's pendulum is employed, has been in successful operation in many towns of the United Kingdom since 1857. It is on this principle that the great national regulating system is worked. The standard clock at Greenwich, which itself is regulated by astronomical observation, is connected with one or more clocks in all the larger and more important towns throughout the country, and by a very perfect combination of batteries, relays, and electro-magnets retards and accelerates these as the case may be, and fires time-guns at certain hours.

Electric Fishes. See Electricity, Animal.

Electric Light. The energy lost by a current in overcoming the resistance of the circuit is transformed into heat. By proper adjustment the heat so generated at one part of the circuit may be made so great as to cause the material there to glow. All forms of E. L. depend on this principle. In Swan's, Edison's, Lane-Fox's, Crooke's, and Maxim's so-called *incandescent* lights, the current traverses a very thin filament of carbon, which is enclosed in a hermetically sealed vacuum globe, so as to prevent rapid dissipation. In all forms of the *arc-light*, again, it is the air that acts as the highly resisting part. The circuit is completed by bringing into contact and then separating two carbon points, when an intense light at once springs into existence, provided the current is strong enough. The expense involved in keeping a sufficient number of galvanic cells in good order long hindered the practical application of electric lighting; but with the improvement in magneto-electric machines, such as the Gramme, the Siemens, the Brush, &c., a new era began, and already the E. L. has been most successfully applied to the lighting of streets, railway stations, lighthouses, theatres, large halls, steamers, railway trains, private houses, &c. These machines must be driven by a steam or gas engine, so as to attain a rapidity of motion sufficient to give a strong current. To describe all the forms of E. L. now in use would be impossible here. Some, however, merit mention. Thus in Jablochkoff's electric candle the carbons are set in side by side, being separated by a thin non-conducting strip. As the anode always wears away faster than the kathode, this form of light requires an alternating current, so that both carbons burn down at the same rate. The Brush Light, the Siemens, the Serrin, the Jamin, and others, are all of one type, in which the carbons are adjusted in the same vertical line, and are kept in position by a special mechanical device. By an Act of 1888 powers were given for the electric lighting of the metropolis and large towns in the provinces. At present the Houses of Parliament, the reading-room of the British Museum, most of the theatres, many of the large business houses, public institutions, railway termini, residences, and a few of the main thoroughfares in some towns both in this and other countries, are lighted by electricity. In the Faure Accumulator and other improved forms of Plante's secondary or storage battery, an important step towards the problem of storing electricity for future use has been taken. At the present time (1895) there are 105 E. L. works in operation in the United Kingdom, which represent at least 88,000 horse power.

Electric Railway. See Railways.

Electric Telegraph. See Telegraph.

Electric Telephone. In 1861 Reiss succeeded in transmitting sounds electrically and through an imperfect telephone conveyed musical tones, &c. In this telephone a thin strip of elastic platinum was attached to a tympanum, which acted as a contact-breaker, and was so framed as to take up sound-vibrations. The strip of platinum at each vibration made or broke contact, partly or entirely, as it beat against the tip of a wire of platinum—the current proceeding from a battery connected with the tympanum. The receiver was an iron wire secured to a sounding board and encircled by coiled insulated wire, part of the circuit. Now, because the pitch of a note depends on the quick repetition of vibrations, the pitch of a musical note despatched from the transmitter was reproduced by the iron core as it was magnetised and demagnetised rapidly. Also when the vibrations were caused only by speech, a good transmitter effected a reproduction of the speech at the farther end, yet rather imperfectly, when the contacts of the parts were light and the speech was loud. Later, Reiss invented another receiver consisting of an electro-magnet and an iron armature which became attracted by the former and thus vibrated under the continually interrupted current. In 1876, the magneto-telephone was invented by Graham Bell. By this instrument the vibrations of a thin plate of iron, caused by a person speaking to it, are transmitted by electric current and identically to a similar instrument at the farther end, which sends forth sounds identical to those produced by the speaker. No battery is required, as the transmitter is so formed that it generates the induced currents. In Edison's telephone the vibrations of a voice, actuating a diaphragm of mica, cause it to compress a button of prepared lamp-black placed in the circuit. The varying pressures make the button offer a varying resistance to the current flowing from a battery also in the circuit. In this way the strength of the current is varied which is received in an electro-magnetic receiver and there produces corresponding vibrations. Edison discovered that the friction becomes lessened on the passage of a current between them, if a platinum point be allowed to press against a rotating cylinder of moist chalk; and also that an elastic disk is thrown into vibrations which correspond to the fluctuating currents, flowing from the speaker's transmitting instrument, if the platinum point be attached to the disk. By application of these facts, Edison has invented a telephone receiver of peculiar power. Varley and Dolbear have succeeded in inventing telephone receivers, where the production of sounds is promoted by the attraction between the oppositely-electrified armatures of a condenser.

Electri′city. Among the ancients, the properties possessed by certain bodies, when rubbed, of attracting small pieces of light material was generally known. The phenomenon obtained its name from the substance by which it was first observed, *elektron*, or amber; but it is now recognised that every kind of matter is similarly affected, that friction is always attended with the production of E., but that, in many instances, the peculiar molecular condition which constitutes the electrified state is so speedily lost that all trace of electrification is gone before there is time to make the necessary search. Viewed as an exact science, E. is appropriately termed *electrodynamics*, which naturally divides into *electrostatics* and *electrokinetics*. The former treats of E. in equilibrium, and discusses all phenomena which are usually included under the name *frictional E.*; and the latter treats of E. in motion, and is synonymous with the term *galvanism*.

Electrostatics.—The first thing to be considered is *electrification*, and this may be effected in several ways, as shown by the following experiments (see Thomson's *Electrostatics and Magnetism*, and Maxwell's *Electricity and Magnetism*):—*Experiment I.*—Take a piece of glass and a piece of resin, neither of which exhibits any electrical phenomena; rub them together and then separate them. They will be found to attract each other. Take another pair, treat them similarly, and suspend them so as to have as free motion as possible in azimuth. It may then be observed—

1. That the two pieces of glass repel each other.
2. That each piece of glass attracts each piece of resin.
3. That the two pieces of resin repel each other.

Bodies which exhibit these phenomena are said to be *electrified*; and those which, like the glass, repel the glass and attract the resin are vitreously or *positively* electrified, while those which attract the glass and repel the resin are resinously or *negatively* electrified. The indication of these two kinds of E. by opposite signs is very appropriate, but the application of the positive sign to one rather than to the other is purely arbitrary. Electrified bodies always act upon each other in accordance with the law indicated above, that like kinds repel each other, unlike kinds attract. If a small light pith ball be suspended by means of a silk thread, it may be electrified by contact with either the glass or the resin, and may then be employed as an electroscope, or instrument for showing the kind of E. with which a given body is charged. *Experiment II.*—Suspend by a silk thread from the lid of an unelectrified metallic vessel, also suspended by means of silk threads, an electrified piece of glass, so as to hang freely in the inside of the vessel without touching it; then it may be shown that the outside of the metallic vessel is vitreously electrified, and that the electrification at any point is quite independent of the position of the glass in the interior, and disappears if the glass be removed without touching. The outside vessel in this case is electrified by *induction*. No force, either of attraction or repulsion, can exist between an electrified body and a body not electrified; and hence when bodies not previously electrified are acted upon by an electrified body, it is because they have become electrified by induction. If the glass had been suspended outside the vessel instead of inside, inductive effects would have been apparent; but in this case the outside surface nearer the glass would have been resinously electrified, and the further portion of the surface vitreously electrified; whereas in the original case the whole exterior was charged with vitreous, and the whole interior with resinous, E. *Experiment III.*—Let things be as in Experiment II., but further let a second metallic body be suspended by silk threads near the first. Bring now a metal wire similarly suspended, so as to touch simultaneously the exterior surfaces of the two bodies. The first will then be found to have lost some of its electrification, while the second has become positively electrified—electrified by *conduction*. If a silk thread or a rod of glass or resin had been used instead of the metal wire, no transfer of E. would have occurred. Hence we have two groups into which matter may be divided, *conductors* and *non-conductors* or *insulators*—or, more correctly, good conductors and bad conductors, for all substances resist the passage of E., and all conduct E., though in very different degrees. The metals are good conductors; air, gases generally, resins, glass, rubber, paraffin, silk, &c., are good insulators. If in the above experiment the wire connecting the metallic bodies be removed, and the glass taken out of the vessel without touching it, this vessel will be found to be negatively, while the second body is positively, electrified. If the connection between the bodies be renewed, all electrification will disappear, thus showing that the electrifications are equal and opposite. *Experiment IV.*—Let there be two insulated hollow metallic vessels, A and B, the first as in Experiment II., and the second having the resin, from friction with which the glass was electrified, freely suspended in its interior. The exterior surfaces of A and B will be respectively vitreously and resinously electrified. Connect A and B by means of a metal wire, and all electrification will disappear, thus showing that the charges are equal and opposite. Remove the wire, and take the glass and resin out of their respective vessels; then A will be found to be resinously, and B vitreously, electrified. These charges also are equal and opposite, as may be shown either by reconnecting the bodies with the wire, when all electrification will disappear, or by introducing them both without touching into a large hollow conducting vessel, when no electrification will be apparent in its exterior surface. We may thus charge a vessel with a quantity of E. exactly equal and opposite to that of a given electrified body without diminishing the charge on the latter. *Experiment V.*—Charge the vessel B, as above, with a certain quantity of positive E., which we may call for convenience a unit, and introduce it into the interior of a larger insulated conducting vessel, C. If B be made to touch the inside of C, it will be found upon removal to be completely discharged, while C will be charged, with a unit of positive E. Recharge B, and repeat the same operation (C being still charged), and the charge on C will be doubled. By repetition of this process, C may be charged with any number of units below a certain limit. From this experiment we observe further that electrification exists only at the surface of the conductor; that an uncharged body introduced into the interior of a conductor remains uncharged, and therefore cannot be attracted or repelled by the electrical forces, and that therefore these electrical forces must be in equilibrium at every point in the interior of a conductor.

Since forces of repulsion or attraction exist between electrified bodies according as they are similarly or oppositely charged, the question naturally arises, upon what does the intensity of the force depend? To solve this problem Coulomb invented his Torsion Balance (q.v.), by means of which, from numerous experiments, he established that the force between two electrified bodies was directly proportional to the charges, and inversely proportional to the square of the distance separating them.

When an uncharged conductor is brought near a positively-charged conductor, a negative charge is induced on the nearer surface of the former. As they are brought closer and closer, the inductive action becomes stronger and stronger, and the electric densities of the charges greater and greater, till at last the resultant forces may become so intense as to overcome the insulating power of the air, and give rise to a disruptive discharge through the air between the surfaces. This discharge usually takes the form of a spark, by which almost the whole electrification is discharged at once; but in certain circumstances other forms, such as the electric glow and the electric brush, are produced. The electric glow takes place in the air surrounding a sharp point of an electrified conductor, when by the inductive reaction of another conductor the electric density is increased till it overcome the insulating power of the air. The air in the immediate vicinity of the point becomes really a conductor; but at a certain distance insulation predominates, and here the glow terminates. If the particles of air were stationary, the charge would be retained; but the particles being free to move, are electrified and driven off, and are then replaced by new unelectrified particles. These are, in their turn, electrified and repulsed, chiefly along the line of intensest force, which extends in a direction straight out from the point, and is made evident by the appreciable current of air which exists. This glow may be seen sometimes during a thunderstorm round the extremities of lightning-conductors, whose virtue lies in their pointed character; for the induced E. is so condensed that it draws, as it were, the E. from the clouds by a gradual process, and not by a series of sudden discharges, as would otherwise be the case. The electric brush is produced round a blunt point or small ball, and consists of a succession of discharges, ramifying into the air, and producing a sound whose pitch depends upon the rapidity with which the discharges take place. No current of air, however, accompanies this discharge. When a series of successive discharges has taken place through the air, a peculiar odour may be made sensible. This odour is now known to be due to the formation of ozone, an interesting and in many ways peculiar allotropic form of oxygen.

When two oppositely-charged conductors are separated, an attractive force has to be overcome, and work, therefore, must be done. Accordingly every charged conductor possesses Energy (q.v.) or power of doing work, in virtue of its electrification; and this energy is proportional to the charge multiplied by another quantity which is called the *potential*. Now the energy evidently falls off as the distance from the conductor is increased, and therefore the potential also must diminish, becoming zero at infinity. The potential of a charged conductor at a given point may be defined as the work which must be done to remove unit of negative E. from that point to an infinite distance, supposing the distribution not to be influenced during the operation. Accordingly the work done in removing this unit from one given point to another may be represented by the difference of the potentials at these points. The ratio of the charge on any conductor to its potential is termed the *capacity* of the conductor. This quantity, potential, in electrical science, has exactly the same relation to E. which temperature has to heat, which pressure has to fluid, and is as important in electro-dynamics as these are in their respective sciences of thermo-dynamics and hydro-dynamics. Fluid, heat, and E. all tend to pass from one place to another, if the pressure, temperature, and potential respectively be greater in the first place than in the second; and no such transfer occurs unless such difference exist. The charge on a conductor is numerically equal to the capacity multiplied by the potential; the potential is the charge divided by a distance; and the capacity, therefore, must be of the same dimensions as distance, *i.e.*, linear. Further, the potential at any point due to a system of conductors is the sum of the potentials due to each conductor. When an accumulator, a Leyden jar for instance, has been electrified for some time and then discharged, it is found, for certain dielectrics, to become recharged, and may again be discharged. This recharge, which is always much less than the actual charge, is called the *residual charge*, and upon Faraday's widely-accepted theory of action through a medium is to be referred to the polarization of the dielectric, which constitutes induction, and which is the 'essential function both in the first development and consequent phenomena of electricity.'

Electrokinetics.—The friction of two different substances is always attended with the production of E.; but in certain instances, probably in all, simple contact and separation are sufficient to give rise to a difference of potential. For example, if a disk of copper and a disk of zinc be placed in contact and then separated, the zinc is found to be positively electrified, and the copper negatively. While they are in contact, an electro-motive force, due in some hidden way to the chemical affinity of the substances, seems to act from one to the other so as to produce a difference of potential. This same difference of potential is produced if the contact be made not directly but by means of any metallic connection, provided the system be at a uniform temperature. Thus if a disk of iron be introduced between the zinc and the copper the difference of potential between the terminal pieces will be exactly the same as if simple contact were made without the presence of the iron; and further, this difference is equal to the sum of the difference of potential between the zinc and iron and the iron and copper. Accordingly a circuit formed of a number of different metals at the same temperature will be in electrical equilibrium as soon as each has acquired its proper potential. From such an arrangement a current cannot be obtained. If the junctions, however, be at different temperatures, the contact forces will not generally balance, and, as first discovered by Seebeck, there will result a current whose energy finds its equivalent in the thermal energy expended in rendering the temperature of the circuit unequable. (See THERMO-ELECTRICITY.) If the disks of copper and zinc, after having been placed in contact and separated, are immersed in a compound liquid, they are at once reduced to the same potential. This loss of electrical energy has its equivalent in the work done in decomposing a certain quantity of the liquid. Bring the metals into contact again, and the same set of operations may be repeated. This successive differentiation and equalising of potentials may be made to take place simultaneously by connecting the immersed disks by a metal wire. Let Z be the zinc and C the copper, connected above by a wire, and immersed below in a compound liquid. In virtue of the metallic contact, Z becomes positively and C negatively electrified. In the liquid, however, they are reduced to the same potential, and therefore there must be a passage of E. through the liquid in the direction of the arrow from the place of higher to the place of lower potential, accompanied by a simultaneous flow of E. through the wire from C to Z, in order to restore the difference of potential at the point of contact. This is the fundamental principle of the Voltaic Battery, under which heading a description of the various kinds now in use, and a consideration of the electrolytic processes (see ELECTROLYSIS) which attend their action, will be found. Since the current must set, upon this theory, from the copper to the zinc through the circuit, the copper is termed the anode and the zinc the kathode.

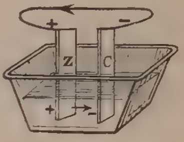


Fig. 1.

If a conductor be connected with the poles of a battery, a current is set up, whose strength is measured by the number of units of E. which pass through every section in the direction between the electrodes in unit time. This current is due to the difference of potentials of the poles, or the electro-motive force of the battery. Now every conductor offers resistance to the passage of a current; and according to the law given by G. S. Ohm in 1827, and known as *Ohm's Law*, this resistance (R) is connected with the electro-motive force (E) and the intensity of the current (I) by the formula $E=RI$, or, the electro-motive force, acting between the extremities of any part of a circuit is the product of the intensity of the current and the resistance of that part of the circuit. The most delicate experiments, of which modern science is capable, fully bear out this law, which offers a method for comparing the resistances of different conductors by observing the different intensities produced for the same electro-motive force. If a number of wires of the same substance, but of different lengths and cross-sections, be taken and compared as to their resistances, it is found that the resistance is directly proportional to the length, and inversely proportional to the cross-section, a relation which has a close analogy in the flow of water through tubes. The current in overcoming this resistance must, in accordance with the conservation of energy, do internal work, and the equivalence of this internal work we find in the heat generated throughout the circuit. Joule, Lenz and Jacobi, and Riess, working independently, established by experiment that the heat developed is proportional to the square of the current; and Joule further, by careful measurement of all the quantities involved, verified the equation, which may be obtained from theoretical considerations, $JH=I^2Rt$, where J is Joule's equivalent, H the heat developed, I the intensity, R the resistance, and t the time during which the current flows.

In making measurements of resistance, it is necessary to have a definite and convenient *unit*. The unit now almost universally employed is that fixed by the British Association in 1863, sometimes called the B. A. Unit, but more commonly an *Ohm*. This unit is professedly a resistance which, expressed as a velocity, is ten millions of mètres per second; but in reality it is the resistance of a wire formed of an alloy of silver and platinum of a definite length and cross-section, and at a certain temperature. From a comparison with this, permanent coils of any number of units of resistance may be formed, and these may then be employed for the determination of any unknown resistance. The determination of resistances can be made by either of two ways, in which the result is independent of the variations of the electro-motive force and internal resistance of the battery. The one method is by means of the differential galvanometer, an instrument which will be described when we come to treat of electro-magnetism; but the most convenient method, for which an ordinary mirror galvanometer is all that is necessary, is by means of an arrangement of conductors known as Wheatstone's Bridge, after the name of the contriver. It consists essentially of six conductors connecting four points.

The resistances of metallic conductors vary considerably, and it is interesting to observe that if the metals be arranged in the order of their electric conductivities, the table agrees exactly with a table drawn up in a similar manner for heat conductivities. Beginning with the best conductor, the following list, according to Regnault, indicates the relative positions of the commoner metals—silver, copper, gold, cadmium, zinc, tin, palladium, iron, lead, platinum, mercury. The resistance is also considerably affected by temperature. In the case of copper, palladium, and platinum, and probably all pure metals except the magnetic ones, the resistance would appear to vary directly as the absolute temperature. From experiments made by Tait and his students it would appear that the rate of increase of resistance of iron with temperature undergoes a peculiar and sudden change at about a dull red-heat—the same temperature at which iron loses its magnetic properties, and at which also the *reglow* during cooling occurs, first observed and described by Barrett. Nickel presents the same peculiarities, but at a much lower temperature. The electric resistance of insulators being so great, is only determinable approximately, and a rise of temperature seems to diminish the resistance. In experimenting, care must be taken that the effects of surface conduction, which is often much greater than true conduction, are thoroughly eliminated. In investigating the resistance of liquids, great difficulty is experienced in overcoming electrolytic action.

In 1820, while lecturing to a few advanced students at Copenhagen, H. C. Œrsted observed that a wire connecting the poles of a voltaic cell affected a magnet in its vicinity. Subsequent experiments showed that the magnet always tends to set itself perpendicular to the direction of the current. To get the direction in which the magnet will turn under the action of the rectilinear current + — (Fig. 2), suppose a person to place himself facing the magnet in the line of direction of current so that the current passes from his feet to his head. The magnet will turn so that the pole which points north will move to the left. A current in the same direction below will turn the magnet round the opposite way; and a current in the opposite direction the same way. Accordingly, if we bring the circuit right round the magnet, as shown in Fig. 3, the effect will be increased. The tangent of the angle through which the magnet turns is directly proportional to the strength of the current; a simple relation which at once suggests an easy method for the measurement of current intensities. By coiling the wire which forms the circuit round several times in succession, each distinct coil being carefully insulated by india-rubber or silk coating from its fellow, the action is rendered more intense. Instruments constructed on this principle are called *galvanometers*. The tangent galvanometer is simply a magnet suspended freely in the centre of a multiple coil over a graduated circle, the numbers on which give at once the tangents of the corresponding angles. The mirror galvanometer is essentially the same instrument, but the magnet is very small, and is fixed to the back of a circular mirror of small mass, which is suspended by a silk fibre in the heart of a compact multiple coil. A beam of light thrown through a small aperture upon the mirror is reflected upon a screen, thus indicating by its position the deflections of the mirror and magnet due to the electric currents through the coil. The distance of the light spot on the screen from the centre or point directly in front of the instrument is really the tangent of *twice* the angle of rotation, for the beam of light is necessarily turned through double the angle which the mirror describes. The differential galvanometer has two independent coils, such that when currents are made to flow in opposite directions they act in opposite directions on the needle, the resultant effect on which may be thus reduced to zero when the currents bear a certain ratio to each other depending upon the resistances in the two circuits. By this means, as mentioned above, resistances of conductors may be compared.

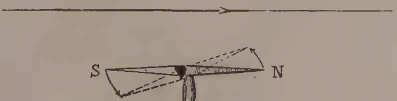

Fig. 2.

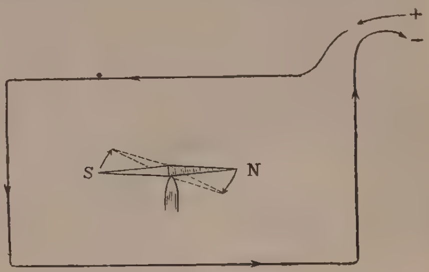

Fig. 3.

Closely connected with the action of a current upon a magnet are the striking discoveries of Ampère regarding the mutual actions of currents. Let there be a given rectilinear current flowing in a given direction, and let a second current be brought near. If the second current be moving in the same direction as the first, it is attracted; if in the opposite direction, it is repelled. If it flows at right angles to the first and away from it, it is urged in the direction of the first current; and if it flows towards the first current, it is urged in the opposite direction. From his investigations on closed circuits, Ampère established four experimental facts, with the aid of which and one assumption he developed his theory of the mutual action of currents. These data are—(1) The reversal of either current reverses the mutual effect. (2) A sinuous current has the same effect as a straight or continuously curved one from which it nowhere deviates much. (3) A conductor traversed by a current, and moveable only in the direction of its length, is not set in motion by a contiguous closed circuit. (4) Equal currents in similar circuits produce equal forces. The one assumption which Ampère made was that the force between two small elements was in the straight line joining their middle points. This assumption cannot be tested experimentally, for it is not possible to form a small current element without at the same time forming a whole circuit. The attractive and repulsive phenomena of currents are very beautifully shown by means of Ampère's *solenoids* of conducting wire, which act in a manner precisely similar to magnets. A solenoid is virtually a helix, but so arranged

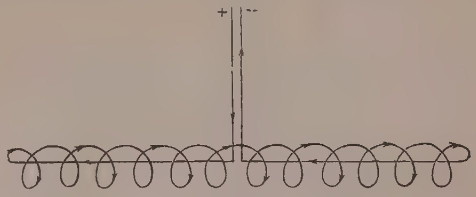

Fig. 4.

that the current passed through it has no resolved effect *along* the axis of the helix. One simple manner of effecting this is shown in Fig. 4, where the current along the rectilinear portions completely neutralises the axially-resolved portion of the current in the helix. Such a system tends, when suspended so as to have freedom of rotatory motion in a horizontal plane, to set itself in the magnetic meridian; and two solenoids show polar attractions and repulsions exactly similar to magnetic phenomena. If a person set himself so as to look directly at one end of a solenoid, the current will appear to be flowing round, say in the positive direction (*i.e.*, opposite to the hands of a watch); if he then similarly regard the other end, the direction of the current will be negative. The former end it is which corresponds to the north pole of a magnet, while the other end acts as a south pole. For convenience we shall call these ends the north and south poles respectively of the solenoid. Let two solenoids (A, B, in Fig. 5) be placed so that the north pole of A faces the south pole of B. That is, when A is looked at from B, the direction of the current through A is positive; and when B is looked at from A, the direction of the current through B is negative. A mere inspection of the figure shows that at every point on the terminal circuit of A, the current flows in the same direction as for the corresponding point of B; and consequently, in accordance with the fundamental law of the mutual action of currents, the solenoids *attract* each other. If two north poles or two south poles had been similarly placed, the solenoids would have been repelled. The special application of these results to the production of *electro-magnets*, and Ampère's ingenious theory of magnetism suggested by these phenomena, are discussed under the article MAGNETISM.

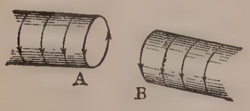

Fig. 5.

Œrsted's discovery of the motive influence of a current upon a magnet, when taken in connection with the principle of the conservation of energy, has been shown by both Thomson and Helmholtz to lead to Faraday's striking discovery of the *induction* of electric currents in a conductor moving relatively to a magnet. (See MAGNETISM.) The mathematical analysis indicates the existence of a new electromotive force, that of the induced current, which always acts opposite to that which has set the magnet in motion, and which, being quite independent of the intensity of the original current, must be produced by the relative motion, even if no such current existed. To the same class of phenomena belongs Arago's discovery of the *damping* effect of a copper plate upon a magnet oscillating over it, in virtue of which the magnet is brought to rest much more rapidly than it would be if no plate were there. The energy of the currents induced on the plate is obtained from the magnet's kinetic energy, which accordingly suffers loss, while the induced currents, in accordance with Œrsted's discovery, react upon the magnet, forcing it round in the direction opposite to that in which it is moving until it comes to rest. These isolated cases remained inexplicable, until the genius of Faraday unravelled the mystery, and established a new and most important branch of electro-kinetics.

Let there be two conducting circuits, known respectively as the *primary* and *secondary*. Let the primary be connected with the poles of a voltaic battery, in such a manner that the current may be produced, maintained, stopped, or reversed at pleasure. In the secondary closed circuit let a galvanometer (sufficiently distant from the primary as to be unaffected by it) be introduced, and then set two rectilinear portions of the circuits beside each other. At the instant of *making* the primary current, the galvanometer needle will be deflected—indicating by its direction that there has been produced in the secondary circuit a current flowing in a direction *opposite* to that of the primary current. Maintain the primary current constant, and the needle returns to its normal position—the secondary current has ceased. *Break* the primary circuit, and at that instant the needle is again deflected, but to the other side—indicating a secondary current in the *same* direction as the primary. Every variation in the primary produces electromotive force in the secondary, generating a current in the same or opposite direction as the primary, according as the intensity of the primary suffers decrease or increase. When there is no variation, there is no electro-motive force. While the primary current is being maintained constant, let it be approached to the secondary circuit. During the approach a secondary current will flow in the *opposite* direction to the primary. If the primary be moved away, there will be a secondary current in the *same* direction as the primary. The same phenomena are observed if the approach and separation be accomplished by the motion of the secondary current. These inductive effects are very closely connected with Ampère's discovery of the mechanical action of currents, as shown by the following law, enunciated by Lenz in 1834:—*If a constant current flows in the primary circuit A, and if, by the motion of A, or of the secondary circuit B, a current is induced in B, the direction of this induced current will be such that, by its electro-magnetic action on A, it tends to oppose the relative motion of the circuits.* This law, established before the modern theory of energy was dreamed of, affords one of the most remarkable confirmations of the conservation principle. The effects of induction by variation of the primary current are increased when the circuits are placed nearer, and the most effective methods of arranging the circuits is by forming them into circular or spiral coils, and packing them as close together as possible. The introduction of an iron rod or bundle of wire into the interior of the coils has a powerful intensifying effect upon the secondary current. The current induced at the *making* of the primary current is found from experiment to be exactly equal and opposite to that induced at the *breaking* of the primary. If the primary, then, be made and broken in rapid alternation, as rapid a succession of direct and inverse secondary currents will be produced. The secondary current further is always more intense than the primary, and sparks of considerable brilliancy can be obtained by breaking at any one point the metallic connection in the secondary circuit. Ruhmkorff's *induction-coil* affords, in this way, beautiful illustrations of transformation of energy. It consists essentially of two coils, the thicker internal one being the primary, and the thinner but longer external one the secondary. Inside the interior of the inner or primary is a bundle of iron wires, terminated at its extremities by disks of soft iron. When a current is passed through the circuit, the iron core becomes an electro-magnet, attracts a small iron disk which forms the extremity of one arm of a lever, whose other extremity is consequently displaced, and by its displacement breaks the primary circuit. The current accordingly ceases to flow, the soft iron core loses its magnetism, and the lever returns to its original position, thus completing the circuit, and permitting the current anew to flow. The same cycle of operations takes place, and thus an automatic or self-governing arrangement is produced, by which the current can be made and broken in rapid succession. But at each *make* and *break* of the primary, the secondary current, rendered the more intense by the presence of the iron core, is induced, and a rapid series of sparks may be obtained between the terminals. The spark may be varied considerably, as regards its luminous and heating powers, by altering the distance between the terminals, or it may be made to traverse the rarified gas of a Geissler tube, and produce beautiful and striking combinations of stratified and coloured lights. When the current in the coil of an electro-magnet is stopped by breaking the contact between the extremities of two wires held one in each hand, a smart shock will be felt. This Faraday showed to be due to the *induction of the current on itself*. Here the inductive action, due to the cessation of the primary current, is exerted on the same conductor which carries the current, and is more powerful than on a neighbouring conductor because the wire is nearer to itself than any other wire can possibly be. The phenomenon is best observed with the coil of an electro-magnet because of the intensifying effect of the iron core; but it takes place on all occasions when a circuit is broken, for the spark which is seen when a break is made in the circuit is due to the more intense secondary current set in operation at the moment the primary is broken.

It is impossible for one to study these varied electric phenomena, static and kinetic, without in some way striving to get a glimpse of their true nature. What is E.? is a question which has existed from earliest historic times, which has occupied the attention of every electrician, and which yet remains unanswered. The consideration of the various theories that have been mooted will naturally come under notice in a brief historical sketch of the progress of the science. In a most valuable and original treatise on the magnet, published by Dr. Gilbert in 1600, we have the first step towards a philosophical combination and generalisation of the phenomena as then known. He showed that electrification can be produced in many other bodies than amber, and is accompanied by the same attractive manifestations in all cases. Boyle, Otto de Guericke, Newton, and other philosophers of that century, contributed several new facts, and the formation of the Royal Society of London roused a somewhat general spirit of inquiry in this direction; but it was not till the present century that the unity, which characterises a true science, came to be recognised in what had previously been regarded as merely isolated phenomena. As early as 1733, however, the elementary facts of frictional E. were known; for in that year Dufay published his theory of two electric fluids, *vitreous* and *resinous*, which permeate matter, and give rise to all the known phenomena of attraction, repulsion, and induction. Matter which showed no electrification was neutral, because the two fluids were present and mixed in equal quantities. Friction was supposed to produce a separation of the electricities in the rubbed bodies; and when any substance, in which the one kind predominated, was brought near the unelectrified body, it separated the electricities in it by repelling to the further side its own kind, and attracting to the nearer side the opposite kind. The assumptions necessary for this hypothesis were the existence of two imponderable fluids, each of which should attract the other and repel itself. In 1752 Benjamin Franklin filled a Leyden jar from the clouds, thus proving the identity of lightning and E., originated the names of *positive* and *negative*, and enunciated his single-fluid theory. This fluid is imponderable, attracts matter, but is self-repellent. Unelectrified matter contains a certain quantity of this fluid; and friction of two substances has the effect of transferring some of the fluid from the one to the other—thus rendering the one positively and the other negatively electrified. A further assumption, however, has to be made, to the effect that particles of matter which do not contain this fluid in sufficient quantity repel one another. At first sight this would seem a serious objection, for what would become of the law of gravitation? But it must be remembered that gravitation exists between non-electrified bodies, *i.e.*, bodies which contain upon this hypothesis just sufficient fluid to counterbalance by its attraction upon the material particles the repulsion existing between them. Every known phenomenon in frictional E. is explained as simply by the one hypothesis as by the other; and the only scientific objection which can be brought against either is that relating to the necessary assumption of an *imponderable*, incompressible fluid, exhibiting attractive and repulsive properties. The nomenclature suggested by these theories still in great part remains, and will always, no doubt, be retained on account of its great convenience. The phrases, transference or passage of E., separation and recombination of the electricities, are continually met with in our modern treatises; but they must not be taken as in any way upholding either of the fluid hypotheses. The great advance made in recent times in electrostatics is the development of the theory of the *potential*. As a mathematical quantity in the theory of attractions it was recognised by Laplace; but its vast importance was only first fully appreciated by George Green in 1828, in his essay *On the Application of Mathematical Analysis to E. and Magnetism*, in which it is called Potential Function. This essay, long unknown, was only brought to light by Sir W. Thomson (Lord Kelvin), after the more important theorems which it contains had been rediscovered independently by himself, Chasles, Sturm, and Gauss. The first-observed phenomenon in contact E. was the peculiar sensation in the tongue, noticed by Sulzer in 1762, when silver and lead were brought into contact with it and each other. In 1791, after careful investigation of the phenomena attending the convulsions of the muscles of a frog when placed in contact with two metals, Galvani laid the foundation of *galvanism* or electrokinetics; and in 1800 Volta published the account of the voltaic pile—a series of disks of zinc and silver, with moistened cardboard between every other pair. Succeeding years were chiefly employed in improving the galvanic battery, till in 1820 Œrsted, by his discovery of the action of a current upon a magnet, laid the foundation of electro-magnetism. Then followed the brilliant researches, experimental and theoretical, of Ampère, which entitle him to the name of the 'Newton of E.' In 1827, Ohm enunciated his law of resistance; and about the same time Faraday began his investigations, establishing the induction of electric currents in a conductor moving relatively to a magnet, in 1831; the law of electrolytic action, in 1834; and the inductive effects of electric currents, in 1835. These brilliant discoveries have resulted in the invention of magneto-electric machines of every description; and have done more to unite electric phenomena into one grand whole, and to demonstrate the high probability of the greatest of modern generalisations, the conservation of energy, than the life-work of any other investigator; while they more than ever tend to raise the question as to the real nature of E. W. Weber, by a very beautiful but in some points objectionable hypothesis, deduced all the known laws of electric action, even to the induction of currents. He supposed that the forces exerted on each other by *moving electric particles* differ from those exerted when they are at rest—that is, their mutual potential energy is a function of their relative velocity. At first sight this would seem to be contrary to the conservation principle; but the formula given by Weber satisfies the necessary mathematical criterion for the existence of a potential, and this is all that is required so as to be consistent with the doctrine of energy. Faraday, in his researches, had always regard to what he called *lines of force* emanating from the conductor in every direction through space. The direction of the line of force passing through a given point represented the direction of the resultant action at that point, so that lines of force are everywhere perpendicular to equipotential surfaces. Thus Faraday looked for the seat of electrical action, not merely in the conductor itself, but also in the surrounding medium. On the same principle, Sir W. Thomson explained the kinetic energy of a current as being not in the matter of the wire itself but in surrounding space, giving rise to a rotatory motion round the lines of force as axes. J. Clerk Maxwell worked up the conception into a complete theory of electrical action. The medium which transmits light and heat is thrown into a state of motion in the neighbourhood of a magnet, as indicated by the effect of magnetism on polarized light. Now, every current is surrounded by lines of magnetic force, so that a certain inertia has to be overcome in starting the current, and a certain momentum must exist in the current when started in virtue of the kinetic energy of the medium. In this inertia and momentum, by the application of Lagrange's dynamical equation to the moving system, Maxwell discovered the known laws of induction and the mechanical action of currents.

It has now been generally recognised that the application of E. as a motive power results in the avoidance of many losses attendant upon the use of steam, compressed air, or hydraulic method. And, besides, whereas in the case of any one of these three a certain proximity of the prime mover to the spot where the power is to be used is absolutely indispensable, with E. no such necessity exists. Thus, at a comparatively great distance the conductor conveys the electric current from the dynamo or generator to the distributor, which disperses it in the various directions required, in such power, that in addition to lighting a district, it will work ventilators, lifts, cranes, pumps, drills, lathes, centrifugals, mining-excavators, turn-tables, traversing-platforms, dock gates, refrigerators, &c. In Mexico, the town of Quadalajara is lighted by means of E. conveyed from a generating station 17 miles distant, on the Rio Grande. Again, by a system of storage, E. will now produce the locomotive power for launches, tram-cars, railway-cars, road vehicles, &c. A launch capable of carrying 60 persons has been successfully propelled by E. alone.

Electricity, Animal. Organised beings, as masses of mere matter, are subject to the laws which determine electrical equilibrium and electrical disturbance. But the physiological changes which occur in the tissues of an animal cause electrical variations. The investigations of these phenomena constitute A. E. Certain fishes have special organs for the development of electricity, by means of which they can communicate a shock to other animals, thus paralysing their prey, or acting in self-defence. These electric fishes are—(1) The torpedo, a species of ray found abundantly in the Mediterranean, occasionally in the Atlantic, and rarely in the North Sea; (2) the *Gymnotus electricus*, an eel-like fish, common in the lakes and rivers of S. America, especially in Guiana; (3) the raasch or thunder-fish of the Arabs, a native of the Nile and other African rivers; (4) the *Mormyrus longipinnis*, a kind of pike found in the Nile; (5) the *Rhinobatiss electricus*, a ray from Brazil; (6) the *Tetraodon electricus*, a species of globe-fish found in the Nile; (7) the *Gymnarchus electricus*, an eel also found in the Nile; and (8) the *Trichiurus electricus*, a ribbon-like fish found in the Red Sea and Indian Ocean. Some have also asserted that the common skate of the British coasts possesses an electric organ. The electricity generated by these fishes has considerable tension, is capable of developing a spark, of magnetising steel, and of affecting a galvanometer. It would appear that in the structure of these fishes the nerves are always distributed to the positive side of the electrical plate. But in these animals there is always a special apparatus for the evolution of electricity alone. Such arrangements in the animal kingdom are rare, and the electricity produced far exceeds in amount and tension that which may be obtained from any living tissue, such as muscle, by means of a delicate galvanometer. The present state of our knowledge of A. E. will be best understood by a slight sketch of the rise and progress of this department of science. The discovery of A. E. dates from 1786, when Galvani, who was then Professor of Anatomy and Physiology in Bologna, had his attention directed to the convulsions produced in frogs' legs by the working of an electrical machine in their vicinity. It must, however, be acknowledged that Swammerdam had experimented in the same direction so early as 1678. Recognising the fact that the skinned hind-limbs of a frog may be used as a delicate electroscope, Galvani attempted, on 20th September, 1786, to employ them in experiments on atmospheric electricity. He suspended a number of frogs' legs from the iron trellis-work surrounding the balcony of his house, by means of copper hooks, and saw, when the legs were blown about by the wind so as to cause them now and again to touch the iron, that they were convulsed. After many experiments he concluded that the convulsions were not due to electricity from the atmosphere, but to an inherent A. E. This discovery, announced by Galvani as that of a nervous fluid which, if not life itself, was something akin to it, soon attracted great attention, and wild speculations were put forth, in which it was asserted that the entire source of life was attributable to this new principle, which, in honour of its discoverer was called *galvanism.* In 1791 Alexander Volta, Professor of Natural History in the University of Pavia, repeated Galvani's experiments, and devised numerous others, the result of which was that he asserted that the contractions in the frog's legs were not due to an inherent A. E., as Galvani had supposed, but to the action of the juices of the frog's limb on the metals with which it was connected. These investigations led to the discovery of the production of electricity by the contact of dissimilar metals, to the invention of the well-known *voltaic pile*, and to *voltaic* (often termed *galvanic*) *electricity*, to which the world is so much indebted. Volta's experimental criticism and denial of Galvani's fundamental position led to a bitter controversy, in which most of the scientific men of the time took part. Galvani, aided by his nephew Aldini, showed that under special circumstances muscular contractions might be obtained without the aid of any metal at all, by simply allowing the sciatic nerve of an insulated frog's leg to drop on the muscles and come into contact with them externally. This experiment Volta and his followers objected to on the ground that the contact of such dissimilar substances as muscle and nerve, aided by a little blood or serum, was quite sufficient to produce the electrical current which caused the muscles of the leg to contract. The discovery of the voltaic pile, and the great practical consequences flowing from it, caused the world to forget for a time the subject of A. E. For twenty-eight years after the death of Galvani, which happened in 1798, little was heard of the matter, and *animal magnetism*, as it was called, was held in contempt. But in 1826 Nobili, by means of a delicate galvanometer, demonstrated the existence of an electrical current in the frog, which he stated passed from the feet to the head of the animal. Nobili attributed the current thus obtained to Thermo-Electricity (q.v.), an opinion which has since been proved to be erroneous. In 1837, Matteucci, then Professor of Physiology in Pisa, obtained a current in a similar way, and made the important announcement that 'the interior of a muscle, placed in connection with any part whatever of the same animal, such as nerve, surface of skin, or surface of muscle, produces a current which goes in the animal from the muscular part to that which is not so.' He further worked out many of the details of the subject, and must be regarded as the founder of all our modern views. In 1841 Emil Du-Bois-Reymond, the distinguished Professor of Physiology in the University of Berlin, repeated Matteucci's experiments and further investigated the subject with the aid of most delicate galvanometers, and other ingenious apparatus specially contrived for the kind of work. He was at length able to announce the law of the muscular current, as at present understood, viz., 'Any point of the natural or artificial longitudinal section of a muscle is positive in relation to any point of the natural or artificial transverse section.' Thus it may be stated in general terms that the surface of a muscle is always positive to its transverse section, so that when one terminal (*A*) of a galvano-

The Thunder-fish.

Gymnotus electricus.

meter is connected with the longitudinal section or with the surface, and the other terminal is connected with the transverse section (*B*), a current flows through the coils of the galvanometer from *A* to *B*. The same is true of nerve. Du-Bois-Reymond also showed that there is no current peculiar to the frog, as Matteucci supposed. Currents may also be obtained from the human being by placing both hands or other parts of the body, with special contrivances, in connection with the terminals of a galvanometer. It may be stated generally that all living textures, when connected with a galvanometer sufficiently delicate, indicate the existence of electrical currents; and an electrical change takes place, and a current is developed in a muscle whenever it enters into contraction. As regards nerve: 'during the passage of a nervous impulse the natural nerve current undergoes a negative variation. But a nerve in its absolutely natural condition appears to be, like a muscle, isoelectric; hence we may say, that in a nerve during the passage of a nervous impulse a current of action is developed. This *current of action* may be shown either by the galvanometer or the rheoscopic frog. It should be mentioned that Hermann (of Zurich), almost alone among physiologists, denied the existence of any inherent current in animal tissues, and he attributed all the phenomena observed to death of part of the muscular or nervous structure exposed, leading by chemical changes to differences of potential, and consequently to a current.'

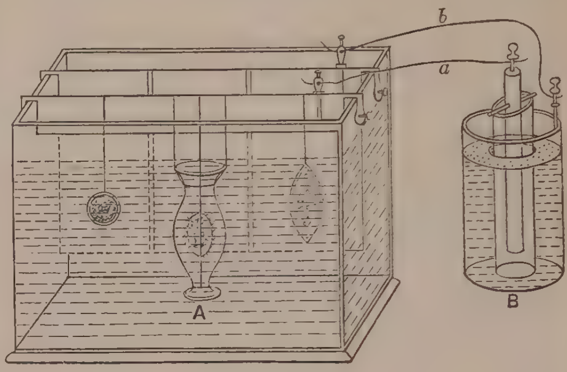
Electricity, Medical. Electricity has been employed as a curative agent from very remote times. Paracelsus ascribed curative power to the loadstone; but it was not till 1748 that Jallabert applied the electrical machine to the cure of paralysis. Franklin used it for the same purpose. Cavallo in 1780, Poma and Arnaud in 1787, employed it in paralysis, chronic rheumatism, chorea, epilepsy, &c. In 1789 Galvani made the discovery which immortalised his name, and the new voltaic and galvanic instruments superseded the electrical machines. The discovery of induced galvanic electricity by Faraday, and the invention of the rotary magneto-electric apparatus of Pixii in 1832, formed the next great advance in electro-therapeutics. The varieties of electricity depend upon its mode of development, which may be by friction or mechanical action, by contact or chemical action, or by induction from these sources or from magnetism. Frictional electricity, generated by the machine, is of a low degree of intensity, but is produced in large quantity and of great decomposing energy. It is still employed as a stimulant to sensory nerves, as a counter-irritant, a sudorific, and in the treatment of paralysis, and other affections, and for such purposes it is applied as the bath, the aura, the spark, and the shock. Galvanic or voltaic electricity is developed by the contact and chemical action of dissimilar substances. Galvanism applied to the skin excites more or less inflammatory action, accompanied with a sense of burning, the sensation varying from a slight tingling to an almost intolerable pain, and, if maintained for a sufficient length of time, it may produce ulceration and destruction of the skin and subjacent structures. It increases and diminishes sensibility and muscular irritability, is a tonic, and increases nutrition; it stimulates the secretions and the circulation, coagulates blood, increases the activity of the lymphatics and glands, promotes the absorption of exudations, and dispersion of tumours. These effects are best marked when the constant current is used; but when the current is intermittent the contractile effects on the muscles are very much increased. The continuous gentle action of small, single, and compound voltaic apparatus has been employed successfully in paralysis, amaurosis, neuralgia, &c., by application to the surface of the body over the parts affected, or by needles thrust into them (galvano-puncture). By galvano-puncture aneurism has been cured by the coagulation of the contents of the sac; attempts have been made to dissolve calculi in the bladder; and surgical cauterization of otherwise inaccessible parts has been successfully performed. The apparatus employed for the production of interrupted or induced currents are the magneto-electric and the electro-magnetic coil machines. The former consists of a bar of iron (round which thin iron wire is coiled), and a horse-shoe magnet. Electricity is evolved by the iron bar being maintained in a constant whirling motion before the poles of the magnet. The machine is not self-acting, and its currents pass in opposite directions. The electro-magnetic machine has the advantage of being self-acting; but the objection to it is that it requires a battery to keep it in action, and, of course, the use of acids. By later improvements, however, since the introduction of the carbon electro-negative, and the solution of the bisulphate of mercury, it has been made portable, and also effective. The electro-magnetic machine has now almost entirely superseded other electric machines in therapeutics, more especially since the publication of the work of Duchenne (of Boulogne), with whom it was a favourite instrument. Our limits do not permit of a detailed description of the apparatus. Electricity is administered by including a portion of the body between the two excitors or electrodes, thus causing it to form a part of the established circuit. Much of the results of electricity is due to the kind and quality of the current used, the method of application, and the direction of the current. When it traverses from the centre to the periphery, it is termed the direct or descending current, and when from the periphery to the centre, the inverse or ascending current. A descending current may be made to pass to or from a painful spot; in the former case, if the kathode be placed over it, and in the latter, if covered by the anode. In the former case there is increased action at the point of treatment, and in the latter diminished action. Different opinions have existed regarding the directions in which the currents should run in their therapeutical employment. The beneficial effects of electricity in the treatment of many diseases are firmly established.

Electrol'ysis is the decomposition of a chemically compound substance by means of an electric current. If two pieces of platinum, connected with the poles of a voltaic battery, are immersed in a quantity of slightly-acidulated water, and if, at the same time, the electromotive force of the battery be sufficiently strong, an electric current will pass and decompose the water into its constituent parts, hydrogen being given off from the platinum connected with the kathode, and oxygen from the platinum connected with the anode. The liquid so decomposed is termed the electrolyte; and the platinum or other metal surfaces by which the current enters and leaves, the electrodes. The electrode by which the current enters is called the anode, and the electrode by which the current leaves the kathode. The products of the decomposition are known as the Ions—the Anion appearing at the anode, the kathion at the kathode. These names were invented by Faraday with the aid of Whewell, and are now in general use. The fundamental law of E., as established by Faraday and confirmed by Beetz, Hittorf, and others, is that the quantity of electrolyte decomposed in a given time is proportional to the strength of the current; and the same current decomposes chemically equivalent quantities of different electrolytes in the same time. In many cases of electrolytic action, the actual ions are not given off, but instead substances formed by the chemical action of the ions upon the electrolyte. For instance, the products of the decomposition of a solution of sodic sulphate are oxygen and hydrogen at the anode and kathode respectively—exactly the decomposition in the case of acidulated water or dilute sulphuric acid. Careful experimental examination of the phenomenon shows that at the anode there is sulphuric acid as well as oxygen, and at the kathode caustic soda as well as hydrogen. If the electrodes, after E. has been going on for some time, be disconnected from the battery poles, and joined to the terminals of the coil of a delicate galvanometer, a current will be evident—flowing in the direction opposite to that which produced the E., but soon disappearing. This is due to what is known as the *polarization of the electrodes*, in virtue of which their potentials are rendered different, and the existence of an electro-motive force made possible. No polarization takes place when the electrodes are formed of the metal which enters as one of the chemical constituents of the electrolyte. Thus zinc electrodes in sulphate of zinc do not become polarized. It is this polarization that renders the measurement of the electric resistance of electrolytes so difficult. It seems, however, that Ohm's law of the relation between resistance and length of current holds for electrolytes as well as for metallic conductors; but that, unlike metallic conductors, electrolytes have their resistance diminished with increase of temperature. Experiments have also been made by various physicists to investigate the change of resistance due to change of density of the solution of a given electrolyte. Beetz, Kohlrausch and Nippoldt, and Paalzow investigated this subject in different ways, endeavouring by more or less ingenious devices to eliminate the error due to polarization.

The phenomena of E. are not yet fully explained, and cannot be till a more exact knowledge of the molecular constitution of bodies is obtained. According to Clausius, dissociation is constantly going on in a compound liquid—that is, the compound molecules, which are constantly changing their relative positions, become broken up into their component molecules on account of the continually occurring collisions, so that each individual atom may be supposed to be continually changing its partner from time to time. This process Clausius supposes to go on always, and indifferently in all directions; but when a current is passed through the liquid the molecules become influenced by the electro-motive force, so that each molecule of the kathion struggles towards the kathode, pairing for a time with each molecule of the anion which it meets struggling in the opposite direction towards the anode. Accordingly at the electrodes free ions collect, and these are charged, each kathion positively and each anion negatively. Upon this theory polarization is due to the collection of positively-charged ions at the negative electrode, whose potential is thus raised, and an electro-motive force contrary to the electrolysing current generated. Now the ions deposited on the electrodes tend to become free, escaping as gas, diffusing through the liquid, or precipitating as a solid, so that here we have the explanation of the dissipation of polarization. This theory further shows how only liquids can act as electrolytes, the molecular conditions necessary for the process not existing in solids and gases; but it cannot fully explain why compound liquids are not *all* electrolytes. E. is yearly being practically applied in numerous and important ways. Among these may be mentioned the manufacture of secondary batteries, bleaching, and sewage purification. In the last named process all the offensive matter is thrown down as mud by E. applied with iron electrodes. The effluent becomes pure and clean. The mud is disposed of as manure. E. is also used in physical laboratories and as a means of testing the accuracy of and calibrating instruments.

Electro-Metallurgy is the art of depositing or precipitating in a metallic state various metals or alloys from their solutions by means of electrical currents. It is one of the most useful of all the applications of electricity, and since its discovery, within comparatively recent years, it has been applied to innumerable useful and important metallurgical operations, and has indeed revolutionised many processes. The history of the discovery is inseparably bound up with the gradual development of knowledge and experience in electricity, so that it is difficult to apportion the honour of first discoverers among the numerous claimants to that distinction. Jacobi of St. Petersburg announced in 1839 that he had discovered a means of 'converting any line, however fine, engraved on copper, into a relief by galvanic process.' In the same year Spencer communicated an elaborate paper to the British Association on working in metals by voltaic electricity, in which he gave details of numerous experiments performed by him, commencing in September, 1837. Spencer successfully obtained by electro-deposit of copper, impressions from engraved plates, facsimiles of medals, and stereotype plates. C. J. Jordan also claimed that he had successfully conducted similar experiments previous to the announcement of Jacobi's investigations. From 1839 dates the practical working of metallurgical operations by electro-deposit, and, as usual, a host of patents were applied for and obtained, each claiming some new process or application, the deposition of particular metals, special forms of batteries, or new solvents for the metals to be deposited. The most successful of the patentees from a commercial point were George R. and Henry Elkington, who, in March, 1840, secured a patent for 'coating, covering, or plating metals' with gold and silver. The patent of the Elkingtons was the foundation of the now enormous industry in electro-plate carried on in Birmingham and Sheffield, as well as at many foreign centres.

The practical operations of E.-M. as conducted at the present day may be divided into (1) electro-depositing, in which any metal—as, for example, copper—is precipitated on a mould and so formed into the substantial ground of any article useful or ornamental; and (2) electroplating, or the coating of any metal with a different metal or alloy. The processes by which the metals in both cases are deposited are quite the same, but in the one case a mould is placed in the plating-vat, while in the other it is the article to be plated or covered which is so treated. In the preparation of electrotype copies of art metal-work, which constitutes one important branch of E.-M., both processes are usually employed; the body of the article, a jug or vase for example, being deposited in copper on a mould, and subsequently electroplated with silver or gold. The deposition of metals from solutions of their salts is due to the electrolytic action of the current (see ELECTROLYSIS), in virtue of which the electrolyte is decomposed, and the metallic component appears at the negative electrode. The moulds having been prepared, they are placed in a trough or vat (A) filled with an acid solution of blue vitriol (sulphate of copper), and opposite the moulds are suspended plates of metallic copper. A wire (*a*) passes from the metal rod on which the mould is hung to the zinc pole of a Daniell's cell (B), that being the battery originally employed, though now generally superseded; and the circuit is completed by connecting the rod from which the plates of metal depend with the copper of the battery cell by another wire (*b*). As the action proceeds, copper is by slow degrees reduced from the solution and deposited on the prepared moulds, the amount so taken up being replaced by a similar quantity dissolved from the plates of copper. The process of deposition may go on till any desired thickness of copper is attained, and neither is there any limit to the size of the object deposited. The objects when taken from the bath are treated like ordinary castings; and to many of them, in common with nickel-silver and Britannia-metal articles, the process of electroplating, or coating with silver (and sometimes gold), is next applied. In the early years of plating the expense of the process prevented works of great size from being undertaken by E.-M. as each pound of copper deposited required the expenditure of 1 lb. of zinc and 1½ lb. of sulphuric acid. Now in all large works the Daniell battery is superseded by Wilde's or Gramme's magneto-electric engine, which deposits at less than one-tenth the cost of galvanic electricity, and works of large dimensions, such as full-size statues, are produced by electro-deposit. Besides such works and reproductions of art manufactures, electro-deposit is very extensively employed for copying wood-engravings and for preparing electrotypes for



Electric Battery.

printing, as well as in cheap jewellery and button-making, and a great variety of minor metallurgical operations.

Electroplating.—This operation is most largely employed for preparing imitations of silver plate for table use, the basis of the best quality of which is nickel or German silver, while for an inferior class of wares the Britannia metal is used. When Britannia metal is to be plated, it has first to receive a thin coating of copper, as silver or gold will not adhere to that particular alloy. The articles to be plated are first 'buffed,' or smoothed on leather to give them a proper surface to receive the coating of precious metal. They are then successively dipped in an alkaline solution, a weak acid, and in pure water, after which cleaning they are plunged in a solution of cyanide of mercury to prevent any oxidation taking place. The articles are now ready to be placed in the silvering vat (if silver is to be deposited), which contains a solution of cyanide of silver, and in which plates of silver also are hung. When the silvering is complete the plated goods are washed and brushed with a metallic wire brush. Electro-gilding is conducted on an analogous principle, the bath being prepared with chloride of gold, cyanide of potassium, and carbonate of potash.

A great number of metals in addition to those mentioned can be deposited by electricity, and even an electro-deposit of brass is obtained in practice. The deposit of nickel has also been conducted on a commercial scale; and especially in America that metal is now very extensively employed for plating iron objects, fittings of harness, door and other knobs, hat-pegs, and many similar objects. Tin has also frequently been deposited by electricity, and the separation of tin and iron in old tin plate is largely accomplished by similar means.

Electrostat'ic In'struments are of three kinds—(1) those which produce, (2) those which accumulate, and (3) those which measure given charges of electricity. To the first kind belongs the common frictional machine, in which a glass wheel or cylinder is made to revolve and rub against a leather surface coated with an amalgam of zinc and mercury. Each portion of the glass surface as it moves away becomes positively electrified, and upon coming opposite a set of sharp metal points in connection with an insulated conductor, known as the *prime conductor* of the machine, induces in them a negative charge. If the machine is in working order a discharge takes place through the air between the glass and the points, and the glass loses a portion of its electricity, which is transferred to the prime conductor. To make a continuous production possible the negative electricity on the coated leather surface must also be removed, and this is effected by connecting it, directly or through the agency of its prime conductor, with the earth. The first machine of this kind was Otto de Guericke's rotating globe of sulphur, which was electrified by friction with the hand. In Lord Armstrong's *hydro-electric* machine, the electricity is produced by the friction of the minute drops of water upon the walls of the apertures through which steam is sharply driven at considerable pressure. Volta's *electrophorus* consists of two equal-sized plates, the one of ebonite or resin backed with metal, the other of metal. The former has a metallic pin which, when the plates are in contact, connects the metal plate with the metallic back of the ebonite plate. The ebonite plate is first negatively electrified by rubbing it with cat-skin, and then brought near the metal plate, whose potential is thus rendered negative by induction. When they are sufficiently near, a spark passes between the metal plate and metallic pin, and upon the separation of the disks the metal is found to be positively electrified. Since the ebonite long retains its electrification, especially if the air is dry, this process may be repeated again and again, and a conductor fully charged by successive additions. The energy of the electrification has its equivalent in the excess of work spent during the separation over the work done by the electrical forces during the approach of the plates. The induction machine of Holtz is on the same principle. It consists of two parallel concentric glass wheels, one fixed, the other capable of rapid rotation. Near the exterior surface, and at opposite sides of the rotating wheel, are placed two metallic combs, each connected with an insulated conductor. On the fixed wheel two pieces of pasteboard are fastened facing the combs. One of these is electrified negatively by contact with a rubbed piece of vulcanite, and acts inductively through the disks on the comb opposite, which discharges electricity on the surface of the revolving disk, becoming itself negatively charged, as does the second comb, with which it is connected meanwhile. When the positively charged portion of the disk comes opposite the second comb, discharge takes place between them; and after a few turns the positive electricity on the glass disk exceeds the negative on the comb, so that the discharge is followed by the positive electrification of the conductor of this comb. Brilliant and long-continued sparks are produced on breaking the connection of the conductors.

Of electric accumulators the most important is the Leyden jar, so named from Leyden, where its accumulating power was first observed and investigated by Kleist, Cuneus, and Muschenbroeck about the year 1746. It consists usually of a cylindrical glass jar, coated internally and externally with tin-foil, and having a metallic rod in connection with the interior coating, rising a few inches above the top of the jar and terminated by a brass knob. The jar is charged by collecting electricity from the prime conductor of a machine by means of this knob; while the external layer is kept at zero potential by being put in connection with the earth. (See ELECTRICITY.) An *electric battery* consists of a number of charged Leyden jars, with their external surfaces connected, as also their internal surfaces, by means of metallic rods joining the knobs. It is necessarily very dangerous to handle, and is only employed in experiments which require large charges.

The first instrument which was used to *measure* forces due to charges, and therefore charges of electricity, and the first instrument accordingly which deserved the name of *electrometer*, was Coulomb's torsion balance. Formerly, however, before electrometers had reached their present development and importance, the name was given to what were nothing more than *electroscopes*, or instruments for *showing* the presence and nature of electrification. The best known of these is the so-called *gold-leaf* electroscope, which consists of an insulated vertical metallic rod, with a knob or disk at its upper and two gold leaves suspended from its lower extremity. The gold leaves are free to move, and of course show repulsion when the rod becomes electrified either by induction from, or contact with, a charged conductor. Electrometers for the direct measurement of differences of potential, between two conductors, have been of recent years carried to a high degree of perfection, both in theory and construction, especially by Lord Kelvin. His absolute electrometer is an improved form of the attracted-disk electrometer of Sir W. Snow Harris. The principle is that when two small disks at different potentials are placed face to face, with a small space between them, the electrification will be nearly uniform on the opposed faces, if no other conductor be near. One of Lord Kelvin's chief improvements is the addition of the *guard-ring*, which does away with much of the disturbing effect of the case containing the disk. The instrument, thus improved, consists essentially of two parallel plates at different potentials, one of which is divided into two portions, a central circular and movable portion, and an outer immovable ring, which is the so-called guard-ring. No part of this movable portion is accordingly near the edge, and its electrification is practically uniform. The lower surface of the guard-ring is plane and parallel to the upper opposed surface of the other disk. The movable disk, which just fills the aperture of the guard-ring, is suspended from an arm of a delicate balance, and is adjusted by means of a weight on its upper surface so as to have its lower surface in the same plane as the lower surface of the guard-ring. If the potentials of two conductors are to be compared, they are placed in connection each with one of the disks. The weight on the suspended disk is then removed, and the lower disk screwed up until its attraction brings the suspended disk down to exactly its original position. The attractive force between the disks must then be equal to the weight removed, and is therefore known as well as the distance between the disks, so that the difference of potential is at once determinable. The necessity of adjusting the lower disk for each observation is an inconvenience, which, however, does not exist in electrometers of the *divided-ring* construction. The extremely delicate and refined quadrant electrometer of Lord Kelvin is constructed after this method, the principle of which will be evident from the following short description. A cylindrical conducting box is divided into four quadrants, separately insulated. The opposite quadrants are united, thus forming two pairs, each pair being kept at the same potential throughout. The one pair (*A*) is usually connected with the earth, and the other (*B*) with the body whose potential is to be measured. There is another conductor (*C*) suspended close below the quadrants so as to have free azimuthal motion round a vertical line, which coincides with the axis of the cylindrically-arranged quadrants. This conductor is kept at a high potential by being connected with the inner coating of a Leyden jar which forms the lower portion of the instrument. If the potential of *B* be of the same sign as that of *C*, *C* will tend to move from *B* to *A* with a nearly uniform force, which will be ultimately equilibrated by the torsion of the suspension apparatus. Within certain limits the deflexions are connected with the potentials by a simple formula. A voltmeter has lately been designed by Lord Kelvin on the principle that two adjacent bodies at different potentials mutually attract each other. Of the two conductors in this instrument one is movable and the other fixed. The maximum potential difference it is capable of indicating is 12,000 volts.

Various methods are adopted to protect persons and their property from a dangerous connective contact with any part of electrical apparatus. A 'cut-out' checks the undue strength of the electric current, and in that way protects the wire, lamps, &c. The names of Killingworth Hedges, Napier Prentice, and Cardew may be mentioned in connection with these devices. For the various instruments connected with electric telegraphs and cables, see TELEGRAPH. See also articles, HUGHES, KELVIN, MAXWELL, and MORSE.

Electroto'nus, in Physiology, is the condition into which a living nerve passes while it is traversed by a continuous electrical current. While in this condition its properties are changed, so that in the neighbourhood of the anode its irritability and rate of conductivity are diminished, and its power of producing a current of electricity is increased, while in the neighbourhood of the kathode the reverse is the case. The part near the anode is said to be in an *anelectrotonic*, and that near the kathode in a *cathelectrotonic* state. See NERVE.

Elec'tuary, a medicinal preparation in which the active ingredients are incorporated with some conserve, such as honey, molasses, or syrup. Such medicines are usually insoluble and of large bulk, as sulphur. They are frequently called *conserves*. *E. lénitif* is almost identical with *E. sennæ comp.*

Ele'git is an English law-term denoting a writ of execution (statute 13 Edw. I. c. 18) directed to the sheriff, commanding him to take in execution, but not to sell, the lands, but not the goods (see Bankruptcy Act of 1883), of a debtor. These the creditor holds until he gets satisfaction for his debt, during which time he is *tenant by E.* Any estate vested in a mortgagee or purchaser, any glebe (or churchyard), part of an ecclesiastical benefice, any advowson in gross cannot be so taken in execution.

El'egy (Gr. *elegos*, from *è è* and *lĕgein*, 'to cry woe') radically signifies a lament without reference to metrical form. Among the Greeks the word was early applied to a poem written in distichs of alternate hexameters and pentameters, and devoted either to the praise of valour, as in Callinus and Tyrtæus, or to the inculcation of moral precepts, as in Solon and Theognis. This measure soon came to be regarded as the fittest vehicle for sustained emotions and tender sentiments, and with Simonides and Mimnermus the sad E. attained the highest excellence. Catullus and Gallus were the first successful writers of Roman E., which reached its highest perfection in the tender Tibullus, the brilliant Propertius, and the sensuous Ovid. The term E. may now be applied to any serious piece pervaded by a melancholy tinge, without regard to the measure. The quatrain of Gray's *Elegy*, however, has come to be regarded as the representative form in English, and as, on the whole, the best fitted for mournful themes.

Elegy, in music, a name occasionally given to a composition expressing the same ideas as the poetic E.

Elemen'tal Spirits were, in mediæval superstitions, the spirits of the elements fire, air, earth, and water, and were named respectively salamanders, sylphs, gnomes, and nymphs or undines. The gnomes, spirits of the earth and the underworld, were mischievous and malevolent in their relations to human beings; while the sylphs, the spirits of the air, were a species of benevolent fairies. The literary 'machinery' supplied by these fanciful creatures, personified types of the powers of the elements in which they have birth and life, has been employed with excellent effect by modern writers. The conduct of the story of Pope's *Rape of the Lock* is managed chiefly by sylphs—

> 'The light militia of the lower sky.'

Baron Fouqué is indebted to the E. S. of water for his beautiful *Undine;* while in the graceful tales of Lessing and Tieck the creatures of the elements are invested with the rarest beauty, and are described with much suggestive meaning.

El'ements, in astronomy, are the numerical quantities necessary for computing the place of a planet or satellite in the heavens. The major-axis and eccentricity fix the size of the elliptic orbit; but besides these we must also know the inclination of the orbit to the ecliptic, the longitude of the ascending node, the longitude of the perihelion, and the time of its perihelion passage. The longitudes are measured from the line of equinoxes. The dimensions and masses of the bodies themselves are also tabulated as E. See Herschel's *Outlines*.

Elements, Chemical. All researches into the composition of matter have shown that it consists essentially of two kinds—that which is capable of decomposition or resolution into two or more distinct substances, and that which is capable of no such change. To the first of these kinds the name of compounds has been given, to the second that of elements. All compounds are formed of the elements, the nature of the compound depending not alone upon the elements which it contains, but also upon the proportions in which these are present. Numerous as the compounds are, they yet contain comparatively few elements, science up to the present time having revealed the existence of but sixty-six of the latter, if gallium, argon, and helium be included in the list. The elements vary in their appearance, physical state (under ordinary conditions), and in their properties. They are divided into two groups—the metals and the non-metals. Of the former all are solid at ordinary temperatures, with the exception of mercury or quicksilver, which is liquid. They are all opaque, and for the most part exhibit the peculiar appearance termed metallic lustre. They are, as a rule, good conductors both of heat and electricity. Many are soft, such as lead, copper, silver, iron, &c., either at ordinary temperatures or when heated, and these can be rolled and hammered into various shapes, and drawn into wire. Others, however, are brittle under all conditions, such as cobalt, titanium, &c., and as a consequence are neither malleable nor ductile. The distinguishing chemical character of a metal is that it forms at least one compound with oxygen which is a base, *i.e.*, a substance capable of combining with an acid to form a salt. Of the non-metals five are gaseous under all conditions, viz., hydrogen, oxygen, nitrogen, argon and helium, one gaseous under ordinary conditions, but capable of condensation to a liquid when submitted to extreme pressure and intense cold, viz., chlorine. Bromine is the only liquid non-metal at ordinary temperatures; the remainder are solid. Many of the non-metals are transparent, others opaque; some are opaque in one condition, transparent in another. Carbon, for instance, is opaque in graphite and charcoal, transparent in the diamond. Metallic lustre is not a special character of the metals; it is possessed by several of the non-metals. Thus graphite, tellurium, and selenium, as far as their appearance goes, might readily be mistaken for metals. The non-metals are generally bad conductors of heat and electricity. None can be said to be ductile or malleable.

El'emi, a fragrant and resinous substance, obtained from plants belonging to the natural order *Amyridaceæ*, or 'Myrrh order.' E. was formerly obtained from Egypt, but is now chiefly brought from Manilla and America. It is obtained from the *Icica Icicariba* of Brazil. E. consists of the juice of the trees, which exudes from punctures made in the bark. It is used in making ointments and plasters. It contains a volatile oil, and is soluble in alcohol.

El'ephant (Gr. *elephas*), the name given to two species of large mammalia, regarded in modern zoology as included in a special order of Placental or higher mammals, named *Proboscidea*. The characters of this order are found firstly in the elongation of the nose to form a sensitive, highly muscular, prehensile proboscis or trunk; secondly, in the absence of canine teeth, and in the growth of the incisors to form tusks, the molar teeth being few in number; thirdly, in the feet being provided each with five toes, which are not fully indicated or completely divided from the foot externally, whilst the feet are padded with a thick skin; and, fourthly, in the absence of clavicles. Included in this order, besides the two species of living forms, are various extinct forms (mammoth, mastodon, &c.), which receive special articles, and are also referred to in treating of the palæontology of the present group. With the general form of the E. all are familiar. The skin is almost destitute of hairs, and presents a hard tanned-looking surface. Notwithstanding the apparent impenetrability of the skin, these largest of land mammalia are singularly liable to be tormented by insects, and to protect themselves against the latter, are accustomed to take mud-baths, wallowing in the mud of rivers, and thus covering their skin with a layer of clay, which renders them less exposed to the attack of their enemies. Mohr, the German explorer, informs us that he has seen the African E. dig a kind of pit or bathing-tub near a pond or river which has a steep wall in front, the pit being about the same height and breadth as himself. The animal, when about to bathe himself, sprinkles water on the sides of his bath so as to moisten the clay, and then rubbing his sides against the pit, coats his skin with the clay. These 'E. tubs' are especially numerous on the Zambesi. The pinna or outer ear is large and flat. The dorso-lumbar vertebræ, or those of the back and loins taken collectively, number twenty-three, not more than three being lumbar bones. There are four sacral vertebræ, and the tail is short. The bodies of the vertebræ are much more flattened than in any other terrestrial mammal; and the vertebræ of the neck being especially flattened, this organ is in consequence very short. The object of this arrangement is to afford strength and solidity to the spine. The skull is very large in proportion to the body; its great size being due chiefly to the development of air-cavities in the *diplöe* or middle layer of the cranium. Thus in old elephants the space between the inner and outer layers of the skull, especially in the frontal or forehead region, may be actually greater than the breadth of the cylindrical and elongated cavity containing the brain itself. The nasal bones are shortened, and the pre-maxillæ, or front portions of the upper jaw, are elongated. The radius of the fore-arm is fixed in a prone position, and crosses the ulna, its neighbour bone, in an oblique manner; this position preventing any movement of rotation such as is possessed by man. The fingers, wrist, and metacarpus or palm, are all shortened and thickened. The ilia or haunch-bones are expanded from side to side. The thigh-bones are long and slender, and when the animal is at rest, are directed perpendicularly to the axis of the trunk, and do not form an acute angle as in quadrupeds generally. The ham-muscles consequently extend to the middle of the hind-limbs, and this arrangement causes the peculiar and somewhat awkward gait of these animals, the whole leg being apparently lifted from its middle joint. The tibiæ shin-bones are short, and the foot and ankle bones are compressed. The thumb may consist of a single bone only in some cases. Two kinds of teeth only are developed—incisors and molars. The former have no enamel, and are entirely composed of dentine (or ivory) and cement. All living elephants possess incisors in the upper jaw alone, but the Dinotherium (q.v.) possessed lower incisors as well. The incisors further exhibit a peculiarity, in that, as they spring from permanent pulps, they continue to grow through the lifetime of the animal, and thus constitute tusks. The molar teeth exhibit a peculiar pattern, being essentially composed of alternating plates of enamel and cement, variously arranged in different patterns. In living elephants, only the incisors are preceded by milk teeth. The molars number six on each side in upper and lower jaws, and as the foremost molars are worn away, those behind are pushed forward to supply their place. The stomach is simple. No gall-bladder exists. The cerebellum or lesser brain is uncovered by the cerebrum or true brain, the cerebral hemispheres being largely and deeply convoluted. The males possess two large *vesciculæ seminales*, and four prostate glands. The E. goes with young about two years, and a single young one is produced at a birth.

African Elephant.

The two species of living elephants are the Indian E. and the African E. A variety of the former has been described under the name of Ceylon E., whilst the famous 'white elephants' are albino varieties of the Indian species. The Indian elephants possess tusks in the males only. No lower incisors are present, and the molars number one or two on each side of each jaw, and exhibit on their crowns a transverse or cross arrangement of the enamel plates. The forehead is concave, the ears small, the skull pyramidal; whilst the fore-feet possess five, and the hind-feet four hoofs. The colour is a pale brown, inclining to grey. The African E. has a convex forehead, very large ears, four hoofs on the front-feet, and only three on the hind-feet. Both males and females have tusks, those of the males being the larger, and weighing in large specimens 50 to 70 lbs. each. The length of full-grown tusks is about 6 or 7 feet. The Indian E. attains to 10, and the African to 12 feet in height. Both species are plant-eaters, and feed on grasses and on the leaves and bark of trees. Water is sucked up in drinking into the trunk, and is then squirted into the mouth from the proboscis. The E. without the tip of its proboscis is a very helpless animal. The trunk, composed of several hundreds of delicate muscles enabling it to move in every direction, ends in a finger-like process, where the nostrils are situated. This process aids the animal in picking up the smallest substances, and from its extreme sensibility also serves as an organ of touch. Of the two species, the Indian E. far exceeds its African neighbour in docility, intelligence, and tractability. The latter never attains a high degree of familiarity with man, and can never be so thoroughly domesticated as the Indian E. The African E. is hunted for its ivory and hide. The tusks are chiefly obtained from Senegambia, Guinea, Sofala, and Mozambique. The Indian ivory, and especially that obtained from Ceylon, is very highly esteemed. Elephants are also found in Siam, the Malay Peninsula, and Sumatra. The Indian E. is employed extensively in Asia as a beast of burden. Of its intelligence and remarkable instinct many curious tales may be related. In no part of their history, perhaps, do elephants exhibit greater intelligence than in their participation in the stratagems whereby wild members of their species are captured. These latter live in herds in the depths of forests, and apparently resort continually to one place to drink and bathe. Wild males are captured by decoy-females, who exhibit a pretence of fondness for them, while, in the meantime, the males are being stealthily secured by ropes or cables attached to adjoining trees. Left tied, the wild elephants are subdued by hunger and thirst. Whole herds may be captured by being led by decoy-elephants into large traps enclosed by firm stakes. Elephants rarely breed in a domesticated state; the African, however, breeding oftener in captivity than the Indian species.

Fossil and extinct elephants are known to geologists from numerous fossil remains. The more important of these extinct species are described under DINOTHERIUM, MAMMOTH, &c. The general distribution in time of the *Proboscidea* may in the present instance be briefly referred to. In the Miocene rocks of India six fossil species have been discovered, and a true E. (*E. antiquus*) occurs in the Pliocene rocks of Europe. The latter is found in Italian and French deposits of this age, and appears to have survived the glacial epoch. The Mammoth (q.v.) is the best-known Post-Pliocene E., and other forms of this age are the donkey E. of Malta, so named from its small size; and the pigmy E., which did not exceed 2½ feet in height. The Mastodon (q.v.) is of Miocene, Pliocene, and Pleistocene age, whilst the Dinotherium occurs in Miocene strata.

Elephan'ta (Hind. *Ghárápuri*), a celebrated island of India, in Bombay harbour, 6 miles E. of the city of Bombay, and named so by the Portuguese on account of a large stone elephant at the landing place on the S. of the island. It is 5 miles in circumference, is traversed by two long hills separated by a narrow valley, and has springs of good water. The few inhabitants cultivate rice and rear sheep and poultry for the market of Bombay. E. is chiefly famous, however, for its cave temples. At a short distance from the shore is the great temple, an artificial cavern, 130 feet long, and 133 feet broad, and of an average height of 17 feet. The rock is a kind of basalt or porphyry; and the roof owes its support to peculiar massive columns Within the entrance there is a gigantic figure (consisting merely of a bust and three heads) which serves as a pillar. This figure is 23 feet in circumference, and is supposed to represent the Hindu triad; but from the rest of the figures and the emblems on the walls, it seems probable that the temple was dedicated to the god Siva. There are also two similar temples on a small scale. Nothing whatever is known of the origin of these caves. From the mouldering nature of the stone, it may be assumed that the temples are of no very great antiquity. No religious worship is now conducted here; but it is a favourite resort of Bombay pleasure-seekers, and a semi-religious fair takes place here in February. A banquet was given here in honour of the Prince of Wales in 1875. Four caves in all have been excavated; the fifth is choked up with debris. There is no inscription legible and it is impossible to give the date of the cutting of the temples; some persons put it down at the 8th c. A.D. while others reckon it to be two centuries later.

Triad Figure, interior of Temple at Elephanta.

Elephant Fish, a name given to an Elasmobranchiate fish, nearly allied to the *Chimæra* (q.v.) or 'king of the herrings,' and included in the division *Holocephali* of the above order of fishes. It derives its name from its long snout, the tip of which is bent backwards like a hoe.

Elephant-Grass, a species of bulrushes belonging to the *Typhaceæ* or Bulrush order. This plant affords a large quantity of pollen which in Scinde is used for making a kind of bread, to which the name of *boor* or *booree* is given. The familiar name of the grass is derived from the fact of elephants feeding largely upon it.

Elephant Hawk-Moth.

Elephant Hawk-Moth, a genus of Lepidopterous insects belonging to the *Sphingina* or hawk-moths, which are distinguished by the antennæ being thickened in the middle or at their tips. The wings are long and narrow, and the trunk or proboscis is well developed. This moth has the body tinted rosy red, varied with light-green. The light-green of the wings is prettily contrasted with rose-coloured bands; and the hinder wings have a black base fringed with white. The E. H.-M. is known in France as the 'vine sphinx.' It produces two broods annually, the larvæ making cocoons on the ground by binding mosses and leaves together.

Elephanti'asis (from the Gr. *elephas*, 'elephant') is sometimes called *E. Arabum*, *Bucnomia tropica*, and Cochin or *Barbados leg*. The name is derived from a resemblance of the limbs of those affected with the disease to the huge rough limbs of the elephant. E. is a tropical disease common in India, Arabia, and Africa. The legs are the parts most frequently affected, but the disease attacks also the arms and the scrotum. In some cases the hypertrophy is so enormous that those affected are unable to walk; but although the limbs may be thus enlarged, the hands and feet are usually of normal size. There are at least two varieties of the disease. In the simplest form there is hypertrophy only, and no inconvenience is felt except from size and weight. In the more complex form there is, in addition, the product of morbid action, the parts being hard like stone, and the skin rough like the bark of a tree. The cause of the disease is not definitely known, though by some it has been attributed to the larvæ of the mosquito which are taken into the stomach with water and become absorbed into the system. It may, however, be hereditary, and may depend on some fault in dietetics. The simple form is gradual in its development, and without constitutional disturbance; but the complex or tubercular is accompanied with febrile action, and appears to be a product of inflammation. No cure for E. has been discovered. In scrotal E. the morbid growth is frequently removed by excision.

Elephanti'ne, called *Jesiret el Sag*, the 'blooming,' or *Jesiret-Assouan*, a small island in the Nile opposite Assouan (q.v.), at the foot of the first cataract. Its old Egyptian name was *Ebo*, 'the town of elephants,' *eb* being the hieroglyphic symbol for *elephant* and *ivory*. In former times it was of strategic importance from its position on the southern frontier of Egypt Proper. It was remarkable for its fertility, and was the seat of a monarchy, the only existing relic of which is a list of the names of nine kings. It formed the southern limit of the Roman empire under the later Cæsars. There are remains of temples to Kneph and Ammon, a tower with sculptures of the time of Alexander the Great, and a Nilometer, consisting of a staircase descending into the river and bearing graduated scales and inscriptions showing the heights to which the Nile rose at certain periods under the Cæsars.

Elephant-Seal, or **Sea-Elephant,** names given to several large species of Seals (q.v.), of which the best known is the *Moringa* (or *Macrorhinus*) *proboscidea*. The nose of the males is elongated to form a short proboscis. The teeth number four upper and two lower incisors, two canines, six præmolars, and four molars in each jaw. The incisors are of conical shape, and the canines are very stout and pointed. The colour of the fur is a bluish-grey in the males, deepening into dark brown; the fur of the females being darker. The length of a full-grown male nearly equals 30 feet, and they are from 15 to 18 feet in circumference at their greatest girth. The skin is prized as a 'seal-skin,' whilst the oil is also valued, the male affording about seventy gallons. These animals are polygamous, and the males fight desperately for the possession of the females. They feed chiefly on seaweeds. They are found on the Falkland Islands, Kerguelen Island, S. Shetland, and neighbouring S. Pacific Islands.

Elephant's Ear, a name popularly applied to the species of *Begonias*—plants belonging to the natural order *Begoniaceæ*—from the appearance of their oblique stipulate leaves. These plants occur in the E. and W. Indies and in S. America. See BEGONIACEÆ.

Elephant's Foot, or **Hottentots' Bread,** a genus of Monocotyledonous plants belonging to the order *Dioscoreaceæ*, or that of the 'Yams' (q.v.), and so named from the form of the shortened tuberous stem or root-stock, which is rough and tuberculate, and gives origin to a weak climbing stem. The name 'tortoise-plant' has also been given to this plant, from the shape of the stem suggesting that of a tortoise. The central cellular part of the stem is eaten by the Hottentots. The name E. F. is also applied to the species of *Elephantopus*, a genus of plants belonging to the order *Compositæ*, the radical leaves of which are of large size.

Elephant-Tusk Shell, a genus of Gasteropodous mollusca belonging to the family *Dentalidæ*, in which the shell is tubular and curved, shaped like an elephant's tusk, open at both ends, and possessing a circular aperture. The foot is pointed, and has symmetrical side lobes, from the presence of which Huxley inclined to place the *Dentalium* among the Pteropodous molluscs. The head is rudimentary, and the intestine has a neural flexure. *Dentalium arcuatum* is a familiar species.

Elephant, White, an ancient and exclusive Danish order of knighthood, in which the number of knights, other than those of the Danish royal family, was only thirty.

Elletta'ria. See CARDAMOM.

Eleusin'ian Mysteries. These venerable solemnities were begun at Eleusis by the special command of the goddess Demeter, and in connection with the suffering she endured on account of the loss of her daughter Persephone, and with her joy on Persephone's return from Hades. When Eleusis was absorbed into Athens, there was an increase of dignity in its great festival; but the oversight of it remained with the descendants of Eumolpus, and the most important rites continued to be performed at Eleusis. The lesser mysteries, celebrated in February, were in honour of Persephone, The Daughter; the greater, in August, in honour of Demeter, The Mother. The former took place at Agræ on the Ilissus, and were a preparation for the greater mysteries. The chief rites were the sacrifice of a sow, and initiatory purification by a priest. The greater mysteries lasted for nine days, and were held both at Athens and Eleusis. On the first day, the initiated assembled at Athens; on the second, they went in procession to the seaside to be purified; the third was a day of fasting and sacrifice; on the fourth day a procession took place with a basket containing pomegranates and poppy-seeds, carried on a waggon drawn by oxen, and followed by women; the fifth was the torch day, when the initiated (or *mustæ*), led by the torch-bearer, went in the evening with torches to the temple of Demeter at Eleusis; the sixth was the most important day of the festival, when the statue of Iacchus, son of Demeter, was carried along the sacred way to Eleusis, accompanied by vast crowds shouting and singing; on the following day the initiated returned to Athens; the eighth day was supplementary, and was added in honour of Æsculapius; and on the last day a libation of wine was offered in the ceremony 'Plemochoæ.' These were the external rites of this festival, but we possess no certain knowledge of the doctrines revealed to the initiated in the celebration of the mysteries.

Eleu'sis, a town of Attica, was situated in the Thriasian plain, opposite to the island of Salamis, and near the borders of Megaris. It was on the road from Athens to the Isthmus. It was the chief seat of the worship of Demeter and Persephone. See ELEUSINIAN MYSTERIES.

Eleu'thera, the most productive, and, after New Providence, the most populous of the Bahama Islands, is separated from Abaco by N. E. Providence Channel, about 28 miles in width. It is long and narrow, has an area of about 80 sq. miles, and a pop. of 7358, of whom only 5 are Europeans, engaged for the most part in the culture of the pine-apple, orange, and lemon. There are but 55 persons of African blood and, it is said, the race is fast dying out in the Bahamas.

Eleuthe'ria Bark, a name occasionally given to the bark of the Croton E. and Cascarilla Bark (q.v.). It derives its name from the island of Eleuthera, from which it is exported.

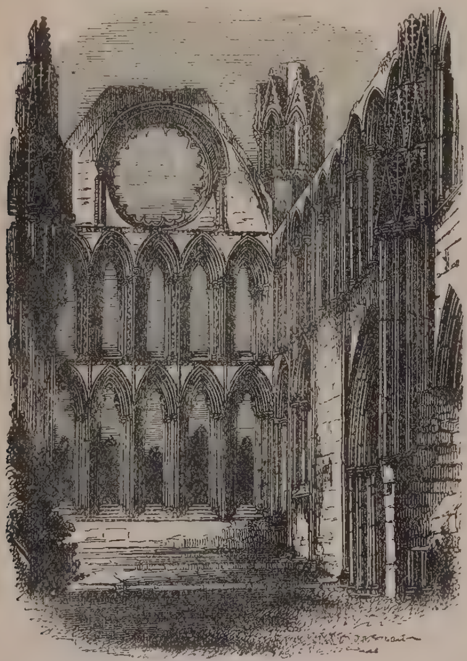
El'evated, the term applied to wings turned upwards in an armorial bearing or other heraldic device.

Eleva'tion, in architecture, a vertical plan of the front or of any external face of a building in which the proportions are set out geometrically, exactly as they are to exist in the actual building, and not as they would appear subject to the laws of perspective.

Elevation, in astronomy, is the height of a body above the horizon in angular measure. Obviously, then, the E. of the equator is the complement of that of the pole, which latter is equal to the latitude of the place. A star is at its maximum E. when it is situated on the meridian of the place of observation.

Eleventh, in music, an interval of an octave and a fourth.

El'gin, the chief town of Elgin or Moray shire, is beautifully situated in the vale of the Lossie, 5 miles from the mouth of that stream and 177 miles N. of Edinburgh. E., formerly interesting chiefly from the beauty of its situation and the number of its fine antiquities, has considerably altered within recent years. Surrounded by new and elegant villas, the residences of the gentry that have been attracted to a town which as a place of residence offers so many advantages, it has emerged from the quiet that was until lately its chief characteristic, and is now a county town of some gaiety, much exclusiveness, and no trade. It is a station on the Great North of Scotland Railway, and is accessible also by the Highland Railway. With the other 'E. burghs,'—Banff, Peterhead, Inverurie, Cullen, and Kintore—it returns a member to Parliament. E., the ancient *Helgin* (named after *Helgyn*, a Norse chief), was the seat of a royal castle prior to the reign of William the Lion. Of its beautiful cathedral, one of the finest and most interesting remains in the country, the most ancient (Early English) portions were commenced by Bishop Moray in 1224, when the see of Moray was transferred hither from Spynie. The vicissitudes of ages have reduced it to ruin. Other fine buildings were the church of St. Giles and the monastery of the Black Friars, both of which have been demolished. The walls of the church of the convent of Grey Friars still remain. The ruins of the ancient castle crown the elevation known as the Lady Hill. Among the more modern buildings and institutions are Gray's Hospital, a useful institution built and endowed in terms of a bequest of £20,000 left by Dr. Alexander Gray of Bengal; the E. or Anderson Institution, which has had its origin similarly in a bequest of £70,000 by Major-General Anderson; the Courthouse and Union Bank. Pop. parl. burgh 7799; entire civ. par. 9285; entire town 7894.



Elgin Cathedral.

Elgin and Kincardine, Thomas Bruce, Seventh Earl of, was born 20th July, 1766. Educated at St. Andrews, Paris, and in Germany, he entered the army, and rose to the position of general. He was occupied mainly, however, as a diplomatist, and it was while (1799) British envoy at Constantinople that he rescued the Elgin marbles (q.v.) from the Turks, and brought them to this country. In answer to his critics and assailants in connection with this matter, E. published in 1810 a volume entitled *Memorandum on the Subject of the Earl of Elgin's Pursuits in Greece.* For half a century he was a Scotch representative peer. He died at Paris, 14th November, 1841.—**James Bruce, Earl of E. and Kincardine,** a distinguished statesman and diplomatist, son of the preceding, was born in Park Lane, London, 20th July, 1811, was educated at Oxford, and succeeded to the peerage in 1841 on the death of his father. In 1842 he was appointed governor of Jamaica, and in this post, which he held for four years, he showed so much ability, that in 1846 he was made governor-general of Canada, when that dependency was in a state of great discontent. E. restored order, while he settled the 'Fisheries' question, established free trade between the United States and British North America, and introduced the wise policy of self-government into the colony. Although at one time so unpopular that in 1849 he was assaulted by a mob in Montreal for assenting to a bill indemnifying those inhabitants of Lower Canada whose property had been injured or destroyed by the rebellion of 1837-38, he was a universal favourite before he left Canada in 1855. In 1849 he was made a peer of the United Kingdom. In 1857, in consequence of difficulties with China, E. was sent out as Plenipotentiary, and after delay caused by sending the troops under his direction to India to assist in suppressing the Mutiny, he arranged, along with the French Plenipotentiary, Baron Gros, the Treaty of Tientsin (1858), making China freer than it had hitherto been to foreigners. He also concluded a somewhat similar treaty with Japan. Having returned to his native country to fill the office of Postmaster-General, he was soon recalled to China by a treacherous onslaught of the Chinese upon a British squadron, but with the help of French allies he penetrated (1860) to Pekin, and dictated peace there. In 1861 E. succeeded Lord Canning as Viceroy of India, but died of fever, 20th November, 1863, at Dhurumsala in the valley of Cashmere. E. has been succeeded in the earldom by his son, **Victor Alexander Bruce,** born at Montreal, 1849, and the son of his second wife, who was the daughter of the first Earl of Durham. The present Earl was Treasurer of the Household and First Commissioner of Works in 1886. He is Lord-Lieutenant of Fife, and has been a staunch supporter of the Home Rule policy of Mr. Gladstone and Lord Rosebery. In recognition of his services to the party, he was appointed Governor-General of India in 1893 in succession to the Marquess of Lansdowne.

Elgin Marbles, a collection of statues and *alti* and *bassi relievi*, brought chiefly from the Parthenon of Athens by the Earl of Elgin, and purchased from him by Government in 1816 for £35,000. They are now in the British Museum. Lord Byron, in the *Curse of Minerva* and in *Childe Harold*, assailed Lord Elgin for despoiling 'Athena's poor remains,' and Payne Knight declared that the marbles were the works of journeymen unworthy the name of artists, a stricture which elicited an eloquent reply from Benjamin Haydon. It is now evident that the removal of these sculptures from Athens preserved them from mutilation or destruction, and has been most beneficial to English art. They are probably the work of Phidias (B.C. 490-432), and consist of:—(1) The Metopes, which represent the battle of the Centaurs and Lapithæ, a favourite subject of Greek art. According to Visconti, the footmen who are here represented grappling with the Centaurs are intended for the Athenian followers of Theseus. These metopes are considered the finest extant specimens of *alto relievo.* (2) The Frieze, which consisted originally of slabs 3 feet 4 inches in height, extending over 524 feet. Of this, 249 feet are preserved in the British Museum along with 76 feet in plaster casts of portions which were not conveyed to London. This frieze, the largest continuous piece of sculpture produced in Greece, is the perfection of bass-relief. It represents the procession of the *Panathenæa*, or great festival in honour of Minerva held every fifth year, and is unsurpassed for grace, majesty, and animation. It consists mainly of a line of horsemen advancing two abreast; but there are also bearers of vessels, flute-players, victims, and citizens on foot. The attitude of the figures, the distribution of the drapery, is exquisitely varied; the champing horses and graceful riders uniting boldness of form with perfect truth to nature and faultless simplicity of design. 'The horses in the frieze,' said Flaxman, 'appear to live and move. We can scarcely suffer reason to persuade us they are not alive.' (3) Statues and fragments from the east and west pediments. Among these are part of a figure of Hyperion rising from the sea, the heads of the horses of Hyperion, Winged Victory, the Fates, head of one of the horses of Night, torsos of Cecrops, Ceres, fragments of Neptune and Minerva, the Ilissus, a lifelike figure, held by Canova to rival in merit the Theseus or Hercules, which last is a masterpiece of symmetry and truth, and the best-preserved of the marbles. Several of these sculptures seem to have been coloured, and adorned with precious stones and metal trappings.

The E. M. are unsurpassed for harmony and chastity of design, for grandeur of conception along with constant fidelity to nature. 'It is,' says Benjamin Haydon, 'the union of nature with ideal beauty—the probabilities and accidents of bone, flesh, and tendon from extension, action, or repose, that rank the E. M. above all other works of art in the world. Were the E. M. lost there would be as great a gap in art, as there would be in philosophy if Newton had never existed.' See *The E. M.*, by Sir Henry Ellis; *Visconti on the Sculptures in the Collection of the Earl of Elgin; Life of Benjamin Haydon.*

El'ginshire, Mor'ay or **Murr'ay Shire,** a county in the N. of Scotland, consisting of two portions, a smaller (inland) enclosed within the counties of Inverness, Nairn, and Banff, and a larger (maritime) bounded by these counties on the E., S., and W., but washed by the Moray Firth on the N. The Findhorn waters its N.W. corner; the Lossie flows through the middle of the maritime portion, past Elgin into Moray Firth at Lossiemouth; and the Spey flows partly through the county, partly along its eastern boundary. Covesea Caves, near the lighthouse of the same name, are large, intricate, natural windings in the rocks, formerly the resort of smugglers. The surface is mostly flat, and the 'Howe of Moray,' embracing the greater part of the area, is occupied by cultivated fields, of which wheat is the most common crop, and by fir and larch plantations. Sandstone, hard in texture and fine in colour, abounds. The soil is for the most part open and gravelly, with loams and clays in the N., which is very fertile. The climate is mild and dry. Of the 308,499 acres, which form the total area of land and water in E., 37,424 are under corn crops (oats 21,823); 18,144 are under green crops (potatoes 1701, and swedes and turnips 15,997); 38,137 are under clover, sainfoin, and grasses in rotation; and 7794 are under permanent pasture and grass not broken up. Small fruit is cultivated over 27 acres, and 66 represent the amount of bare fallow and uncropped arable land. Mountain and heath occupy 40,194 acres, and 65 are laid out in nursery grounds, while 47,650 are devoted to woods and plantations. For live stock see CATTLE, HORSE, PIG, and SHEEP. E. is the east part of the ancient province of Moray. It was early occupied by Scandinavian tribes, and here, as in the other north-eastern counties, the language, features, names, &c., of the inhabitants still retain distinctive traces of a Scandinavian origin. Elgin Cathedral, Pluscarden Priory, Kinloss Abbey, the 'Norman' church of Birnie, and Spynie Palace, are among the chief architectural antiquities, and there are many old and historically interesting castles. E. and the county of Nairn send a member to Parliament. The chief towns are Elgin and Forres. Pop. civ. county 43,453; parl. county district 31,608; and total E. and Nairn parl. county dist. 37,613.

El'ias, St., a mountain belonging to the range of the Sea Alps, on the N.W. coast of N. America, on the American side of the boundary-line between British N. America and the United States territory of Alaska. It is 17,800 feet above the sea, and the chain of which it is the culminating point extends to the S.E. for nearly 100 miles along the coast.

Eli'jah (Heb. 'God-Jehovah'), 'the grandest and the most romantic character that Israel ever produced,' is called 'the Tishbite of the inhabitants of Gilead,' which is literally all that is known of his parentage and birthplace. The facts of his life, gathered in the Bible narrative, are briefly as follow:—Ahab, the king of Israel, had introduced the religion of his wife's countrymen, the worship of the Phœnician Baal, and it is chiefly as a witness against this dishonour done to Jehovah that E. acts. He first appears on the scene (about 910 B.C.) announcing the vengeance of heaven in the shape of a severe drought and consequent famine. For this he had to flee from the vengeance of Ahab, and especially of Jezebel his wife. He hid himself at the brook Cherith, where his food was brought to him by ravens. From this he removed to Zarephath, between Tyre and Sidon, where he stayed with a widow, whose meal and oil he increased, and whose son he restored to life (1 Kings xvii.). After two years he reappeared before Ahab, and had his famous encounter with the prophets of Baal on Mount Carmel (1 Kings xviii.). Being in consequence again in danger of his life from the rage of Jezebel, he fled to the desert to the S. of Canaan. Arrived at Horeb, he had an interview with Jehovah, who comforted him and instructed him to appoint Elisha his successor. He again confronted Ahab, after his robbery of Naboth (1 Kings xxi.). After Ahab's death E. had occasion to denounce the conduct of his son Ahaziah, who had sent to consult the oracle of Baalzebub at Ekron (2 Kings i.). Finally he was taken up to heaven in a chariot of fire (2 Kings ii.).

There are serious difficulties in connection with E.'s biography, but the method of encountering them has not always been happy. To transform the 'ravens,' *e.g.*, into Arabs, merchants, &c., is a piece of trivial rationalism, whether done in the interests of revelation or against them. The whole career of the great prophet is enveloped in miracle, and cannot possibly be explained by hypotheses which reduce it to a commonplace level. Take away the startling, extraordinary, and marvellous element in his history, and his majestic character disappears along with it. There is nothing left that requires or deserves explanation; we need not suppose any veritable fact in the narrative at all. But great historical figures are not easily manufactured. It is more natural to suppose that the glowing and fearless genius of E. left a mark as true as it was indelible on the national memory; that his patriotic audacity involved him at times in deepest peril, and again secured him moments of supreme triumph. The mysterious Providence that moulds every life might shine out more vividly in this passionately-inspired man, and the circumstances and incidents of his heroic destiny might easily take a colouring of romance from the devotion of a grateful posterity, not because it had forgotten, but because it had remembered, his services to the Jehovistic faith of his fatherland. It may be difficult to reconcile E.'s letter to Jehoram King of Judah (2 Chron. xxi. 12-15) with the apparent date of his 'translation' (2 Kings ii.) five years earlier, but such a difficulty rather concerns a certain theory of inspiration than the really historic character of the record. No grander form stands out in the whole line of Hebrew prophets, nor did the reverence of later ages err when it exclusively associated his name with that of the great legislator himself.

Elimina'tion, in algebra, is the process by which from a given set of equations another is deduced, in which some of the original unknown quantities no longer appear. A system of n homogeneous equations in n variables cannot be satisfied by a common set of values unless there exists a certain definite relation between the coëfficients; and the algebraic expression which, equated to zero, represents this relation is termed the *eliminant* or *resultant* of the system of equations. This eliminant is a determinant of the nth order when the equations are linear. The only two works which can be said to give anything like a complete treatment of the subject are Faa de Bruno's *Théorie Générale d'Élimination*, and Salmon's *Higher Algebra*. The development of its theory and methods is chiefly due to Euler, Bezout, Sylvester, and Cayley.

El'iot, Sir John, an eminent English statesman and orator, in whom it has been well said 'centres the earlier struggle for parliamentary liberty,' was born of an old Devonshire family (since ennobled by the title of Earl of St. Germains) in Cornwall, 20th April, 1592. From an early age he showed a high and fearless spirit, and a vehement temper. After a careful education at Oxford he travelled for some time, and in 1614 entered public life as member for St. Germains. E. obtained the favour of Buckingham, and from

1619 to 1623 held the office of Vice-Admiral of Devonshire, receiving the honour of knighthood. E.'s activity, however, in the suppression of piracy, out of which Buckingham wished to make profit, caused him to lose ground with his patron, and he was even thrown into prison. Early in the reign of Charles I., E., now member for Newport, became prominent as the leader of the Parliamentary or Country party, and the uncompromising opponent of Buckingham. Fixing upon the responsibility of the king's ministers to Parliament as the leading principle of constitutional government, he led the House of Commons by a series of remarkable speeches to impeach the minister, and in this course he persisted, although he was thrown into prison for ten days. He was the prime mover of the first Grand Remonstrance on the 'state of the realm,' which preceded the assassination of Buckingham, and in the third Parliament of Charles denounced the dissolution which the infatuated monarch had determined on, saying, 'Some have gone about to break Parliaments, but in the end Parliaments have broken them.' In 1629 he was, along with two other leaders of his party, thrown into the Tower on the charge of disobedience to the royal commands, and ordered before liberation to pay fines of £2000, £1000, and £500. He refused, and his confinement was so rigorous that his health broke down, and he died 27th November, 1632. He had spent his time in prison in corresponding with his family and political friends, and in writing—among his works being a fragmentary *Memoir*, and an *Apology for Socrates*. A complete biography of E. is that by the late John Forster.

Eliot, George, the literary pseudonym adopted in 1857 by Marian Evans, one of the greatest of English novelists. The daughter of a land-agent, she was born near Nuneaton, Warwickshire, 22nd November, 1820, and received her early education at Coventry. Among her first efforts were translations of Strauss's *Leben Jesu* (1846) and Feuerbach's *Wesen das Christenthums* (1853); and, after a residence at Geneva (1849-51), she settled in London, becoming sub-editor of the *Westminster Review*. In the autumn of 1856 the editor of *Blackwood's Magazine* received from George Henry Lewes, as the work of an anonymous friend, the first of those *Scenes of Clerical Life* whose appearance next year proclaimed the rise of a new master-mind—a woman's, as Dickens was probably first to divine. They were followed in brilliant succession by *Adam Bede* (1859) *The Mill on the Floss* (1860), *Silas Marner* (1861), *Romola* (1863), *Felix Holt* (1866), *Middlemarch* (1872), and *Daniel Deronda* (1876). G. E. also published poems—the longest, *The Spanish Gypsy* (1868); the most powerful, *The Legend of Jubal* (1870)—and a volume of essays, *Theophrastus Such* (1879); but it is her novels that give her a claim to be remembered as the most commanding genius that has appeared among women in the whole realm of literature. Her special sphere was that quiet English country life which she had known in early youth; but her works are mainly distinguished by philosophic thought and profusion of scientific illustration, by intensity of unsectarian religious thought, by familiarity with the subtler processes of the mind, and with both the outer and the inner life of English society, and by a pure and strong sympathy with human knowledge. *Romola*, deemed by some 'a magnificent piece of cram,' by more regarded as her masterpiece, is altogether exceptional, a picture of Florentine life in the days of Savonarola. G. E. married first G. H. Lewes (q.v.), and afterwards a gentleman of the name of Cross. She died in Cheyne Walk, Chelsea, 22nd December, 1880.

Eliot, John, the 'Apostle of the Indians,' was born at Nasing, Essex, in 1604, educated at Cambridge, and emigrated to Massachusetts in 1631. He became pastor of the church in Roxbury near Boston, and applied himself to the Indian languages. In 1646, with a few friends, he went to a company of Indians and explained to them the Christian religion. Encouraged by the interest they evinced, he obtained a grant of land from the colonial government on which the Indians might settle and become civilised. By 1674 there were fourteen such settlements, to all of which E. preached. Though still pastor of Roxbury, he regularly travelled through forests and swamps to visit his dusky converts. In 1660 the important Indian church of Natick was formed. About this time E. published the New Testament in the Indian language, and three years after the Old Testament, the first Bible printed in America—a work of great philological interest. E. also instituted schools and wrote school books for the Indians. He died 20th May, 1690. See biography by Small, prefixed to facsimile of his *Indian Primer* (Edinb. 1878).

E'lis, an ancient division of the Peloponnesus, extended from Achaia on the N. to Messenia on the S., and from Arcadia in the E. to the Ionian Sea on the W. It was divided into three parts—E. Proper, or Hollow E., in the N., which consists of a fertile plain watered by the river Peneus; Pisatis, in the middle, which is the lower valley of the Alpheius; and Triphylia ('the country of the three tribes') in the S. E. contains more fertile land than any other division of the Peloponnesus, and produced in abundance wheat, flax, cotton, and grapes. Its rich pastures reared numerous horses and cattle, and it still contains much excellent timber. It possessed the temple of Olympian Zeus, whose festival, celebrated once in four years at Olympia, drew thither strangers in vast numbers; and in consequence of the sacred character which it thus acquired, its soil was regarded by the Greeks as inviolable. These games were abolished by Theodosius, A.D. 394. Of the ancient city of E., now *Kaloskopi*, the existing remains are scanty. Its gymnasium was by far the largest in Greece, and in it the competitors at the Olympic games were compelled to undergo a month's training before the competition. Modern E., together with Achaia, has an area of 1901 sq. miles and a pop. of 210,713.

Eli'sha (Heb. 'God the deliverer'), the disciple and successor of Elijah, held the office of prophet in Israel for a period of not less than sixty-five years [called at least four years before the death of Ahab (1 Kings xix.-xxii.) and died in the reign of Joash]. This prophet presents a striking contrast in appearance, manners, and character to his predecessor. Elijah, with his disordered locks and rough dress, was a true son of the desert, and made the desert his home; E. was a civilised man, dressed in the ordinary style, and frequenting the haunts of men. In character the former was distinguished by fiery zeal against all that opposed Jehovah; the latter, by toleration towards the false religions and general beneficence. The most remarkable feature of the history of E. is the great number of miracles he performed, and the astonishing nature of some of them—*e.g.*, the horses and chariots of fire that encompassed him at Samaria; the smiting of the Syrian host with blindness, and their subsequent capture; the swimming of the iron in the water; the raising to life of a dead man by touching the bones of the buried prophet—in all of which E. appears not like one on whom a double portion of Elijah's spirit had fallen, but rather as an Oriental thaumaturgist. The moral and spiritual elements are absent from the circumstances of his career. We cannot discover in him an instructor and guide of the people, and, except in a certain mildness and gentleness of character, to which the maniacal outburst of temper at Bethel, when he cursed the children in the name of the Lord, and procured their destruction, forms a startling exception, there is little to justify the parallel drawn between him and Christ.

Elisors. If the sheriff, or coroner, who ought to return the jury be a party to a suit, or interested in it, the *venire* (see VENIRE FACIAS) is directed to two clerks of the court, or to two persons of the county named by the court and sworn; and these two, who are called E., or electors, shall name the jury, and that without challenge.

Elix'ir (Arab. *al-iksir*, 'quintessence'), a term in chemistry and modern pharmacy used to denote a tincture with more than one base, or a compound tincture. Among the alchemists an E. denoted a liquor for transmuting metals into gold, and in later times a quintessence, a cordial, or a substance which invigorates. The term tincture is now more common. A great variety of medicines have appeared under the term *E. vitæ*, or E. of life, which are merely compound tinctures of aromatic and stimulating substances. The elixirs best known in pharmacy are the following :—E. paregoric, or *Tinctura camphoræ composita*, a preparation of opium, benzoic acid, camphor, oil of anise, and proof spirit, an excellent remedy for allaying spasmodic cough in bronchitis and phthisis; dose from 15 to 60 minims; 1 drachm contains ¼-grain powder of opium = ⅛ grain of extract. E. of vitriol, or *Acidum sulphuricum aromaticum*, is prepared from sulphuric acid, rectified spirit, cinnamon, and ginger. It is used for making an acid drink, and for checking profuse perspiration. Tincture of aloes and myrrh is sometimes called *E. proprietatis*.

Eliz'abetgrad, a town in the government of Kherson, Russia, on the Ingul, 130 miles N. by W. of Kherson. It has an arsenal with six bastions, and there are four suburbs. The streets, spacious and well built, are in some instances lined with trees. E. has a good general trade and an important annual fair. Pop. 58,720.

Eliz'abeth, Queen of England, the daughter of Henry VIII. and Anne Boleyn, was born 7th September, 1533. She shared her mother's disgrace, and was for a time in seclusion. From this she was allowed for a short period to emerge, but was again disgraced and declared illegitimate along with her sister Mary. In the reign of Edward VI. E. appeared at court, and having avowed herself a Protestant, was looked upon as the hope of the Protestant party. But in the reign of Mary, though she conformed to Papistry, she once more suffered under the royal displeasure. Accused of being concerned in the plot of Sir Thomas Wyatt, she was sent to the Tower in 1554, and would have probably been beheaded but for the fear of a Protestant rising. On her release she was transferred to Woodstock, and then allowed to remain at her residence, Hatfield House, in Hertfordshire, till the death of Mary, 17th November, 1558.

These hardships made E. the singular and successful sovereign she is universally recognised to have been. From her father she inherited courage, pride, frankness, bluff and sometimes brutal manners, cordiality in her dealings with, and a genuine love for, her subjects; from her mother a sensuous nature, a commanding figure, and love of flattery. But her early education in the school of solitude and misfortune rendered her capable of subordinating the gratification of her passions to that of her intellect, taught her what was then the politician's chief art, dissimulation, and made her the most accomplished and eccentric woman of her time. While her brother Edward VI. thought her the essence of propriety, and called her his 'sweet sister Temperance,' she was coquetting outrageously with Lord Seymour, and yet she jested at his death. Her varied culture at court and in retirement made her at once a graceful dancer and musician, a skilful horsewoman, a devotee to classics and to the 'new literature,' as familiar with Tasso and Ariosto as with Demosthenes; 'she could talk poetry with Spenser and philosophy with Bruno; she could discuss euphuism with Lyly, and enjoy the chivalry of Essex; she could turn from talk of the court fashions to pore with Cecil over despatches and treasury books; she could pass from talking business with Walsingham to settle points of doctrine with Parker, or to calculate with Frobisher the chances of a N.W. passage to the Indies.' Extravagantly fond of rich dresses, jewels, and gorgeous processions, she was also extremely economical. She detested war on account of its expense, and grumbled at the bill she had to pay for the defeat of the Armada. Although her passions frequently led her astray, she never let them seriously affect her public policy; throughout her reign she was guided by the counsels of the Cecils, and not by those of Leicester and Essex.

When E. ascended the throne in her twenty-fifth year, she was welcomed by all classes, Catholics as well as Protestants, for her religious opinions were known to be moderate, and domestic misgovernment, national disorders, and religious fanaticism had made the name of Mary in the last degree odious. Circumstances, more than religious sentiment, made E. a Protestant sovereign. She fell back upon what her father did. The majority in her first Parliament was Protestant, and it repealed the Statutes of Heresy, dissolved the monasteries which had been founded, deprived Mary's bishops of their office, restored the royal supremacy, and established the Church on the Prayer-Book of Edward VI. and the Thirty-Nine Articles. In her ecclesiastical policy she was aided by Parker, a moderate but resolute divine, who was made Archbishop of Canterbury in 1559, and in her foreign policy by William Cecil, Lord Burleigh. Although the former was non-revolutionary and the latter peaceful, yet the Act of Uniformity by which her Church policy was carried out led to bloody persecutions both of Romanists and of Puritans, or the Protestants who took their doctrines from Geneva, while the policy of Cecil ended in war. E. supported by money the Protestants struggling in France, in the Netherlands, and in Scotland. Her rival Mary, Queen of Scots (q.v.), brought into collision with the Scottish nation, fled into England and was imprisoned by E. Being looked upon as the next heir to the throne, Mary became the hope of the Roman Catholic faction in England. Conspiracies were formed in her favour. The Dukes of Northumberland and Westmoreland headed a rebellion in the north which was put down with great severity. Pope Pius V. published a bull absolving E.'s subjects from their allegiance to her. At length the discovery by the spies of Walsingham (q.v.) of a plot against her life by a Roman Catholic gentleman named Babington led to an outcry by Parliament for vengeance on Mary. She was charged with being accessory to Babington's plot, tried before a commission, and beheaded 8th February, 1587, in the hall of Fotheringay Castle. Mary had bequeathed to Philip of Spain her rights upon England, and he, resenting the aid given to the Netherlanders, and the attacks made by British seamen on Spanish commerce, resolved on vengeance. The destruction of the 'Armada' (q.v.) was the greatest event in the reign of E. Dudley, Earl of Leicester, who had commanded one of the armies that was prepared to meet the troops of the Duke of Parma, died suddenly in the midst of the national rejoicings, and E. was never herself again. The latter years of her reign were occupied chiefly with Irish affairs. Hugh O'Neil, Earl of Tyrone, raised (in 1595) the flag of rebellion against the authority of England, which had been established in the reign of Henry VIII., and for a time overran Ireland. E. sent against him Essex, who had succeeded Leicester as her favourite, but Essex was not successful and made a delusive truce with Tyrone. He was in consequence recalled, and attempting an insurrection in London, was apprehended, tried, and beheaded 25th February, 1601. Although Ireland was subsequently reduced to submission by Blount, Lord Mountjoy, E. fell into a state of utter despondency after the death of Essex, and, indeed, may be said to have outlived her time. She lived into a period of earnest Puritanism which failed to understand, still less to approve of, her vanity and irreligion; and although by skilful concessions, especially on the matter of monopolies, she avoided a collision with Parliament, she would, had she lived, probably have been found in opposition to the wishes of the second generation of her subjects. In the end her temper became intolerable. She chid her attendants and even her chief adviser, the second Cecil. She believed that she was beset with murderers, had a sword constantly beside her, and repeatedly thrust it through the arras. Finally she refused to take sustenance. Her last act was to indicate by a motion of her head that she wished her successor to be James VI. of Scotland. She died in her seventieth year, 24th March, 1603.

The life of E. was essentially lonely and far from happy. She refused to be married, even when Parliament petitioned her, and declined the offers made by numerous and powerful suitors, including Henri of Anjou, the Duc d'Alençon, Prince Erik of Sweden, the Archduke Karl of Austria, and even, it is said, Philip of Spain; and yet that she felt her loneliness is plain from such ejaculations as that on hearing of the birth of a son to Mary, Queen of Scots—'The Queen of Scots has a fair son, and I am but a barren stock.' It seems now to be proved beyond dispute that she would have gladly married the worthless Leicester, and it is far from certain that she did not stoop to be an accessory to the murder of Amy Robsart, Leicester's wife. Burleigh was able to prevent this marriage, but he was not able to persuade her to another.

From the reign of E. may be said to date the material prosperity, the naval power, the commercial activity, and the literary glory of Great Britain. The great seamen and adventurers of the time, Hawkins, Drake, Frobisher, and Raleigh, made their country the mistress of the seas, and found an outlet for its commercial and colonising energy. What grew into the East India Company obtained its charter, and Birmingham, Manchester, and Sheffield became seats of manufactures. The general increase of wealth showed itself in an increase of luxury, in richer dresses and better houses than had hitherto been known. The first attempt was made by the suppression of mendicity to grapple with the problem of pauperism. The reign of E. saw the fulness of the literary glory of Sidney and Spenser, the death of Marlowe, and the rise of Shakespeare. See Camden's *Annales Rerum Anglicarum et Hibernicarum regnante Elisabethâ* (Lond. 1615); Froude's *History of England* (vols. vii. to xii.), which is especially valuable for the extracts from the state-papers of Cecil, and the documents preserved in the archives at Simancas; also the authorities quoted in Green's *Short History of the English People*.

Elizabeth Stuart, Queen of Bohemia, born in 1596, was the daughter of James I. of England and Anne of Denmark. In 1613 she married the Elector Palatine, Friedrich V., who on the forced abdication of Ferdinand II. in 1619, was called to the throne of Bohemia. This he lost by the battle of Prague (8th November, 1620), which drove the royal spouses to Holland. It was not till after the Peace of Westphalia that E.'s son Karl recovered his father's hereditary estates in the Palatinate. E.'s eldest son was christened Moritz by the Prince of Orange. E. died at London, 13th February, 1662. She left a daughter, E., who, during her parents' retreat at Leyden, studied geometry and metaphysics with Descartes, who dedicated to her his *Principia*. This lady afterwards withdrew to the Abbey of Heroorden, which yielded her 20,000 dollars of income, and where she kept an open house for literary persons of all churches and creeds, Catholics as well as Free-thinkers, and Unitarians as well as Lutherans. She died in 1680. See Miss Benger's *Memoirs of E. S., Queen of Bohemia*.

Elizabeth of Valois, Queen of Spain, born at Fontainebleau, 13th April, 1545, was the daughter of Henri II. and Catharine de Médicis. 'The Princess of Peace' was promised in marriage first to Edward VI. of England, then to Don Carlos, but was ultimately married to Philip II. in 1559, the Duke of Alva appearing as proxy at Notre Dame. She met her husband at Guadalavara, and Brantôme says stared at him so much that Philip said, 'What are you looking at? Is my hair white?' After a short and unhappy life E. died at Madrid, 3rd October, 1568. See Brantôme's *Vie des Dames Illustres*.

Elizabeth, Queen of Spain, born 22nd November, 1602, was the daughter of Henri IV. and Marie de Médicis. She married Philip IV. of Spain in 1615, the Infanta Anna Maria of Austria being at the same time given to Louis XIII., a proceeding most distasteful to the Huguenots. E. had an enemy in the Minister Olivarez. She displayed political energy, and a strong love of her adopted country. She died 6th October, 1644.

Elizabeth Farnese, Queen of Spain, born 25th October, 1692, was the daughter of Odoardo II. of Parma. She was ill-treated by her parents, and was a singularly ugly and obstinate child. In 1714, on the suggestion of Alberoni and the Princess des Ursins, *camarera mayor* or first maid of honour at the Spanish court, she married Philip V., then a widower. Her first act was to drive Des Ursins from Spain. Her active mind at once assumed the mastery over Philip, whom she reconciled with the Duc d'Orleans. She supported the Inquisition, and substituted D'Aubenton for Robinet as the King's confessor. The Spaniards resented the increase of Italian influence at the court. The temporary abdication of the jealous and hypochondriac Philip and the reign of her stepson Louis interrupted her schemes, pursued in the European alliances, the Congress of Cambrai, the Congress of Soissons, &c., for securing the Two Sicilies and the Duchies of Parma and Piacenza to her son Carlos, who became King of Naples in 1734, and Charles II. of Spain in 1759. E. survived her husband until 1766. The 'tenacious termagant,' as Carlyle calls her, had great political ability; she spoke fluently in Spanish, Latin, German, and French. Among her younger children were Maria Anna, married to Joseph, King of Portugal, and Marie-Antoinette, married to Victor Amadeus, King of Sardinia. E.'s *Memoirs* were published in 4 vols. at London, 1746. See also Peralla, *Historia Civil*, and the innumerable private memoirs of the time (Noailles, Saint Simon, Duclos, &c.).

Elizabeth Christine of Brunswick-Wolfenbüttel, born 28th April, 1691, was the daughter of Ludwig-Rudolf of Brunswick-Blankenburg. Her grandfather, Anton Ulrich, who wrote novels—'six vols. in 4to'—brought about her marriage with the Archduke Karl, who had been previously refused by Caroline of Anspach. This event in 1707 caused the elder Brunswick family to become Catholic. E. was proclaimed Queen of Spain at Barcelona, and after her husband's election as Emperor acted as regent there till the Peace of Utrecht (1713). She was then crowned at Presburg Queen of Hungary. On her husband's death in 1740, E. devoted herself to the cause of her daughter, the famous Maria Theresa. She founded the order of the Red and White Star, to be conferred by the Aulic Council of War on twenty-one superior officers who should have served Austria for thirty years. E.'s sister Charlotte married Alexius, the Czarovitch, and had a 'fabulous end.' Her sister Antoinette married Ferdinand Albrecht of Brunswick-Bevern, and became the mother of Friedrich the Great's wife. E. died 21st December, 1750.

Elizabeth, Queen of Hungary and Poland, the daughter of Stephen, Ban of Bosnia, married in 1363 to Louis the Great, King of Hungary and Poland. After her husband's death E., as regent, assisted by the Palatine, Nicolas of Gara, oppressed her subjects until the arrival of a Neapolitan prince, Charles of Durazzo, who was crowned in 1385, and soon after was murdered. E. was herself murdered in 1387 by the Ban of Croatia.

Elizabeth of Poland, Queen of Hungary and Transylvania, born in 1518, daughter of Sigismund I. of Poland, married to John Zapolski, whose death in 1540 left her in a difficult position between Ferdinand I. on the one hand, and the Sultan Suliman, who took possession of Hungary, on the other. E. offered to cede Transylvania to Ferdinand for Ratibor and Oppeln in Silesia, but the bargain was not carried out, and the Turks helped her to drive the Austrians from Transylvania. She died 20th September, 1558, leaving a son Stephen, or John Sigismund.

Elizabeth Petrov'na, Empress of Russia, was the daughter of Peter the Great and Catharine I., and was born 18th December, 1709. Contrary to the order of succession prescribed by the will of Catharine, on the death in 1730 of Peter II., the Dolgorouki family placed on the throne Anna, Duchess of Courland, a niece of Peter the Great. (See ANNA and BIRON.) But a palace insurrection made E. empress, 6th December, 1741. In her reign capital punishment was abolished, but the activity of the 'Secret Chancery' caused the greatest misery, and the ancient authority of the Senate was restored. A successful war against Sweden was terminated by the Peace of Abo (1743), and E. selected the new King of Sweden, Adolf of Holstein-Gottorp. E. made her nephew, the Duke of Holstein (afterwards Peter III.), her presumptive heir, and gave him as wife Sophie of Anhalt-Zerbst (afterwards Catharine the Great). She encouraged education by founding a university at Moscow and an academy of fine arts at St. Petersburg, and she gave to Voltaire the materials for his work on *Russia under Peter the Great*. There were many reasons for the war with Prussia—the influence of Bestuchef, 'corruptiblest brute of a chancellor ever known'; the war-policy of Schouvalov; the indignation of the Czarovitch, whose wife E. had insulted; and, lastly, a personal pique against Friedrich on the part of E. In the Seven Years' War her troops were repeatedly successful, and her death, 5th January, 1762, was a fortunate thing for Friedrich, as her successor Peter was friendly to Prussia. E. earned for herself in Europe the shameful title of 'Catin du Nord.' She was grossly superstitious, being unable to face the dark; and extravagantly luxurious, leaving 15,000 unused dresses in her wardrobe. See Weydemeyer's *Zarstwowanie Elisawety Petrowny* (Petersb. 1834).

Elizabeth of Thuringia, St., daughter of King Andreas II. of Hungary, was born at Presburg in 1207. She was married at the age of fourteen to Ludwig, son of Hermann, Landgraf of Thuringia. When a girl, she astonished the court of Wartburg, the brilliant resort of the *minnesingers*, by her gentleness, benevolence, and piety. After her husband's death in the Fifth Crusade, his brother, Heinrich Raspe, stripped her of authority, which she afterwards declined to resume, contenting herself with her revenues as Landgräfinn. She spent her life in constant penances and benefactions, wandering about to relieve the sick and the poor, and was brutally maltreated by her fanatical confessor, Konrad of Marburg. Worn out by sufferings, she died, at the age of twenty-four, in 1231, in one of the many hospitals which she had erected in Germany. She was canonised in 1235. The victim of monkish cruelty and of her own false ideal of duty, she led a singularly mournful, stainless, and noble though mistaken life. In piety and self-sacrificing zeal she resembles the celebrated St. Theresa. The story forms the subject of Kingsley's *Saint's Tragedy*. See Montalembert's *Histoire de Sainte Elisabeth de Hongrie* (Par. 1836).

Elizabe'than Ar'chitecture, a transition style of English architecture, unique in its origin, application, and duration. It arose with and reached its prime during the reign of Elizabeth, and its chief characteristic as an architectural style is a revived classicism engrafted upon the domestic Gothic of the Tudor period. The necessity for building great cathedrals passed away at the completion of the Reformation, and the hatred of symbols which now took possession of the nation's mind, and of the pride and pomp of the ceremonial of the old religion, as savouring of idolatry, was extended in part to the old religious houses. While many of these were destroyed or injured, no rich and splendid churches were being built for the Protestants, and architecture, no longer employed in building temples for God, was almost wholly occupied during Elizabeth's reign in building mansions for the nobility and gentry. It was evident that a Reformed people could not dwell in mansions the style and feeling of which were Gothic and Catholic; and as at this time—the earlier half of the 16th c.—a classic renaissance in literature and art was beginning to shed abroad its borrowed light, the architects of the period eagerly appropriated classical outline and detail, and modifying these by rules best known to themselves, and combining them with the chief structural features of the late domestic Perpendicular, they created E. A. This style prevailed for about a century. Though true to neither Gothic nor Classical architecture, E. A. is stately and picturesque. It embodied all the ideas of splendour and luxuriousness that prevailed during the 16th c., and its chief characteristics were great bow windows, long and wide galleries, vast elaborately-carved chimneypieces, panelled and wainscoted walls, spacious staircases with carved balustrades, heraldic figures, &c. Noble specimens of this architectural style are Campden House, Longleat, Holland House, Kensington, Hardwick, Burleigh, and Knowle. See Fergusson's *History of Architecture.*

Elizabeto'pol, a town of Russian Transcaucasia, on the Jansha, and capital of a government of the same name. It is divided into four quarters, two of which are inhabited by Armenians and two by Tartars. Pop. 22,073. The principal industries are horticulture and the rearing of bees, silkworms, and cattle. The *government* of E. has an area of 16,721 sq. miles and a pop. of 793,969. Its chief products are madder, tobacco, lint, and grain.

Elk or Moose Deer, the largest species of *Cervidæ* or Deer (q.v.) inhabiting N. Europe and America, being known under the name of 'Moose' in the latter continent. In the E. genus the neck is short and thick, and the hair bushy and coarse. A 'mane' exists on the throat, and the hind legs have tufts of hair above the metatarsus. The muzzle is broad and hairy, and the horns are large and 'palmed,' but have no basal 'snags,' or short branches near the crown. The tail is very short. The E. may attain a height of 7 feet at the shoulders. Its colour is a dark brown, the legs possessing lighter tints. The E. is hunted for the sake of its horns, skin, and flesh. It is wonderfully agile and swift, but is speedily overtaken in snow. When brought to bay, it will fight with great courage and ferocity. It may be domesticated and trained to carry burdens if captured young. The horns in a large specimen may weigh about 60 lbs. In Sweden the E. is not allowed to be hunted, and the chase is greatly restricted in Norway.

American Elk, or Moose.

Elk, Irish, a famous fossil and extinct genus of deer, supposed to be intermediate in structural position with the Reindeer (q.v.) and Fallow Deer (q.v.). Its remains occur in the Pleistocene or Post-tertiary deposits of Ireland, and also in deposits of similar age in England, Scotland, and on the Continent. This animal was of very large size, and the antlers were enormous, attaining an expanse of 10 feet from tip to tip, and a weight of between 70 and 100 lbs. The I. E. does not appear to have survived into the Prehistoric period.

El Khar'geh, the chief town of the Great Oasis, in the Libyan Desert, 115 miles W. of Esneh, on the Nile. The Khargeh and Dakhel oases, taken together, form the Great Oasis. E. K. is the centre of numerous converging routes between the Nile on the E. and the oases on the W. and N. In the vicinity are extensive palm-groves, and there are numerous Egyptian, Roman, and Arabic remains. The oasis and town were visited by Schweinfurth in the winter of 1873-74, by Rohlfs in 1874, and by the Grand Duke of Oldenburg in 1875. Pop. 4060.

Ell (Dutch *eln*, Fr. *aune*, Lat. *ulna*), a linear measure taken originally from the length of the fore-arm. The Flemish E. is 27 inches long; the French E. (see AUNE), 47¼ inches; and the English E., 45 inches.

Ell'enborough, Earl of, Edward Law, an English orator and statesman, was born 8th September, 1790, educated at Eton and Cambridge, and became Lord Privy Seal under the Duke of Wellington (1828), and President of the Board of Control in the two administrations of Sir Robert Peel. In 1841 he was made Governor-General of India. In this capacity his policy was vigorous, and he aided in vindicating the British honour in Afghanistan, but gave great offence to the civil servants of the Company, while some of his proclamations—particularly that in regard to the sandal-wood gates of the temple of Somnauth—provoked much censure and ridicule. Ultimately E. was recalled (1844). He was, however, supported by the Government, appointed to the office of First Lord of the Admiralty, and raised to the dignity of earl and viscount. In Lord Derby's administration of 1858 E. became Indian Minister, but was again unfortunate; a despatch he sent to Viscount Canning rebuking him for what is known as his Oude Proclamation caused a great outcry, and compelled him to resign (1858). After this E. was one of the keenest and most eloquent of the critics of Liberal administrations. He died at his seat, Southam House, near Cheltenham, 22nd December, 1871. See Lord Colchester's *Defence of Lord E.'s Indian Administration* (Lond. 1875).

Ell′enrieder, Marie, a German painter, was born at Constance in 1791, studied art in her native place, but afterwards at Munich and Rome. At Karlsruhe, where she lived for some time, she painted a 'Martyrdom of St. Stephen,' after which she was nominated court painter at Munich. After a second visit to Rome in 1839, she returned to Constance, where she settled till her death in June, 1863. Such were the grace and sweetness of her heads of women and children that it has been said of her 'she painted with angels about her.' Her subjects were for the most part sacred. 'A Child Overtaken by a Thunderstorm' is her best-known *genre* work.

Elles′mere, Francis Egerton, Earl of, an English nobleman and man of letters, was the second son of the first Duke of Sutherland, and was born in London, 1st January, 1800. He entered Parliament in 1822 as Lord Francis Leveson-Gower, supported the cause of free-trade, and helped to establish the University of London. In 1846 he was elevated to the peerage as Earl of Ellesmere. He died 18th February, 1857. E. was an ardent student and a respectable *littérateur*. In 1824 he published a translation of *Faust* with versions of lyrics from Goethe, Schiller, and others; *Mediterranean Sketches* (1843); *The Two Sieges of Vienna by the Turks* (1847); and *Guide to Northern Archæology* (1848).

Ellesmere, a town on the N. border of Shropshire, 10 miles S.W. of Whitchurch by railway. It has a church, part of which dates from the 14th c., and it is situated near a fine lake. Pop. reg. sub-dist. 6296; and civ. par. 5507. The people are mostly engaged in malting.

Ellesmere, Lake, in the province of Canterbury, New Zealand, 20 miles S. of Christchurch, has an area of 125 sq. miles. It receives the Selwyn, but has no outlet, except in wet seasons, when it overflows into the sea.

Ell′ichpoor or Ellichpur (*Ilichpur*), the chief town of a district of the same name in Berar, or assigned districts of the Nizam, 275 miles N. of Hyderabad, and 100 E. of Nagpur. It has a beautiful well and many fine tombs, surrounded by gardens. There is a military cantonment at Paratwada, two miles distant from the town, where the Hyderabad contingent of 73 cavalry, one battery of artillery, and 765 infantry are quartered. The trade is in local products. There are manufactures of cotton and silk fabrics, carved articles, lac ornaments, &c. Pop. 26,637, of whom 19,042 are Hindus, 7301 are Mohammedans, 250 are Jains, and 3 are Parsees.—The *district* is the most mountainous in Berar. Area, 2623 sq. miles; pop. 315,798. The gross revenue is £123,652. The chief products are *joar* (a kind of millet), cotton, rice, excellent wheat, grain, pulses, oilseeds, and timber; besides tea, and various kinds of fruit. In 1853 the district was assigned to the British. The climate is trying, and cholera, small-pox, and fevers prevail.

Ell′iot, an ancient Scottish border family, which has produced several distinguished men. The first really notable E. was **Gilbert**, 'the laird of Stobbs,' in Roxburghshire, who married a daughter of Scott of Harden, and was the grandfather of the Gilbert E. who was made a baronet in 1666. From the latter's younger son are descended the Earls of Minto; while his elder son was father of **George Augustus E.**, the defender of Gibraltar, who was born in 1718, entered the army at the age of fifteen, and distinguished himself at the battle of Dettingen and in the Seven Years' War. After the peace, he was made lieutenant-general, and having been appointed Governor of Gibraltar in 1775, he, in 1782, repelled the prolonged attacks of a Franco-Spanish force of 30,000 men, supported by ten floating batteries, and compelled the enemy to change the siege into a blockade, which ended in the Peace of Versailles, 20th January, 1783. E. received the Order of the Bath, and afterwards the title of Lord Heathfield. He died 6th July, 1790.—**Sir George E.**, brother of the first Earl of Minto, was born 12th August, 1784, entered the navy, rose rapidly in the service, and in 1837 was appointed one of the Lords of the Admiralty, and Commander of the Fleet at the Cape of Good Hope. In 1840 he was appointed to the chief naval command in Chinese waters, and on the 5th of July he captured the island of Chusan. He was promoted vice-admiral in 1847, admiral in 1853, and died at Kensington, 24th June, 1863.—**Sir Charles E., K.C.B.**, nephew of the preceding, was born in 1801, entered the navy in 1816, served in India, on the African coast, and the W. Indies. In 1835 he was appointed Chief Commissioner and Plenipotentiary in China. He was in the centre of the diplomatic operations leading up to the ransom of Canton in August, 1841, and was subsequently in succession Chargé d'Affaires in Texas (1842-46), Governor of the Bermudas (1847-52), of Trinidad (1853-56), of St. Helena (1863-69). He died at Withycombe, Devon, 9th September, 1875.—**Sir Henry Meiers E.**, son of John E. of Pimlico, was born in 1808, educated at Winchester, and entered the Indian civil service, the first of the competition set, in 1827. He became Secretary to the Government of India in the Foreign Department, and died at the Cape of Good Hope in 1853. His chief work was his posthumous *History of India as told by its own Historians* (Lond. 1867). He also wrote a *Supplement to the Glossary of the Indian Terms*, from which was compiled *Memoirs on the Races of the North-Western Provinces of India* (Lond. 1859).

Elliot, Ebenezer, the 'Corn-law Rhymer,' was born near Rotherham, in Yorkshire, 7th March, 1781. He began life in an iron-foundry, where his father was clerk. In 1821 he started an iron-work at Sheffield, and was so successful that he retired from business in 1841. He died near Barnsley, 1st December, 1849. E.'s poems comprise—(1) Pieces descriptive of scenery and rural life, chiefly in Yorkshire, as, *The Vernal Walk*, *Night*, *Wharncliffe*, *The Village Patriarch*; (2) the political pieces, or *Corn-Law Rhymes*, to which he more especially owes his fame. These appeared between 1831 and 1836, and are marked by great fire of diction and a certain rude straightforward earnestness. In 1834 appeared a collected edition of E.'s works in 3 vols.; in 1840 an one vol. edition. See Carlyle's essay on the *Corn-Law Rhymes*, and an autobiographic sketch in the *Athenæum* of 12th January, 1850.

Ellipse′, a central curve of the second order, distinguished from the Hyperbola (q.v.) in having no infinite branches. It is one of the so-called conic sections, being the curve in which a right cone is intersected by a plane cutting its opposite sides obliquely. Every point on the circumference is such that the sum of the lines drawn from it to two certain fixed points inside the figure is equal to a constant quantity. These two points are called the *foci* (sing. *focus*). It is symmetrical with respect to two axes, the *major* and *minor*, in the former of which the foci lie. The double ordinate through either focus is called the parameter, and is a third proportional to the axes. Also, the square of any ordinate is less than, or differs in *defect* from, the rectangle contained by the abscissa and parameter—whence the name E.

Ellip′sis (Gr. *elleipsis*, 'omission'), a figure in grammar and rhetoric, by which one or more words are omitted, to be filled in by the imagination. It expresses strong feeling, and conduces to brevity and energy, as in many familiar phrases. The omission of connectives, as in 'The wind passeth over it —it is gone,' is called *asyndeton*, a figure of great importance with the Greek rhetoricians.

Ellip'soid, a surface of the second degree, whose *every* plane section is an ellipse. It is completely determined by its three rectangular axes, *a*, *b*, and *c*. If any two of these axes be equal, the surface becomes an E. of revolution or Spheroid (q.v.).

Ell'is, George, F.R.S., F.S.A., one of the earliest, soundest, and most tasteful of the scholars who have devoted themselves to Early English literature, was born in London in 1745. He was educated at Westminster school and at Cambridge, was one of the authors of the *Rolliad*, a satire on Pitt, with whom he afterwards became reconciled; accompanied Lord Malmesbury as secretary to Lisle in 1797; became a contributor to the *Anti-Jacobin*, and died 15th April, 1815. Walter Scott said E. was the best converser he had known. E.'s works are *Specimens of the Early English Poets* (1790); *Specimens of English Metrical Romances; Essay on the Formation and Progress of the English Language;* and a preface, notes, and appendix to Le Grand's *Fabliaux*. E. renders the quaint language of mediæval poets into modern English with a graceful ease which is made doubly charming by a curious combination of genuine sympathy with mocking humour. He was a worthy forerunner of the new school of critics and historians who have revived an interest in our early literature.—**William E.,** born in London, 29th August, 1794, worked as a missionary in the South Sea Islands from 1816 to 1824, when he returned to London. He was Foreign Secretary of the London Missionary Society from 1838 to 1840. In 1853 he visited Madagascar to examine the state of Christianity there. The results of this journey were embodied in his *Three Visits to Madagascar*, 1853-56, *with Notices of the People, Natural History, &c.* (1859), an excellent work. His other works are—*Narrative of a Tour through Owhyhee* (1826); *Polynesian Researches* (1829); *History of Madagascar* (1839); *Vindication of the South Sea Missions* (1851); and *Madagascar Revisited* (1867). E. died 9th June, 1872.—**Sarah Stickney E.,** born about 1800, married William E. in 1837. She was the authoress of many well-known works, among which are *Women of England* (1838); *Daughters of England* (1842); *Wives of England* (1843); *Hearts and Homes* (1848); *Mothers of Great Men* (1859); and several tales, *The Sons of the Soil, Family Secrets*, &c.—**Alexander John E.,** whose original name of Sharpe was changed by royal license in 1825, was born at Hoxton, 14th June, 1814. He was educated at Cambridge, and entered the Middle Temple, but never practised as a lawyer. He was made an F.R.S. in 1864, and was president of the Philological Society in 1872-74. Among his works are—*Alphabet of Nature* (1845); *Essentials of Phonetics* (1848); *Universal Writing and Printing* (1856); *Early English Pronunciation, with Especial Reference to Chaucer and Shakespeare* (1869-75); *Algebra identified with Geometry* (1874), &c. See PHONETIC WRITING.

Ello'ra, a decayed city of India, in Hyderabad, 13 miles N.W. from Aurungabad, and 170 E. of Bombay. It is encircled by a ruined wall, but is now a mere village, famous only for its rock-cut caves and temples. These are excavated in the side of a hill of red granite, and are of two distinct kinds—caves proper, and temples hewn out of the solid rock. The former are of Buddhist origin; the latter were made, in a later age, by the followers of the Jain and Brahmanical religions, and are among the most stupendous productions of man. Of the caves, the most celebrated is the Viswakarma Chaitya, or assembly hall, which is 85 feet long by 43 feet wide. The façade is less elaborately ornamented than in other cases; the roof is curved, and supported by twenty-eight octagonal figures; at the end is a colossal sitting statue of Buddha. There are numerous *viharas*, or Buddhist monasteries, of which by far the largest is 110 feet by 70. These are all caves proper, and their excavation is placed by Fergusson at about A.D. 600. One of them has Brahmanical sculptures. The rock-cut temples are monolithic, and hewn entirely out of the hill, 'the rock having been cut away externally as well as internally'; each temple looking as if it had been placed in a pit. In the case of the Hylas, the most magnificent of these structures, the pit was dug in the sloping side of the hill, 100 feet deep, 150 wide, and 270 long. In the centre was left standing a block forming the temple, from 80 to 90 feet high. All round is a peristylar cloister, covered with carved objects from the Hindu pantheon. The temple itself is covered with carved and sculptured figures. There is no inscription or other date. It has been assigned to about A.D. 800, allowing for the excavation from thirty to fifty years. It was the work of a Dravidian people, and was dedicated to Siva. A second temple, the Dhumnar Lena, at the corner of the hill, 150 feet square, is so excavated that light is admitted from three sides, while the fourth side is part of the solid rock. The Jain rock-chambers have gateways and detached shrines. Of these the two finest are the Indra Subha and Jaganath Subha, which probably date from A.D. 750. See Fergusson's *History of Indian Architecture*.

In 1818 Holkar ceded E. to the British, and in 1822, in accordance with the provisions of the treaty of Hyderabad, it was handed over to the Nizam.

Ellore', or **Elur,** a town of British India, province of Madras, on the Jummulair, 38 miles N. of Masulipatam. It has manufactures of carpets and leather, was formerly an important military station, and is connected by an aqueduct with the Kistna Canal, but has a bad climate. It was famous in olden times as the chief town of the Northern Circars. Pop. 29,382.

Ells'warth, a port in Maine, on the Union River, 2 miles from its mouth, and 30 miles S.E. of Bangor. It has considerable shipbuilding, and an active wood trade. Pop. 4804.

Ell'wood, Thomas, a Quaker writer, born at Crowell, Oxfordshire, in 1639, now remembered for his relations with Milton, to whom he became reader in 1661. In 1665 he visited Milton at Chalfont St. Giles, Buckinghamshire, and the poet gave him the MS. of *Paradise Lost*, asking him to criticise and return it. E. tells us he read the poem, and took it back to Milton:—'He asked how I liked it and what I thought of it, which I modestly but freely told him; and after some further discourse about it, I pleasantly said to him, "Thou hast said much here of paradise lost; but what hast thou to say of paradise found?"' Milton, says E., sat some time musing, then changed the subject, but on E. visiting him after the Great Plague, he showed him *Paradise Regained*, and said, 'This is owing to you; for you put it into my head by the question you put to me at Chalfont, which before I had not thought of.' He died in 1713. See his *Autobiography* (1714).

Elm (Old Eng. *ellm*, Dut. *olm*, Swed. and Dan. *alm*, comp. Lat. *ulmus*), a genus of Exogenous plants typical of the natural order *Ulmaceæ*, in which the leaves are alternate stipulate, with unisexual flowers borne in loose clusters. The perianth is inferior, irregular, and bell-shaped. The stamens are definite, and are attached to the base of the perianth. The ovary is one or two celled, and the fruit is dry or drupaceous. The seed is solitary, with little or no albumen. The genus *Ulmus* has a two-celled ovary and anatropal ovules, whilst the fruit is a *samara* and possesses winged appendages. The English E. has small elliptic leaves. The flowers are subsessile. This tree grows in all parts of Europe, and affords a hard durable wood, much used by wheelwrights and shipbuilders. Its bark yields a dye, and is used in sugar-refining. Of the galls found in E.-leaves in S. Europe is made E. balsam, a substance formerly much used in eye-diseases. The wych or Scotch E. has large leaves, and grows quickly. The cork-barked E. is doubtfully regarded as a distinct species from the English E. It is common in English plantations. Other species are the Dutch cork-barked E., the smooth-leaved E., the Cornish E., the American white E., and the slippery E. of America. The winged E. of N. America has its branches provided on each side with corky appendages. The China E. affords galls from its leaves, which are much used by the Chinese for dyeing and tanning leather.

Elmi'na ('the mine'), a fortified seaport on the Gold Coast, W. Africa, formerly the capital of the Dutch possessions, 10 miles W. of Cape Coast Castle. It is defended by Fort St. George, one of the oldest as well as strongest of the forts on the Gold Coast. E. was founded by the Portuguese under the name São Jorge da Mina in 1481, and was taken by the Dutch in 1637. It was ceded with the rest of the Dutch possessions in Guinea to the British, 6th April, 1872. During the Ashanti war it was destroyed by the English; but since then it has been rebuilt, and is now a place of some importance. Pop. 10,530.

Elmi'ra, a city of New York state, on the Chemung River, 274 miles N.W. by W. of New York. It stands in a fertile district, and possesses a fine court-house, a well-endowed female college, a state reformatory, and several churches. There are large iron-foundries, manufactories of machinery, wool, boots and shoes, &c. The trade is large, and the town rising greatly. Pop. 30,893.

El'mo's Fire, St., a popular name of the electric brush sometimes seen round the top of masts or other pointed objects during a thunder-storm. The phenomenon, which is accompanied by a hissing noise, is supposed to indicate that the storm is nearly over. By the ancients it was called Castor and Pollux if the appearance were double, or Helena if single. In the latter case it was generally regarded as an evil omen.

Elms'horn, a town of Prussia, province of Slesvig-Holstein, on both banks of the Krückau, 18½ miles N.W. of Hamburg by railway. The principal industries are shipping, tanning, and shoemaking. There are also brandy distilleries, breweries, and manufactures of tobacco, paper, chocolate, straw hats, cement, &c. The Swedes under Wrangel gained a victory here over the Danes, 15th February, 1645. Pop. 9803, of whom many are Jews.

El Obeid', or **Lobeid',** the capital of Kordofan, lies in the heart of the country, at the N.W. base of the Djebel-Kordofan, 220 miles S.W. of Khartum. It is built chiefly of clay and straw, and the houses are scattered over a wide area. There used to be a large trade in gums, gold, ostrich-feathers, &c., and E. O. was a place through which the great caravan route to Khartum passed; but since the Mahdist war the trade has fallen off considerably. Pop. 10,900.

Elocu'tion (Lat. *elocutio*, 'speaking out'), expression in words rendered vivid and impressive by suitable look, accent, modulation, and gesture or action. In ancient times E. was carefully studied as one of the most important elements of oratory. In our own time a simpler taste allows only a minor place to E. in public speaking; and while the art still flourishes on the stage, and in some degree in the lecture-room, it is paid but little attention to in Parliament or in our pulpits or law-courts.

Éloge' (Gr. *eulogia*, Lat. *elogium*, 'praise'), a term denoting eulogy, applied in France to a panegyric or funeral oration regularly pronounced in honour of members of the Academy. The E. reached its greatest perfection in the days of Fontenelle, whose elegant *Éloges des Académiciens* fill two volumes (Par. 1731). It is now a common tribute at the grave of any person of eminence, and sometimes furnishes an opportunity for the expression of political sentiments. Occasionally the E. is in Latin, as in Ruhnken's famous *Elogium Hemsterhusii*. See Thomas, *Essai sur les Éloges*.

El'ohim (sing. Eloah, Arab. *Ilâh*, Syr. *Alôh*, 'power,' 'might'), the Hebrew word meaning *gods* (Micah iii. 7), is also applied to the one God of Israel (Amos iv. 2). The history of the Hebrew nation clearly indicates that their purer conception of God arose from an early polytheistic worship. Joshua (xxiv. 2) accuses the forefathers of the Hebrews of serving other gods beyond the Euphrates. In the time of Moses, Jehovah (properly Yahveh) was acknowledged as the national deity. By the prophets the name E. was certainly applied to the *one* God Jehovah, as if he were to them all that the plural could be, but the older name belonging to the polytheistic period was also retained, and in the opinion of many scholars the occurrence of E. in one of the accounts of creation in Genesis, and of Jehovah in the other, marks a difference in the antiquity and even in the origin of the tradition. This point, however, is still keenly disputed by rival schools of theology and biblical criticism.

Elonga'tion, Angle of, an astronomical term originally applied to the angular distance between two heavenly bodies, but now generally restricted to that distance between a planet and the sun, or a satellite and its planet.

El Pa'so del Nor'té ('the north pass'), a fertile valley of Mexico, in the state of Chihuahua, extends a distance of 10 miles along the right bank of the Rio Grande, and is the thoroughfare leading northward out of the republic into the state of New Mexico. The inhabitants are much engaged in the vine culture, and in the manufacture of a celebrated wine and brandy.

El'phinstone, Mountstu'art, an East Indian statesman and administrator, the fourth son of the eleventh Baron E., was born at Edinburgh in 1779. He entered the East India Company as a cadet (1796), and after some diplomatic service under the Duke of Wellington was nominated first envoy to Cabul in 1808. On the apprehension of a Franco-Russian invasion of British India he concluded a treaty of alliance with Shah Sujah, which was the first step in our eventful relation to Afghan affairs. He published an *Account of the Kingdom of Cabul* (Lond. 1815). In 1816 he took up residence at the court of the Peshwa, and in 1817 was actively engaged in the battle of Kirkee—the deathblow of the Mahratta power. He was governor of Bombay from 1820 to 1827, and his rule was marked by great public works and vast reforms, and was crowned by the enactment of 'the E. Code,' which, for comprehensive clearness and brevity, is comparable to the *Code Napoléon*. The E. College in Bombay was founded in his honour (1827). On his return to Europe he devoted his leisure to his *History of India, the Hindu and Mohammedan Periods* (Lond. 1841), a work which gained him the title of the Tacitus of Indian history. He died at his estate of Hookward, in Surrey, 29th November, 1859. See Colebrooke's *Memoir of E.*, and Sir J. W. Kaye's *Lives of Indian Officers*.

Elphinstone, William, one of the most enlightened of Scotch ecclesiastics and statesmen of the 15th and 16th centuries, was born about 1430. He was the illegitimate son of William E., Archdeacon of Teviotdale. Trained at Glasgow for the Church, he showed a strong liking for law, which he studied on the Continent to such purpose that he obtained a professorship in the University of Paris, and afterwards in that of Orleans. Returning to Scotland about his thirty-ninth year, he threw himself into ecclesiastical and diplomatic life, held in succession the offices of official-general of Glasgow diocese, Rector of the University and official of Lothian, and, under James III. and James IV., Chancellor of the kingdom of Scotland, and Keeper of the Privy Council. This last office he held from 1500 to his death, 25th October, 1514. His chief ecclesiastical offices were those of Bishop of Ross (1481), and of Aberdeen (1483), and no prelate of his country or time had so high a reputation for devotion to his church, erudition, or sagacity. Employed on various embassies, he was a strenuous advocate of an alliance between Scotland and France. Such was his patriotism that the defeat of Flodden is believed to have hastened his death. He aided in establishing the first Scotch printing-press (that of Millar and Chepman) in Scotland (1509-10), and in causing to be printed the *Breviarium Aberdonense* (reprinted in 1853), in which he wrote the lives of Scottish fathers. E. will be remembered chiefly for having obtained from Pope Alexander VI. a bull for the establishment of a college in Aberdeen, otherwise largely benefited by him, which was founded in 1500. Originally St. Mary's College, it has since become known as King's College, and is now merged with Marischal College in the University of Aberdeen. See Cosmo Innes's *Sketches of Early Scottish History*.

El Rosar'io, a town of Mexico, state of Cinaloa, 55 miles

E. of Mazatlan, has some trade with the interior, and was formerly noted for its now abandoned gold-mines. Pop. 6237.

El'sass Loth'ringen, the German form of Alsace-Lorraine (q.v.).

Elsinore' (Dan. *Helsingör*, formerly *Krogen*), a picturesque old seaport of Denmark, on the island of Zealand, and on the W. shore of the Sound, 24 miles N. by E. of Copenhagen by railway. It has a cathedral, a beautiful royal palace (*Marienlyst*), a large custom-house, &c., and is defended by the castle of Kronborg (1574-84), which commands the Sound from a promontory. The Sound is here only 2½ miles broad, and is frozen over in exceptionally severe winters. E. has a good harbour and active manufactures of hosiery, arms, and brandy. Here were formerly collected the Sound dues. E. is the birthplace of Saxo Grammaticus and the scene of Shakespeare's *Hamlet*. Pop. 8925.

Els'ter ('the alder-tree stream') **the Black,** a river in Saxony, rises near Hernhut, flows N.W., and joins the Elbe 8 miles E. of Wittenberg, after a course of 111 miles.—**The White E.** rises on the N.W. frontier of Bohemia, flows N., and joins the Saale 3 miles S. of Halle, after a course of 120 miles.

Els'tracke, Reginald, an accomplished English engraver of the early part of the 17th c. whose works, chiefly portraits, have a high character for firmness and vigour. They are extremely rare, and are much sought after, not only for their artistic merit, but also for their historical value.

El'ton, Lake, a salt lake of Russia, on the border of the Kirghiz Steppes, in the government of Samara, and 90 miles E.N.E. of the point at which the Volga bends S.E. to the Caspian Sea. It is 14 miles long, has an area of 78 sq. miles, but is exceedingly shallow. It yields some 6,000,000 cwt. of salt yearly. The industry employs 10,000 people. All the salt is conveyed for shipment to Kamyschin, on the Volga.

Elutria'tion (Lat. *elutriatus*, 'washed out'), a process of washing with water employed in the laboratory and in several arts for separating the lighter from the heavier particles of disintegrated mineral matter. After the large heavy particles subside, and while the lighter particles are held in suspension, the water is drawn off. E. is usually performed in a vat provided with grinding wheels, as in the case of ores, potter's-clay, and pigments.

El'vas (anc. *Alba*, from the Basque *Alboa*, 'the place on the rugged hill'), a fortified town and bishop's see in the district of Portalegre, province of Alemtejo, Portugal, on a steep hill overlooking a tributary of the Cayo, near the Spanish frontier, and 12 miles W. of Badajoz. The streets are crooked and filthy, but many Moorish houses, with their latticed windows and verandahs, give the town a picturesque appearance. The fortress, the strongest in Portugal, was built by the Moors, and was unsuccessfully besieged by the Spaniards in 1658 and 1711. The cathedral is of mixed Arabesque and Gothic. E. has also a college, an arsenal, a hospital, a theatre, &c. A supply of water is provided by a Moorish aqueduct (*Os Arcos de Amoreiro*), which rises in several tiers of arches to a height of 250 feet, and has a length of 3½ miles. The inhabitants carry on a profitable smuggling trade with Spain, especially in British fabrics. The neighbourhood is rich in wine, oil, and fruits. Pop. 19,318.

E'ly (Old Eng. *Elig*, 'Eel town'), a cathedral city in Cambridgeshire, 72½ miles N.N.E. of London and 15 N.E. of Cambridge by railway. It stands on slightly elevated ground on the left bank of the Ouse, and in the midst of a country exceedingly fertile, producing large quantities of fruit and vegetables (chiefly asparagus) for the London market. Of the parish churches, St. Mary's is partly Norman, partly Early English. But the importance and the renown of E. lies in its famous cathedral, founded by Simeon, the first Norman abbot (1082-94) of the monastery established (970) on the site of the former convent of St. Ætheldrida, daughter of Anna, king of the East Anglians. The building was completed to its western end, and the first tower nearly to the summit, in the time of Bishop Riddell (1174-89). The Galilee or western porch was built 1198-1215. In the time of William of Wykeham it had a choir and a presbytery added to it, which raised it to the very first rank among English churches; and when its old Norman tower fell in 1322, the famous octagon, at the intersection of the nave and transepts, was built by Alan of Walsingham. This octagon, 70 feet by 65, is, according to Fergusson, the only true Gothic dome in existence. It is unsurpassed in beauty by any similar structure in Gothic architecture. All the styles of architecture from Early Norman to Late Perpendicular may here be studied. The nave is Norman, the presbytery belongs to the 13th, and the octagon and choir to the 14th c. The cathedral measures 565 feet from western to eastern exterior, and is one of the largest churches in Europe (area 61,700 sq. feet). The height of the central tower is 215 feet, while the nave is 72 feet high and 75 wide. It is built throughout of stone from Barnack in Northamptonshire, but many of the interior shafts and pinnacles are worked in Purbeck marble. Among the famous ecclesiastics that ruled in E. cathedral were Abbot Theorstan, who espoused the cause of Eadgar the Ætheling, and successfully held the Isle of E. against the Normans for several years; Simeon, the brother of Walkelin, Bishop of Winchester, and a relative of the Conqueror; Longchamp, the Grand Justiciary of Richard I.; Louis de Luxemburg, who had been Chancellor of France and Normandy for Henry VI.; and Stanley, third son of the first Earl of Derby. The cathedral has been restored under the superintendence of Sir Gilbert Scott, at the cost of £45,000. Pop. reg. sub-dist. 7970; civ. par. 3059; and diocese 524,112.

Ely, Isle of (Old Eng. *Eligea*, 'Island of eels'), the Cambridgeshire Fens, or the N. portion of Cambridgeshire, from the rest of which it is cut off by the Ouse. The fen lands, formerly sour from excess of moisture, and producing nothing but reeds and sedge, are now rich and productive in cereals and vegetables. They are protected from inundation by artificial banks along the rivers. Formerly windmills were used to work the machinery by which water was removed from the flats into the streams, but now these have partly given place to steam-engines. Pop. adm. county 63,861.

Ely, County of, is only a royal franchise, and not a county-palatine, though sometimes improperly so considered. See COUNTY.

El'ymus, a genus of Gramineæ (q.v.) or Grasses.

Elys'ium (Gr. *ēlusion*), in Greek mythology the abode of the blessed after death. Homer (Od. iv. 563 *seq.*) places it on the W. border of the earth near to Ocean, and represents its hero-tenants as living in ease and plenty under the mild rule of the golden-haired Rhadamanthus. Elsewhere (Od. xi. 490 *seq.*) he gives a gloomier description of the spirit-land, and makes Achilles say that he would rather be the veriest drudge on earth than king of the shades. Hesiod and Pindar place E. in the Islands of the Blest. The Latin poets regard it as a part of the nether world, and paint it as a delicious region of verdant fields, amaranthine meadows, perennial streams, and shady groves.

Elzevier', or **Elzevir,** the name of a Dutch family who for 130 years were engaged in the business of bookselling and printing, and whose name is identified with accurate and beautiful typography. The first was Lodewijk E., born at Louvain, who started business at Leyden in 1580. His *Eutropius* appeared in 1592, and before 1617 he had published 150 works. His five sons all followed the same trade: Mattheus at Leyden, Ægidius at the Hague, Bonaventura, who in partnership with his nephew Abraham (specially a printer) at Leyden for twenty-six years produced small but beautiful editions of the classics, and the famous *Les Petites Républiques*. The Amsterdam printing house was started in 1638 by Lodewijk of the third generation; he before 1654 had produced 189 works, chiefly 8vo classics, *Cicero* in 4to, *Corpus Juris*, folio, and the *Etymologicon Linguæ Latinæ*. Lodewijk was afterwards joined by Daniel, the son of Bonaventura, who had previously, in partnership with his cousin Jan at Leyden, produced about 30 works, and afterwards, when alone, 118 works, including the 4to *Homer*, Heinsius' edition of *Ovid*, and the New Testament. At Amsterdam Daniel, who lived till 1680, had produced about 152 additional works. Pieter, a bookseller at Utrecht, and Abraham II., who did University printing at Leyden down to 1712, were the last of the family. In 1820 a descendant was governor of Curaçoa. Of the total 1213 Elzevirs, 968 are Latin, 44 Greek, 126 French, 32 Flemish, 11 German, 10 Italian, 22 in Eastern languages. Only one, Heinsius' *De Contemptu Mortis*, is on vellum. Among the 8vos, the most prized are *Pliny* (1635), *Virgil* (1636); *The Imitation of Christ*, *Livy*, *Cæsar*, and *Tacitus* were also masterpieces. Among French works *Comines* and the *Sagesse* of Charron may be mentioned. The *Seneca* is valued as being unbound and showing the original margin. The best lists of Elzevirs are to be found in Brunet's *Manuel du Libraire*. Didot, Nodier, Mottely, Pieters, Bérard, Walther, and De Beaume have written special works on the subject. Elzevirs are with difficulty distinguished, the E. name having been stolen by other printers, and the Elzevirs having issued many anonymous works to escape political or religious censure. There are also close copies by eminent printers like Foppens of Brussels and Wolfgang of Leyden. At one time every book printed in Holland in the 17th c. and marked with a sphere was cherished as an E. The reliable marks are these:—(1) An eagle bearing seven arrows with the motto *Concordia res parvæ crescunt*; (2) a column surrounded by a vine branch, with a philosopher below and the motto *Non solus*; (3) Minerva and an olive-tree, *Ne extra oleas*; (4) a burning pile of wood, *Apud Elzevirios* (in allusion to the name E., which means elm or firewood), or *Ex officina E.*, also appears. The paper came chiefly from Angoulême; the types were, many of them, cut and cast by Garamond and Sanlecque. The Elzevirs were more successful men of business than the older printers, such as the Aldi, Morel, Amerbach, &c., but probably had not the same literary enthusiasm.

Emana'tion, Doctrine of, was the hypothesis by which Plotinus surmounted the dilemma that if God produced a world, as it could not be produced from nothing, it must be produced from God's substance, and was therefore identical with God; or from some other substance, which was therefore contemporaneous with God. The Christian said creation took place by an omnipotent volition, but Plotinus said the world was the mere emanation of the absolute unity into intelligence, and of intelligence into the universal soul. Emanation thus excludes dualism and even pantheism, for though the world is God, God is not the world. There was also a process of reabsorption of the finite into the infinite existence. Intimations of this change are received from time to time through Ecstasy (q.v.). God is also described as Buthos, or Abyss of Being. The successive attenuations of the divine substance, æons or ideas, are described as expanding rays of light. The sum of these æons is *plērōma*, and the last æon, *sophia*, passing into the void (*kenōma*), produces the world.

Emancipa'tion (Lat. *emancipo*, 'I liberate or declare to be free, not a chattel or piece of property') is the act of freeing from any subjection or disability. See CATHOLIC EMANCIPATION and SLAVERY.

Emancipation is a term borrowed from the Roman law, denoting in Scotch law the liberation of a child from paternal authority. See FORISFAMILIATION, PARENT AND CHILD.

Eman'uel I., King of Portugal, was born 3rd May, 1469, and succeeded João II. in 1495. His reign is the most glorious in the Portuguese annals. He reformed education, patronised art and literature, and codified the Portuguese laws; but he is especially memorable as the energetic promoter of his country's commerce and naval power. In his reign Vasco de Gama sailed round the Cape of Good Hope to India, Cabral took possession of Brazil, Lope de Soares opened up the China Trade, and Almeida and Albuquerque extended the Portuguese power in India and on the E. coast of Africa. His reign is the beginning of what is called the *Golden Period of Portuguese History*, which extends from 1495 to 1580. E. made Lisbon the chief seat of commerce in Europe. The only severe reverse which he sustained was in Northern Africa. He was variously styled the Good, the Great, and the Fortunate. Thrice married, his last wife was sister of Karl V. of Austria. He died 13th December, 1521.

Embalm'ing (Fr. *embaumement*, from *baume*; Old Fr. *bausme*, Lat. *balsamum*), the art of preserving dead bodies by employing antiseptic drugs, aromatic, saline, tanning, or other chemical reagents. In Ancient Egypt the art attained a high state of perfection, and bodies, called 'mummies' (from the Arabic *mumia*, 'bitumen,' or *mum*, 'wax'), embalmed in that country thousands of years ago are still in a fair state of preservation. Probably the oldest human relic in the world, the mummy of King Mycerinus, builder of the third pyramid, is now in the British Museum. E. was universal among the Egyptians, and the custom has been ascribed to their belief that an undecayed body would be reanimated after a lapse of 3000 years. Wilkinson, however, thinks 'the custom arose rather from a sanitary regulation for the benefit of the living, and from that feeling of respect for the dead which is common to all men.' Herodotus describes three methods that were pursued in Egypt, each differing in details and costliness. The corpses of the rich were embalmed in a most elaborate and magnificent style. The brains were extracted through the nostrils with curved instruments, and the viscera through an incision in the left side, and drugs and powdered aromatics inserted into the cavities. The wound in the side was then closed, and the body kept in natron for seventy days, and after that time it was swathed in fine linen bands smeared with gum. In some instances the face and other parts of the body were gilded. The other two processes were similar but less expensive. It would appear that there were other modes of E. than those mentioned by the Greek historian, for mummies have been found in which bitumen has been the chief preservative. A modern classification of Egyptian modes of E. is given in Pettigrew's *History of Egyptian Mummies* (Lond. 1834). The embalmed bodies of the rich were enclosed in two coffins of sycamore or cedar wood, painted with hieroglyphic legends. Those of the poor were wrapped in sheets and laid in mummy pits. The bodies of sacred animals were also embalmed by the Egyptians. Other nations, including the Jews, Greeks, and Romans, practised the art of E., but less effectively than the Egyptians. Large numbers of mummies, chiefly preserved by desiccation, have been discovered in Peru. The Aztecs, and others of the extinct tribes of Central America, also occasionally preserved their dead (Bancroft's *Native Races of the Pacific States of N. America*, Lond. 1875). Many caverns, containing Guanche mummies, generally in a good state of preservation, have been opened in Tenerife. The Guanches, the aboriginal inhabitants of the Canary Islands, disembowelled the corpse, washed it with a saline solution, anointed it with a composition of sheep's butter, powdered pumice-stone and pine-tree dust, and dried it in the sun for fifteen days (*Ethnological Society Transactions*, new series, vol. vii.). E. has been studied scientifically in modern times. During last century Lewis de Bil, Clauderus, and Benjamin Gooch operated with varying success, and two bodies preserved in the Royal College of Surgeons show the efficacy of Dr. John Hunter's injection method. In one of these camphorated spirits of wine was thrown into the arteries and veins. An arsenical solution was used by Tranchina of Naples and by Gaunal of Paris. The latter subsequently adopted a solution of sulphate and chloride of aluminium, and a chloride of zinc solution was employed by Dr. Souquet. The Parisian Academy of Medicine tested, in 1847, the processes of Gaunel and Souquet, with the result that the mode of the latter was alone successful. Audigier's method of E. has been adopted in Paris. It consists in pouring a preserving liquid into the larynx through the mouth, and in surrounding the corpse with a vegetable powder saturated with the same liquid. The body, it is said, acquires a wooden hardness. In America Seely has resorted to carbolic acid, and in England Richardson has used conjunctly three solutions with success. A saturated solution of zincic chloride is injected slowly into the tracheal or femoral artery, which is afterwards plugged with silicate of soda. Zinc colloid is then introduced into the brain and abdomen, the nose is stuffed with cotton and wool, and the eyelids and lips drawn together. While it is impossible to say whether these processes of E. will stand the test of time, it would be unreasonable to assert that chemical research is unable to furnish a preservative as efficient as the preparations of the Egyptians. Modern E., however, should be regarded as a scientific curiosity, for it is unlikely that the art will ever be revived widely.

Embar'go (Span. 'arrest or impediment') is a detention or arrest of ships or merchandise by public authority. On breaking out of war, an E. may be imposed on the shipping of the enemy by proclamation. An E. has not the effect of putting an end to the contract of affreightment, the freight being due as if the ship were detained by contrary winds. The master and the crew are consequently entitled to wages during detention.

Em'bassy (Mid. Lat. *ambactia* or *ambavia*, 'service or charge,' from a Celtic word Latinized into *ambactus*, 'retainer,' or the Gothic *andbahts*), a diplomatic mission, the function, or residence, of an ambassador. The Romans had their *legatus*, 'a delegate,' whence this branch of international law is known as *jus legatorum*, and the rights of E. are called *jus legationis*. A sovereign, the head of a department, or a military officer may act on E. without having the title of an ambassador. Lord Coke says of Henry VII. that he would not suffer any foreign ambassador within his realm; and in Poland in the 17th c., one who did not depart after his business was over was thought to be a spy. Whether any state of a confederation can send ambassadors depends on the federal compact. Generally, no objection to religion, rank, or sex of an ambassador can be taken. Madame Guelriant was French ambassador at the Polish court in 1646. The rank of ambassador was fixed at the Congress of Vienna, 19th March, 1815. Diplomatic employés are divided into (1) ambassadors, legates or nuncios; (2) envoys, ministers, or chargés d'affaires. The office of ambassador is terminated by the death of either sovereign. A *consulate* is the official residence of a consul-general, consul, &c., who are inferior officers of a diplomatic service.

Embatt'led, or **Battled,** in heraldry, the partition line across the shield in representation of battlements. This 'difference' was often conferred for distinction in battle.

Embezz'lement is the fraudulent appropriation to his own use of the property (not freehold or parcel of it) of another by the clerk or servant to whom it is intrusted by his employer or master. At common law this offence does not amount to larceny, but is punishable arbitrarily as malversation or Breach of Trust (q.v.). It has, however, been found necessary to enact statutes for the punishment of E. in certain cases. E. is not cheating, because there is no fraudulent contrivance, nor is any false pretence used. Neither is it larceny, because no property is *taken*, the offender being previously in lawful possession; but the line between larceny and E. is often very difficult to draw. Thus the appropriation by a watchmaker of a watch left with him to be cleaned and repaired was held to be larceny, because, as the judge said, 'when a party puts his watch into the hands of a watchmaker to be cleaned or repaired, he only parts with the *custody;* the *possession* of the watch is the possession of the owner.' E. is a felony punishable by penal servitude or imprisonment —a male under 16 years of age is liable to be whipped as well as imprisoned. See Statute 24 and 25 Vict. c. 116. A member of a copartnership who converts the common property to his own use is liable to be tried and punished as if he had not been a member of the copartnership. E. of Government stores is punishable by penal servitude or imprisonment. See BROAD ARROW.

Em'blem (Gr. *emblēma*, 'something inserted'; *en*, 'in,' and *ballein*, 'to throw'), a concrete or pictorial expression of a symbolical idea. Thus the lion is the E. of courage. Among the sacred emblems in heraldry are the winged lion of St. Mark, the angel of St. Matthew, the winged ox of St. Luke, and the eagle of St. John. The red rose, the white rose, and the violet have served respectively as the emblems of the houses of Lancaster, Stuart, and Bonaparte.

Em'blements, a term of English law denoting the profits of land sold, but the word is also used to denote the natural fruits of the ground, which are annually produced through the toil of him who cultivates the land. A tenant, or another in his right, is in all cases entitled to reap the crop which he has sown. On the death of a tenant, the executor, and not the heir, is entitled to the E., since they rank as personal property.

Em'blica, a genus of *Euphorbiaceæ*, of which the only species is the *E. officinalis* or *Phyllanthus E.* It is a native of India and the Malay Archipelago. Its acrid fruit is used in India as a pickle. The dry ripe fruit is a medicine for diarrhœa, dysentery, and cholera, and is known as *Myrobalani emblici*. The bark is used for tanning and as a black dye.

Em'bolism (from the Gr. *emballō*, 'I throw in'), in medicine, denotes the presence of obstructing clots of blood in the vessels. E. often causes obscure disease and sudden death, especially if it occurs in the large arteries near the heart.

Emboss'ing (Fr. *bosse*, 'a swelling or hump'), the art of producing raised patterns or ornaments on any plane surface of paper, cardboard, cloth, leather, wood, &c. Metal patterns are produced by E. or 'stamping.' In the E. of paper a die with the pattern is first prepared, and a counter-die either in metal or cardboard is made. The dies are fixed in a press, and the paper or cardboard is well damped before E. For the E. of names, monograms, and crests, steel dies and counter-dies are engraved, and E. and colour-printing are required for the printing of such in colours. The E. of cloth, such as velvet, felted table-covers, &c., is done by a cylinder machine, which is a modified form of calender. A colour-printing apparatus is also used, as in calico-printing. The pattern for E. is engraved on one roller, and either countersunk on that opposed to it, or the opposing roller is covered with a yielding surface-thickness of felt. Wall papers are embossed on such cylinder machines. The E. of leather has long been practised, and bold designs are easily produced in that material when it is thoroughly softened by water. There are several methods for producing raised patterns on wood otherwise than by carving, and these may be regarded as modified forms of E. One method applicable to soft wood is to produce the outline of the required pattern by powerful pressure, which sinks and compresses the fibres. The wood being planed level and steeped in water, the previously compressed portion which has escaped the plane expands, and the pattern is produced in relief. Another plan, which may be adopted with hard wood, is to apply a mould containing the pattern red hot to the wet surface. A superficial charring takes place, and repeated wettings and burnings are all that is necessary to procure patterns.

Em'bouchure (Fr.), a mouth or opening, as the mouth of a river. In music it means the part of a wind instrument to which the mouth is applied in blowing.

Embowed', in heraldry, means curved or bent. The left arm bent at the elbow is blazoned 'embowed,' the right arm 'counter-embowed.' The word was formerly in general use in English, as in *Il Penseroso*, 'And love the high embowèd roof,' and in Spenser's *Visions of the World's Vanity*, 'Embowed like the moon.'

Embra'cery, in English law, signifies an attempt to influence a jury in their verdict by persuasion or bribery. E. is a misdemeanour and the party embracing and guilty juror are liable to imprisonment and fine (Statute 6 Geo. IV. c. 50).

Embra'zures are openings for cannon in fortified works or in siege batteries. E., which have an outward slope to allow of free firing, secure the safety of those within the walls.

Embroca'tion (through Low Latin from the Gr. *embrechō*, 'I soak in') denotes the incessant moistening with certain applications, and rubbing of a diseased part, as a means of cure.

Embroi'dery (Fr. *broderie*, a doublet of 'bordering'), decorative work wrought with the needle upon any textile fabric. The art reaches back into prehistoric times. Embroidered patterns are seen upon the garments of persons represented on Egyptian monuments, and from the Book of Exodus we gather that the Israelites acquired the art while dwelling in Egypt. Babylon had a wide-spread reputation for the beauty of her E.; and in Phrygia, Greece, and Rome the art was also carried to perfection. During the Middle Ages nuns, and even monks, and women of royal and noble rank, engaged in it. Some ecclesiastical vestments of that time display gorgeous E. in gold, silver, and coloured silk, frequently enriched with precious stones. England was for several centuries celebrated for various styles of E., and during the 13th c. a new method was introduced which won the admiration of Christendom, and was designated *opus Anglicum.* In it the old feather-stitch (*opus plumarium*) was combined with a chain-stitch, which was laid down in circles for parts of the human face, and in straight lines for the rest of the figure, and an appearance of relief was given to the face by pressing some parts down with a heated instrument. The finest existing example of 'English work' is the Syon Cope, embroidered in gold, silver, and silks in the 13th c., and now treasured in the South Kensington Museum. About the same period was produced the misnamed Bayeux Tapestry (q.v.).

Modern E. may be divided into two classes—white E., worked upon muslin, cambric, &c.; and coloured E., as silk, worsted, gold, &c., worked on silk and other stuffs. France stands in the first rank for the production of white E., and then follow Saxony, Switzerland, and Italy. Glasgow was a great centre of this industry till the crisis of 1857. E. is applied to curtains, caps, collars, &c. In coloured E. China, Japan, and India especially excel, and rich work of the same kind is found on the dresses and common domestic articles of the Turks, Georgians, and Circassians. The vestments of the Russian hierarchy and Albanian costumes resemble tissues of gold and silver, so profusely are threads of these metals employed in their adornment. Artistically coloured E. has greatly declined in England, but there are signs of its revival. *Appliqué* work signifies that the needlework has first been wrought upon some tissue, and afterwards sewn or *applied* to the embroidered stuff. It is common on mediæval velvets. Machines, chiefly modifications of Heilmann's invention, have recently come into use in England and on the Continent, by which elaborate patterns can be executed by one person, who may keep 130 needles in simultaneous motion. The work of fifteen hand-embroiderers is performed by one of these machines. Several sewing-machines have also been adapted to embroidering. See Dr. Ure's *Dictionary of Arts, Manufactures, and Mines.*

Embrun', an ancient town of France, in the department of Hautes-Alpes, on the right bank of the Durance, and on the side of Mont St. Guillaume, about 100 miles N.N.E. of Marseille. Its cathedral, the construction of which is referred to the era of Karl the Great, is one of the finest historic buildings in France. E. manufactures cloth, silk, and velvet. E., the ancient *Ebrodunum*, is of Celtic origin, and is mentioned by Strabo. It was made the see of a bishop during the 4th c., and afterwards of an archbishop. It was ravaged successively by Vandals, Huns, Lombards, and Spanish Arabs. E. suffered greatly in the religious wars of the 16th c., and was partly destroyed by the Duke of Savoy under Louis XIV. (1692). Pop. of commune, 4017; of arrond. 27,050.

Em'den ('the fort on the Ems'), formerly **Embden,** a seaport in the province of Hanover, Prussia, German Empire, on the N. shore of Dollart Bay, near the mouth of the Ems, 70 miles W.N.W. of Bremen by railway. It has a good harbour, and is intersected by several canals, which are crossed by some thirty bridges. The chief buildings are the townhouse (1574-76), an exchange, a custom-house, a school of navigation, a deaf and dumb asylum, and a museum of antiquities. E. has manufactures of linens, hosiery, sailcloth, starch, soap, tobacco, &c., and also extensive shipbuilding yards and breweries. The town, which lies low, is protected from inundation by dykes. The free port of E. became Prussian in 1774, passed to Holland in 1806, France in 1809, Prussia in 1814, Hanover in 1815, and again to Prussia in 1866. Pop. town 13,695; district 18,459.

Em'erald (Fr. *émeraude*, Old Fr. *esmeralde*, Sp. *esmerelda*, Ger. *smaragd*, from the Gr. *smaragdus*). This highly valued precious stone differs from the beryl and aquamarine only by the brilliant green colour which is its characteristic, and which some allege to be due to the presence of organic matter similar to the chlorophyl of leaves, while others ascribe it to a small proportion of chromium oxide. The precious E. crystallizes in the hexagonal system; it is transparent, with a deep-green colour, without any admixture of blue or yellow; in hardness it exceeds quartz, and its specific gravity is 2·732. In percentage composition it consists of silica 68·50, alumina 15·75, glucina 12·50, with generally small proportions of iron, chromium, and lime. The largest emeralds are found in Siberia, on the Tokowoia, while the finest occur in S. America, especially at Muzo, in Colombia. Other mines are at Canjargum in India, Limoges in France, Mount Zabarah in Upper Egypt, and the Henbach Valley in Salzburg. When first taken from the mine, the E. is so soft and friable that it can be reduced to powder by rubbing between the fingers, but it hardens by exposure to the air for a few days. The E. is esteemed in value next to the ruby, and from its supposed great virtues is especially treasured in the East. The Duke of Devonshire owns a fine American E. weighing 8 oz. 18 dwt. In the Hope collection there was another weighing 6 oz., for which its owner paid £500. The E. is often referred to in Scripture and by classical authors. Oriental E. is the name of a rare green variety of sapphire. E. copper, or dioptase, a green crystallized mineral found only in Central Asia, consists of 50 parts of protoxide of copper, 39 of silica, and 11 of water. E. nickel is a compound of carbonate and hydrate of nickel, found at the chrome mines of Texas.

Emer'sion (Lat. *emergere*, 'to come forth'), in astronomy, is the reappearance of one heavenly body from behind another. *Immersion* is its disappearance at the commencement of the occultation or eclipse. Both phenomena are of great use in determining the Longitude (q.v.) of any locality.

Em'erson, Rev. William, a descendant of a chaplain in the Army of Independence, was born at Concord, Massachusetts, 6th May, 1769, graduated at Harvard College in 1789, became a minister of a Unitarian Church in Boston, published several discourses, a *Selection of Psalms and Hymns* (1808), and a *History of the First Church of Boston* (1812), and died 12th May, 1811.—**Ralph Waldo E., LL.D.,** essayist and poet, son of the above, was born at Boston, 25th May, 1803, graduated at Harvard College in 1821, became a Unitarian minister in Boston, but in 1823 abandoned preaching, and since then lived, chiefly at Concord, in seclusion and study. An oration, *Man Thinking*, before the Phi Beta Kappa Society, Cambridge, in 1837, and an address to the senior divinity class, Cambridge, won him wide notice for their daring and poetic transcendentalism. He produced *Literary Ethics*, an oration, in 1838; *Nature*, an essay, in 1839; in 1840 started the *Dial*, a transcendentalist organ, and in 1841 published *The Method of Nature*, *Man the Reformer*, *Lectures on the Times*, and the first series of his *Essays*. A second series of *Essays* appeared in 1844, and his first *Poems* in 1846. In 1848 he visited England, where he lectured on *The Mind and Manners of the 19th C.* In 1850 he issued *Representative Men*, and published, along with W. H. Channing, the *Memoirs of Margaret Fuller* (1852). Thereafter he produced *English Traits* (1856), *Conduct of Life* (1860), *Oration on the Death of President Lincoln* (1865), *Mayday and other Pieces* (1867), *Society and Solitude* (1870), *Parnassus*, a collection of poems (1871), and *Letters and Social Aims* (1876). He died at Concord, 27th April, 1882, aged 78. Throughout his writings E. sought to render life more spiritual and of a nobler moral tone, to lend it an ideal colouring without neglecting its practical needs. His works mingle a beautiful idealism with shrewd ethical teachings. In the nature of his admonitions, in the union of mystical speculation with fiery homely reproof of the age, he resembles Carlyle, but not at the expense of originality. His prose style is crisp, simple, and limpid, rich in words and phrases of singular suggestiveness and pregnancy. His poems lack melody and free lyrical impulse, and are sometimes rough in diction and cloudy in meaning, but embody much of the freshest and subtlest thought to be found in recent verse.

Em'ery (Fr. *émeri*, Old Fr. *esmeril*, Gr. *smuris*, from *smurizō*, 'I polish') is the massive variety of the mineral species Corundum (q.v.), which includes also the sapphire, the Oriental ruby, the Oriental topaz, &c. E. has a dull-brown colour, and varies in hardness and specific gravity according to its degree of purity. Thus sapphire, which is practically pure, crystallized alumina, is only exceeded in hardness by the diamond, and is the purest form of the mineral of which E. is a variety. The supply of E. for industrial purposes comes chiefly from Naxos, Nicaria, and Samos, where it is obtained in large boulders. It is also obtained near Gumuch-Dagh, about 12 miles E. of Ephesus, and in Massachusetts, U.S. E., on account of its hardness, is a substance very extensively employed in the arts. It is used in the grinding, cutting, or polishing of plate glass, flint glass, gems, jewels, edge-tools, brass, &c. It is prepared for use by pounding it under heavy steel stamping tools; and when sufficiently comminuted, it is arranged into sizes by sifting through sieves. Grinding wheels of a composition the essential ingredient of which is E. are in use. E. cloth is made by sifting particles over a surface of calico prepared with dissolved glue. E. dust is laid on the edge of iron and lead wheels for cutting and polishing in lapidary work.

Emet'ics (Gr. *emetikos*, from *emeō*, 'I suffer from sickness') are substances which act specifically on the stomach, independently of their odour, taste or bulk. They should be administered in every case in which a poisonous or injurious substance has been swallowed. If medicinal E. are not at hand, the action may be induced by tickling the fauces with the finger or with a feather, or by copious draughts of tepid water. In slight disorders of the stomach E. afford relief, and in many acute internal diseases nausea is only removed by emesis, occurring naturally or by the administration of E. The occasional use of E. in the pulmonary diseases of infancy is of great value, as infants swallow the discharges from the lungs. E. are partly vegetable and partly mineral, the more important of the former being mustard, ipecacuanha, sanguinaria, &c.; and of the latter, sulphate of zinc, sulphate of copper, and tartrate of antimony. E. that may be taken safely without medical prescription are, for an adult, a teaspoonful of mustard, or 20 grains of ipecacuanha, in tepid water.

Emigra'tion, the removal of persons from one country to another for the purpose of permanent residence. Among nations historically identified with E. are the Greeks, Spaniards, Dutch, and Portuguese. In late years the great body of emigrants are English, Irish, and German. The following figures will show the growth of the practice. In 1815, 2081 persons left, but by 1819 this had increased to 34,787. The numbers fluctuated until 1830, when they began to rise, reaching 103,140 in 1832. From 1846 to 1854 there was a steady rise up to 368,764, but this point reached they fell to 91,770 in 1861. Since then there has been considerable fluctuation in the numbers emigrating from Great Britain. A larger majority of emigrants proceed to the United States—no fewer than 789,000 having landed there in 1881, of whom 250,000 were Germans. Since 1847 the emigrants from the United Kingdom have chiefly gone to U.S. of America, Canada, Australia, and the Cape of Good Hope. The returns of immigrants and liberated Africans introduced into the W. India colonies and Mauritius are very interesting. Thus during the thirty years prior to 1872, Jamaica received 25,000 persons, of whom 16,000 came from the E. Indies; British Guiana received 160,000, of whom 80,000 came from the E. Indies, 28,000 from Madeira, 23,000 from the W. India Islands, 13,000 from Africa, and 12,000 from China. Trinidad received 60,000—44,000 from E. Indies, only 2665 from China. Mauritius received 358,000, of whom 352,000 were from E. Indies and 2500 direct from captured slavers. From 1847—1871 about 125,000 immigrants, liberated Africans and Kroomen, returned home from these colonies.

The following information has been gleaned from the report and returns presented to Parliament in 1894:—

Passenger movement between the United Kingdom and the continent of Europe shows a considerable decrease in the number of passengers inwards in excess of that of the passengers outwards. In 1892 the excess of the former over the latter was 84,164; in 1893 it was 73,280, and in 1894 it had sunk to 13,013, although the number of passengers inwards was in that year 490,330 as compared with 468,642 in 1893, and 490,165 in 1892. In 1894 the total number entered on the alien list (foreigners arriving from continental ports) was 74,015, as against 120,334 in 1893, and of these 35,512 were *en route* to America except 378, who were bound for other countries. Of the 22,066 immigrants who came to remain in the United Kingdom, 7246 were Russians and Poles, 4130 were Norwegians, Swedes, and Danes, and 5817 were Germans. We will now give the general statements of emigration during the year 1894.

Nationality.	To U.S.	To B.N.A.	To Aust.	To C. of G. H.	Other Places.	Total 1894.	Total 1893.
English .	54,253	15,558	9,251	11,824	8,704	99,590	134,045
Scotch . .	10,151	914	941	1,148	1,278	14,432	22,637
Irish . .	39,597	987	725	205	494	42,008	52,132
Total . .	104,001	17,459	10,917	13,177	10,476	156,030	208,814
Foreigners	55,350	6,102	207	3,583	1,790	67,032	95,123
Not distinguished .	80	72	27	—	3,586	3,765	3,696
Grand Total	159,431	23,633	11,151	16,760	15,852	226,827	307,633

Of the English, Scotch, and Irish emigrants in 1894, 88,125 were males and 67,905 were females; of the foreigners and those not distinguished, 42,537 were males and 28,260 were females. Of all the males, in 1894, 30,056 emigrated as general labourers; 11,599 as gentlemen, professional men, merchants, &c.; 6671 as mechanics; 6,172 as agricultural labourers; 4522 as miners, quarrymen, &c.; and 3227 as shopkeepers, shopmen, &c. Of all the females in 1894, 20,000 emigrated as domestic and farm servants, nurses, &c.; 1062 as milliners, dressmakers, &c.; 675 as spinners and weavers, and 237 as gentlewomen and governesses. The occupation of 59,385 females and 29,872 males was not stated: by no means a hopeful phase of emigration, and, indeed, so far as the female portion of it was concerned eminently unsatisfactory. During the year 1894 the demand for labour in Canada, either of the artisan, farm hand, or female domestic servant, has not been over or above the supply on the spot, and consequently immigrants thither have failed to get employment easily. In Australasia (notably in Victoria, Western Australia, and New Zealand), the demand for labour has been fairly great, though in the last-named the supply of unskilled labour has been excessive. At the Cape the labour market has become overstocked, and emigrants are warned to secure engagements before they leave this country if they are bent on going thither. In the other S. African states, although a great impetus has of late been given to trade and agriculture, the penniless immigrant will find it difficult to obtain employment—'the demand is for settlers possessing at any rate some small means.' The emigration hence to the United States of America has been considerably checked during 1894, chiefly owing to the stringent regulations in force as to alien immigration. Both the Argentine Republic and Brazil are practically closed to the British emigrant. In Uruguay a decree has been issued restricting *useless* immigration. Three colonising movements are worthy of mention here. The Jewish colony in the Argentine Republic has been carefully managed, 'all that could be done by the combined employment of capital and ability was ready at hand,' and consequently the venture has proved very successful. The New Australian settlement in Paraguay, chiefly consisting of discontented Australian working-men, would appear to be turning out a complete failure. The Free-land colony in E. Africa is an enterprise which has much to be said in its favour, but which appears for the time 'to be in a state of suspended animation.'

In 1886 the Emigrants' Information Office (31, Broadway, Westminster, S.W.) was established by the Government, and every sort of information useful to the person intending to emigrate may be obtained there. A professional handbook for medical men, barristers, solicitors, &c., is issued, containing full particulars concerning each colony. Penny handbooks, maps, and free circulars are also issued by the same office. Little or no assistance is given by the colonies towards paying an emigrant's passage, but W. Australia and Natal hold out most encouragement.

The average annual number of emigrants from each of the principal countries of Europe is as follows:—Austria-Hungary 74,000, Belgium 22,000, Denmark 9500, France 9800, Germany 96,000, Italy 250,000, Netherlands 5600, Portugal 22,700, Russia 35,000 (not including 90,000 to Siberia), Spain 9000, Sweden 44,000, Norway 16,300, and Switzerland 7500. See also article COOLIES.

Emigration, Law Regarding.—By 4 & 5 Will. IV. c. 76, money was allowed to be borrowed on the security of the poor rates to assist in the E. of the poor, and by 7 & 8 Vict. c. 101, s. 29, the guardians of any parish or union constituted by the Poor Law Commissioners were authorised to apply all money raised or borrowed for the purpose of defraying the expenses of emigration in such parish or in any parish within such union, subject to certain conditions and restrictions. Statute 54 & 55 Vict. c. 23, gives the guardians, &c., power to dispose of children in industrial schools and reformatories by E. And the powers of the Commissioners referred to has now been transferred to the Board of Trade under 35 & 36 Vict. c. 73. The Act 13 & 14 Vict. c. 101, contains provisions for facilitating the E. of poor orphans and deserted children. These Acts do not apply to Scotland; but by 14 & 15 Vict. c. 91, landowners in the Highlands and Islands of Scotland may apply to the Inclosure Commissioners for England and Wales for advances of money to defray the expenses of E. of poor persons within the parishes where their land is, and after inquiry the Treasury may issue a provisional certificate; and by 19 & 20 Vict. c. 9, advances may now be made to landowners, as above, to assist E., and such advances are repayable by rent-charges. See SHIPS' PASSENGERS ACTS.

Em'igrés ('emigrants'), the name given to the French nobles and clergy who fled from France on the outbreak of the Revolution in 1789. Many of them were indemnified on the Bourbon restoration. See Saint-Gervais, *Histoire des É. Français* (Par. 3 vols. 1823).

Emil'ia (named after the *Æmilia Provincia* of the Romans, on the famous *Via Æmilia*), a former division of N. Italy, consisting of parts of the Romagna and of the duchies of Modena and Parma, now portioned into eight modern provinces, Bologna, Ferrara, Forli, Modena, Parma, Piacenza, Ravenna, and Reggio Emilia. In the N.E. it is flat and marshy, in the S.W. mountainous and interspersed with fertile valleys. Bologna forms its centre.

Em'inence (Lat. *eminentia*), an ecclesiastical title, the employment of which was restricted by special enactment of Pope Urban VIII., 1630, to cardinals, ecclesiastical electors, and the Grand Master of the Order of the Knights of St. John.

Emir' (Arab. 'ruler'), the title given to all the descendants of Mohammed's daughter Fatima, who are distinguished by the green turban. It is assumed by many tribal chiefs in the East and in N. Africa. The E.-al-Mumenic, 'Prince of the Faithful,' is a title of the caliphs; E.-al-Omra, 'Prince of Princes,' is at present in Turkey the title of provincial governors; E.-Hadji, leader of the pilgrims; E.-Bazaar, market inspector, &c.

Emman'uel College, Cambridge, was founded by Sir Walter Mildmay, Chancellor of the Exchequer to Queen Elizabeth, in 1584, and is now regulated in accordance with the statutes confirmed by an Order of the Queen in Council, 3rd May, 1882. At the present time the foundation consists of a Master, thirteen Fellows, and twenty-four scholars; two of the scholarships are of £80 per annum, two of £70, eight of £60, six of £50, and six of £40. These are open to resident members and are usually tenable till the time for taking the B.A. is reached, sometimes till the M.A. There are also four *Thorpe* scholarships (two of these are awarded for Theology); four *Johnson* scholarships (£22); two *Ash* (£50); one *Smith* (£16); and three *Dixie* (£30). Other scholarships and exhibitions also belong to the college. In 1894 there were 142 undergraduates, 339 members of Senate, and 652 members on the Boards.

Emm'erich, a walled town in the province of Rheinland, Prussia, on the right bank of the Rhine, 5 miles N.E. of Cleve by railway, with an active shipping trade on the Rhine, and manufactures of tobacco, chocolate, and leather. Pop. 10,241.

Emmetro'pia, the condition of the normal eye as regards power of sight for different distances. Near-sightedness is called *Myopia*, and far-sightedness *Presbyopia* (q.v.).

Emm'ett, Thomas Addis, son of a physician, was born at Cork, 24th April, 1764. He was educated for the law, which he abandoned to become a leader of the 'United Irishmen.' On the Irish insurrection of 1796-98 being suppressed, he was arrested; but his sentence of imprisonment was commuted to exile, and removing to New York, he became a distinguished lawyer. He died 14th November, 1827.—**Robert E.,** younger brother of the above, was born in Dublin, 1778; was intended for the bar, but joined the Irish insurgents; was captured, and executed 20th September, 1803. His death and his love for Miss Curran are the subjects of two of Moore's *Irish Melodies.*

Emo'dic Flo'ra, a name given to plants, as species of *Cedrus*, *Pinus*, *Picea*, &c., found in the 'Emodic region,' or that part of India to the S. of the Himalayan ridge, and from 4500 to 10,700 feet above the sea. The average temperature of the region is from 37° to 66° F.

Emoll'ients (from Lat. *mollis*, 'soft'), substances used to soften the tissues. Externally they are applied as poultices and fomentations, and internally as demulcents. The principal E. are gums acacia and tragacanth, fats, wax, cetaceum, glycerine, collodion, cydonium, linseed, flour, starch, decoctions of barley and linseed.

Emo'tion (from Lat. *e*, 'out,' and *moveo*, 'I move') is one of three fundamental properties of the human mind, the other two being volition and intelligence. Though separated for the purpose of scientific analysis of their separate laws, the three functions are generally present in varying proportions in every mental state. E. includes all the pleasures and pains, the particular sensations, including muscular feelings, and general excitements of the nervous system. It is singular that while Reid's division into intellectual and active powers formally leaves no room for E., Brown's division of internal states into intellectual states and E. leaves no room for volition. The phenomena of E. are, however, described by both writers. One general condition of E. seems to be a change in the mode or intensity of the cerebral and other processes. Once aroused, it tends to diffuse itself over the brain, and unless suppressed or exhausted, passes into the moving organs and the viscera. One large class of characteristic effects of E. is expression, *i.e.*, definite excitement of the muscles of face and features. The muscles of the chest and larynx are in many cases stimulated, and characteristic sounds are emitted. The whole body may be agitated, but the following parts chiefly express and propagate E.—the lachrymal gland and sac, the digestive organs, the skin, and the heart. Characteristic examples of this are the suppression of the flow of the saliva by fear, the spasmodic contraction of the muscles of the pharynx by grief, and the flow of tears caused by tender E. such as pity. Besides specific expression of each class of feelings, it is a general law that pleasant feelings tend to increase the activity of the vital functions, while the tendency of painful feelings is to depress these functions. This is very obvious in the case of pleasurable muscular exercise, and is not contradicted by the pleasure of repose, which may be attended by a reflux of blood to the brain and stomach. The pleasures experienced from respiration and digestion, indeed all the organic pleasures, come under the rule. The pain of cold is only an apparent exception, for it checks perspiration, the function of the skin, although it may at a certain point stimulate the nerves and muscles. On the other hand, indigestion, skin-disease, and, in fact, most diseases, are accompanied by painful feeling. Pleasure, again, has generally a fuller, more intense expression than pain. Pain more often depresses the system and relaxes the muscles; sometimes, however, this is done by very intense concentration of energy on particular muscles. The frenzied excitement of great pain is really a case of shock. The contrast between the two tendencies is best seen in laughter, which sets in violent vibration whole systems of muscles; and grief, which, when severe, 'beats a man down.' The pleasures of sensation seem at first an exception. Even here, however, the pains of touch, hearing, and vision are chiefly due to excess of stimulus. This fact suggested the theory that in all cases pleasure and pain depend on the degree of violence with which the nerve or the sensorium is affected. It must be remembered in dealing with such theories that even where, as in light and sound, it might be possible to connect the painful effect with an increase in the number or character of the external vibrations, we know nothing whatever of the specific mode in which either a sense-pleasure or a sense-pain affects the nerve. But as regards taste and smell, although theory has also attempted to resolve them into vibrations on the external side, it is clear that some substances produce nothing but pleasure, and others nothing but pain. These then must be regarded as specific stimuli, producing nervous muscular activity independently of their character as pleasant or painful. The higher emotions, as wonder and love, illustrate the general rule; those which are pleasant strengthen and give tone to life, whilst shame, hatred, and the like are depressing. The stimulating drugs, on the other hand, alcohol, tea, &c., do not enhance vital action, except indirectly, and then generally at the cost of reaction. The Platonic theory, expounded in the *Gorgias*, that pleasure consists in the supply of a want or the negation of pain, and that pain consists in want, is now generally abandoned as inconsistent with the facts of experience, for men are conscious of indifference, also of pleasure unmixed with pain. The Hamiltonian theory is that pleasure may arise from faculties, capacities, dispositions, and habits, known as various forms, potential and actual, of 'energy.' Pleasure is the reflex of a spontaneous and unimpeded energy. A spontaneous energy is that which is neither strained above nor depressed below a certain pitch, and unimpeded energy is that which reaches its object. This theory is purely verbal, the word 'energy' being defined so as to meet all the known cases of pleasure. The most important distinction in feeling, after pleasure and pain, is that of degree; E. may be either acute or massive. This distinction enters into the volitional strength of feeling, and also into its ideal persistence, or its capacity of being reproduced by the intellect. E. tends to occupy the mind, and a pleasant feeling in idea is the germ of desire. In the same way E. powerfully affects belief, excluding from the mind what interferes with the contemplation of itself. Besides the emotions which may be called primitive, and which are enumerated below, there are emotions formed by the harmony or discord of simple sensations experienced together, by the transfer of feeling from its original causes to contiguous objects, by coalescence of separate emotions. Of this last, the most conspicuous example is conscience. There are also certain general emotions depending on the amount of change operated on the system, and these are novelty, surprise, and wonder; liberty, as opposed to restraint, and power, as opposed to impotence. These emotions of contrast are the real foundation of the Platonic theory. The chief forms of special E. are fear or terror; tender emotions or love, branching out into those of admiration, reverence, and esteem, and by further associations into self-complacency and approbation or glory, power; anger, or the pleasurable E. of malevolence. Connected with the volitional side of the mind there are the higher emotions of pursuit; the exercise of the intellect yields a characteristic E. in the perception of resemblances, and in the jar of contradictions; and there are also æsthetic emotions interwoven with intellectual association. Last of all, comes the E. of the moral sense, which varies from the rudest instinct up to the most sensitive and complex of faculties. The classification of the emotions directly affects æsthetics and phrenology. Among others may be mentioned that of Brown into immediate, retrospective, and prospective; of Hamilton into contemplative and practical; of Spencer into presentative (sensations); presentative-representative, *e.g.*, terror; re-presentative (ideal sympathy with another); re-representative, as property, justice. See Stewart on *The Active Powers* (1828), and Bain, *Emotions and the Will* (3rd. ed. 1875).

Emotions, Physiology of.—The anatomical seat of the emotions is undoubtedly some part of the cerebral hemispheres. Disease of these organs produces the various forms of insanity, in which the emotions are more or less affected. But they are related to the rest of the body in a complex way, the exact physiological mechanism of which at present is not understood. The emotions may be affected (1) by various states of the body, or (2) by outward impressions, and, on the other hand (3), they can influence the actions of various organs.

Empann'el in English law denotes the enrolling on parchment or paper by the sheriff of the names of jurors. The schedule of names is called a panel, and those named in it are bound to attend to serve upon the grand and petty juries.

Empecina'do, Don Juan Martin Diaz, el, was born at Castrillo in 1775, enrolled as a volunteer in 1808, and as a guerilla chief inflicted signal losses on the French occupants of Spain. He was made a general, and in 1815 petitioned Ferdinand VII. to establish a constitutional government, for which he was imprisoned. In 1820 he pronounced in favour of the Cortes, and in 1823 held a command in the corps of General Palencia. On the suppression of the revolution in 1825, this patriotic soldier was captured and executed as a traitor.

Emped'ocles, a Greek philosopher, who flourished about 444 B.C., was born at Agrigentum in Sicily. He belonged to a wealthy class, but supported the democratic party, and was benevolent as well as magnificent in his mode of life. A passage in Aristotle's *Metaphysics*, i. 3, has thrown much doubt on E.'s philosophical position. He derives much from Pythagoreans and Eleatics, and the tradition is that Anaxagoras was his teacher. In the fragments of his writings preserved he laments the uncertainty of ordinary knowledge, and states that a *dæmon* (a soul) polluted with guilt must wander apart from the blessed 30,000 years. He deduced abstinence from animal food from the doctrine of metempsychosis. As like can be known only by like, and as the idea of God, the perfect mind pervading the world, is recognised by man, God must exist. Creation is not an absolute beginning or ceasing to be, but a 'mingling and then a separation of the mingled,' there being four primary elements—earth, air, fire, water. This seems a combination of the fire of Heraclitus and the *homoiomeriæ* of Anaxagoras. But in place of the *desire* of the former, and the *nous* of the latter, E. selected *love* as his formative power. It was hate or separation which produced the misery of the sensible world. We must add his beautiful conception of God—'the sphere in the bosom of harmony, fixed in calm rest, gladly rejoicing.' His system seems to have been emotional and fanciful rather than logical. E. is eulogized by Lucretius in his *De Rerum Naturâ*. The fragmentary writings of E. extant have been edited by Sturz (Leipz. 1805), Karsten (Amsterd. 1838), and Steinn (Bonn, 1852).

Em'peror (Fr. *empereur,* Lat. *imperator, impero,* 'I command'). The primary meaning of E. was a commander-in-chief; and next, one sent on any important expedition. Cæsar assumed the name as a prænomen. This continued under the Empire, *imperator* only becoming part of the formal title after the Antonines, the proper term being *princeps,* or first man in the senate. In the early stages of the Roman Empire the absolute power of the E. was disguised by the form of a senate, but in the 2nd c. Septimius Severus was the apparent autocrat of the Roman world. Temples were raised to him when living, and when dead he was called *divus.* As the successor of the Pontifex Maximus, but still more from there being no chief patriarch of recognised authority, the E. became the head of the Church. He presided in councils, issued edicts against heresies, and was 'orbis Christiani custos.' Even after the division of Karl the Great's empire the E. was revered by the nations of Europe. Though he had no definite political supremacy over all, the mediæval E. ('Imperator terrenus') was the advocate of the Church—a 'secular pope,' deriving authority not through the spiritual pope, but direct from heaven. The position of the E. was greatly strengthened by the fusion of the title with that of the feudally powerful 'King' of the Eastern Franks. The 'Rex Francorum' was first discontinued by Otto the Great (A.D. 962), 'Imperator Augustus' being alone retained. In the feudal conception the E. was the suzerain of all kings and potentates. Various countries at times owed allegiance to the E. Thus Hungary, Denmark, Poland, and France acknowledged Otto the Great. The great interregnum beginning in 1254 loosened many of these relations. Spain, England, and Venice never admitted the supremacy of the E., and the Byzantine princes constantly protested against his title. The E. was crowned at Aachen, the original capital of the (Eastern) Franks, but after Heinrich II.'s time, 'King of the Romans,' at Pavia, or latterly at Milan or Monza, where he became King of Italy or of the Lombards, and at Rome, where he received the crown of the Roman Empire. The coronation at Rome was not held to confer the ownership of the separate kingdoms. Such importance was attached to it, however, that the Italian writers do not include in their list emperors who were not crowned at Rome, and the dates of the *regnum* and the *imperium* are in every case distinguished. This distinction was supported by the Empire passing from one family to another, the Karolings, Italians, Saxons, and Franconians. Hence sprang the latter theory that the pope was lord paramount, and the E. a vassal receiving a fief on conditions variable on each investiture. The word *holy* was applied in the German court, as at the Roman, to the person of the E. The E., at least in the 14th and 15th centuries, sought to represent a spiritual unity by deciding the disputes of inferior sovereigns, a right based on his divine commission. Among other secular privileges of the E. was that of creating kings, and he was the head and centre of the institutions of chivalry. In theory the Empire could be held by any man free-born and orthodox. By the Treaty of Westphalia large changes were made in the position of the E. The rights of making war and peace, levying contributions, passing or interpreting laws, were given to the Diet. The Reformation destroyed the Catholic theory of Empire. The subsequent changes in the attitude of the E. belong to the history of Austria and Germany. The title was dropped in 1806. In 1870 Germany again became an empire, which, however, does not claim to represent the Roman Empire. The German E., or E. *in* Germany, is the E. of a federation, not of all Christians. In the imagination of Napoleon I. the French Empire was a revival of the Karoling idea; he claimed authority over the pope, and called his son 'King of Rome.' The modern notion of E. is the somewhat inconsistent one of an elective despot. The title has been adopted by several new dynasties, as Brazil, Haiti, and Mexico, all of which have disappeared. Barbarous princes, like those of China and Abyssinia, also prefer the title to that of king. It was assumed in 1876 by the sovereign of Britain, to express the relation in which she stands towards the rajahs of India.

Emperor Moth, a species of Lepidopterous insects, the larva of which, common on heather in summer, is green, and has seven hairy pink tubercles set on black rings. It is the largest British moth. Each wing has a large transparent spot. The night or peacock moth of France (of the same species), may attain an expanse of wing of 5 inches. The E. M. is nearly related to the silk-moth.

Emperor Moth.

Em'phasis. See ACCENT.

Emphyse'ma (Gr. *emphusaō,* 'I inflate'), a distension of the body with air. E. of the lungs may be *vesicular* or *interlobular. Traumatic* E. is most commonly caused by a wound of the *pleura costalis* and the lung from an external puncture or a fractured rib. E. is sometimes caused by foul gases escaping into the cellular tissue.

Emphyteu'sis (Gr. 'an implanting'), in Roman law, a right in land granted by the superior for a yearly rent called *canon emphyteuticus.* The *emphyteuta,* or tenant, was not allowed to sell without making the first offer to the *dominus,* but he was entitled to the full profits of the subject. The word E. has been applied to Scottish feu-holding.

Empir'ic (Gr. *empeirikos,* 'searcher after facts in nature,' from *peiraō,* 'I try'), originally meant a man who gained his knowledge from experiment, and was applied to a medical school founded by Philinus of Cos and Serapion of Alexandria, which made the science of medicine depend upon experience, but which afterwards neglected science and fell into disrepute. Consequently a quack or pretender in any field, but chiefly in medicine, is called an E. Empiricism, in philosophy, is applied to the system which is based on observation and induction.

Empiric For'mulæ, in chemistry, are the symbols employed to denote the quantities of the respective elements of a substance without giving an insight into its constitution or the arrangement of its atoms. See CHEMISTRY.

Empir'ical Laws are laws which seem to hold during the occurrence of certain phenomena, but which do not give the explanation or cause of these phenomena, as in Bode's Law (q.v.). Kepler's were E. L. until Newton established his theory of gravitation. In time, probably, they will be shown to be all dependent upon a few great underlying principles.

Emplas'tra (Gr. *emplassō,* 'I plaster up') are external applications, of a firmer consistence than ointments, spread on linen or leather. They are mostly made from powders, extracts, or gums, and owe their consistence to metallic oxides, or to wax, resin, &c. Almost every solid medicine may be applied in this form, so that the non-official preparations are numerous.

Em'poli (a corruption of the Lat. *emporium,* 'the market-place'), a town in the province of Firenze, Italy, on the left bank of the Arno, in a fertile district, and 16 miles below the city, of Florence, with which it is connected by railway. It has a fine church of the 11th c., adorned with paintings by Giotto. There are manufactures, cotton and leather, and trade in fruits and grain. Pop. 18,030.

Empo'rium (Gr. *emporion,* from *emporos,* 'a wholesale trader'; Lat. *emporium*), the centre of a special commercial or manufacturing industry, or a warehouse for the storage and disposal of goods.

Emp'tion. See SALE OF GOODS.

Empye'ma, an accumulation of pus in the chest, caused by secretion in the pleural cavity, or by the bursting of an abscess of the lung. In the former case it is the result of pleuritis, and in the latter of organic disease or injury of the lungs. E. generally proves fatal, but is sometimes cured by drawing off the fluid with a trochar and canula.

Ems, or **Bad-Ems,** a market-town in a narrow valley on the Lahn, in the province of Hesse-Nassau, Prussia, 6 miles

S.E. of Coblenz by railway. It was celebrated for its baths as early as the 14th c. The springs, which are alkaline, vary in temperature from 93° to 135° F., and are beneficial in nervous and stomachic complaints. Near E. are silver and lead works. Pop. 7989.

Ems (probably the *Amisia* of Tacitus), a river in N.W. Germany, rises in the S.W. slope of the Teutoburger Wald near Paderborn, flows N.W., receives the Leda and Hasse, and enters Dollart Bay, near Emden, after a course of 215 miles. It drains an area of 5200 sq. miles, and is two-thirds navigable.

E'mu or **Emeu,** a bird belonging to the family *Struthionidæ*, order *Cursores*, and is a native of Australia. It attains a height of from 5 to 7 feet, and its plumage is light brown mottled with dirty grey. The throat is nearly naked, but the head is feathered, unlike that of the cassowary, from which the E. also differs in having no horny crest or pendent wattles. The three toes are directed outwards. The E. is monogamous, and lays from nine to thirteen dark-green eggs. They are placed in a hollow on the ground and hatched by the male, which is smaller than the female. The E. is swift, but can be hunted down with dogs. It inhabits the plains, living upon grass and wild fruits. An amber-coloured oil, esteemed for its anti-rheumatic properties, is made from its skin, a full-grown bird yielding from six to seven quarts. The E. can be easily domesticated; but no pains having been taken to rear it, it is dying out rapidly.

Emu.

Emul'sin, or **Synap'tase,** is a nitrogenous substance occurring in bitter almonds along with amygdaline. It is a species of ferment, and when added to solution of amygdaline, causes the latter to take up water and to split into hydrocyanic acid, oil of bitter almonds, and grape-sugar.

Emul'sions (Lat. *emulgeo*, 'I milk') are white liquid preparations obtained by mixing oil and water by the addition of some mucilaginous or saccharine substance, as camphor, balsams, &c. Emulsion of bitter almonds is used in cough medicines.

Em'ydin, a substance found in the yolk of turtles' eggs. It is probably derived from the decomposition of some more complex albuminous substance. A somewhat similar substance called *ichthin* has been found in the eggs of fishes.

Em'ys, a genus of Chelonians, represented by the terrapins or water-tortoises, belonging to the family *Emydidæ*. In this family the head is flat and covered with skin, the neck is retractile, the feet are broad, the nails sharp, the toes webbed, and the tail is conical and furnished with plates. In E. there are four hinder and five front toes. The most familiar species are the chicken tortoises and the lettered tortoises, both common in N. American lakes. The former is from 6 to 9 inches long, and is brown in colour. The lettered tortoise is so named from the markings on the edge of the body. The Quaker tortoise has long foreclaws. Allied to the E. are *Malaclemys, Cistuda, Chelydra*, &c.

Enam'el (Fr. *émail*, Old Fr. *esmail*, Ital. *smalto*, of Ger. origin, *smalti* in Old High Ger. meaning 'what has been fused or melted'; comp. mod. Ger. *schmelzen*, and Eng. *smelt*), a vitreous compound, consisting of a basis of transparent glass combined with colouring metallic oxides, applied principally to the surface of metal and fused by the action of fire. E. is either opaque or transparent according to the oxide. The oxide of tin produces an opaque white E., such as is seen on watch-dials, and a little peroxide of manganese communicates a violet tinge to it. Oxide of cobalt produces blue; oxide of lead yellow; the oxide of copper green; cuprous oxide ruby-red, &c. Any work of art in metal encrusted or painted with E. colours is commonly called an E. The art of decorative enamelling is of great antiquity, and had its origin in the East. There are different styles of metal enamelling, distinguished as *cloisonné*, *champ-levé*, and *painted* enamels. In the last, opaque or semi-fluid colours are spread over the surface of the metal with a brush. In cloisonné enamels, partitions (French *cloisons*) formed of slender strips of copper are soldered on the metal surface, and in champ-levé enamels spaces are dug out of the metal, and in both cases the cells are filled in with E. paste, which is permanently fixed to the metal by fusion. Old enamels from China and Japan are masterpieces of the art, and are highly valued. Chinese enamels are distinguished for brilliancy of colours, while Japanese enamels are unsurpassed for beauty and intricacy of design. The most interesting mediæval Greek E. extant is the celebrated Pala d'Oro, an altar front in St. Mark's at Venice. In France and England cloisonné enamelling is now carried on extensively. A celebrated firm is that of Messrs. Elkington & Co., Birmingham.

In champ-levé work metal plates with prepared troughs are now obtained by casting and by electro-deposition. Champ-levé was practised extensively in Constantinople, and early in the 12th c. Köln and Limoges were the great seats of its manufacture. The largest enamels were executed in this method, because there was little difficulty in procuring large plates of copper. Two varieties of champ-levé are recognised: one, belonging to the 11th and 12th centuries, has the flesh-tints and draperies as well as the ground represented by E.; and the second, practised in the two following centuries, has the figure chased in low relief on a gilded ground, the E. being restricted to the space around the figure. Early in the 14th c. Italian artists struck out a new path, and produced the translucid enamels upon relief, the design being chased upon a gold or silver plate and covered with brilliant E. tints. Painted enamels originated with the Limoges artists of the 15th c. The design was no longer expressed by engraved lines, but by colours mixed with fusible fluxes, applied to a copper plate. The plate was covered with a translucent flux, and upon this the design was outlined with a black E., around which the other colours were filled in. Flesh-tints were rendered upon a violet ground with white E. applied in varying thicknesses to secure effect of light and shade, and the background and draperies were heightened with golden touches. In the 16th c. *grisaille* (grey) enamels were produced at Limoges by working upon a thick dark-coloured layer with white opaque E., shaded flesh-tints being retained for the face. Translucent colours were sometimes spread over the grisaille. The chief artists of the late Limoges school were the Penicauds, L. Limousin, the Courtois or Courteys family, Jean Court, also called Vigier, Martin Didier Pape, and Pierre Raymond or Rexmon. The main difficulty of E. painting consists in the artist not having actual colours to work with, but substances which are to take these colours after firing. See ENCAUSTIC PAINTING.

The coating of the inside of cast-iron pots and saucepans with E. glaze, to protect them from the action of acids, is comparatively new. Still more recent is the application of coloured E. to plates of iron for use as railway and other signs, dials, &c. Articles of cast-iron are prepared for enamelling by being heated to a low red heat and slowly cooled, scoured with sand in warm dilute sulphuric acid, then washed and dried. Several coats of E. mixtures of variable composition are then applied, one coat being vitrified before the next is laid on. Letters and ornamental designs in E. colours are stencilled and fused upon the last coat.

Enamel is the name given to the hard external coating of the teeth, which contains a large quantity of oxide of lime.

Ena'ra, or **Inare,** a lake of Russia, in Lapland, 60 miles long and 20 broad, in about lat. 69° N. and long. 28° E., has an area of 1050 sq. miles. It is studded with islands, and connected with the Varanger Fiord by the Pasvig River.

Enar'ea, a country of the Gallas, in Africa, to the S. of Abyssinia, in lat. 7° 40' to 8° 40' N. and long. 36° 40' to 37° 35' E. It is bounded on the N. by Nonno, is watered by the Didesa, Omo, and Gibbe, and is intersected by offsets of the Abyssinian highlands. Coffee is extensively cultivated, and there is an active trade, chiefly in gold, ivory, civet, skins, and ornamented arms. The Mohammedan religion prevails.

Enarthro'sis (Gr. *arthrōsis*, 'a joining') is the ball-and-socket form of joint, like the shoulder and hip, allowing motion in every direction.

Encamp'ment (Lat. *campus*, 'a plain') is the temporary station occupied by an army or division, with its artillery, baggage, or stores. In early times an established arrangement of the troops, &c., in camp, was rigidly adhered to. (See CAMP.) In modern times, the leading idea in arranging an E. is to dispose the lines so that at a few minutes' notice every battalion shall be able to assume its position in order of battle. The extent of the front is determined by the number of troops in camp, and is generally calculated at the rate of two paces for every file of infantry, and three for each file of cavalry. The tents for infantry now generally in use accommodate fifteen, those for cavalry twelve men each, and they are usually ranged in rows or 'streets.' In the single rows of cavalry, a total frontage of 19 yards must be given for each troop. The extent of front covered by the tents of each battalion is no greater than that battalion will occupy in order of battle. In selecting a site for E. it is desirable to choose a spot where wood and water can be readily obtained; the front should be covered by forest or stream, and the rear be perfectly open. Formerly the natural strength of the site of a camp was a matter of first importance; and even in our own time, when a complete watching system has been elaborated, the natural defences of a site—the marshes and rivers which bound it, &c.—and the character of the roads converging upon it, are carefully considered in encamping. For camps of instruction, see ALDERSHOT, KILDARE, &c.

Encarpa, in architecture, a festoon of fruit, or of flowers, frequently used as decoration of friezes or other flat spaces.

Encarpa.

Encaus'tic Painting (Gr. *en*, 'in,' and *kaustikos*, 'caustic,' from *kaiō*, 'I burn'), a process of using colours mixed with wax and subsequently heated, somewhat akin to enamel painting. Ancient descriptions of the art, as practised by the Greeks and Romans, are not quite clear as to the modes of operating. In one process it would appear that the wall was first coated with wax, and upon it a design was outlined with a style, and filled in with colours in a wax medium with a hot spatula, the whole being subsequently polished. The art, lost for centuries, but revived in the 18th c. by Bachelier, Comte Caylus, and Miss Greenland, is seldom practised now.

Encaustic Tile, a tile with an ornamental design produced by inserting and 'burning in' coloured clays. Encaustic tiles were much in vogue for pavements in cathedrals during the Middle Ages, but for some centuries later the art of making them was neglected till it was revived and brought to great perfection by the late Herbert Minton. The modern process is as follows:—From red clay consolidated into a 6-inch cube a sufficient thickness to form the body of one E. T. is cut off with a wire. The upper side of the tile is then faced with fine clay to form the ground of the pattern, and a coating of the same material is applied to the lower side, and pierced with holes to prevent the tile warping. A plaster-of-Paris mould, bearing the intended pattern in relief, is then pressed upon the tile, and the indentations so formed are filled with various-coloured 'slips,' or fine clays, in a semi-fluid state. After partially drying, the superfluous slip is scraped off, and the coloured pattern left flush with the surface is then slowly dried and baked. Hard non-porous encaustic tiles are extensively manufactured in the Stafford potteries, and encaustic floors, even in dwelling-houses, are now common.

Enceinte' (Fr. 'an enclosure,' from Lat. *incincta*) is a term in fortification used to designate the well or rampart enclosing a fortified place, and secondarily the whole of the fortified area.

Enceph'ala (from Gr. *kephalē*, 'the head'), a name given to the three higher classes of Mollusca, the *Gasteropoda*, *Pteropoda*, and *Cephalopoda*, from the fact that they possess a well-developed head. These groups are so named in contradistinction to the Lamellibranchiate molluscs, or *Acephala*, which possess no distinct head.

Encephalar'tos, a genus of Exogenous plants belonging to the *Cycadaceæ*. The species of E. produce starch. *E.* or *Zamia pungens* has ripened and produced its fruit at Chatsworth in England. Many species afford 'Caffre bread.'

Encephali'tis, or **Cerebri'tis,** inflammation of the brain substance, or of the structures generally within the cranium, is often associated with *meningitis*, and followed by softening or induration. There are two varieties of softening of the brain—(1) Inflammatory *red softening*, or acute ramollescence; and (2) *white softening*, the result of an atrophic process. Red softening is frequently followed by abscess, and is essentially a fatal disease. In induration, the texture of the brain resembles the white of egg boiled hard, the convolutions being flattened, and there is an absence of blood and serum in the encephalon. Causes:—Morbid poisons, associated with zymotic or constitutional diseases; intemperance; *coup de soleil;* great mental excitement, &c. E. may be *traumatic*, resulting from injury; or *idiopathic*, *acute*, or *chronic*. In acute E. there is usually delirium, followed by a loss of mental power terminating in dementia. In chronic E. the mental symptoms may be slight; but there is always loss of intellectual vigour, failure of memory, confusion of ideas, and irritability of temper. The disease often ends in general paralysis, or death from apoplexy. Treatment:—General measures must be adopted to remove the exciting cause, and the brain must have perfect rest. Hygienic measures and a change of scene are of primary importance.

Enceph'alon, a term sometimes applied to that part of the nervous system within the skull. See CEREBRUM.

Enchondro'ma, or **Cartilag'inous Tu'mour,** may be innocent or semi-malignant. In the first case it is smooth, elastic, round, or flattened, seldom exceeding the size of an orange, and growing slowly without pain. In the second it is rapid in growth, attains an enormous size in a few months, and deposits secondary growths in internal organs, which are frequently associated with encephaloid cancer. The treatment consists in excision of the tumour, or amputation of the affected part, when possible.

Encho'rial Writing. See HIEROGLYPHICS.

Enck'e, Johann Franz, was born at Hamburg, 23rd September, 1791, studied at Göttingen, served from 1813-14 in the Hanseatic Legion, and in 1815 was appointed a lieutenant of artillery in the Prussian army. He left the service and became astronomer at the Seeberg Observatory near Gotha, whence he went to Berlin in 1825. He was made editor of the *Berliner Astronomische Jahrbuch* in 1830, and died 2nd September, 1865. His greatest labours are the determination of the orbit of the 1680 comet; the reduction of the transit observations of 1761 and 1769, and calculation of the sun's parallax; and the discovery of the short-period comet which goes by his name. See Bruhn's *Life of E.* (1869).

Encke's Comet has the shortest period and the least aphelion distance of all the known comets. It revolves in a very eccentric ellipse, which does not, however, extend to the orbit of Jupiter, and moves in a plane inclined at an angle of about 13° 20′ to the ecliptic. The period is 3·29 years, but it seems to be lessening by about two hours and a half every revolution, a fact accounted for by Encke by the presence of a resisting medium pervading space. It was first recognised by Encke as a comet of short period in 1819, and its subsequent appearances have been so accurately observed, that its orbit and motions are as well determined as those of any planet. Its last reappearance commenced on 1st November, 1894.

Encore' (Fr. 'again,' Old Fr. *ancore*, Ital. *ancora*, a corruption of the Lat. *hanc horam*), a call made by an English audience for the repetition of a part of a performance. The French similarly cry *bis* (twice).

Encrini'tal Lime'stone, a name given to certain limestones intermingled with rocks of Carboniferous age, from their containing vast quantities of fossil Encrinites or Crinoids.

En'crinite, or **Lily Star,** the name given to certain fossil *Echinodermata* (q.v.) belonging to the order *Crinoidea* (q.v.). There are a few living species of crinoids, whilst a vast number of fossil species, popularly named E., are known. The crinoids appear to be first represented in the Lower Silurian rocks. The Carboniferous or Coal period is, however, the great region of crinoids. Many strata of Carboniferous limestone are wholly composed of crinoid remains; and the crinoids of this period, as well as those of all other Palæozoic rocks, are distinguished chiefly by having the grooves of the arms running to the mouth in closed channels, and by their rounded stalks. The mesozoic crinoids include the genus *Encrinus*. *E. liliformis* is a well-known Triassic species, these typical encrinites having the joints of their stalks perforated by a small canal, and having the arms composed of two series of alternating pieces. The genera *Pentacrinus* (Lias) and *Extracrinus*, and the *Apiocrinidæ* or pear E. of the Oolitic rocks are well known. The latter are so named from their pear-shaped calyx.

Encrinites.

Encyclopæ'dia (Gr. *en*, *kuklos*, and *paideia*, lit. 'a circular course of education'), a work meant to treat, generally in alphabetic order, of the whole circle of knowledge. Aristotle was the first who saw the connection between all branches of knowledge, but his idea was not embodied in the form of an E. for ages, as the works of Pliny, Varro, and Suidas are unsystematic compilations. Albertus Magnus (1193-1280) made a collection of remarks on scientific facts which bears closer resemblance to an E., but a more clearly encyclopædic work was the *Speculum Naturale Morale Doctrinale et Historiale* of Vincent de Beauvais (1264) compiled from Aristotle and Aquinas. In the 13th c. the idea of throwing knowledge into encyclopædic shape seems to have been common, from the number of works then written with the title *Summa* or *Universitas*. The chief of such books was Roger Bacon's *Opus Majus*, a summary of the knowledge of his times, and the introduction to an E. on a larger scale, the *Compendium Philosophiæ*, which was never finished. Whewell calls the *Opus Majus* the E. and the *Novum Organum* of the 13th c. In the 16th c. the encyclopædic idea again became active. Ringelberg published at Basel the earliest work entitled a Cyclopædia, which was followed by similar compilations, the best being Alsted's *E. Scientiarum Omnium* (1620), a collection of treatises giving special attention to grammar, rhetoric, and logic. Two remarkable French works belong to this period, the *Grand Dictionnaire Historique et Critique* by Louis Moreri (10 vols. Lyon, 1674), and the still better known *Dictionnaire* by Bayle (2 vols. Rotterdam, 1696). The very earliest attempt to gather the body of science and art into lexicographic form was probably made by Hoffmann in his *Lexicon Universale* (2 vols. Basel, 1677). This was followed by Thomas Corneille's *Dictionnaire des Arts et des Sciences* (2 vols. Par. 1694), and Coronelli's Italian *Biblioteca Universale* (45 vols. Venice, 1701). In 1706 appeared the *Lexicon Technicum* of Dr. J. Harris (Lond. 1706), and in 1727 Ephraim Chambers's *Cyclopædia* (Lond. 2 vols.), which suggested the great French E. (See ENCYCLOPÉDISTS.) Of encyclopædias issued since E. Chambers's, the most noteworthy are Barrow's *Universal Dictionary of Arts and Sciences* (1751), *E. Britannica* (1st ed. 3 vols. 1771, 9th ed. 24 vols. 1875-89), *Rees's Cyclopædia* (45 vols. 1802-19), Brewster's *Edinburgh E.* (18 vols. 1810-30), the *Encyclopædia Metropolitana* (30 vols. 1818-45), the *London E.* (22 vols. 1829), *Penny Cyclopædia* (27 vols. 1833-43), Knight's *English E.*, based on the *Penny* (22 vols. 1853-61), *W. and R. Chambers's E.* (1st ed. 1860, 10 vols., new ed. 1888-92), *Illustrated Globe Encyclopædia* (1876, new ed. 1895). Of French encyclopædias, besides Diderot's famous *Encyclopédie* (28 vols. Par. 1751-72), the chief are the *Encyclopédie Méthodique* (1782-1852, 201 vols.), *Encyclopédie des Gens du Monde* (22 vols. 8vo, 1833-44), *Encyclopédie Moderne* (1846-62, 42 vols.), *Dictionnaire de la Conversation et de la Lecture* (52 vols. 1834-39), *Biographie Universelle* (1st ed. 1811, later ed. 1854), *Nouvelle Biographie Générale* (46 vols. 1862-70). The chief German encyclopædias are the *Œconomische Encyclopedie* (242 vols. 1773-1858), the *Conversations Lexicon* (1st ed. 8 vols. 1796-1809, later ed. 17 vols. 1865), Meyer's *Grossem Conversations Lexicon* (44 vols. 1840-55), and, above all, Ersch and Gruber's colossal undertaking, the *Allgemeine Encyclopädie der Wissenschaft und Künste* (1818, still unfinished). Those of America are the *British Encyclopædia* (Philad. 1798-1804), *E. Americana* (14 vols. Philad. 1829-48), the *New American Cyclopædia* (16 vols. New York, 1857-63, revised as *American Cyclopædia*, 16 vols. 1873-76). Schemnis' *German-American E.* (11 vols. 1869), and Johnston's *Universal Cyclopædia* (4 vols. 1878, new ed. 1894). Others are Mellado's Spanish *Enciclopedia Moderna* (34 vols. Madr. 1848-51), the *Nordisk Conversations Lexikon* (5 vols. Copenh. 1858-64), *Svenskt Konversations Lexikon* (Stockh. 1845), Rieger's *Slovink Naŭcny* (vols. i.—v., Prague, 1860-65). The enormous Chinese E. in 5020 vols., entitled *Ku tu shu tseih ching*, also merits notice.

Encyclopé′dists, the name given to a French school of writers, from their contributing to the great encyclopædia of the 18th c. edited by Diderot. A project of translating Ephraim Chambers's English encyclopædia having failed, Diderot resolved to form a new and far ampler work, the plan of which was matured between 1745 and 1748, the first volume appearing in 1751, and the last in 1765. The foremost authors of the time contributed to the book; among others, Diderot, D'Alembert, Voltaire, Montesquieu, Turgot, Grimm, Rousseau, Marmontel, Daubenton, Jaucourt, Haller, Du Fresnoy, and Condorcet. There was great variety of belief among these, some being deists, others materialists, others pantheists; and no consistent attack was made on Christianity throughout, though the Catholic priesthood was boldly assailed. This encyclopædia was the first great embodiment of the sceptical and revolutionary spirit, of which it became a most potent organ. Though not pledged to any social theory, and the vehicle of no new social facts, the book, by its clear statement of existing evils, prepared the way for their abolition. It presented the latest scientific results, gave great space to practical arts and industries, but contained no articles on biography or history. See La Porté's *Esprit de l'Encyclopédie* (Par. 1768), Voltaire's *Question sur l'Encyclopédie* (1770), and Taine's *Ancien Régime* (1876).

Endem′ic (Gr. *en*, 'among,' and *dēmos*, 'the people'), a term applied to diseases to which the inhabitants of any country are peculiarly subject, and which proceed from local causes and conditions. When from any cause in the manners and customs of a people, or in their local surroundings, the general health of a community deteriorates, an E. disease is the result. Diseases peculiar to certain localities are, in some way or other, connected with terrestrial and climatic influences, the most marked type of diseases of this class being ague or intermittent fever. E. disease may be caused by unavoidable influences, such as solar heat, the density and electricity of the air, low-lying or elevated situations; or by remediable causes, as swampy districts, luxuriant and decaying vegetation, and by the habits of the people, giving rise to miasmatic and filth diseases. E. diseases are caused also by errors in diet, and principally by the use of contaminated drinking water. Many E. diseases are preventable. Even those of miasmatic origin may be checked by draining and cultivating the soil, as has been done in the Tuscan Maremma. E. diseases, as a class, are not communicable from man to man like epidemic diseases, although the latter class of diseases are said to be E. in certain countries. In the tropics, the principal E. diseases are malarious fevers, dysentery, diarrhœa, cholera Asiatica, specific yellow fever, and hepatic affections. In the temperate disease realm, zymotic and constitutional diseases cause the greatest mortality; *leprosy* and *elephantiasis* prevail in Scandinavia; *pellagra* in Italy, France, and Spain; *plica polonica* in Poland and Tartary; *goitre* and *cretinism* in Switzerland; *beri-beri* in Further India and the Eastern Archipelago. Sanitary improvements in civilised countries are rendering E. diseases less frequent, and even phthisis has been shown to be, in great measure, preventable.

End′erby Land, an extensive tract of land in the Antarctic Ocean, lat. 67° 30′ S., long. 42°-60° E., discovered by Biscoe in 1831, and now understood to be an island. Morrell, in 1827, found drift-ice close to the S. of E. L.

Ender′mic Medica′tion, a mode of administering medicines through the skin, as in neuralgia, skin-diseases, the reduction of tumours, &c. Constitutional effects often result from E. M., as salivation from mercury applied in this way.

En′dive, a species of Composite plants belonging to the *Cichoraceæ* or Lettuce section of the order, also known as the 'garden succory.' It is a native of China, but grows well in our gardens, where it is sown in May, and survives through the winter. A salad is made of the leaves.

End′licher, Stephen Ladislaus, was born at Presburg, 24th June, 1804, studied at the universities of Pesth and Vienna, and devoted himself to the study of botany and of Eastern languages. In 1828 he held a post in the imperial library at Vienna, in 1836 became keeper of the museum of natural history, in 1840 Professor of Botany in the High School of Vienna, and director of the Botanic Garden. He contributed greatly to the establishment of the Academy of Sciences (1846). The political movements of 1848 affected him so strongly that he committed suicide, 28th March, 1849. Among his works are *Genera Plantarum*, in Latin (Vien. 1831-41), and others upon botany and geography.

Endocardi′tis, an inflammation of the serous membrane, or endocardium, covering the valves and internal surface of the heart. See HEART, DISEASES OF.

Endocar′dium (Gr. *endon*, 'within,' and *kardia*, 'the heart'), the lining membrane of the heart. See HEART.

En′dogens, or **Endog′enous Plants** (Gr. *endon*, 'within,' and root *gén*, from *gignomai*, 'I am born'), a great natural division of the vegetable world, characterized by the *inward growth* of the stem. The term is used chiefly in opposition to Exogen (q.v.). Endogenous plants possess only one seed-leaf, and the name *Monocotyledonous* is therefore used synonymously with E., whilst the leaves of E. show a *parallel venation* or arrangement of their veins. In their growth also E. differ from the higher exogens. The *radicle* or young root of the E. divides into numerous fibres, which, as they pass outwards, are covered by a thin sheath or *coleorhiza*. The roots are hence called *enderhizal*. The stem of any endogen (well exemplified by palms, bamboos, grasses, lilies, &c.) shows no division into layers of pith, wood, and bark, as in the stem of an exogen. No concentric woody circles, nor *medullary rays* running between the pith and circumference, are to be seen. The bark of an endogen cannot be separated from the wood, and exhibits no annual increase as in exogens. The bundles of vessels are also diffused through the tissues of the endogenous stem without any definite arrangement. The stem is composed of cells in its young state, but afterwards of bundles of woody, spiral, and other vessels. The endogenous stem grows, therefore, by additions to its central portion, the older vessels being pushed outwards; and there seems to be a definite limit to the outward growth of these plants, since, after a certain thickness has been attained, the stem may increase in height but not in thickness. E. possess flowers with stamens and pistils, and the seeds are held in an ovary or seed-vessel. They may be subdivided into the (1) *Dictyogenæ* (in which the leaves have reticulated venation), exemplified by the natural orders *Smilaceæ*, *Trilliaceæ*, and *Dioscoreaceæ*; and (2) the *Petaloideæ* (with parallel-veined leaves and a coloured perianth), represented by the great bulk of E., such as orchids, palms, lilies, grasses, and many other less familiar groups.

Endorse′ (Lat. *in*, 'on,' *dorsum*, 'the back'), in heraldry, is an ordinary containing one-fourth of the pale. It is generally borne on the field in pairs.

Endorse. See BILL OF EXCHANGE.

Endow′ment, in English law, is the application of wealth to any use or to any person such as the settling of Dower (q.v.) upon a woman. The term is also applied to a provision for the support of a church, school, charity, &c., or to a portion to maintain a vicar when his benefice is appropriated.

Endröd′, a village of Békés, Hungary, on the Körös, 92 miles E.S.E. of Pesth. It is situated in a very fertile region, and has a trade in horses, cattle, sheep, grain, &c. Pop. 1898.

Endym′ion, a youth (variously described as king of Elis, shepherd, or hunter) renowned for his beauty and for the perpetual sleep in which he spent his days. He was greatly beloved by Selēnē (the Moon), who, according to a Carian tradition, lay beside the sleeping E. in a cave of Mount Latmos. The sleep of E. is indifferently accounted for. Some say it was the gift of Zeus, some a punishment for falling in love with Hērē, others that Selēnē, fascinated by his charms, conveyed him to Latmos, and lulled him to slumber that she might nightly kiss him without reserve. The myth itself has received various explanations. E. is regarded by some as an astronomer, by others as a personification of Sleep. The Eleans showed his tomb at Olympia. Max Müller (*Oxford*

Essays, 1856) takes E. as a name of the setting sun (from *enduō*, probably a dialectical variety of *duō*, 'I sink or set'), who goes to sleep in the caves of Latmos (Night), to be followed there by Selēnē, the daughter of Latona (Night). E. is the subject of Keats' longest poem.

En′emy. Originally every subject of a belligerent state was said to be the E. of every subject of the opponent state, and everybody's property was liable to confiscation; but now a distinction is made between combatants and non-combatants. An E.'s subjects, resident in the country declaring war, generally get notice to depart. An E.'s property within the country, debts due by an E.'s subjects, and even public stocks held by the government, are now seldom confiscated. Non-combatant enemies, if they resist, are liable to severe punishment from the home government, and whatever plunder they take is forfeited to the public. On the other hand, their property within their own territory is partially protected, though on sea it is subject to capture. Accordingly there has always been more freedom for private exertion at sea. There was a system of issuing letters of *marque* (*i.e.*, licenses to cross the boundary) from the belligerent government which gave a right to the thing captured, and were recognised by the E. as authorising war. Privateering has been stipulated against in certain treaties, and the Declaration of Paris (30th March, 1856) declares privateering abolished. War on land is growing more humane. Formerly, an army pillaged in order to live. Now no commander severs his connection with his base whence his supplies come. The separation of the army from civilians has had a good effect, having strengthened discipline, and reduced war to a science. But the deeper changes, such as the abandonment of killing or enslaving prisoners, have arisen from the growth of intelligence and sympathy. Though the modern tendency is to excuse anything that does wholesale execution, infernal machines, constructed to produce a frightful moral effect by severe wounding or mutilation, are now little resorted to. The use of savage allies has always been criticised; but in 1848 the Russians brought Circassians into Hungary, and the Turks employed them in the insurrectionary wars of 1876. Systematic pillage was practised in the Thirty Years' War, and by Turenne and Catinat under Louis XIV. The substitution of fixed contributions in certain districts dates from the campaigns of Villars and Marlborough. Contributions were discountenanced by Wellington, were unknown in the Crimean War, and were paid for by the Germans in 1870. Military stores and buildings are held lawful plunder, and may be destroyed. In sieges a distinction is now made between forts and fortified towns: some generals do not bombard the latter, except after notice to the inhabitants. It is often difficult to fix the line where rebels become entitled to the privileges of combatants. Peace is generally adjusted by definite treaties, very often qualified by secret articles. Such treaties are often acceded to or protested against by neutral powers. These documents were in Latin till, in the 18th c., French became the *lingua franca* of diplomacy.

Ener′gico (Ital. 'with energy'), a mark of expression in music.

En′ergy (Gr. *energeia*, from *en*, 'in,' and *ergon*, 'work') is the capacity which a material system possesses for doing work, *i.e.*, for overcoming resistance. A stone ascending into the air against the gravitating attraction of the earth, a bowl rolling with ever-decreasing velocity along the ground, the slow onward and downward grinding of a glacier, all indicate the existence of E.; for all moving bodies possess power of doing work in virtue of their motion. But a raised weight, a drawn bow, a stretched piece of india-rubber, a quantity of compressed air, a heated body, a charged electric conductor, &c., also have each a certain capacity of doing work, though there is no evident motion. We thus recognise two apparently distinct forms in which E. is made evident, viz., that of motion, or *kinetic E.*, and that of configuration, or *potential E.* Now, the working power of a moving body must increase with both the mass and velocity, but must further be quite independent of the *direction* of motion. These, conjoined with other considerations more mathematical, lead to the definition of kinetic E. as half the product of the mass into the square of the velocity ($K = \frac{1}{2} m v^2$). For a clearer comprehension of potential E., take the case of a raised weight—say a weight of 10 lbs., at a height of 50 feet. The work which is stored up in it, and which it could perform if allowed to fall to earth, is estimated at 10 × 50 = 500 foot-pounds—where a foot-pound is the amount of work which must be expended upon a weight of one pound so as to raise it through a distance of one foot at the surface of the earth. This stored-up work, valued at 500 foot-pounds, is a measure of the potential E. We may then define the potential E. of a given material system, at any instant, as the amount of work stored up in that system during its passage from a certain configuration to the configuration it has at the instant in question. We find, on a close investigation of any physical phenomenon, that kinetic and potential energies are mutually transformable. Thus an ascending stone is continually losing in kinetic and gaining in potential E.; a descending stone the converse. The potential E. of a bent bow is made evident in the rapid flight of an arrow; the bowl derives its motion from the E. stored up in the muscle of the bowler; the heated body generates aërial currents, and raises the temperature of surrounding bodies; the charged conductor may give rise to a variety of motions—light, heat, sound, &c.—or may make a part of its E. sensible as an electric shock. From these few examples it will be seen what a wide significance in science the term E. has. Under it we study the nature, the effects, and the relations of the formerly so-called *imponderables*—light, heat, electricity, &c.; we investigate all phenomena of attraction and repulsion existing in the physical universe; we trace results through their varied transformations back to some known principle, thus rendering the whole science of natural philosophy more and more the vast and coherent structure which it should be, and which has for its foundation the grandest of modern generalisations—the *conservation of E.* This principle may be thus enunciated:—The total E. of the universe, or of any portion of it, uninfluenced save by its mutual actions, is *constant* throughout all transformations. It is this indestructible and non-creatable character which most warrants us in conceiving E. as something which has an existence as real and objective as matter; and it is utterly opposed to the possibility of perpetual motion, taken in its purely scientific sense of doing work without an expenditure of an equivalent quantity of E. The experimental basis for this generalisation is that any one form of E. may, by suitable means, be transformed wholly or in part into an *equivalent* amount in any other form. This constitutes the *transformation of E.* These principles were fully recognised, in their purely *mechanical* connections, by Newton; but they have only been developed during the last fifty years.

One of the most remarkable discoveries is the calculation upon theory by Professor Thomson of the lowering of the freezing-point of water by pressure, and the subsequent experimental verification, even to its numerical details, by Lord Kelvin. The latter extended the theory further in this direction, and deduced the interesting law that solids which *expand* when melted have their melting-point *raised* by pressure, and solids which *contract* when melted have their melting point *lowered* by pressure. For the application of this law to the explanation of physical phenomena, see EARTH and GLACIERS. Another discovery by Lord Kelvin is the so-called *electric convection of heat*, or the effect produced by a current directed through an unequally-heated metallic wire or bar—tending to equalise the temperature in some metals, as in the case of iron, and to render it still more unequal in others, as in copper. In electrolysis we have the E. of the electric current expended in dissociating the molecules whose combination forms the electrolyte; and the researches of Faraday show that the more hidden actions of chemical combination and decomposition are as truly governed by this law of conservation as the more evident motions of the solar system. Experiment shows that there is always a definite amount of heat taken in or given out during the formation of a given quantity of a chemical compound; and further, that a compound, if capable of being decomposed by heat, requires to give out or take in precisely the same amount to effect its decomposition.

Now one of the most evident properties of heat is its tendency to diffuse itself in all directions, and thus ultimately render all bodies of one and the same temperature. But mechanical work can be obtained from heat only when it is capable of being transmitted from one body to another, *i.e.*, when we have two bodies at *different* temperatures. Evidently, then, heat tends, when left to itself, to destroy its power of doing useful work. In other words, though the amount of E. is constant, its *availability* for work is diminishing; and thus are we led to Lord Kelvin's more recent development of the science, viz., the *dissipation of E.* It simply asserts that no natural process is reversible, and that all transformations are accompanied by a constant degradation of E. to the final unavailable form of uniformly-diffused heat. Hence if, as suggested by Professor Tait of Edinburgh, we take the word *entropy* to mean availability for work of a given quantity of E., we are led to the conclusion that the 'entropy of the universe tends to zero.' Heat can only do work when it is let down, so to speak, from a hotter to a colder body—just as a mass of water, however great, is useless unless it can be let down from a higher level to a lower. Further, the greater the difference of temperature between the boiler and condenser of a heat engine, the greater is the amount of work the engine is capable of performing as the boiler is cooled to the temperature of the condenser. If there were no dissipation of E., every natural phenomenon would be reversible, *i.e.*, would be capable of going over its various stages in the reverse order, fulfilling at each instant exactly the same conditions as in its original progress. But on account of the tendency which heat has to diffuse, very few instances in nature can be adduced which are even approximately reversible; and so unless it be possible to localise or prevent the diffusion of a given quantity of heat, we are compelled to accept the dissipation principle as an important law in nature. Professor Clerk Maxwell, however, showed, upon the molecular theory of gases, that the localisation could be effected if the molecules of matter were of sufficient size to be individually directed by physical means. The excessive smallness and great number of the molecules, however, render this impossible, and thus shut the only door of escape from this principle, overthrowing the whole of that materialism which has of late years been advocated by quasi-scientific sceptics.

E., then, including as it does Electricity, Magnetism, Gravitation, Heat, Light, Sound, &c. (q.v.), must be recognised as *the* agent in the physical universe—matter being in itself passive and merely the vehicle by which E. is made evident. The most plausible speculation regarding the ultimate nature of matter is that which supposes the atoms to be vortex rings in a perfect homogeneous fluid. (See VORTEX.) If we suppose this fluid to be almost but not quite frictionless, we see that the atoms may be but forms of E., and that ultimately matter may cease to exist, an equivalent portion of hidden E. reappearing as each vortex disappears. Regarding the more hidden properties of E., experiment suggests the following hypotheses as highly probable:—That transformations of E. take place through a medium, which, according to Lord Kelvin, must have an appreciable density to fulfil the requisite conditions for the propagation of light, radiant heat, and magnetic action; and that potential E. is really kinetic, being due to motions of displacement of some nature through the ether, as the medium has been called.

In conclusion, be it remembered that the theory of E. is still in its infancy. Grove's *Correlation of the Physical Forces* (1842) was the first step in this direction; but under the care of such men as Kelvin, Rankine, Helmholtz, Joule, Clausius, Maxwell, &c., the science has grown so rapidly, and has opened up such important lines of research, that it has established the whole of natural philosophy upon a new and firmer basis. The researches of Faraday have done more towards this than all other previous discoveries put together; yet it is a curious fact that this distinguished experimentalist never fully appreciated or recognised the potency of the principle of the conservation of E.

En'fantin, Barthélemy Prosper, 'Père,' was born at Paris, 8th February, 1796. He was expelled from the École Polytechnique for having taken part in the 'national defence' at Montmartre in 1814. For some years he was a bank clerk, and in 1825 was introduced by Rodriguez to the dying St. Simon. Later, E., along with Rodriguez and Bazard, the head of the French Carbonari, started a journal, the *Producteur*, in which they explained St. Simon's views, calling themselves the 'Supreme Fathers.' E. divided all human characters into the constant and the variable, the profound and the superficial. After a split in the sect, E. was called by his preachers—Barrant, Transon, Laurent, &c.—'the living law,' while the *Globe* newspaper argued that the salvation of society depended on the recognition of E. as Pope. In 1832 the society was put down by Government, and E. was imprisoned for conspiring against public morality. He afterwards lived in seclusion for some years, but was a member of the Algerian Scientific Commission of 1841, and edited the journal *Le Crédit Public*, 1848-50. He died 1st September, 1864. E. wrote many socialistic works; among the latest, *La Vie Éternelle, Passé, Présente, Future* (1861). E.'s works, along with those of St. Simon, were published in 20 volumes (1865-69) by a council of followers.

En'field, a town in Middlesex, 10 miles N.E. of London by railway, celebrated as the seat of the Government small-arms factory. It belonged to the Crown till the time of James I., and there was here an extensive royal chase, disforested in 1729. Pop. parl. div. of county 84,414; reg. sub-dist. and civ. par. (each) 31,803.

Enfilade' (Fr. *enfiler*, lit. 'to thread,' hence 'to take in line') is to sweep any line of works or of troops with shot from a battery placed on the prolongation of such line. An E. is evaded by constructing works so as to present angles to the enemy's fire, and on the side of the attack by advancing to these works in zigzag trenches.

Enfran'chise (Fr. *franc*, Ger. *frank*, 'free'), to liberate, to confer on a person free privileges, as of voting in a constitutional government, &c. It also means to *naturalise*.
